This statement is not in accord with the controlling authorities heretofore cited. Whatever may be the individual opinions of an Examiner, the orderly course of business requires that the decisions of the Commissioner should be followed.

The petition is granted.

EX PARTE CONKLIN.

Decided May 26, 1898.

1. CAVEAT—STATUTE CONSTRUED—RIGHT OF PERSONAL REPRESENTATIVE TO FILE.

Section 4902 of the Revised Statutes of the United States, under the terms of which caveats may be filed, does not give the right to file a caveat to any one other than the inventor, and in the absence of any expressed right being vested under the statute in the personal representative of an inventor to file a caveat no such right exists, nor can it be implied.

2. SAME—STATUTE AND RULE CONSTRUED—RENEWAL.

Section 4902 of the Revised Statutes does not provide for the renewal of a caveat, and although the rules of the Patent Office provide for such renewal yet in the absence of any express language in the statutes giving the right of renewal in order to validate the rule the word "renewal," as employed in the rule, must be taken to mean not an extension of the caveat originally filed, but rather considered as referring to and making the so-called renewal a new caveat, based upon the papers originally filed.

3. SAME—SAME—RIGHT OF PERSONAL REPRESENTATIVE TO RENEW A CAVEAT.

If the so-called renewal must be considered in effect as a new filing of the original caveat, an executor cannot renew the caveat filed by a deceased inventor, for the reason that the executor, under the statutes, could not have filed the caveat in the first instance.

4. SAME—SAME—SAME.

An executor or an administrator of a deceased inventor is not deprived of any substantial right if he be not allowed to renew a caveat; but even if he were the remedy cannot be found in the Patent Office, but rather should be the subject of legislation by Congress. If at the time of the death of a caveator an invention had not been perfected, his executor could not file an application for patent in his representative capacity. If the invention had been perfected, then the executor could file an application for a patent, and in either case no injury that would flow from the denial of a right to renew the caveat would follow.

IN the matter of the petition for renewal of caveat of Egbert W. Conklin, deceased, by his executors, Horace E. Conklin and Charles W. Loomis.

Messrs. Edson Bros. for the petitioner.

DUELL, *Commissioner:*

The petitioners seek to renew a caveat, and in passing upon their right to so do it is necessary to briefly review the facts.

It appears that the petitioners are the executors of the estate of Egbert W. Conklin, deceased, who on June 24, 1884, filed a caveat for an improvement in sieves. The caveat was renewed yearly, but in several cases not until after the expiration of the previous year. In October, 1893, Conklin having died, the petitioners, Horace E. Conklin and Charles W. Loomis, were duly appointed executors of his estate, and letters testamentary under his will were granted and issued to them on December 16, 1896. On March 22, 1897, the petitioners, as executors, renewed the caveat, no question at that time being raised as to their right to so do. On March 24, 1898, they made a second application for the renewal of the caveat, paying the renewal fee of $10; but it was then held that under the statute the right to file a caveat was limited to the inventor and no authority for filing a caveat was vested in his legal representatives, and the renewal fee was returned to the attorneys representing the executors.

The question presented by the petition is whether or not an executor has a right to renew a caveat. It has heretofore been held by the Office that there was no authority vested in an executor to file a caveat. Section 4902 of the Revised Statutes of the United States, under the terms of which caveats may be filed, does not give such right to any one other than the inventor, and I am entirely clear that in the absence of any expressed right being vested under the statute in the personal representative of an inventor to file a caveat no such right exists, nor can it be implied.

The section referred to does not provide for a renewal of a caveat; but the rules of the Patent Office since prior to July 8, 1870, have provided for the renewal (so called) of a caveat. Rule 185 says:

> 185. The caveat may be renewed, on request in writing, by the payment of a second caveat fee of $10, and it will continue in force for one year from the date of the payment of such second fee. Subsequent renewals may be made with like effect. * * *

In the absence of any express language in the statute giving the right of renewal I am of the opinion that in order to validate the rule the word "renewal" as employed in the rule must be taken to mean not an extension of the caveat originally filed, but rather considered as referring to and making the so-called renewal a new caveat, based upon the papers originally filed.

Upon an examination of the decisions of the Commissioners of Patents I find that Mr. Commissioner Fisher in *Cyrenus Wheeler, Jr.*, v. *G. M. Peters* (C. D., 1870, 141) has so held, and as the Office rule at that time in force relative to the renewal of caveats was in substance the same as the present rule, 185, I see no reason for declining to give full weight to this ruling as an authority. The Commissioner there said:

> Wheeler filed a caveat in June, 1865. He refiled it by an additional payment in 1868, and again in 1867. This is sometimes erroneously called a renewal of a caveat. It is in effect a new filing. The law gives effect to a caveat only for a single year, and makes no provision for an extension or renewal of the term. As, however, it does not declare that one caveat only shall be filed for each invention, it is within the power of the caveator to file as many as he pleases, and therefore as fast as one expires he may file another. This is usually done by a payment of a new fee and the adoption of the old papers as the papers for the new caveat; but, as before remarked, it is in legal effect a new, independent caveat, having but a single year to run, and relating back only to the date of the payment of the fee.

If a so-called renewal must be considered in effect as a new filing of the original caveat, it is clear that an executor cannot renew the caveat filed by a deceased inventor, for the reason that such executor under the statutes could not have filed the caveat in the first instance.

I do not see that an executor or administrator of a deceased inventor is deprived of any substantial right if he be not allowed to renew a caveat; but even if he were the remedy cannot be found in the Patent Office, but rather should be the subject of legislation by Congress. If at the time of the death of a caveator an invention has not been perfected, his executor could not file an application for patent in his representative capacity. If the invention has been perfected, then the executor could file an application for patent; and I do not see in either case any injury that would follow from a denial of the right to renew a caveat.

For the reasons above set forth I am of the opinion that the petitioners have no right to renew the caveat, and the petition is therefore dismissed.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

HUBBELL *v.* THE UNITED STATES.

Decided May 31, 1898.

SECOND SUIT—RES ADJUDICATA—ESTOPPEL.

Claimant filed a petition in the Court of Claims for royalty upon cartridges and primers alleged to have been manufactured by the United States under his patent. The petition was dismissed. A motion for new trial was filed by claimant and was also dismissed. Application for appeal was filed; but appeal was not allowed. A second petition was filed after the first petition had been dismissed and was based upon the same patent involved in the first petition. This petition was also dismissed by the Court of Claims. Appeal from this judgment was taken to the Supreme Court. The defense was that of *res adjudicata*. *Held* that even if a somewhat different theory or state of facts were developed upon the trial of the second petition the judgment in the former petition would not operate the less as an estoppel, since the patentee cannot bring suit against an infringer upon a certain state of facts and after a dismissal of his action bring another suit against the same party upon the same state of facts and recover upon a different theory. The judgment in the first action is a complete estoppel in favor of the successful party in a subsequent action upon the same state of facts. (Walk. on Pats., sec. 468; *Dubois* v. *Railway Co.*, 5 Fish., 200; *Bradley Mfg. Co.* v. *Eagle Mfg. Co.*, 66 O. G., 315; 57 Fed. Rep., 980.)

APPEAL from the Court of Claims.

STATEMENT OF THE CASE.

This was an appeal from a judgment of the Court of Claims dismissing the petition of William Wheeler Hubbell, who, as patentee of an "improvement in cartridges," claimed that the United States had manufactured and used cartridges covered by his patent under an implied contract to pay a reasonable royalty therefor.

The petition contained, among others, the following allegations: That—

> your petitioner is the first and original inventor of an improvement in cartridges, for which Letters Patent of the United States were granted to him in due form of law, and, according to law, dated and issued the 16th day of February, A. D. 1879, vesting in him the exclusive right to make, vend and use the same for seventeen years from the date thereof.
>
> Your petitioner has pending a suit for compensation up to March 31, 1893, case No. 12,793, in the Court of Claims, and has never sued any officer nor brought any other suit than that before this present petition.
>
> Your petitioner prays for an account of the full and entire number of the said cartridges made or used by the defendant, its officers or employees in its service, or for distribution to the States, since the said March 31, 1893, to be separately stated when ordered, and for leave to make the same a part of this petition when precisely ascertained by amendment.
>
> Your petitioner further claims a just compensation for the making or use by the defendant, its authorized officers or employees, for its service, of his said patented invention of cartridge, to wit: he claims the sum of one hundred and ten thousand dollars due to him on this behalf by the United States from the 31st March, 1893, up to May 31, 1898.
>
> And he prays for judgment for all making or use of his said patented invention from the said 31st March, 1893, to said 31st May, 1898, by the defendant, its authorized officers or employees in its service, or on its behalf, in pursuance of law, in the sum of one hundred and ten thousand dollars, with leave to amend his petition in this behalf when the precise numbers have been duly reported by the proper departments of the United States.

Upon the trial of this case the Court of Claims made, among others, the following finding:

> The facts in this case are the facts already found in case No. 12,793, between the same parties as to the same subject-matter, except as to the time since the beginning of the other action, during which time, to wit, from the beginning of the other action to the beginning of this action, the Government manufactured cartridges of the same form and kind as those described in these findings, known as the "reloading-cartridge," in which said case No. 12,793 the following proceedings were had and the following facts were found, which facts are now found herein and are hereto annexed, as follows, to and including finding VIII.

The IXth finding is as follows:

> The following are, in substance, the proceedings had in case No. 12,793 between the same parties:
>
> April 19, 1893. Petition filed.
> May 18, 1893. Amendment to petition filed by allowance of judge at chambers.
> June 4, 1893. Traverse filed.
> July 25, 1893. Amendment to petition filed and allowed.
> October 2, 1894. Amendment to petition filed and allowed.
> December 15, 1894. Amendment to petition allowed.
> January 10, 1895. Claimant's requests for facts and brief filed.
> April 9, 1895. Additional brief for claimant filed.
> April 13, 1895. Defendant's requests for facts and brief filed.
> April 16, 1895. Argued and submitted.
> April 16, 1895. Claimant's brief of argument filed.
> April 20, 1895. Waiver filed by claimant.
> June 1, 1895. Davis, J., filed the opinion of the court. Petition dismissed. Findings of fact filed.
> August 14, 1895. Motions for new trial, amendment of findings and for reversal of judgment filed by claimant.
> August 21, 1895. Application for appeal filed by claimant.
> December 14, 1895. Motion of claimant for new trial overruled, with leave to submit to the consideration of the court. Findings II, III, IV amended in the form requested by claimant in his motion, subject to objection of the defendant to their allowance.
> October 6, 1896. Claimant's request for findings of fact filed under order of court.
> March 15, 1897. Requests, etc., of October 6, 1896, ordered to law-docket.
> April 15, 1899. Motion to amend findings continued.
> November 18, 1899. Continued.
> November 12, 1901. Motion of claimant to amend order of court filed.
> November 16, 1901. Motion of claimant to amend order of court heretofore entered as to the evidence to be used on the trial allowed, subject to objections of defendant on the argument.

Upon these and other facts found, the court dismissed the petition, but as no opinion was filed, the reasons for this judgment do not appear.

Subsequently additional findings were made, but as they are not material, they are not here repeated.

From the judgment of the Court of Claims dismissing his petition, petitioner applied for and was allowed an appeal to this Court.

Mr. George S. Boutwell, *Mr. F. P. Dewees*, and *Mr. W. W. Hubbell* for the appellant.

Mr. Charles C. Binney and *Assistant Attorney-General Pradt* for the appellee.

Mr. Justice BROWN delivered the opinion of the Court.

As the claimant in his petition relies only upon the patent of February 18, 1879, No. 212,313, for an improvement in cartridges, and as the proceedings in the former suit in the Court of Claims were based, in part at least, upon this patent, it will not be necessary to refer to any prior patents.

The only defense we are called upon to consider is that of *res adjudicata*. As bearing upon this defense the following facts are pertinent;

April 19, 1883. Claimant filed his petition in the Court of Claims for a royalty upon cartridges and primers alleged by him to have been manufactured by the United States under his patents, between February 18, 1879, and March 31, 1883.

June 1, 1885. This petition, after having been several times amended, was dismissed and findings of facts filed.

August 14, 1885. Motions for new trial, amendment of findings, and for reversal of judgment were filed by the claimant.

August 21, 1885. Application for appeal was filed by claimant, but such appeal does not appear to have been allowed.

December 14, 1885. Motion for new trial was overruled by the court, and the claimant was given leave to submit to the consideration of the court certain amended findings, subject, however, to objection of the defendant as to their allowance.

October 8, 1886. Claimant's request for findings was filed under order of the court, and on March 15, 1887, it was ordered to the law-docket.

The argument was deferred from time to time until November 16, 1891, when the motion of claimant to amend an order of court as to evidence was allowed subject to the objections of the defendants on the argument.

The petition under consideration was filed June 11, 1888, after the first petition had been dismissed by the Court of Claims, and is based upon the patent issued February 18, 1879, which was one of the patents involved in the first petition. A claim is made in this petition for royalty upon cartridges manufactured, in accordance with this patent, and used by the United States for nearly six years prior to the filing of this petition, but subsequent to the time of the filing of the first petition.

In this connection the court has found that the facts in the case under consideration are the same as those in the prior case, except as to the time since the beginning of the other action, during which time, to wit, from the beginning of the other action to the beginning of this action, the Government manufactured cartridges of the same form and kind as those described in these findings.

1. As the prior action was between the same parties, and was based in part, at least, and principally, upon the same patent, it would appear that the judgment of the court dismissing the petition would operate as a complete estoppel to the present suit, unless the proceedings subsequent to the judgment in the former suit in some way deprived that judgment of its force and effect as *res adjudicata*. (3 Rob. on Pats., sec. 1017.)

While the record of the former case was not sent up with the transcript from the Court of Claims, it appears from the petition in the case under consideration that, at the time the petition was filed, there was a suit pending by the petitioner in the Court of Claims in case No. 13,793, for compensation up to March 31, 1883; and, in the findings, that the facts in both cases were the same, except as to the time covered by the petitions. The identity of the two actions with respect to the parties, the subject-matter and the facts sufficiently appear. As it further appears that the petition in the former case was dismissed upon an opinion filed and certain findings of fact, it will be presumed to have been dismissed upon the merits, (*Loudenback* v. *Collins*, 4 Ohio St., 251;) and that such dismissal covered every question put in issue by the pleadings, including the validity of the patent and its use by the defendant.

But if there were any doubt with regard to this point, it would be resolved by an inspection of the opinion of the court (which may be examined for the purposes of identification), as it is published in 20 Court of Claims, 354, wherein it not only appears that the case was considered and disposed of upon the merits, but the court concludes its opinion (p. 370) in the following language:

> Upon our construction of the patent in issue the Government cartridges do not infringe the claimant's; but if we are in error as to this, still the claimant cannot recover, as the essential characteristics of his invention now found in the Government cartridges were developed by officers of the army in 1864. That is, if the relative position of the vents and the wall of the fulminate-chamber is a material part of the claimant's patent, the Government has not infringed, this feature not appearing in its cartridges; but if this position is not material, still the claimant cannot recover, as the other characteristics of his invention, found in the cartridge now used by the defendant, were introduced by them prior to the use of the patent or the filing of the application for it, and even prior to the application of 1865.

Whether the reasons given by the Court of Claims for the dismissal of this petition are correct or not; whether, indeed, this judgment were right or wrong upon the facts presented, is of no importance here. If such judgment were based upon an erroneous view of the claimant's patent, it was his duty to have promptly taken an appeal to this Court, where the whole case would have been reopened and the error of the Court of Claims, if such there was, would have been rectified.

It is insisted by the claimant that in the former action the main contention arose upon the manufacture and use of what was known as the "cup-anvil cartridge," together with a certain reloading-cartridge, which had been experimentally manufactured, and that no claims for the "cup-anvil cartridge" or for the reloading-cartridge in that suit are in issue in the case at bar. The suit, however, was upon the same patent, and it was found by the Court of Claims to have been upon the same facts, and we think the estoppel operates upon

everything which was, if not upon everything which might have been, put in issue in the former case. The presumption is that the issues were the same, and if they were in fact different, it was incumbent upon the claimant to show that the prior case was decided upon questions not involved herein. We have before us only a decision upon the merits, and upon the same state of facts, of a claim identical with this, and we perceive no reason why it should not operate as an estoppel.

But there seems to be nothing upon which to base claimant's argument that the issues were not the same. The findings show that the manufacture of the reloading-cartridge with the grooved anvil-disk, referred to in finding VI, commenced at the Frankfort Arsenal in the month of July, 1879, and that from February, 1879, to March 31, 1883, being the period covered by the first suit, the United States manufactured 3,866,352 reloading-cartridges. We see nothing to indicate that these reloading-cartridges were manufactured experimentally, or that the issue as to these cartridges was not presented and decided in the former case. The claim in the present suit is also for reloading-cartridges.

But, even if a somewhat different theory or state of facts were developed upon the trial of the second case, the former judgment would not operate the less as an estoppel, since the patentee cannot bring suit against an infringer upon a certain state of facts, and after a dismissal of his action, bring another suit against the same party upon the same state of facts, and recover upon a different theory. The judgment in the first action is a complete estoppel in favor of the successful party in a subsequent action upon the same state of facts. (Walk. on Pats., sec. 468; *Duboise* v. *Railroad Co.*, 5 Fish., 200; *Bradley Mfg. Co.* v. *Eagle Mfg. Co.*, 66 O. G., 315; 57 Fed. Rep., 989.)

2. It only remains to consider, then, whether any proceedings taken in the Court of Claims since the dismissal of such petition deprived its judgment of its character as an estoppel. A motion for a new trial was made August 14, 1885, but as this motion was overruled in the following December, clearly this would not deprive the judgment of its efficacy as a plea in bar. Indeed, it may well be doubted whether the pendency of a motion for a new trial would interfere in any way with the operation of the judgment as an estoppel. (*Harris* v. *Barnhart*, 97 Cal., 546; *Chase* v. *Jefferson*, 1 Houst., Del., 257; *Young* v. *Brehe*, 19 Nev., 379.)

3. It further appears that on August 21, 1885, an application for an appeal was filed by the claimant, but as this appeal was never allowed or perfected, and as it does not appear that a transcript of the record was ever filed in this Court, it is obvious that the authorities which hold that an appeal perfected to a superior court vacates the judgment of the court below, have no application to this case.

We are therefore of opinion that the defense of *res adjudicata* is sustained, and the judgment of the Court of Claims dismissing the petition is, accordingly, affirmed.

U. S. Circuit Court of Appeals—Eighth Circuit.

DICKERSON v. TINLING.

Decided December 13, 1897.

1. PRELIMINARY INJUNCTION—ARTICLES IMPORTED FROM ABROAD.
Preliminary injunction granted where a party purchases abroad articles covered by a United States patent and imports them for sale in this country.

2. SALE ABROAD BY PATENTEE—RESTRICTIONS AS TO USE.
Even if a party who buys a patented article without restriction in a foreign country from the owner of the United States patent has the right to use and vend it in this country he has no such right if he bought it with the express condition that it be not imported into the United States.

3. CONDITIONAL SALE—RIGHTS OF PATENTEE.
The patentee has the same right and power to sell the patented article upon conditions or with restrictions that he has to sell it at all.

APPEAL from the Circuit Court of the United States for the District of Colorado.

STATEMENT OF THE CASE.

This was a suit by Edward N. Dickerson against Hugh L. Tinling for alleged infringement of a patent. The court below denied a motion for preliminary injunction, and the plaintiff thereupon appealed to this court.

Before SANBORN, THAYER, and RINER, Judges.

Mr. Edward N. Dickerson (*Mr. Anthony Gref* and *Mr. James H. Brown*, on the brief) in *pro per.*

Mr. Sam B. Berry for the appellee.

SANBORN, *J.*:

This is an appeal from an order denying a motion for a preliminary injunction to restrain the defendant from infringing Letters Patent No. 400,086, issued March 26, 1889, to the Farbenfabriken, vormals Friedr. Bayer & Co., a corporation of Germany, hereinafter called Bayer & Co., as assignee of Oskar Hinsberg. The Letters Patent secure to Bayer & Co. the monopoly of the manufacture and sale of phenacetin or paracet-phenetidin in the United States. The appellant, Edward N. Dickerson, alleged in his bill that these Letters Patent had been issued and assigned to him and that the appellee was infringing upon his rights by vending in the United States the improvement described in the patent. The appellee answered that Bayer & Co. was the sole owner and manufacturer of phenacetin, which he averred was the same substance which was manufactured by others in Germany and elsewhere as paracet-phenetidin; that Bayer & Co. was the real owner of the patent in suit, and the appellant was its agent and held the assignment of all rights under the patent for its benefit; that the appellee had been informed and believed that about March 26, 1889, Bayer & Co., or Hinsberg for it—

> obtained a patent on, or registered, in the German Empire, this name "phenacetin,"

and that the German patent or registration had expired or been rendered void by the authorities of the German Empire, and—

> that he, in common with many citizens of the United States, has bought small quantities of said "phenacetin" from persons outside of the United States, who had perfect and legal right to deal in the same, being the legal purchasers and sellers thereof, and that he has brought the same into the United States, and that he has resold a small quantity thereof in the United States for a legitimate profit.

The answer contains some other allegations, but none that are material to the issue, and it contains no other denial of infringement. To this answer the appellant filed the usual replication, and upon these pleadings and certain affidavits, from which it appears that no patent had ever been issued in Germany, as alleged in the answer, and that every package of phenacetin that had ever been sold by Bayer & Co. in a foreign country had a prohibition against its importation into and sale within the United States printed upon it and was sold subject to that prohibition, the motion for the temporary injunction was heard and denied.

If it were conceded that Bayer & Co. is the real owner of the Letters Patent in suit, as alleged in the answer, it would be difficult, upon the facts disclosed by this record, to justify a sale of phenacetin in the United States by this appellee. Section 4884 of the Revised Statutes provides that—

> every patent shall contain * * * a grant to the patentee, his heirs or assigns, for the term of seventeen years, of the exclusive right to make, use and vend the invention or discovery throughout the United States, and the Territories thereof.

The answer avers that the appellee bought the phenacetin he is selling in a foreign country, either from Bayer & Co. or from others who had a legal right to sell it in that country. He must have bought it, therefore, of Bayer & Co., or its vendees, or of others. If he bought it of others than Bayer & Co. or its vendees, he bought with it no right to sell it in the United States, because no one but Bayer & Co. and its vendees had that right in this country. The right to sell the patented article in the United States is not governed by the laws of Germany or of England, but by the laws of this nation, and under those laws and the patent before us Bayer & Co. has the "exclusive right to make, use and vend" phenacetin in the United States. Thus in *Boesch* v. *Graff*, (51 O. G., 477; 133 U. S., 697, 703; 10 Sup. Ct., 378,) a case in which the defendant had purchased in Germany, from one Hecht, who had the legal right to sell them there, certain burners which had been patented in both Germany and the United States, Chief Justice Fuller said:

> The right which Hecht had to make and sell the burners in Germany was allowed him under the laws of that country, and purchasers from him could not be thereby authorized to sell the articles in the United States, in defiance of the rights of the patentees under a United States patent.

The cases of *Adams* v. *Burke*, (33 O. G., 114; 17 Wall., 453, 456,) *Hobbie* v. *Jennison*, (63 O. G., 1207; 149 U. S., 355, 362; 13 Sup. Ct., 879,) and *Keeler* v. *Folding-Bed Co.*, (157 U. S., 659, 664; 15 Sup. Ct., 738,) in which it was held that one who purchases patented articles of a territorial assignee within the district of the United States assigned to him may sell them again in the territory owned by another, do not rule the case in hand. They rest upon the principle that one who buys the patented article of a party who is legally empowered to sell it under the patent has once paid tribute to the monopoly and has thereby acquired the right to use and sell the article he buys elsewhere within the United States; but one who purchases in a foreign country of others than the owners of the United States patent or their vendees pays nothing, either directly or indirectly, to the owners of the patent, and therefore he acquires no right to make, use, or vend the article which he buys within the territorial limits of their monopoly. It follows that if the appellee bought the phenacetin he is selling of others than Bayer & Co. or its vendees he is infringing upon the exclusive right of this patentee and an injunction should issue.

On the other hand, if the appellee bought the phenacetin he is selling in a foreign country from Bayer & Co. or from its vendees, subject to the express condition that it should not be imported into the United States or sold within their limits, the exclusive right to sell the patented article within the United States which was granted to Bayer & Co. by the patent was not abridged by that purchase. Conceding, but not deciding, that one who buys a patented article without restriction in a foreign country from the owner of the United States patent has the right to use and vend it in this country, upon the general principle that a patented article purchased from the patentee passes without the limit of the monopoly, (*Holiday* v. *Matheson*, 24 Fed. Rep., 185; *Dickerson* v. *Matheson*, 57 O. G., 1724; 6 C. C. A., 466; 57 Fed. Rep., 524, 527,) there can be no doubt that a patentee has the same right and power to sell the patented article upon conditions or with restrictions that he has to sell it at all. Bayer & Co. had the right to sell its phenacetin in Germany without restriction. It had an equal right to sell it subject to the limitation that it should not be sold or used in any way that would curtail or affect the exclusive right which that corporation held under this patent to make, use, and vend the phenacetin in the United States. If the corporation sold the patented article subject to such a restriction, the purchasers, with notice of this limitation, whether immediate or remote, could acquire no better right than strangers to infringe upon the monopoly secured by the patent. That monopoly would still remain intact, and purchasers of the phenacetin which had been sold under the restriction must be liable for its use and sale in the United States to the same extent as those who made it or bought it of strangers within their limits. (*Dickerson* v. *Matheson*, 57 O. G., 1724; 6 C. C. A., 466; 57 Fed. Rep., 524, 526, 528; *Id.*, 50 Fed. Rep., 78, 77; *Id.*, 47 Fed. Rep., 819.) The record is that every package of this article sold by Bayer & Co. in a foreign country was sold on the express condition that it should not be imported into or sold within the United States, and that this prohibition was plainly printed upon every package. The necessary result is that whether the appellee bought in a foreign country the phenacetin which he is now selling in the State of Colorado from Bayer & Co. or its vendees subject to this restriction, or from others without restriction, he is alike an infringer upon the exclusive right to make, use, and vend the phenacetin within the United States which was granted to this corporation by the Letters Patent.

The order denying the motion for a temporary injunction must accordingly be reversed, and the case must be remanded to the court below, with directions to issue the injunction, and it is so ordered.

Attorneys.

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D. C., June 15, 1898.

SIR: The Secretary of the Interior has ordered that L. C. Weltner, of Uniontown, Pa., be not recognized after this date as attorney or agent in the prosecution of any claim or other matter before this Department or any Bureau thereof.

Very respectfully,

EDWARD M. DAWSON,
Chief Clerk.

The Commissioner of Patents.

Preparation of Specifications, Entry of Amendments, Etc.

LEGIBLE WRITING REQUIRED.

The specification and claims must be plainly written or printed on but one side of the paper. All interlineations and erasures must be clearly referred to in marginal or foot notes on the same sheet of paper. Legal-cap paper with the lines numbered is deemed preferable, and a wide margin must always be reserved upon the left-hand side of the page.

AMENDMENTS MUST BE SPECIFIC—HOW WRITTEN.

In every amendment the exact word or words to be stricken out or inserted in the application must be specified, and the precise point indicated where the erasure or insertion is to be made. All such amendments must be on sheets of paper separate from the papers previously filed, and written on but one side of the paper. Erasures, additions, insertions, or mutilations of the papers and records must not be made by the applicant.

SPECIFICATIONS REWRITTEN.

When an amendatory clause is amended, it must be wholly rewritten, so that no interlineation or erasure shall appear in the clause, as finally amended, when the application is passed to issue. If the number or nature of the amendments shall render it otherwise difficult to consider the case, or to arrange the papers for printing or copying, the Examiner or Commissioner may require the entire specification to be rewritten.

Attorneys' Use of Assignment Records.

(ORDER No. 1,207.)

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., May 31, 1898.

It has been brought to my attention that certain attorneys and other persons have made use of the assignment records to obtain the addresses of persons having applications pending before this Office, in order to send them letters and circulars offering to secure foreign patents or to transact other business which it may be presumed the attorneys of record in such applications are competent and willing to do. Such use of the assignment records is not a proper or legitimate use. These records are not open to the public for any such purpose.

It is hereby ordered that any attorney or other person who is known to make such use of the assignment records of this Office will be denied access thereto.

C. H. DUELL,
Commissioner.

CERTIFICATES OF REGISTRATION ISSUED JUNE 21, 1898.

Labels.

6,604.—Title: "CUBAN DAISY." (For Cigars.) *American Lithographic Company*, New York, N. Y. Application filed May 27, 1898.

6,605.—Title: "BLUE POINT RACCOON CREEK RYE WHISKEY." *Henry H. Elliott*, Washington, D. C. Application filed May 25, 1898.

6,606.—Title: "DEWEY'S VICTORY." (For Whisky.) *Alfred B. Sheaffer*, Philadelphia, Pa. Application filed May 16, 1898.

6,607.—Title: "OLD GLORY." (For Whisky.) *Alfred B. Sheaffer*, Philadelphia, Pa. Application filed May 20, 1898.

6,608.—Title: "OUR CHOICE T, GOOD LUCK AND SWAN CHOP." *W. J. Butterfield*, New York, N. Y. Application filed May 12, 1898.

6,609.—Title: "GOLDEN ROD." (For Syrup.) *Charles W. Shaw & Co.*, Baltimore, Md. Application filed May 25, 1898.

6,610.—Title: "HOLLAND FLOUR." *Wolf, Sayer & Heller*, Chicago, Ill. Application filed April 11, 1898.

6,611.—Title: "IMPERIAL SILVER POLISH." *Asher Green* and *Woolf Green*, New York, N. Y. Application filed May 16, 1898.

6,612.—Title: "FAIRY QUEEN." (For Brooms and Dusters.) *Lee Broom and Duster Company*, Davenport, Iowa, and Lincoln, Nebr. Application filed May 6, 1898.

6,613.—Title: "MEDICATED FRENCH TISSUE." (For a Preparation for Corns and the Like.) *The Silver Suds Manufacturing Co.*, Philadelphia, Pa. Application filed May 5, 1898.

Print.

70.—Title: "DEWEY'S CHEWING." (For Confections.) *Thomas H. McInnerney*, New York, N. Y. Application filed May 16, 1898.

APPLICATIONS UNDER EXAMINATION.

Condition at Close of Business June 14, 1898.

Room No.	Divisions and subjects of invention.	Oldest new application and oldest action by applicant awaiting office action. New.	Amended.	No. of applications awaiting action.
	In arrears—Between two and three months.

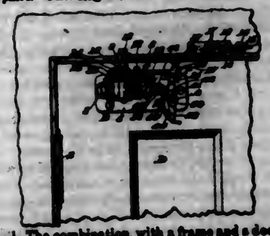
PATENTS

GRANTED JUNE 21, 1898.

605,834. FISH-TRAP. FREDERICK L. ALBERT, Tampa, Fla., assignor of one-half to Ernest H. Hester and Calvin B. Barnard, same place. Filed Apr. 22, 1897. Serial No. 633,412. (Model.)



Claim.—A reticulated fish-trap having an inlet located at the reëntrant angle *i k l* formed by the junction of two of its sides, the outer end or entrance of said inlet being at or near the top of the trap and the inner end of said inlet being within the trap not far from its bottom, in combination with an outlet by which the fish may be removed, substantially as described.

605,885. ELECTROLYTIC PRODUCTION OF AMALGAMS, &c. EMILE ANDREOLI and GABRIEL ANDREOLI, London, England. Filed Sept. 17, 1895. Serial No. 562,514. (No model.) Patented in England Aug. 9, 1895, No. 15,094.

Claim.—An apparatus for the production of amalgam consisting of a cell provided with positive and negative compartments separated by porous diaphragms, the negative compartments having a raised middle portion in the form of a table or block between the sides of which and the said partitions are narrow vertical spaces, the top of the block or table and the vertical spaces being covered and filled with a continuous body of mercury forming a cathode, substantially as described.

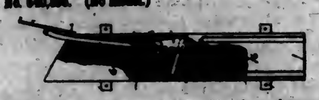
605,886. COMBINED DOOR-CLOSER AND CHECK. GEORGE ASHLEY, New Britain, Conn., assignor of one-third to George B. Ashley, Jr., same place. Filed Aug. 28, 1897. Serial No. 649,169. (No model.)

Claim.—1. The combination, with a frame and a door, of a spring mounted on the door and operatively connected with the frame; a slide on the door, operated by the spring and having a catch-face; and a spring-actuated detent disposed in the path of movement of said catch-face.

2. The combination, with a frame and a door, of a spring mounted on the door and operatively connected with the frame; a slide on the door, operated by the spring and having a catch-face; and a spring-actuated detent disposed in the path of movement of said catch-face and mounted for longitudinal movement.

3. The combination, with a frame and a door, of a spring-case carrying a shaft operatively connected with the frame; a spring fixed, respectively, to the case and to the shaft; a gear on said shaft; a sliding rack on the door, meshing with the gear and having a projection; and a detent disposed in the path of movement of said projection.

4. The combination, with a frame and a door, of a spring-case mounted on the door and carrying a shaft operatively connected with the frame; a spring fixed to the case and shaft, respectively; a slide on the door; means operated by said shaft for actuating the slide; a by-pass projection carried by the slide; and a detent disposed in the path of movement of said projection.



5. The combination, with a frame and a door, of a spring-case mounted on the door and having a shaft operatively connected with the frame; a spring fixed, respectively, to the case and the shaft; a longitudinally-slotted rack on the door; a gear on said shaft, meshing with said rack; means extending through the slot for guiding the rack; a projection on the rack; and a detent disposed in the path of movement of said projection.

6. The combination, with a frame and a door, of a spring-case mounted on the door and having a shaft operatively connected with the frame; a spring fixed, respectively, to the case and to the shaft; a slide; means on the shaft for operating said slide; a detent having a slot; a pin passing through said slot; a spring acting against said detent; and a projection on the slide, adapted to be engaged by said detent.

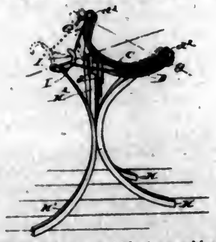
7. The combination, with a frame and a door, of a spring-case mounted on the door and having a shaft operatively connected with the frame; a spring fixed, respectively, to the case and to the shaft; a slide provided with a projection; means on the shaft for operating said slide; a detent supported between its ends, one of the arms of said detent being disposed in the path of movement of said projection; a stop against which said arm acts; and a spring bearing against the detent.

8. The combination, with a frame and a door, of a spring mounted on the door and operatively connected with the frame; a slide on the door, operated by the spring and having a catch-face; a detent disposed in the path of movement of the catch-face and longitudinally slotted; a stud passing through the longitudinal slot; and a spring acting against said detent and of less strength than the door-operating spring.

605,887. MAIL-BOX. JOHN AVERY, Galesburg, Ill., assignor of one-half to George W. Hudson, same place. Filed June 15, 1897. Serial No. 640,288. (No model.)

Claim.—1. In a mail-box, and in combination, a box, a top therefor hinged to one side of the box, a mail-receiving plate hinged to the side of the box opposite to that to which the top is hinged and extending across and dividing the box when closed into an upper mail-receiving box and a lower mail-delivery box, and a direct link connection connecting said top and plate for moving one by the movement of the other.

2. In a mail-box, and in combination, a box, a hinged lid, a hinged mail-receiving plate dividing the box when closed, into an upper mail-receiving box and a lower mail-delivery box, a link operatively connecting said lid and plate, a signal, a swinging signal-hood, an arm projecting from said hood, and a lug on said link for actuating said hood, substantially as described.



3. In a mail-box, and in combination, a box, a hinged lid, a hinged mail-receiving plate dividing the box when closed, into an upper mail-receiving box and a lower mail-delivery box, a link operatively connecting said lid and plate, a signal, a swinging signal-hood, an arm projecting from said hood, a door to the delivery-box, a chain connecting said door and the arm projecting from the signal-hood, and a lug projecting from said link, substantially as described.

4. In a mail-box, and in combination, a box, a hinged lid therefor, a hinged mail-receiving plate within the box, a link operatively connecting said lid and plate, a swinging signal-hood, means operated by said link-rod for swinging said hood in one direction upon the opening of the lid, a delivery-door, and a connection between said hood and delivery-door for swinging the hood in the other direction upon the opening of the delivery-door, substantially as described.

5. In a mail-box and in combination, a box, a signal, a receiving-door, movable means operated positively by the receiving-door for disclosing the signal, a delivery-door, and means operatively connecting said delivery-door and means whereby opening the delivery-door will obscure the signal, substantially as described.

6. In a mail-box, and in combination, a box, a hinged lid, a hinged mail-receiving plate dividing the box when closed, into an upper mail-receiving box and a lower mail-delivery box, a link operatively connecting said lid and hinged plate, a signal, a swinging signal-hood, and a lug on said link operatively connecting said link and signal, substantially as described.

605,888. BAG HOLDER OR CLAMP. William J. Ayers, Bryan, Ohio. Filed July 20, 1897. Serial No. 645,257. (No model.)

Claim.—1. In a clamp or holder the combination with the jaws or clamps, one movable toward and from the other, of a mechanism for advancing the movable jaw embodying a pivoted member movably connected with its support and jaw respectively, and adapted when swung on its center to have its free end move across its center of motion to form a lock, and a spring for supporting the jaw with a yielding pressure; substantially as described.

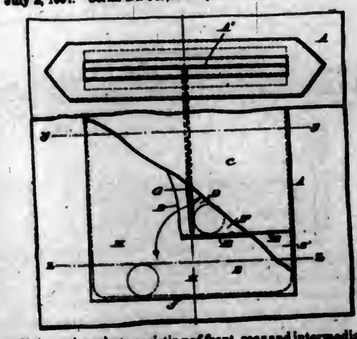
2. In a clamp or holder the combination with the jaws or clamps one movable toward and from the other, of a yielding support embodying a toggle for advancing said movable jaw, said toggle being adapted to move across its dead-center to form a lock; substantially as described.

3. In a clamp or holder the combination with the jaws or clamps one movable toward and from the other of a toggle pivotally connected with the jaw at one end and with its support at the opposite end and a spring interposed at one end of the toggle whereby the jaw is supported with a yielding pressure, said toggle being movable across its dead-center to form a lock; substantially as described.

4. In a clamp or holder the combination with the jaws or clamps one movable toward and from the other, of a toggle having one of its members jointed to the movable jaw and having its other member jointed to an elastic arm on a suitable support, said toggle being adapted to move across its center of motion to constitute a lock; substantially as described.

5. In a bag-holder the combination with the stand or support and the fixed jaw, of a yielding movable jaw, a yoke having its ends pivotally connected with the ends of the movable jaw and constituting one member of a toggle and a second toggle member pivotally connected with the stand or support at one end and with the yoke at the opposite end; substantially as described.

605,889. TELESCOPE-BOX FASTENER. Sidney F. Baker, Santa Barbara, Cal. Filed June 9, 1897. Serial No. 640,092. (No model.)



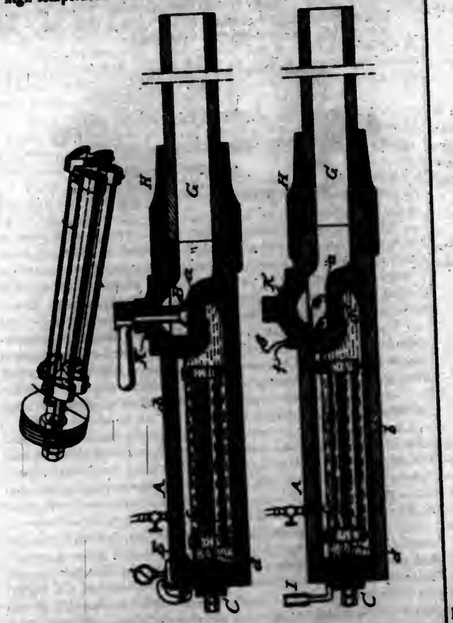
Claim.—1. A fastening device and lock for the purpose set forth, comprising a raised sheet-metal plate, or keeper with side angle elevations, and a series of transverse slots or openings with their upper edges slightly projected or lipped; in connection with a hook-plate and spring or clasp attached thereto, both to engage in keeper, and a lock for permanently engaging all the parts as shown and described.

2. A fastening device and lock for satchels or telescopes comprising a raised metal plate or keeper having a series of transverse slots, carried by and rigidly fastened one at each end of inner section, and a metal hook-plate with a transverse slot therein, a hook formed at the lower end thereof and carrying a fastening spring or clasp, said plate rigidly fastened one at each end of the other or outer section, to engage in respective and relative slots in keepers as one section is passed down over the other, in connection with a lock, substantially as shown and described.

3. A fastening device and lock for satchels or telescopes, comprising a raised metal plate or keeper having a series of transverse slots carried by and rigidly fastened one at each end of inner section, and a metal hook-plate with a transverse slot, a hook at lower end, and a spring or clasp attached to plate, carried by and rigidly fastened one at each end of outer section to engage in keepers, and a lock presenting a pivoted bolt or bar operated with a key and attached upon hook-plate at the slot or opening, to permanently engage all the parts, as shown and for the purpose set forth.

605,840. POCKET. Henry Bandler, Philadelphia, Pa. Filed July 2, 1897. Serial No. 643,226. (No model.)

Claim.—A pocket consisting of front, rear and intermediate pieces having their sides connected, the intermediate piece having a vertical passage therein, and the rear piece extending above said passage and below the intermediate piece and folded upwardly, and connected with the bottoms of the front and intermediate pieces.



605,841. METHOD OF AND APPARATUS FOR FIRING PNEUMATIC ORDNANCE. Lemoe W. Bates, Chicago, Ill. Filed June 26, 1896. Renewed Nov. 18, 1897. Serial No. 660,016. (No model.)

Claim.—1. The art of propelling projectiles, which consists in confining a body of water or other suitable agent in a strong chamber constituting a portion of the gun; subjecting the same to the heating effect of an electric current until it is converted into gas or vapor; and lastly, permitting the gas or vapor to enter the projectile tube or barrel and to act upon a projectile therein.

2. The art of propelling missiles and projectiles, which consists in confining a suitable agent in a strong chamber or receptacle of limited capacity; subjecting the same to high heat generated in said containing-receptacle; maintaining the heat until by reason thereof and of the vaporization of the agent a pressure is developed which converts the agent into a high-tension gas or vapor; and finally, permitting the gas or vapor to enter the projectile tube or barrel and to act upon the projectile therein.

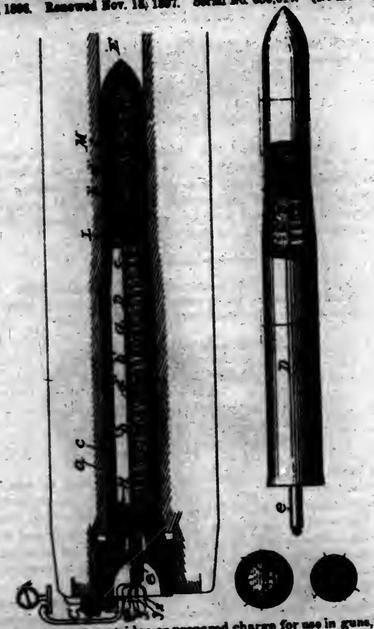
3. A gun, having a strong pressure-generating chamber within it, to contain suitable agent, and capable of being placed in or out of communication with the projectile tube or barrel at will; and an electric heater applied to said generating-chamber, and adapted to heat the contents thereof and thereby to generate pressure within said chamber.

4. In a gun, the combination of a barrel or projectile-tube; a pressure-chamber; a sealing device interposed between the barrel and the pressure-chamber; and an electric heater adapted to produce a high temperature within the pressure-chamber.

5. In combination with the barrel or projectile-tube of a gun, a pressure-generating chamber directly attached thereto and forming a permanent part of the gun; a passage-way or opening connecting the chamber with the projectile-chamber or barrel; a seal applied to said opening; means for opening said seal from outside the gun; and an electric heater applied to the generating-chamber and serving to heat the contents thereof.

6. In combination with the barrel or projectile-chamber of a gun; a pressure-generating chamber directly attached thereto; an electric heater applied to said chamber and serving to heat its contents; a pressure-indicating device serving to show the pressure existing within the chamber; and a sealing device serving to close and open communication between the generating-chamber and the barrel or projectile-chamber.

7. In combination with the barrel of a gun; a pressure-generating chamber; a wall or diaphragm separating the barrel and said chamber; a liquid-chamber in rear of the fluid-pressure chamber; a diaphragm separating the two chambers; a differential valve mechanism sealing the openings in the two diaphragms; and a valve controlling escape of liquid from the liquid-chamber; whereby the differential valve is controlled, substantially as set forth.



8. In combination with pressure-chamber A, liquid-chamber L; and barrel or tube G; differential valve h, i, j, controlling communication between the pressure-chamber and the barrel; and ventvalve N, controlling escape of liquid from chamber L, all substantially as described and shown.

9. In combination with the barrel of a gun, a plurality of pressure-chambers permanently connected with and forming part of the gun, each provided with an electric heater within the gun, and with a sealing device controlling communication with the barrel.

10. In combination with the barrel of a gun mounted upon trunnions; a pressure-generating chamber connected therewith; an electric heater applied to said chamber; electric supply-wires passing from the trunnion of the gun to the heater; and contact-plates located at the trunnion and permitting rise and fall of the barrel without disturbing the electrical connections.

11. In a gun, the combination of a barrel or projectile-tube; a pressure-generating chamber constituting a permanent and integral part of the gun; a wall or partition separating said chamber from the projectile-tube; and a sealing device serving to close and open a passage through said partition, substantially as and for the purpose set forth.

605,842. ELECTRICALLY-HEATED CHARGE FOR CARTRIDGES OR SHELLS. Lemoe W. Bates, Chicago, Ill. Filed June 30, 1896. Renewed Nov. 18, 1897. Serial No. 659,017. (No model.)

Claim.—1. A cartridge or prepared charge for use in guns, comprising a suitable projectile; a shell or casing; an agent contained within said shell or casing, adapted to be converted by heat into a vapor or gas; means for retaining and releasing the gas or vapor as required; and an electric heater applied to said shell or casing, substantially as and for the purpose set forth.

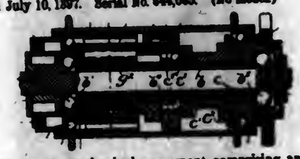
2. The combination of a cartridge shell or casing provided with an orifice or vent; a sealing device adapted to close or open said vent as required; an electric heater applied to the shell or casing; and an agent or substance contained within said shell or casing and adapted to be converted into a gas or vapor under the action of the electric heater, substantially as set forth.

3. A cartridge shell or casing provided near its rear end with a diaphragm or partition, and with a liquid-chamber in rear thereof; a valve-controlled vent for said liquid-chamber; an opening through the diaphragm, connecting the liquid-chamber and the interior of the shell; an opening at the forward end of the shell; connected valves applied to and sealing said openings, that of the partition being of larger area than the other; an electric heater applied to the shell or casing; conductors for supplying electricity to the heater; and water or other suitable agent contained within the shell or casing, all substantially as set forth.

4. In combination with a hollow shell or casing adapted to be introduced into a gun; a sealing device serving to seal the chamber within the shell or casing; an electric heater within the shell or chamber; an agent contained within the shell or chamber, and adapted to be vaporized by the heat of the electric heater; means for retaining and releasing the pressure at will; and a gage adapted to indicate in suitable units the pressure within the shell or chamber.

5. A prepared charge or cartridge for guns and ordnance comprising the following elements in combination; an outer shell or casing; an inner shell or casing; an intermediate insulating substance; an electric heater; a differential valve mechanism for sealing and unsealing the chamber within the inner shell; a liquid-chamber in rear of the larger valve; and a valve-controlled vent for said liquid-chamber; whereby the liquid may be retained within its chamber and the valves thereby held to their seats until the requisite pressure is attained within the shell or chamber, and then released, substantially as set forth.

605,843. NON-REFILLABLE BOTTLE. John W. Bear, Udell, Iowa. Filed Mar. 8, 1898. Serial No. 673,042. (No model.)



Claim.—1. A non-refillable bottle having an internal annular groove in its neck, a lock-casing placed in said neck with one end in

said groove, a bolt having a sliding engagement in said casing, and a key for projecting the bolt into said groove at a point opposite to the engagement of the casing with said groove, substantially as set forth.

2. A non-refillable bottle having an internal annular groove in its neck, a lock-casing placed in said neck with one end in said groove and provided with a notch in its side, a bolt having a sliding engagement in said casing and provided with a marginal spring-tongue adapted to engage said notch when the bolt is projected, and a key for projecting said bolt, substantially as set forth.

605,844. MECHANICAL MOVEMENT FOR BICYCLES. VICTOR DELARDEN, Boston, Mass., assignor to Josiah Quincy, same place. Filed July 10, 1897. Serial No. 644,065. (No model.)

Claim.—1. A mechanical movement comprising an outer hub or wheel having inwardly-projecting gear teeth, an eccentrically-arranged externally-toothed ring meshing with the internal teeth on the hub or wheel, antifriction rollers or balls having graded diameters for sustaining the toothed ring in its eccentrical arrangement, and means controllable at will for causing said ring to revolve on its own axis or else on the axis of the said hub.

2. A mechanical movement comprising a stationary spindle, a bearing-sleeve rotatable about said spindle, a hub arranged concentrically with relation to the spindle and sleeve, and internally toothed, an eccentrically-arranged externally-toothed ring intermeshing with the internal teeth on the hub, antifriction devices of graded diameters for supporting said ring by said bearing in its eccentrical arrangement, a sprocket-wheel, means for imparting power from said sprocket-wheel to said ring, and a brake for intermittingly holding said bearing-sleeve stationary.

3. A mechanical movement comprising a stationary spindle, a sleeve rotatable relatively to said spindle, antifriction devices inserted between said sleeve and said spindle, an eccentrically-arranged toothed ring, antifriction devices of graded or varying diameters for supporting said ring by said bearing in its eccentric arrangement, a rotatable hub, internally toothed and intermeshing with the eccentrical ring, a sprocket-wheel, means for connecting the sprocket-wheel with the toothed ring, antifriction devices between the said hub and the said sleeve, and a brake for intermittingly holding said sleeve against rotation.

4. A mechanical movement comprising a hub having internal gear-teeth, an eccentric externally-toothed ring intermeshing with the gear-teeth, an eccentric sleeve to which said toothed ring is secured, means for driving said eccentric sleeve, a bearing sleeve or ring concentric with the hub and surrounding the eccentric sleeves, means for holding said bearing-sleeve stationary temporarily and antifriction devices having varying diameters and interposed between said sleeves.

5. A mechanical movement comprising a hub having internal gear-teeth, an eccentric externally-toothed ring intermeshing with the gear-teeth, a sleeve concentric with the hub and extending through the toothed ring and having a flange, a bearing ring or sleeve concentric with the first-named sleeve and secured to said flange, antifriction devices having varying diameters and interposed between the toothed ring and the said second-named bearing ring or sleeve, and means for locking said first-mentioned sleeve or ring against movement.

6. A mechanical movement comprising a bicycle-hub having internal gear-teeth, a sprocket-wheel, an eccentric toothed ring intermeshing with the said gear-teeth and connected with the sprocket, a brake-wheel having a bearing-sleeve concentric with the hub, graded antifriction rollers or balls inserted between said bearing-sleeve and said toothed ring, and spacing graded rolls arranged alternately with the antifriction devices.

7. A mechanical movement including a toothed gear, an eccentric toothed ring intermeshing therewith, a bearing ring concentric with the toothed gear, means for holding said ring stationary, antifriction-rolls having varying diameters for holding said ring in its eccentric relationship, and reduced rolls *f'* for spacing the antifriction-rolls.

605,845. CHANGE-SPEED MECHANISM. VICTOR DELARDEN, Boston, Mass., assignor to Josiah Quincy, trustee, same place. Filed Nov. 1, 1897. Serial No. 657,017. (No model.)

Claim.—1. A mechanical movement comprising a driving member, a driven member, one of which is arranged eccentrically with relation to the other, and rotary devices having graded diameters arranged to maintain the eccentric relation of said members, said devices being also arranged to transmit to said driven member, either their movement of revolution or of rotation and revolution.

2. A mechanical movement comprising two members each circular in cross-section, one driving and the other driven, with rotary devices having graded diameters whereby motion may be transferred from one said member to the other, either the movement of rotation or of revolution or both of said movements of said rotary device may be transmitted to the driven member.

3. A mechanical movement comprising two members each circular in cross-section, and one within the other, and one driving and the other driven, with rotary devices traveling in a common path about the axis of one of said members, said devices having graded diameters whereby motion may be transferred from one said member to the other and an eccentric relation maintained between them.

4. A mechanical movement comprising a driving member, a driven member, an eccentric for transmitting motion to said driven member, and antifriction devices having graded diameters for maintaining said eccentric in a position eccentric to said driving member, and freely revoluble about the axis of said driving member to transmit to the driven member either their movement of rotation or of revolution or both of said movements.

5. A mechanical movement comprising a rotary member, an eccentric revoluble about the axis of the said member and controllable means for varying the speed of revolution of the eccentric independently of the speed of rotation of the said member.

6. A mechanical movement comprising a rotary member, an eccentric connected positively with said member and rotated thereby, and controllable means loose relatively to said rotary member for varying the revolutions of said eccentric about the axis of said rotary member without changing the number of its rotations.

7. A mechanical movement comprising a driving member, a driven member, one of which is eccentric to the other, and positively-rotated rotary devices freely revoluble about the axis of one of said members in a common path, and inserted between said members for transmitting movement from the driving to the driven member.

8. A mechanical movement comprising a driving member, a driven member, an eccentric for transmitting motion to said driven member, antifriction devices having graded diameters for maintaining said eccentric in a position eccentric to said driven member, and means for causing said eccentric to revolve either in unison with the rotation of the driving member, or at a different speed therefrom.

9. A mechanical movement comprising a driving member, a driven member, an eccentric for transmitting motion to said driven member, antifriction devices having graded diameters for maintaining said eccentric in a position eccentric to said driven member, a bearing-sleeve concentric with said driving member, and on which said antifriction devices are adapted to roll, and means for temporarily holding said sleeve against rotation.

10. A mechanical movement comprising a driven member, a driving member, a bearing concentric with said driven member, and antifriction devices of varying diameters inserted between said eccentric and said bearing, and means for connecting one or more of said antifriction devices with said driven member.

11. A mechanical movement comprising a rotatable driven member, a driving member, a bearing concentric with and normally rotating with the driven member, an eccentric for transmitting movement from the driving member to the driven member, antifriction devices inserted between the eccentric and the said bearing, and means for alternately holding the bearing against movement and locking it to the driving member.

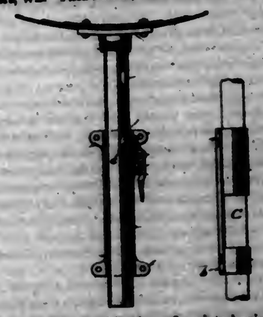
12. A change-speed device for vehicles comprising a wheel-hub, a driving-wheel and friction mechanism independent of the driving-wheel interposed between said hub and said driving-wheel, for transmitting different speeds to said hub relatively to the speed of the driving-wheel.

13. A change-speed device, comprising a hub, a driving-wheel, and friction mechanism independent of said driving-wheel inside of said hub for causing said hub to rotate either in unison with the driving member or at a different speed therefrom.

14. A change-speed device comprising a hub, a driving-wheel, and friction mechanism independent of said driving-wheel located within said hub for causing said hub to rotate either in unison with the driving-wheel or at a slower speed relatively thereto.

15. A change-speed device comprising a rotating driving-wheel, a rotatory hub concentric therewith, and a friction-eccentric located within one of the said parts for imparting power from the driving-wheel to the driven hub.

16. A change-speed mechanism comprising a fixed spindle, a driving wheel or sprocket, a hub, a rotatable bearing concentric with the driven member and detachably connected with the driving-wheel, an eccentric driven by the driving-wheel revoluble rotary devices between the eccentric and the bearing for imparting motion to the hub, and means for disconnecting said bearing from the driving-wheel and holding it stationary.



17. A change-speed mechanism comprising a driven hub, a driving-wheel, a bearing-sleeve concentrically arranged in said hub, an eccentric in said hub connected therewith, antifriction devices of varying diameters interposed between said eccentric and the bearing-sleeve, a power-transmitting sleeve connected to said driving-wheel and said eccentric, a lock for said sleeves, and mechanism for operating said lock and holding said bearing-sleeve stationary.

18. A change-speed mechanism, comprising a spindle, a hub rotatable around said spindle, a bearing-sleeve on said spindle, an eccentric, antifriction-rolls of different diameters between said eccentric and the bearing-ring, means between the eccentric and the hub for causing the hub to rotate in unison with the revolutions of the eccentric, a driving-wheel, a sleeve on the first-mentioned sleeve connected to said driving-wheel for rotating the eccentric in unison with the said driving-wheel, and means for holding said bearing-sleeve stationary at will.

19. A mechanical movement comprising a driving member, an eccentric, a bearing, antifriction devices of different diameters between said eccentric and said bearing, and means of connection between said driving member and said eccentric, comprising pins projecting from one of said parts into enlarged apertures in the other of said parts.

20. A change-speed mechanism, comprising a driven hub, a driving-wheel, a spindle about which the hub and wheel rotate, a sleeve on said spindle relatively to which the wheel may rotate, a ring connected to said driving-wheel to rotate therewith, rotary devices inserted between the said sleeve and the ring, means connecting one or more of said rotary devices with the said hub, and means for temporarily holding the said sleeve against movement, whereby the revolution of the rotary devices thereabout will transmit motion from the said driving-wheel to the said hub at a reduced rate of speed.

605,846. WAGON-SEAT SUPPORT. CHARLES BERGER, Two Corners, Wis. Filed Dec. 27, 1897. Serial No. 663,447. (No model.)

Claim.—1. The combination of a plate having at least one cylindrical guide protuberance and lateral apertured ear extensions, a gas-pipe standard apertured at intervals of its length and engageable with the plate protuberance, a spring-latch in pivotal connection with said plate protuberance for engagement with any one of the standard-apertures, and a head in screw-thread connection with said standard.

2. The combination of a plate having upper and lower cylindrical guide protuberances and lateral apertured ear extensions, a gas-pipe standard apertured at intervals of its length and engageable with both plate protuberances, a spring-latch in pivotal connection with said upper plate protuberance for engagement with any one of the standard-apertures, and a head in screw-thread connection with said standard.

605,847. RAILWAY-SIGNAL. ALBERT W. BIDDINGER, Harrison, Ohio, assignor of one-half to Robt. C. Frederick, West Harrison, Ind. Filed Nov. 3, 1897. Serial No. 657,854. (No model.)

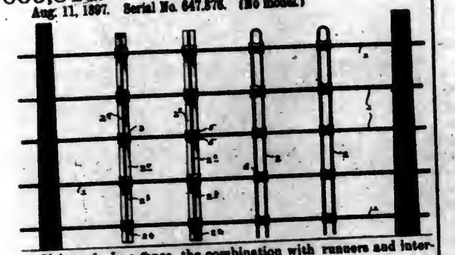
Claim.—1. The combination with a signal, of a tripping-lever therefor which is adapted to be actuated by the train, a lock for said lever, and operating-levers positioned on opposite sides of said tripping-lever, and actuated by the train, one of said operating-levers adapted to lock the tripping-lever and the other to unlock the same, substantially as described.

2. The combination with a signal, of a tripping-lever therefor, actuated by the train, a lock for said lever, an operating-lever positioned on each side of said tripping-lever and operated by the depression of the rail, bell-crank levers pivoted adjacent said operating-levers with their outer ends supporting the same, said operating-levers alternately engaging the rail, and an operative connection between the inner ends of the bell-crank levers and the lock, substantially as described.

3. The combination with the rail, of a tripping-lever adapted to engage said rail and be depressed thereby, a lock for preventing the depression of the lever, means operated by the train for operating said lock to engage and release the tripping-lever, and a signal operated by the tripping-lever, substantially as described.

4. The combination of the rail, the ties positioned a slight distance therebeneath to permit the rail to swing downwardly, a tripping-lever pivotally mounted and extending beneath the rail and transversely thereof, a block positioned a slight distance beneath said lever, a locking-bar pivoted to said lever and adapted to swing therebeneath between the under side thereof and the block and prevent the depression of said lever, operating means actuated by the train and positioned on opposite sides of the tripping-lever for the purpose of swinging said locking-bar, and a signal operated by the tripping-lever, substantially as described.

5. The combination of a support, a series of sections pivoted thereto, a reversing-bar to which the sections are connected, a spring for holding the sections with their faces outward, substantially as described.



605,848. WIRE-STRETCHER. CHARLES L. BOSSE, Ackerland, Kans. Filed Nov. 29, 1897. Serial No. 660,265. (No model.)

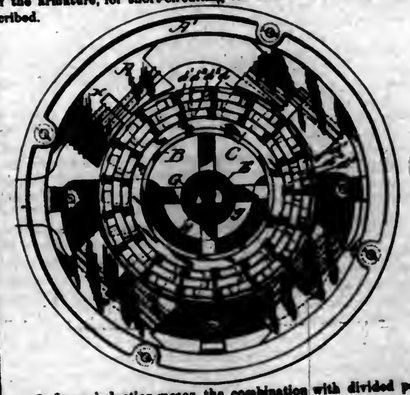
Claim.—The combination with the casing having oppositely-located extensions, rack-bars seated in said extensions, a gear-wheel engaging the rack-bars to actuate them in opposite directions, clamp-blocks on the outer ends of the rack-bars, clamping-levers pivoted to said blocks, and an anchor having its inner end bifurcated to strad-

dle the rack-bar and bent to embrace the clamp-blocks, and its outer end formed into a hook to engage a post, all substantially as described.

605,849. FENCE. HERMAN H. BRANDES, Corydon, Ky. Filed Aug. 11, 1897. Serial No. 647,876. (No model.)

Claim.—1. In a fence, the combination with runners and intersecting stays or pickets, each having parallel spaced bearing-points arranged in contact with the runners at one side, of clamps arranged at the intersections of the stays or pickets with the runners, and in contact with the runners at the opposite sides from the stays, and each clamp having a body portion transversely spanning the stay, in contact with the bearing-points thereof at the same side as the intersecting runner, and engaging the opposite side of the runner from said stay, and provided with terminal upper and lower ears engaging the side edges of the stay respectively above and below the plane of the intersecting runner, substantially as specified.

2. As a new article of manufacture, a clamp for securing stays or pickets to wire fence-runners, the same consisting of a plate having a flat body portion or bearing-face, provided at each end with spaced upper and lower engaging ears separated by an intervening slot, the slots at opposite ends of the plate being extended inwardly beyond the bases of said engaging ears, and the body portion or bearing-face of the plate being longitudinally crimped, in alinement with and between the contiguous ends of said slots, substantially as specified.



3. In a fence, the combination with runners and intersecting stays or pickets, each having parallel spaced bearing-points arranged in contact with each runner, of clamps arranged at the intersections of the stays or pickets with the runners, and each clamp having a flat body portion transversely spanning the stay in contact with the bearing-points thereof, terminal upper and lower ears engaging the side edges of the stay or picket and spaced apart to occupy positions above and below the intersecting runner, the portions of the clamp between the ears at each end thereof being cut away to form alined slots extending inwardly beyond the bases of the ears, and the bearing portion of the clamp being crimped between and in alinement with said slots to receive the runner, and being deflected rearwardly or toward the stay to bow the runner rearwardly between the bearing-points of the stay, substantially as specified.

4. In a fence, the combination with runners and intersecting stays, each having parallel spaced bearing-points in contact with each runner, of clamps each consisting of a plate provided at its opposite ends with alined inwardly-extending slots, engaging ears deflected from the plane of the body portion of the clamp at points between the outer and inner ends of said slots and engaging the opposite side edges of the stay, the body portion of the plate between the inner ends of and in alinement with said longitudinal slots being forwardly crimped to form a seat for the runner, substantially as specified.

5. In a fence, the combination with runners, of a connecting stay or picket consisting of a continuous metallic strap, provided with a continuous longitudinal crimp and parallel spaced bearing-points, upon opposite sides of said crimp, for contact with the runners, and a clamp comprising a flat body portion spanning the interval between the bearing-points of the stay, provided at each end with upper and lower ears engaging the opposite side edges of the stay, said clamp being cut away between the ears at each end to form inwardly-extending slots, and being crimped between the inner ends of and in alinement with the slots to receive the runner, said crimped portion of the clamp and the inclosed portion of the runner being deflected rearwardly into the space formed by the longitudinal crimp of the stay, and between the bearing-points of the latter, substantially as specified.

605,850. ELECTRIC MOTOR. FREDERICK B. REMER, St. Louis, Mo., assignor to the Emerson Electric Manufacturing Company, same place. Filed Aug. 21, 1897. Serial No. 648,004. (No model.)

Claim.—1. In an induction-motor, the combination with a field-core formed with divided polar projections, a winding on said polar projections, which windings preponderates on one of the halves of each of said polar projections, the windings on alternate polar projections being in opposite directions, and an armature comprising a laminated core and induced-current-conducting bars whose ends are bent one upon the other, to form a continuous conductor at the ends of the armature, for short-circuiting said bars, substantially as described.

2. In an induction-motor, the combination with divided polar projections, of a winding thereon which embraces a portion of a polar projection, and then the entire polar projection, said winding being wound in opposite directions on alternate polar projections, an armature comprising a laminated core with transverse grooves in its periphery, and induced-current-conducting bars which are arranged in each of said transverse grooves the ends of said induced-current-conducting bars in adjacent grooves being bent one upon the other to form an unbroken contact through the ends of said bars at each side of the armature, for short-circuiting the currents induced in said bars, substantially as described.

3. The herein-described armature for induction-motors, the same comprising a laminated core formed with transverse grooves in its periphery, and induced-current-conducting bars arranged in said grooves and having their ends bent so as to form a continuous short-circuiting band at each side of armature, for said induced-current-conducting bars, substantially as described.

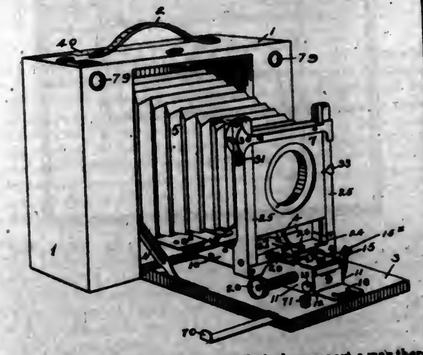
4. The herein-described armature for induction-motors, the same comprising a laminated core provided with suitable seats at, or near, its periphery for the reception of induced-current-conducting bars, and induced-current-conducting bars arranged in said seats, one end of said bars being formed with a bent portion d, and the other end of said bars being provided with tongues d', d^3, and d^3, to cooperate with each other and the bent portions d of adjacent bars, substantially as described.

5. The herein-described armature for induction-motors, the same comprising an elongated core, and induced-current-conducting bars whose ends are bent one upon the other, said ends interlocking with each other; substantially as described.

6. The herein-described armature for induction-motors, the same comprising a laminated core formed with grooves in its periphery, the mouths of which grooves are contracted, and induced-current-conducting bars D which are inserted endwise through said grooves below their mouths, a solid end d of said induced-current-conducting bars being bent upon the armature in one direction on one side thereof, and tongues d', d^3, and d^3 on said induced-current-conducting bars which are bent on each side of the armature, to cooperate with their companions and with the solid bent portions d of adjacent induced-current-conducting bars, substantially as described.

7. The herein-described armature for induction-motors, the same comprising a core formed with radially-elongated openings, and two companion induced-current-conducting bars which are inserted through the said openings, the ends of said bars terminating a short distance beyond the core where they are bent in opposite directions, the bars in adjacent openings being bent, one upon the other; substantially as described.

8. The herein-described armature for induction-motors, the same comprising an elongated core and induced-current-conducting bars which are inserted through radially-elongated openings in the said core from opposite sides and bent one upon the other, said bars being formed with a bent portion d on one end and tongues d', d^3, and d^3 on the other end; substantially as described.



9. The herein-described armature for induction-motors, the same comprising an elongated core formed with openings for the induced-current-conducting bars, and induced-current-conducting bars which are inserted through said openings from opposite sides in pairs, said current-conducting bars being formed with a bent portion d at one end, and tongues d', d^3, and d^3 at its other end, the tongue d^3 being provided with lateral wings d^4, and tongues d' and d^3 being provided with recesses d^5 on their under edges for receiving the wings d^4 of adjacent tongues; substantially as described.

10. In an electric motor, the combination with the armature and its shaft, a frame-plate formed with eccentric openings for said shaft, and bearings introduced in said eccentric openings for the armature-shaft, said bearings being bored axially correct; substantially as described.

11. In an electric motor, the combination with a frame-plate provided with a hub having an eccentric opening, of bushings arranged in the ends of said hub and bored so as to be axially correct, and an armature shaft mounted in said bushings; substantially as described.

12. In an electric motor, the combination with a frame-plate provided with an elongated hub having an eccentric opening formed through it, of bearings having recesses formed on their under sides, said bearings being bored axially correct for the armature-shaft, and an armature-shaft; substantially as described.

605,851. PHOTOGRAPHIC CAMERA. FRANK A. BROWNELL, Rochester, N. Y., assignor to the Eastman Kodak Company, same place. Filed Apr. 5, 1897. Serial No. 630,602. (No model.)

Claim.—1. The combination with the bed or support, a way thereon, a carriage adjustable on the way, and means for securing it thereto, of the slide on the carriage, the rack-and-pinion connection between them, the frame on the slide and laterally adjustable thereof, and the front board vertically adjustable in the frame, and means for securing said parts rigidly, substantially as described.

2. The combination with the bed or support, a way thereon, the carriage adjustable on the way, and means for securing it, the slide on the carriage having the rack, the arbor and the pinion cooperating therewith, the plate on the carriage adjustable laterally thereof, the standards secured to the plate, the front board vertically adjustable on the standards and securing devices between them, substantially as described.

3. In a camera, the combination with the bed or support, the way thereon, the carriage adjustable on the way, the arbor mounted in stationary bearings on the carriage, having the extensible outer portion and the pinion on said arbor, of the slide movable on the carriage, the rack thereon in constant engagement with the pinion and the front board carried by the slide, substantially as described.

4. In a camera, the combination with the casing, having the way, the folding door having the way thereon, cooperating with the way on the casing, the carriage adjustable on the way, and securing devices therefor, of the slide carrying the front board movable on the carriage, a rack-and-pinion connection between the slide and carriage, an extensible arbor to which the pinion is connected, and a spring for retracting the outer member of the arbor within the edge of the door, whereby the latter may be closed, substantially as described.

5. In a camera, the combination with the casing having the way, the hinged door, the way thereon cooperating with the way in the casing, the carriage movable on said ways, a locking device for the carriage, the arbor on the carriage, and the pinion thereon, of the slide movable on the carriage having the rack engaging the pinion, the sleeve on the arbor movable longitudinally thereof, and having the wheel at its outer end, the spring for retracting the sleeve, and the front board carried by the slide, substantially as described.

6. In a camera, the combination with the carriage, the slide adjustable thereon, the plate 16^a having spring-fingers 16^b thereon, in frictional engagement with the carriage, the rack on the plate 16^c, the movable pinion on the carriage cooperating with the rack, and the front board carried by the slide.

7. In a camera, the combination with the carriage, the slide adjustable thereon, the transverse plate 24 having the slot and adjustable transversely of the slide, the standards 25 thereon, and the bolt for securing the plate to the slide, of the front board sliding between the standards, and securing devices for fastening the board to the standards, substantially as described.

8. In a camera, the combination with the standards and the front board sliding vertically between them, of the strap 30 secured to the board passing around the standards, and the cam 31 for securing the parts together, substantially as described.

9. In a camera, the combination with the casing, of the hinged door narrower than the casing, ways in the casing, and on the said door, and the camera-front movable on said ways, of the extensible rod 70 mounted on the door and adapted to be extended to substantially the width of the casing to support the forward end of the door when the camera is on its side, as set forth.

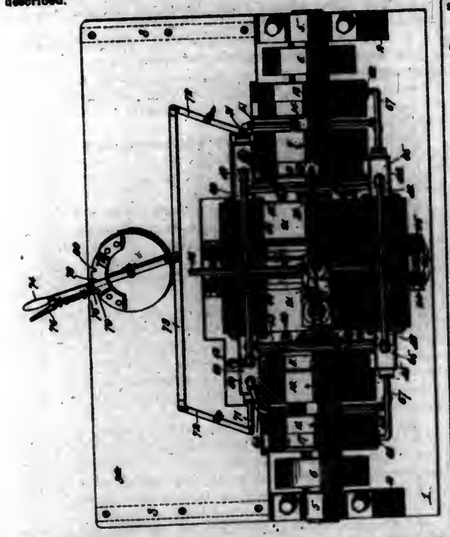
10. In a camera, the combination with the casing having the central exposing-chamber, the open film-chambers on opposite sides thereof, and the casing-back for closing them, of the spool-centering projection 42 in one of the film-chambers, the sliding frame having the end piece 44 provided with the spool-centering projection, and the adjustable spring for operating the end piece 44 to hold the spool, substantially as described.

11. In a camera, the combination with the casing having the spool-chamber, of the spool-centering device therein, the frame sliding in the chamber and having the end piece for cooperating with a film-spool, the spring connected to said frame and the plate having a series of apertures with which the spring may be connected to regulate the tension of the springs, substantially as described.

12. In a camera, the combination with the casing open at front and back having ways in the front, and the hinged door at the front having the ways, the carriage movable on said ways, and the camera-front on the carriage, of the bellows connected to the front, the frame 6 at the rear of the casing narrower than the latter, film-chambers in the casing on opposite sides of the frame and open at the rear, the removable frame 56 having rollers at opposite sides, detachable connections between the frames 6 and 56, and the removable back for the casing adapted when removed to permit access to the film-chambers and to the frame 56, substantially as described.

13. In a camera, the combination with the casing open at the rear and the sliding door for closing it, of the frame 6 at the rear of the casing, the film-chambers on opposite sides of the frame 6 open at the rear, and the removable frame 56 having the rollers at opposite sides thereof, and detachable connections between said frames 5 and 56, substantially as described.

14. In a camera, the combination with the casing open at the back, having the central exposing-chamber, and the film-chambers at the sides thereof, also open at the back, of the removable casing-back 61 sliding in ways on the casing, having the removable door 63, and the springs 62, substantially as described.



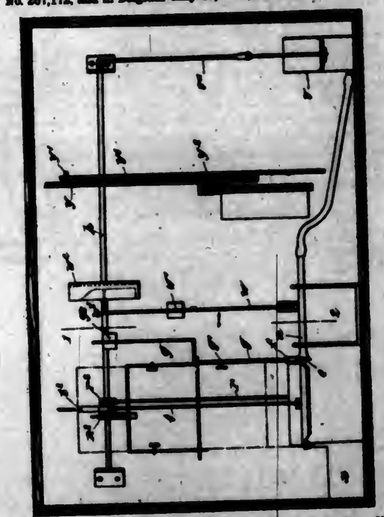
15. In a camera, the combination with the casing open at front and rear, the hinged door at the front having ways, and the camera-front movable on said ways, of the removable back for the casing, and the locking-bolt 66 for securing the casing-back, accessible from within the front of the casing, substantially as described.

16. In a camera, the combination with the casing open at the back, having the central exposing-chamber and the film-chambers at the sides thereof, all said chambers being open at the back, of the removable frame 56, having rollers 59 at the sides, between the film and exposing chambers, detachable connections between the frame and the rear of the exposing-chamber, and a removable back for the casing permitting access to both the frame and film chambers when removed, substantially as described.

605,852. ROTARY STEAM-ENGINE. LOUIS K. GARRAHAN and CHARLES S. GARRAHAN, McLouth, Kans. Filed Apr. 20, 1897. Serial No. 634,621. (No model.)

Claim.—1. A rotary engine, comprising a stationary casing provided with a cylinder extending concentrically of the axis of the casing, and of circular form in cross-section, an annular groove at and communicating with the inner side of said cylinder, a shaft extending axially through the casing, an annular packing-ring within the cylinder geared to said shaft, and of segmental form in cross-section, its curved surface corresponding to and fitting snugly against the inner surface of the cylinder, and provided with an annular rib projecting inwardly from the center of its curved surface, and fitting

snugly in the groove communicating with said cylinder, and a piston having a flat surface secured against the flat surface of the said packing-ring; said piston and packing ring conjointly forming a complete circle and a steam tight partition for the cylinder, substantially as described.



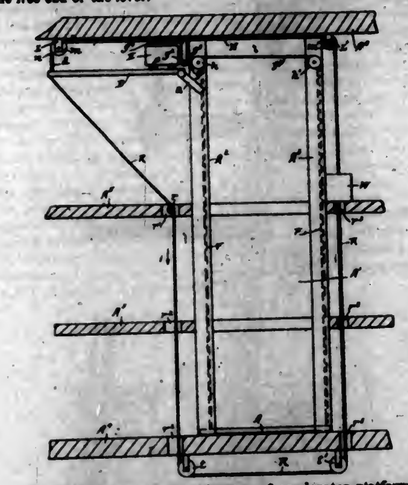
2. A rotary engine, comprising a stationary casing provided with a circular cylinder having steam-ports, a shaft journaled in the casing axially of the cylinder, a piston in the cylinder and geared to said shaft, a reciprocating abutment partitioning said cylinder at times between the steam-ports, a steam-chest connected to the steam-supply, a second steam-chest, a pair of pipes connecting them, a pair of pipes connecting the last-named steam-chest with the ports of the engine, an exhaust-pipe also communicating with the last-named steam-chest, a slide-valve in said last-named steam-chest, and connecting the exhaust-pipe with one of the pipes connected to the ports of the engine, and closing one of the pipes leading from the first-named to the last-named steam-chest, and a reciprocatory valve in said first-named steam-chest, which once in each revolution of the piston cuts off the supply of steam to the cylinder, substantially as described.

3. A rotary engine, comprising a stationary casing provided with a circular cylinder having steam-ports, a shaft journaled in the casing axially of the cylinder, a piston in the cylinder and geared to said shaft, a reciprocating abutment partitioning said cylinder at times between the steam-ports, a steam-chest connected to the steam-supply, a second steam-chest, a pair of pipes connecting them, a pair of pipes connecting the last-named steam-chests with the ports of the engine, an exhaust-pipe also communicating with the last-named steam-chest, a slide-valve in said last-named steam-chest, and connecting the exhaust-pipe with one of the pipes connected to the ports of the engine, and closing one of the pipes leading from the first-named to the last-named steam-chest, a reciprocatory valve in the first-named steam-chest, which once in each revolution of the piston cuts off the supply of steam to the cylinder, and means to shift the position of the valve in the last-named steam-chest, and consequently reverse the movement of the engine, substantially as described.

4. A rotary engine, comprising a casing provided with a plural number of circular cylinders provided with steam-ports, a shaft journaled in the casing axially of said cylinders, pistons set at an angle to each other in the cylinders and geared to said shaft, reciprocating abutments arranged opposite each other, and between the ports of and partitioning their respective cylinders, a pair of reverse-valve steam-chests, pipes connecting the same with said ports, exhaust-pipes leading from said steam-chests, a second pair of steam-chests connected to a steam-supply pipe, a pair of pipes connecting each of said steam-chests with the reverse-valve steam-chests, slide-valves in the reverse-valve steam-chests cutting off the passage of steam through one of the pipes leading from each of the other steam-chests, and connecting one of the pipes leading to each cylinder with their respective exhaust-pipes, reciprocating valves in the other steam-chests, and means to alternately and automatically operate said valves so that the supply of steam to each cylinder will be cut off once in each revolution of the piston, but never from both pistons at the same instant, and to shift the abutment out of the path of their respective pistons during the time the supply of steam is cut off, and a lever connected to the reverse-valves, whereby their positions may be reversed and the engine caused to operate in the opposite direction, substantially as described.

605,853. MACHINE FOR VENDING LIGHTED CIGARS OR CIGARETTES. ACHILLE CAUDE, Carbon, France. Filed Nov. 24, 1897. Serial No. 659,705. (No model.) Patented in France May 21, 1897, No. 267,172, and in Belgium May 21, 1897, No. 126,326.

Claim.—An automatic coin-freed machine for vending lighted cigars or cigarettes consisting in the combination of coin-freed mechanism whereby the machine may be set into action; a supply-hopper having a delivery-spout controlled by a distributing-drum giving passage to one cigar or cigarette at a time; means for communicating shaking motion to the contents of the hopper, means adapted to receive and grip the cigar or cigarette and to present one end thereof to the flame of a lamp; a longitudinally-sliding suction-tube adapted to fit onto the other end of the cigar or cigarette and connected to an air-pump; and cam and lever mechanisms operated from a main shaft whereby the operation of the delivery, gripping, and suction devices in proper order is effected substantially as specified.



605,854. ELEVATOR. WILLIAM CLINE, Lancaster, Pa., assignor to Daniel D. Good, John J. Stewart, and Joseph Breidhamer, same place. Filed Aug. 19, 1896. Serial No. 602,512. (No model.)

Claim.—1. The combination, in an elevator, of a lever, a traveler on the lever, the lever being free to move under the weight of the traveler after a downward impulse is given the free end of said lever, and a connection between the elevator platform or car and the traveler, whereby said platform or car is raised by lowering the free end of the lever.

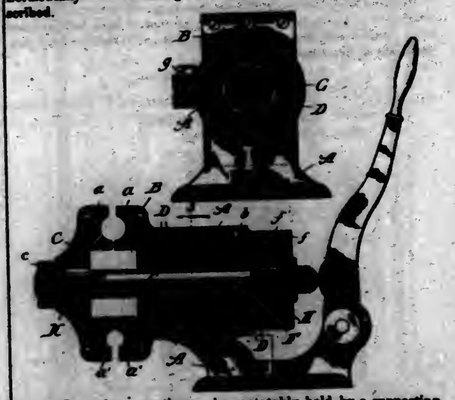
2. The combination, in an elevator, of a lever, a traveler on the lever, a connection between the elevator platform or car and the traveler, whereby said platform or car is raised by lowering the free end of the lever, a counterpoise-weight connected with said end of the lever, and a hand-rope connecting said weight and said free end of the lever, substantially as and for the purpose specified.

3. The combination, in an elevator, of an elevator platform or car, a drum located above the platform or car, lift-ropes connecting the drum and the elevator platform or car, a lever hinged at one end, a traveler on said lever, the lever being free to move under the weight of the traveler after a downward impulse is given the free end of said lever, and a connection between the drum and the traveler, whereby said platform or car is raised by lowering the free end of the lever.

4. The combination, in an elevator, of an elevator platform or car, parallel drums located above said platform or car, lift-ropes connecting the platform or car and said drums, a lever hinged at the ends adjacent to the drums, a traveler on the lever, the lever being free to move under the weight of the traveler after a downward impulse is given the free end of said lever, and connections between the drums and the traveler, whereby said platform or car is raised by lowering the free end of the lever.

5. The combination, in an elevator, of an elevator platform or car, parallel drums located above opposite sides of said platform or car, lift-ropes connecting the sides of the platform or car with the drums above said sides, a lever hinged at the end adjacent to the drums, a traveler on the lever, the lever being free to move under the weight of the traveler after a downward impulse is given the free end of said lever, a sheave located adjacent to the hinged end of the lever, ropes connecting the drums and the traveler and passing over said sheave, and means for raising and lowering the free end of the lever, for the purpose specified.

6. The combination, in an elevator, of an elevator platform or car, a drum located above said platform or car, lift-ropes connecting the elevator platform or car and the drum, a lever hinged at the end adjacent to the drum, a traveler on the lever and having a connection with the drum, whereby said platform or car is raised by lowering the free end of the lever, a counterpoise-weight, a rope passing above the lever and connecting the free end thereof with said weight, and a hand-rope passing below the lever and connecting said free end with the counterpoise-weight, substantially as and for the purpose specified.



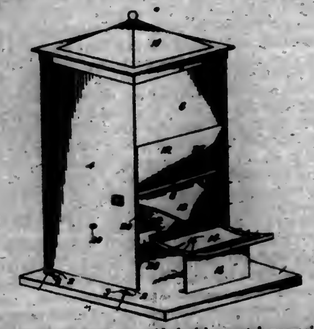
7. The combination, in an elevator, of an elevator platform or car, drums located above opposite sides of the platform or car, lift-ropes connecting the sides of said platform or car with the drums above the same, a lever hinged at the end adjacent to said drums, a traveler on the lever, connections between the drums and the traveler, whereby said car or platform is raised by lowering the free end of the lever, a rope passing over sheaves above the lever and connecting the free end thereof and a counterpoise-weight, and a hand-rope passing around sheaves beneath the lever and said free end of the lever and the counterpoise-weight, substantially as and for the purpose specified.

8. The combination, in an elevator, of an elevator platform or car, a drum located over the platform or car, lift-ropes connecting the drum and said platform or car, a lever comprising two parallel members having rails lengthwise thereof, a traveler between said parallel members and having wheels engaging said rails, the lever being free to move under the weight of the traveler after a downward impulse is given the free end of said lever, and a connection between said drum and the traveler, whereby the platform or car is raised by lowering the free end of the lever.

605,855. VISE. OLIVER COLBURN, Chicago, Ill. Filed Dec. 30, 1897. Serial No. 663,576. (No model.)

Claim.—1. In a vise, a stationary jaw rotatably held by a supporting-base, a guide passing through and having a loose guided bearing within the said stationary jaw-piece, a movable jaw mounted on or made integral with the said guide, in combination with a spring associated with the said jaws and adapted to hold them together, and a means for adjusting the tension of the said spring, substantially as and for the purpose described.

2. In a vise, a stationary jaw, rotatably held by a supporting-base, a guide-rod passing through and having a loose guided bearing within the said stationary jaw-piece, a spring adapted to hold the jaws together, and a means for adjusting the tension of the said spring; in combination with a movable jaw mounted on and moving horizontally with the said guide-rod, substantially as shown and described.



3. In a vise, a stationary jaw rotatably held by a supporting-base, a guide-rod passing through and having a loose guided bearing within the said stationary jaw-piece, a spring surrounding the said rod and adapted to hold the jaws together, and a means for adjusting the tension of the said spring; in combination with a movable jaw, mounted on and moving horizontally with the said guide-rod, substantially as shown and described.

4. In a vise, the combination of a stationary jaw, rotatably held in a base-piece, a movable jaw mounted on and moving with a guide-rod, the said guide-rod passing through the stationary jaw, a spiral spring surrounding the said guide-rod and adapted to exert a pressure between the said jaws for holding them together, a means for adjusting the tension of the said spring, and a lever for separating the said jaws, substantially as shown and described.

5. In a vise, the combination of a base-piece A, provided with an adjustable supporting-ring, the jaw-piece B, rotatably supported therein, a guide-rod G, having a reciprocating bearing within the said jaw-piece B, a jaw C carried by the said guide-rod and a spring D adapted to hold the jaws together, substantially as shown and described.

6. In a vise, the combination of a base containing a ring, a stationary jaw-piece supported therein, a guide-rod passing through the said stationary jaw, a horizontally-movable jaw mounted on the said guide-rod, a spring adapted to hold the said jaws together, and a lever for separating the said jaws, substantially as shown and described.

605,856. MATCH-SAFE. ERNEST P. COMEY and FRANK A. GREEN, Seward, Nebr. Filed May 15, 1897. Serial No. 636,645. (No model.)

Claim.—1. A match-safe, provided with a match-magazine, having a converging bottom, a rotary cylinder therein, provided with a peripheral groove to receive one match at a time, an igniting-surface arranged to oppose the headed end of the match and in its path as it is conveyed by the rotatable movement of the cylinder, and a gravity-dog interposed between the match-chamber and said igniting-sur-

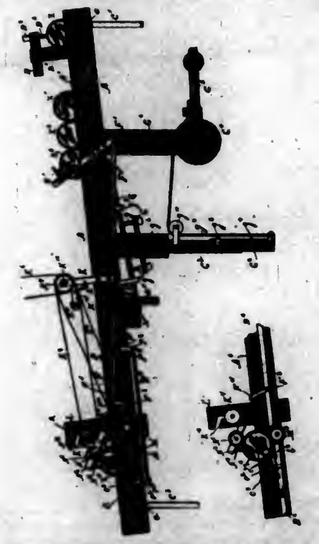
face, and pivoted at its upper end to the front wall of the safe, and provided with a rearwardly-projecting arm to engage the front wall and limit the back swing of the dog, substantially as described.

2. A snatch-safe, consisting of a slotted base, side walls provided with hinge-lugs which engage said base, a back wall and a front wall connecting said side walls, tie-bolts clamping said side walls in place, and a cover pivotally mounted upon one of said bolts and provided with a lock, whereby it may be secured in its closed position, substantially as described.

605,857. FIRE-EXTINGUISHER. GUSTAVUS W. COOK, Herndon, Va., assignor to Henry P. Holden, Washington, D. C. Filed Sept. 17, 1897. Serial No. 651,884. (No model.)

Claim.—1. In a fire-extinguisher, an alkali-tank in combination with an acid-bottle adapted to rest in a seat in the upper part of the alkali-tank when the tank is in its normal position and to gravitate from the seat when the tank is turned upside down, said bottle having discharge-vents in its side so arranged as to be automatically closed when the bottle is in the seat, substantially as described.

2. The alkali-tank, having a chamber at its top provided at the side with a distributing hose-pipe and at the bottom with a vapor-tight partition having a beveled opening as a seat for the acid-bottle, in combination with an acid-bottle adapted to fit snugly into and rest in said seat when the tank is in its normal position and to gravitate from said seat when the tank is turned upside down, said bottle having discharge-vents around that part of it which rests against said seat and being provided with guides to direct it in moving into and out of said seat and with a stop to limit its outward movement, substantially as described.



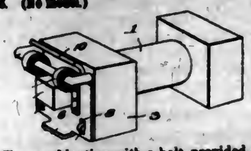
605,858. MACHINE FOR LABELING CANS. WILLIAM S. CRAIG, Chicago, Ill., assignor to Frederick G. Libbs and Dietrich H. Brunjes, same place. Filed May 7, 1895. Serial No. 548,409. (No model.)

Claim.—1. In a machine for labeling cans, the main frame of the machine provided with inclined tracks down which the cans roll; a locking device for holding the unlabeled cans and releasing them one at a time to pass down the inclined tracks; comprising the yielding detent-rod E^3, the rod E^3 which is swung into detaining position at each operation, and supports for said rods; a tripping device operated by a can rolling down the tracks, said tripping device itself operating the above locking device, substantially as described.

2. In a machine for labeling cans, the main frame of the machine provided with inclined tracks down which the cans roll; a locking device for holding the unlabeled cans and releasing them one at a time to pass down the inclined tracks; comprising the yielding detent-rod E^4, the rod E^3 which is swung into detaining position at each operation, and supports for said rods; a tripping device comprising the trip F^4, placed in the path of the rolling cans, the rock-shaft F^5, crank-arm F^3 and a connection between the said crank-arm and the said locking device, substantially as described.

3. In a machine for labeling cans, an escapement for single cans consisting of pivoted arms carrying a cross-bar for checking the cans, a frame pivoted to the arms, and having means for engaging a can, a link pivoted to said frame and to the machine-body, whereby movement of the arms in one direction will cause said frame to rise over the can, and movement thereof in the opposite direction will cause said frame to descend between the cans, and means for oscillating said escapement.

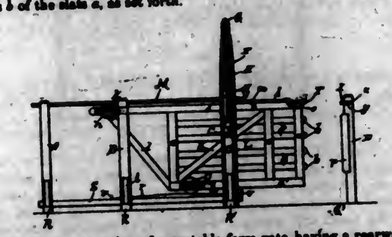
4. In a machine for labeling cans, a locking device for holding the unlabeled cans and releasing them one at a time, consisting of one or more pivoted arms E'; one or more arms E^3 and E^4 pivoted thereto; the brace E^5, and the cross-rods E^3 and E^4, substantially as described.



5. In a machine for labeling cans, a locking device for holding the unlabeled cans and releasing them one at a time, consisting of one or more pivoted arms E'; one or more arms E^3 and E^4 pivoted thereto; the brace E^5, and the cross-rods E^3 and E^4; in combination with a tripping device adapted to operate the said locking device, substantially as described.

6. In a machine for labeling cans, the rolls M^4 and M^5 placed in the path of the cans and rotated by appropriate mechanism; a roller N' yieldingly supported above and rotated in the same direction as the rolls M^4 and M^5; the said rolls bearing against the bottom and the said roller against the top of a can which has received its label for pressing down and smoothing the said label; a non-rotating brush bearing against the can and acting in conjunction with the roller N' for the same purpose; and movable stop-rolls for holding the can in position while it is rotated during the said smoothing, and for releasing it subsequently, substantially as described.

7. As an organized can-labeling apparatus, a framework carrying downwardly-inclined tracks, a paste-box for supplying paste to the surface of the can, a locking device for holding the cans in place and releasing one can while the rest are so held, a label-holder and labels, an endless belt mounted on revolving rollers above the tracks for pressing the label upon the can, a trip device in the track of the can for operating the locking mechanism above, a trip device for operating the stop-rolls hereinbelow mentioned, an upper roller for pressing the label upon the can as the said can is revolved, lower rolls for so revolving the said can, and stop-rolls for holding the can in position during such operation, substantially as described.



605,859. NUT-LOCK. PETER OVERAN, Hanticoke, Pa., assignor of one-half to Paul Barrall, same place. Filed Jan. 27, 1896. Serial No. 668,136. (No model.)

Claim.—The combination with a bolt provided with a squared end, of a nut having a loop on its top and hook-studs, a plate having a squared aperture and holes to receive the hooks, said plate being connected to the loop by coiled springs, substantially as set forth.

605,860. GATE. GRANVILLE DAVIS, North Salem, Ind., assignor of one-half to David D. Thomson, same place. Filed Aug. 30, 1897. Serial No. 649,961. (No model.)

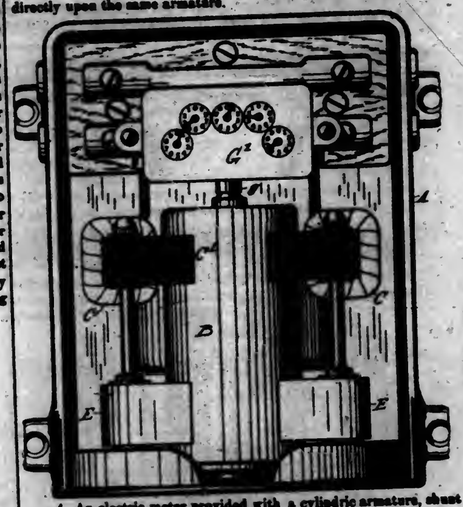
Claim.—1. In a portable farm-gate of the class described, having a double inclined single track with upturned ends, and suitable braced supporting-posts mounted on sills, the combination of the gate L, consisting of the slats *a*, the diagonal brace *g*, the uprights *c*, the rearwardly-projecting top slats *d*, supported by the diagonal brace *l*, and the bottom slats *d'*, with the slotted brackets *s* and *t*, in which are mounted the rollers K and O; the track-rail M, secured between the tops of the posts A, B, and C, to engage the roller K; the stringer S, secured upon the sills R and E', between the posts A, B, and C, to support the track *r r'*; the horizontal bar E, secured at its center to the tops of the posts C, the double, diagonal arms F and F', secured to the sill E', and to the horizontal bar E, the pulleys G and G', upon the upper ends of the arms F and F', the swivel-pulleys J, secured to the inner end of the track-rail M, the ropes H and H', passing over the pulleys G, G', and J, and secured to the pivotal lever *m*; the lever *m*, pivotally mounted between the top slats *d*; the pivotally-mounted latch T, connected with the lever *m*, by the wire *k*, and the locking-post D, having an adjustable loop I secured by a bolt *x*, and adjusted by the set-screw *y*, and having guide-blocks P, to receive the projecting ends *b* of the slats *a*, as set forth.

2. The combination of a portable farm-gate, having a rearward triangular extension, provided at its outer extremity with a bracket *s* carrying a loose roller K, and a bracket *t* secured upon the lower rail at its rear end, carrying a loose roller O, with the straight upper track M, and the double inclined lower track *r*, against which bear said rollers K and O, substantially as set forth.

605,861. NUT-LOCK. JAMES DURAN, Pullman, Ill. Filed May 26, 1897. Serial No. 638,691. (No model.)

Claim.—1. A nut-lock consisting of a locking-bar, retaining-blocks adjustably mounted thereon one near each end and each having its lower edge cut away to receive a nut, and a supplemental locking member mounted on the locking-bar near its center with a nut-receiving notch upon its under side, substantially as described.

2. A nut-lock consisting of a locking-bar, retaining-blocks adjustably mounted thereon one near each end and each having its lower edge cut away to engage over a nut, and a supplemental locking member mounted on the locking-bar between its ends and formed upon its under face with a notch to engage a nut and having a vertical slot at its other end to receive a rectangular shank of a bolt held in the locking-bar, substantially as and for the purpose specified.



3. The combination with the rails and fish-plates, of a locking-bar having a central enlargement, retaining-blocks adjustably mounted on the ends of said bar and having notches on their lower edges to engage nuts on the bolts that secure the fish-plates to the rails, the bolt passed through the enlargement of the locking-bar, a nut on said bolt, the supplemental locking member having upon its under face a notch to engage the said bolt and provided at the other end with a vertical slot, and a bolt held in the locking-bar and having a rectangular shank engaging in said slot, all substantially as and for the purpose specified.

605,862. ELECTRIC MOTOR. THOMAS DUNCAN, Fort Wayne, Ind. Filed May 20, 1897. Serial No. 637,313. (No model.)

Claim.—1. An electric motor provided with a cylindric armature, a shunt-field within the armature, and a series field without the armature comprising separate horseshoe-shaped cores partially embracing the armature, and series coils wound upon said cores.

2. An electric motor provided with a cylindric armature, a shunt-field within the armature, and a series field without the armature comprising separate wide-backed cores having converging poles partially embracing the armature, and series coils wound upon said cores.

3. An electric motor provided with a cylindric armature, shunt and series fields actuating said armature, and a magnetic drag acting directly upon the same armature.

4. An electric motor provided with a cylindric armature, shunt and series fields actuating said armature, exterior drag-magnets acting directly upon the same armature, and an interior magnetic conductor opposite said drag-magnets.

5. An electric motor provided with a cylindric armature, shunt and series fields actuating said armature, exterior drag-magnets made wide at the back and with converging poles partially embracing said armature, and a magnetic conductor upon the interior of the armature opposite said drag-magnets.

6. An electric motor provided with a cylindric armature closed at its upper end and having a supporting-spindle revolubly mounted in bearings permitting a rising movement of the armature, a nut of larger diameter than the armature and adapted to be screwed up against the lower edge of the armature to lift and close the latter, and a stop between which and the nut the armature may be rigidly clamped.

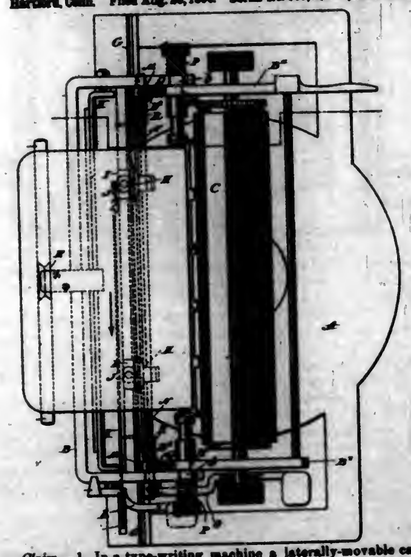
7. An electric motor provided with a cylindric armature, a series field without the armature, drag-magnets without the armature, a magnetic conductor within the armature opposite the drag-magnets, a standard carried by said conductor and supporting a magnetic core, and shunt-coils wound upon said core.

8. An electric motor provided with a cylindric armature, a series field without the armature comprising opposite horseshoe-shaped cores and series coils wound upon said cores, a shunt core and coil within the armature and means for adjusting the relative angular positions of the cores and shunt cores.

9. An electric motor provided with a rotary armature, a lower bearing therefor carried by the motor-frame, and an upper bearing carried by an arm, a lug on the motor-frame against which the inner end of the arm is rigidly seated, and a removable clamping-nut holding the arm in place.

10. An electric motor provided with a cylindric armature open at its lower end, a series field without the armature, a shunt coil and core supported upon a standard rising within the armature from its open lower end, a bearing within said standard for the lower end of the armature-spindle, and a detachable arm carrying the bearing for the upper end of the spindle.

11. The combination with the cylindric armature, of the series coils wound upon apertured cores, standards upon which the cores are bolted, drag-magnets also secured to said standards, a magnetic conductor rising within the armature opposite the drag-magnets, a standard mounted upon said conductor and supporting the shunt coil and core within the armature, a lower spindle bearing within the standard, and a detachable arm carrying the upper spindle-bearing.



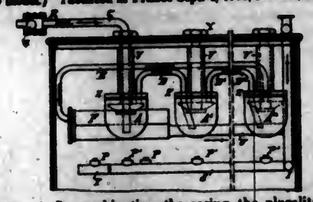
605,863. AXLE-GAGE. JAMES F. DUNHAM, Torrington, Conn. Filed July 21, 1897. Serial No. 645,203. (No model.)

Claim.—A gage consisting of a beam, a T-shaped bracket having a tapered socket fitting on one end of said beam, the arms of said bracket being slotted to produce ears, graduated segmental strips secured to said blades, thumb-screws threaded into the bracket through slots in the segmental strips, a pointer secured on the end

of each arm and projecting out over the segmental strips to indicate the angle at which the blades are held, and a second bracket adapted to slide upon the beam, said bracket having curved shoes, as and for the purpose described.

605,864. TYPE-WRITING MACHINE. JOHN M. FAIRFIELD, Hartford, Conn. Filed Aug. 26, 1896. Serial No. 603,949. (No model.)

Claim.—1. In a type-writing machine a laterally-movable carriage having a plurality of bearings on one side of the printing-center, a platen-frame hinged thereto forward of said bearings, said platen being located above the type, said platen-frame overhanging said printing-center, means for normally moving the carriage in one direction, said means being located between said bearings, and means for normally swinging the platen-frame into an upright position, and a locking means for detachably holding said platen-frame in the printing position.

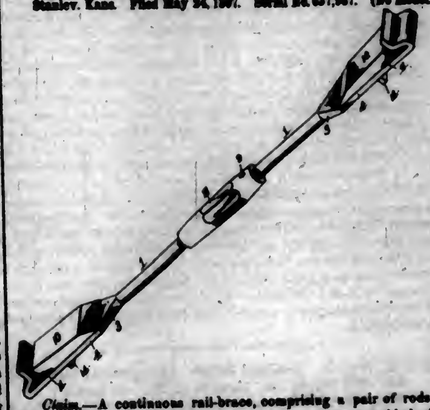


2. In a type-writing machine a carriage-frame susceptible only of lateral movement, a platen-frame overhanging the printing-center, said platen being above the type, a plurality of bearings for said carriage, the bearing portion of said carriage being located on one side of the printing-center, the overhanging platen-frame being hinged to the forward portion of the carriage, and to one side of the bearings, means for normally swinging the platen-frame into an upright position, and a hook detachably engaging the rear or bearing portion of the platen-frame for holding the platen down rigidly in position over the printing-center.

3. In a type-writing machine a carriage-frame susceptible of lateral movement only, a plurality of bearing-points for said carriage, said bearing-points being located on one side of the printing-center, means for laterally moving the carriage in one direction, said means being located in line with the movement of said carriage and between its bearing-supports, a platen-frame in the same plane with and hinged to said carriage-frame, springs for normally causing the overhanging portion to assume an upright position, and hooks engaging with the bearing portion of said platen-frame for locking it in the printing position, substantially as described.

4. In a type-writing machine, a carriage-frame, a bearing-rail underneath the forward edge of said carriage, an overhead bearing-rail to the rear thereof, a platen-carrying frame hinged to the forward portion of said carriage adjacent to said forward bearing-rail, the weight of said platen and frame being sufficient to hold said carriage against said bearing-rail, in combination with a spring for normally swinging the platen-frame into an upright position, and a lock for positively holding said platen in the printing plane.

5. In a type-writing machine, a carriage, an underneath bearing-rail therefor toward its forward edge, an overhead bearing-rail therefor toward its rear edge, a counterweight for said carriage to hold the same against its bearings when in operative position, said counterweight comprising a platen-carrying frame hinged at the forward edge of said carriage adjacent said underneath bearing-rail, in combination with a means for normally causing said platen-carrying frame to swing into an upright position to expose the printing, and means for detachably holding said platen-carrying frame in a proper printing plane, substantially as described.



605,865. APPARATUS FOR VAPORIZING OILS. LOUIS E. FRAIPONT, Paris, France. Filed May 26, 1897. Serial No. 637,260. (No model.) Patented in France Sept. 4, 1896, No. 260,438.

Claim.—1. In combination, the casing, the plurality of retorts connected in series, each being a complete retort in itself, means for feeding hydrocarbon to the first retort of the series, a drain-pipe connected with the retorts, a superheater connected with the last retort of the series and arranged to receive the volatilized hydrocarbon therefrom, a gas burner or jet beneath each retort and the superheater for independently heating said retorts and superheater, said burners being supplied with gas from the superheater, substantially as described.

2. In combination, the casing, the plurality of retorts, each complete in itself, said retorts being connected in series, means for feeding hydrocarbon to the first retort of the series, a drain-pipe connected with the retorts, the superheater comprising three tubes, two above and one centrally below and connected in series, connections from the last retort of the series to one of the upper tubes, the gas flowing thence through the second upper tube and finally into the lower one, the gas-jet beneath each retort, the jets beneath the superheater adapted to impinge against the said lower tube, and the pipe connections from the superheater to the burners, substantially as described.

605,866. CONTINUOUS RAIL-BRACE. WILLIAM G. GRAHAM, Stanley, Kans. Filed May 24, 1897. Serial No. 637,967. (No model.)

Claim.—A continuous rail-brace, comprising a pair of rods 1, flattened to form the base-plates 4, said base-plates provided with openings 7, their inner ends being adapted to be received by a turnbuckle 8, which is mounted upon said inner ends thereof, a key or cotter 9, adapted to be inserted through an opening in one end of the turnbuckle, and a corresponding opening through one end of rod 1, clamp-block 10, provided with pendent lugs 12, adapted to be inserted through the openings in base-plates 4, said lugs provided with openings also to receive split wedge 14, to prevent disengagement as fully set forth and described.

605,867. TIRE FOR CYCLES OR OTHER VEHICLES. CHARLES H. GRAVES and GEORGE GRAVES, Cotteril, England. Filed Apr. 12, 1898. Serial No. 677,249. (No model.)

Claim.—1. The combination of hollow india rubber sections or balls E, having air-holes E', with the india-rubber rings or washers F between each ball, forming a resilient cushion or support for the covers of tires of cycles and other vehicles as shown and described.

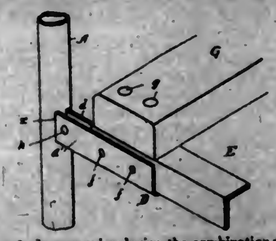
2. The construction of tires consisting of strips of canvas B, upon the metal rim A, binding-strip C with wires or cords D, balls E and washers F, stretched cover G, and outer cover H, substantially as shown and described.

3. Outer covers for balls or sectional tires consisting of strips of canvas B upon the metal rim A, binding-strip C with cord or wire D, stretching cover G and outer cover H substantially as shown and described.

605,868. PROCESS OF AND APPARATUS FOR BURNING ACETYLENE GAS. MAXIMILIAN GRIEB, West Hoboken, N. J., assignor to Edward H. Dickerson and Julius J. Seubert, New York, N. Y. Filed Jan. 15, 1897. Serial No. 619,297. (No model.)

Claim.—1. The process of burning acetylene gas, which consists in ejecting the same at suitable pressure through a burner, and in preventing the gas from reaching its kindling temperature at its point of escape to the atmosphere, substantially as described.

2. The process of burning acetylene gas, which consists in causing the gas to reach its kindling temperature only at a distance from the burner-surface and not in contact with the orifice where the escape occurs, substantially as described.



3. The process of burning acetylene gas, which consists in preventing the burning gas from reaching its kindling temperature in contact with the burner by cooling the gas by a jet of air under pressure and thereby preventing its reaching its kindling temperature until it has left the burner-surface, substantially as described.

4. The process of burning acetylene gas, which consists in cutting off the flame from the burner-surface by means of two opposed jets of air under pressure, approximately horizontally directed toward each other at about the point of delivery of the burner, substantially as described.

5. A burner for acetylene gas, which consists of a gas-jet and two separate air-jets having their delivery-points approximately at right angles to each other at about the surface of the burner, substantially as described.

6. The combination in a gas-burner of the jet A, the horizontally-delivering pipes B, B, the pipes D, C, and the single stop-cock for controlling both the air and gas pressure, substantially as described.

605,869. SECURING DEVICE FOR BREECHBANDS. ROBERT S. GROVE, Philadelphia, Pa. Filed Dec. 22, 1897. Serial No. 663,063. (No model.)

Claim.—1. In a securing device, the combination of the hook or catch having an upwardly-projecting slot angularly disposed, a supporting-plate formed of pressed steel bent into substantially U-shaped form and having parallel side walls or flanges, *d*, *d'*, to embrace the said hook or catch and a pin transversely disposed secured at its opposite ends in said flanges adapted to said hook or catch, substantially as specified.

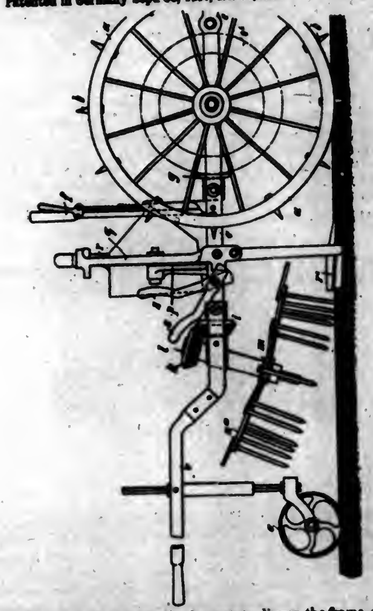
2. As a new article of manufacture, a supporting-plate for a bedstead-fastening formed of a sheet of metal pressed or stamped into substantially U-shaped form and having side walls or flanges, *d*, *d'*, the connecting metal between the side walls or flanges being cut away for a portion of the length of the plate, and a holding-pin secured to said side walls or flanges, adapted to a catch provided in the bed-post, substantially as specified.

3. The combination of the supporting-post, a flattened hook-plate, *b*, having an inclined slot therein and provided with a rearwardly-extending rivet-shank squared for a portion of its length and adapted to suitably shaped openings in the supporting-post, a plate, D, bent up from pressed steel to form two flanges or side walls, *d*, *d'*, a pin, *h*, carried between said flanges or side walls and adapted to enter the inclined slot, *b'*, and side rails, E, formed of angle-iron and having one web adapted to be secured between said flanges or side walls, *d*, *d'*, substantially as specified.

605,870. BALL-BEARING. WILLIAM S. GUNDLACH, Buffalo, N. Y. Filed Mar. 9, 1897. Serial No. 626,666. (No model.)

Claim.—1. The combination with an outer tubular member provided on its inner side between its ends with an annular row of lugs leaving the end portions of the tubular member extending from opposite sides of the lugs, of an inner tubular member arranged in one end of the outer tubular member and provided at its inner end with an annular row of longitudinal lugs which fit into the spaces between the lugs of the outer tubular member, substantially as set forth.

2. The combination with an outer tubular member provided on its inner side between its ends with an annular row of radial lugs leaving the end portions of this member extending from opposite sides of the lugs, of an inner tubular member fitted into the inner end portion of the outer member and provided with an annular row of longitudinal lugs which engage with said radial lugs, and a bearing-cup having an external screw-thread which engages with an internal screw-thread in the outer end portion of the outer tubular member and bearing against the shoulder formed by the lugs of the inner and outer tubular members, substantially as set forth.

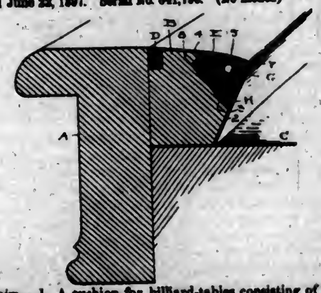


3. The combination with the casing and the axle having its end portion provided with an external screw-thread, of a bearing-cup connected with the casing and provided with an axial opening, an internally-screw-threaded adjusting-sleeve mounted on the screw-threaded portion of the axle and consisting of inner and outer sections arranged in the axial opening of the bearing-cup, a cone arranged on the inner end of the inner sleeve-section and having a diameter larger than the axial opening of said cup, a head arranged on the outer end of the outer sleeve-section and having a diameter greater than the diameter of the axial opening of the bearing-cup, and a coupling device connecting the opposing ends of the inner and outer sections of the adjusting-sleeve, substantially as set forth.

4. In a bearing, the combination with the casing and the axle or spindle having its end provided with an external screw-thread, of a bearing-cup connected with the casing and provided with an axial opening the outer portion of which is of larger diameter than the inner portion thereof forming an outwardly-facing shoulder in said opening, an internally-screw-threaded adjusting-sleeve mounted on the threaded portion of the axle or spindle and consisting of an inner and an outer section, the outer section of which is larger in diameter than the inner section forming an inwardly-facing shoulder on the outer section, a packing-ring bearing against the outwardly-facing shoulder of the cup and the inwardly-facing shoulder of the outer sleeve-section, an interlocking leg and recess formed on the opposing ends of the sleeve-sections, a cone arranged on the inner sleeve-section, and a row of balls arranged between said cup and cone, substantially as set forth.

5. In a bearing, the combination with the axle and the casing journaled on the axle, of an absorbent lubricating-tube arranged within the casing, and a spiral wire which bears against the inner side of

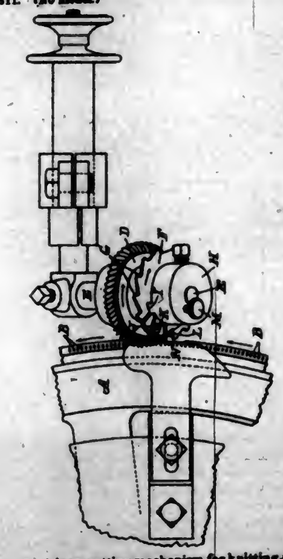
the lubricating-tube and presses the same against the inner side of the casing, substantially as set forth.



605,871. POTATO-DIGGING MACHINE. ERNST HANPEL, Hannoid, Germany. Filed Oct. 9, 1897. Serial No. 654,710. (No model.) Patented in Germany Sept. 30, 1897, No. 94,501.

Claim.—1. In combination in a potato-digger, the frame, a rotary harrow, the shaft therefor and the two sets of teeth extending downwardly and substantially parallel with the shaft of the rotary harrow, said teeth being long and short, the short teeth being at a greater distance from the shaft than the long teeth, substantially as described.

2. In combination in a potato-digger, the frame, a rotary harrow, a shaft therefor, the two sets of teeth extending downwardly and substantially parallel with said shaft, some of said teeth being shorter than the others, and being arranged at a greater distance from the shaft than the long teeth and an inclined rod over the short teeth adapted to take the weeds and potato-tops and direct them laterally, substantially as described.



605,872. BILLIARD-TABLE. AUGUST HAND, Cleveland, Ohio. Filed June 23, 1897. Serial No. 641,796. (No model.)

Claim.—1. A cushion for billiard-tables consisting of a strip of india-rubber having a bore longitudinally through the same from end to end, a coiled-wire spring vulcanized in said rubber about said bore and a flat canvas-covered strip of spring metal vulcanized in the rubber in front of said coiled wire, said flat strip and coiled wire being located directly behind the portion of the cushion which receives the stroke of the ball and having a wall of rubber between them, substantially as described.

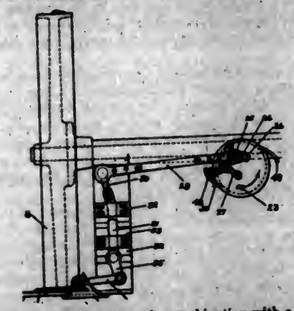
2. In a billiard-table, a cushion-strip B with a longitudinal rabbet having inclined converging sides 3 and 4 terminating in a point 8 directly at the rear of the line of stroke by the ball, in combination with a rubber cushion fixed in said rabbet and having a longitudinal bore in the stroke-line with said point 8, a coiled spring in the wall of said bore and a flat metal spring in front of said coiled spring, substantially as described.

605,878. LOOP-CUTTING ATTACHMENT FOR KNITTING-MACHINES. SETH T. HARSHAW, Lansingburg, N. Y., assignor of one-half to Campbell & Cluts, Cohoes, N. Y. Filed Nov. 26, 1897. Serial No. 659,811. (No model.)

Claim.—1. A loop-cutting mechanism for knitting-machines consisting of a rotary cutter and a stationary cutter, means for actuating said rotary cutter in a line that is radial in respect to the center line of the knitting-cylinder, and adapted to sever each loop at, or near, the middle of the latter, as and for the purpose specified.

2. In a knitting-machine, the combination, with a knitting-cylinder and a shield or guard held in a stationary position and extended beyond the line of the needles of said cylinder, of a loop-cutting mechanism provided with a stationary cutter and a revolubie cutter operated by the knitting-cylinder; the said loop-cutting mechanism being arranged to sever the loops on a line that is radial to the center of the knitting-cylinder and so that the separation will practically be at the middle of the loop, as and for the purpose specified.

3. In a loop-cutting mechanism, the combination of a rotary cutter provided with a series of peripheral cutting-teeth, a stationary cutter adapted to engage successively in the loops formed by the knitting-machine, means for actuating said rotary cutter to effect the cutting of the loops at, or near, the middle of the latter, and means—substantially as set forth—for maintaining said cutters in facial contact, as herein specified.



605,874. MOWER. ALFRED HART, Chicago, Ill., assignor to Frederick B Hart and Ralph W. Hart, same place. Filed Nov. 24, 1894. Serial No. 529,295. (No model.)

Claim.—1. In a harvesting-machine, a reciprocating sickle, mechanism for reciprocating said sickle, and means which act automatically to adjust the operating mechanism for changing the length of the stroke of the sickle, substantially as described.

2. In a harvesting-machine, a reciprocating sickle having a stroke of variable length dependent upon the speed of the machine, substantially as described.

3. In a harvesting-machine, the combination with a reciprocating sickle, of means for reciprocating said sickle by the movement of the machine, and mechanism whereby increase of speed of the machine increases the length of stroke of the sickle, substantially as described.

4. In a harvesting-machine, the combination with a sickle, and means for driving said sickle by the movement of the machine, of mechanism operated by variation of the speed of the machine for driving the sickle with the greatest power when the machine moves slowly and for driving the sickle with less power when the speed of the machine is increased, substantially as described.

5. In a harvesting-machine, the combination with a reciprocating sickle, of means for reciprocating said sickle by the motion of the machine, a governor, and devices controlled by the governor, whereby increase of speed of the machine increases the length of stroke of the sickle, substantially as described.

6. In a harvesting-machine, the combination with a reciprocating sickle, and means for reciprocating said sickle by the movement of the machine, of mechanism which acts to drive the sickle with a short stroke when the machine moves slowly and to suddenly increase the length of stroke of the sickle when the machine moves more rapidly, substantially as described.

7. In a harvesting-machine, a reciprocating sickle, mechanism for reciprocating said sickle, and means for adjusting the sickle-operating mechanism while the harvester is in motion to change the length of stroke of the sickle, substantially as described.

8. In a harvesting-machine, the combination with a reciprocating sickle, a rotary shaft, means for driving said shaft by the forward movement of the machine, a driving-disk, and a wrist-pin carried thereby, of mechanism connected to said wrist-pin for reciprocating said sickle, and means for moving said wrist-pin toward and from the axis of the driving-shaft while the machine is moving, substantially as described.

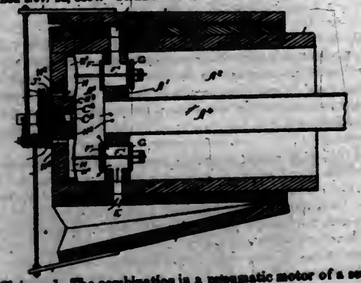
9. In a harvesting-machine, the combination with a reciprocating sickle, a rotary shaft, means for driving said shaft by the forward movement of the machine, a driving-disk, and a wrist-pin carried thereby, of mechanism connected to said wrist-pin for reciprocating said sickle, a governor, and cam mechanism operated by said governor to move said wrist-pin toward and from the axis of the driving-shaft, substantially as described.

10. In a harvesting-machine, the combination with a reciprocating sickle, a rotary shaft, means for driving said shaft by the forward movement of the machine, and a driving-disk mounted upon said shaft, of a segment 24 pivoted upon said disk, a wrist-pin carried by said segment, and mechanism whereby the segment is operated and the position of the wrist-pin, relatively to the axis of the driving-shaft, is regulated by the speed of the machine in traversing the field, substantially as described.

11. In a harvesting-machine, the combination with a reciprocating sickle, a rotary shaft, means for driving said shaft by the forward movement of the machine, and a driving-disk mounted upon said shaft, of a segment 24 pivoted upon said disk, a wrist-pin carried by said segment, a lever 46 pivoted to said disk, said lever being connected to said segment, and a cam movable into engagement with said lever, substantially as and for the purpose specified.

12. In a harvesting-machine, the combination with a reciprocating sickle, a rotary shaft, means for driving said shaft by the forward movement of the machine, and a driving-disk mounted upon said shaft, of a segment 24 pivoted upon said disk, a wrist-pin carried by said segment, a lever 46 pivoted to said disk, said lever being connected to said segment, a cam 39, having an ear 49 and groove 51, and means for moving said cam toward and from said disk, substantially as described

13 In a harvesting-machine, the combination with a reciprocating sickle, a rotary shaft, means for driving said shaft by the forward movement of the machine, and a driving-disk mounted upon said shaft, of a segment 24 pivoted upon said disk, a wrist-pin carried by said segment, a lever 46 pivoted to said disk, said lever being connected to said segment, a cam movable into engagement with said lever, and guides controlling the points at which said lever may be moved into and out of engagement with said cam, substantially as described.



14. The combination with a rotary disk and a reciprocating pitman connected to and actuated by said disk, of means controlled by the speed of said disk for automatically varying the length of the stroke of the pitman, substantially as described.

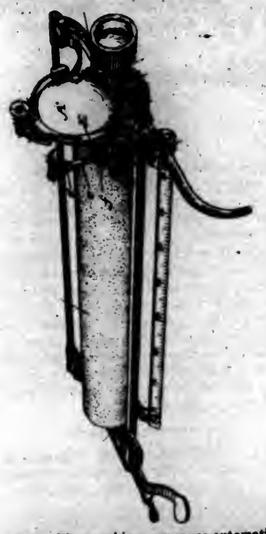
605,875. VEHICLE-WHEEL. EDWARD C. HAYES, Chicago, Ill. Filed Feb. 26, 1897. Serial No. 625,108. (No model.)

Claim.—The combination with the channel-rim of a vehicle-wheel, of an elastic or cushion tire, said elastic tire being provided with an opening through which a retaining-band having overlapping ends is inserted, the overlapping ends of said band being pierced to receive a bolt inserted through an opening in the rim of the wheel registering therewith and in the plane of the abutting ends of the elastic tire, said tire being adapted to be drawn back to afford access to the overlapping ends of the retaining-band for adjusting the position thereof and thereby the clamping action of the band upon the portion of the tire which is compressed between the said band and the channel-rim, and permitting the piercing of one of the overlapping ends of the retaining-band after such adjustment has been made, whereby the tire is independently adjusted and secured in position upon the wheel with the desired force or clamping action, substantially as and for the purpose specified.

605,876. PNEUMATIC MOTOR. FREDERICK W. HENDELAND, Chicago, Ill., assignor to The W. W. Kimball Company, same place. Filed Nov. 13, 1897. Serial No. 658,991. (No model.)

Claim.—1. The combination in a pneumatic motor of a series of pneumatics, a series of valves corresponding to the pneumatics and controlling the inflating and deflating thereof, a series of motors controlling said valves and a rotating valve controlling said motors, substantially as specified.

2. The combination in a pneumatic motor of a series of pneumatics, a series of valves corresponding to the pneumatics and controlling the inflating and deflating thereof, a series of motors controlling said valves and a single valve controlling said motors, substantially as specified.



3. The combination with a pulley or other rotating device, of a wind-motor for driving the same, and consisting of a series of pneumatics, valves controlling the pneumatics, and membrane-motors for operating said valves, said membranes being each provided with a large valved air-passage and a small permanently-open air-passage whereby the membrane-chambers may be alternately inflated and deflated, substantially as specified.

4. The combination with the valve controlling the power-pneumatic of a wind-motor, of a membrane-motor having both a large valve-controlled passage to the outer air and a small permanently-open passage to the exhaust-pressure chamber through which it is alternately inflated and deflated, substantially as specified.

605,877. TYPE-WRITING MACHINE. EDWARD E. HORTON, Toronto, Canada. Filed June 12, 1897. Serial No. 640,577. (No model.)

Claim.—1. A type-writing machine embracing in its construction a line-spacing lever, a ratchet-wheel rotated a distance equal to one line-space by each operation of the line-spacing lever, and means for adjusting the rotation of the ratchet-wheel to the predetermined number of lines, substantially as specified.

2. A type-writing machine embracing in its construction a line-spacing lever, a ratchet-wheel rotated a distance equal to one line-space by each operation of the line-spacing lever means for adjusting the rotation of the ratchet-wheel to the predetermined number of lines, and an indicator operated by the completion of the movement of the ratchet-wheel, substantially as specified.

3. In a type-writing machine a means to automatically announce the completion of a page of writing consisting of a ratchet-wheel and an indicator, operated by the completion of the movement of the ratchet-wheel, in combination with the line-spacing lever, a pawl carried by the line-spacing lever to actuate the ratchet-wheel, and an adjustable stop to limit the reversal of the ratcht-wheel, substantially as specified.

4. In a type-writing machine a means to automatically announce the completion of a page of writing, consisting of a ratchet-wheel, a gong, and a striker operated by the ratchet-wheel to sound the gong on the completion of the movement of the ratchet-wheel, in combination with the line-spacing lever, a pawl carried by the line-spacing lever to actuate the ratchet-wheel, and an adjustable stop to limit the reversal of the ratchet-wheel, substantially as specified.

5. In a type-writing machine a means to automatically announce the completion of a page of writing consisting of a ratchet-wheel and an indicator, operated by the completion of the movement of the ratchet-wheel, in combination with the line-spacing lever, a pawl carried by the line-spacing lever to actuate the ratchet-wheel, a detent-pawl normally engaging the teeth of the ratchet-wheel during its forward rotation, and a trip raised by the ratchet-wheel into position on the completion of a page of writing to upset the detent-pawl and allow of the reversal of the ratchet-wheel, substantially as specified.

6. In a type writing machine a means to automatically announce the completion of a page of writing, consisting of a ratchet-wheel, a gong, and a striker operated by the ratchet-wheel to sound the gong on the completion of the movement of the ratchet-wheel, in combination with the line-spacing lever, a pawl carried by the line-spacing lever to actuate the ratchet-wheel, a detent-pawl normally engaging the teeth of the ratchet-wheel during its forward rotation, and a trip raised by the ratchet-wheel into position on the completion of a page of writing material to upset the detent-pawl and allow of the reversal of the ratchet-wheel, substantially as specified.

7. In a type-writing machine a means to automatically announce or intimate the completion of a page of writing, consisting of a standard connected to the carriage of the machine, a stud projecting from the side face of the standard, a gong connected to the outer end of the stud, a ratchet-wheel revolubly mounted on the stud between the standard and the gong, and a striker actuated by the completion of movement of the ratchet-wheel to sound the gong, substantially as specified.

8. In an attachment for a type-writing machine to automatically intimate or announce the completion of a page of writing, the combination of the line-spacing mechanism, a ratchet-wheel actuated by the operation of the line-spacing mechanism, a gong, a striker for the gong operated by the movement of the ratchet-wheel, and an adjustable stop to limit the reverse movement of the ratchet-wheel, substantially as specified.

9. In an attachment for a type-writing machine to automatically intimate or announce the completion of a page of writing, the combination of a ratchet-wheel actuated by the operation of the line-spacing mechanism, and a series of adjustable stops to limit the reverse rotation of the movement of the ratchet-wheel, substantially as specified.

10. In an attachment for a type-writing machine to automatically intimate or announce the completion of a page of writing, the combination of the carriage of the machine, a ratchet-wheel revolubly connected to the carriage, actuated by the operation of the line-spacing mechanism, a series of adjustable stops to limit the reverse rotation of the movement of the ratchet-wheel, a gong, and a striker operated by the completion of movement of the ratchet-wheel to sound the gong, substantially as specified.

11. In an attachment for a type-writing machine to automatically intimate or announce the completion of a page of writing, the combination of a ratchet-wheel, a detent-pawl engaging the teeth of the ratchet-wheel, a trip adapted to be raised toward the detent-pawl during the rotation of the ratchet-wheel, the line-spacing lever, having a line-spacing pawl, and an auxiliary pawl adapted to engage and raise the trip against the end of the detent-pawl, and lift it out of engagement with the teeth of the ratchet wheel, substantially as specified.

12. In an attachment for a type-writing machine to automatically intimate or announce the completion of a page of writing, the combination of a ratchet-wheel, a detent-pawl engaging the teeth of the ratchet-wheel, a trip adapted to be raised toward the detent-pawl during the rotation of the ratchet-wheel, the line-spacing lever, having a line-spacing pawl, an auxiliary pawl adapted to engage and raise the trip against the end of the detent-pawl, and lift it out of engagement with the teeth of the ratchet-wheel, and means for reversing the ratchet-wheel to return it to its starting position, substantially as specified.

13. In an attachment for a type-writing machine to automatically intimate or announce the completion of a page of writing, the combination of ratchet-wheel, a detent-pawl engaging the teeth of the ratchet-wheel, a trip adapted to be raised toward the detent-pawl during the rotation of the ratchet-wheel, the line-spacing lever, having a line-spacing pawl, an auxiliary pawl adapted to engage and raise the trip against the end of the detent-pawl, and lift it out of engagement with the teeth of the ratchet-wheel, means for reversing the ratchet-wheel to return it to its starting position, a gong, and a striker actuated by the completion of the movement of the ratchet-wheel to sound the gong, substantially as specified.

14. In an attachment for a type-writing machine to automatically intimate or announce the completion of a page of writing, the combination of a ratchet-wheel, a detent-pawl engaging the teeth of the ratchet-wheel, a trip adapted to be raised toward the detent-pawl during the rotation of the ratchet-wheel, the line-spacing lever, having a line-spacing pawl, an auxiliary pawl adapted to engage and raise the trip against the end of the detent-pawl, and lift it out of engagement with the teeth of the ratchet-wheel, means for reversing the ratchet-wheel to return it to its starting position, a gong, a striker actuated by the completion of the movement of the ratchet-wheel to sound the gong, and a series of adjustable stops to limit the reverse rotation of the ratchet-wheel, substantially as specified.

15. In an attachment for a type-writing machine to automatically intimate or announce the completion of a page of writing, a ratchet-wheel having a series of teeth, in combination with a line-spacing lever, having an auxiliary pawl adapted to engage the teeth of the ratchet-wheel during the forward rotation of its movement, a detent-pawl to engage the teeth of the ratchet-wheel during its forward rotation, a trip to be engaged by the auxiliary pawl and raised against the detent-pawl to lift it out of engagement with the teeth of the ratchet-wheel on the completion of its rotation, a gong, a striker actuated by the movement of the ratchet-wheel to sound the gong, and an adjustable stop to limit the reverse rotation of the ratchet-wheel, substantially as specified.

16. In an attachment for a type-writing machine to intimate or announce the completion of a page of writing, the combination of the carriage of the machine, a standard connected to the carriage, a stud extending from the side face of the standard, a ratchet-wheel revolubly mounted in the stud, a spring connected to the stud and to the ratchet-wheel to reverse it, a second stud projecting from the top of the side face of the standard, a detent-pawl pivotally mounted on the stud engaging the teeth of the ratchet-wheel, a striker the hub of which is pivotally mounted on the said second stud, an arm depending from the hub of the striker, a pin connected to the side face of the ratchet-wheel, adapted to engage the said arm to raise the striker into an elevated position during the forward rotation of the ratchet-wheel, a gong adapted to be sounded by the fall of the striker, and a pawl connected to the line-spacing lever to rotate forwardly the ratchet-wheel, substantially as specified.

17. In an attachment for a type-writing machine to automatically intimate or announce the completion of a page of writing, the combination of the carriage of the type-writing machine, a standard connected to the carriage, a stud projecting from the side face of the standard, a ratchet-wheel pivotally mounted on the said stud, a spring connected to the stud and to the ratchet wheel to reverse it after the completion of its movement, a stud projecting from the top of the standard, a detent-pawl pivotally mounted on the stud engaging the teeth of the ratchet-wheel, a striker, the hub of which is rotatably mounted on the second stud, an arm depending from the hub of the striker, a pin connected to the side face of the ratchet-wheel to engage the said arm to lift the striker into an elevated position, a pin connected to the standard to arrest the return movement of the striker and arm, a gong adapted to be sounded by the fall of the striker, and an auxiliary pawl connected to the line-spacing lever to actuate the ratchet-wheel, substantially as specified.

18. In an attachment for a type-writing machine to automatically intimate or announce the completion of a page of writing, the combination of the carriage of the type-writing machine, a standard connected to the carriage, a stud projecting from the side face of the standard, a ratchet-wheel pivotally mounted on the said stud, a spring connected to the stud and to the ratchet-wheel to reverse it after the completion of its movement, a stud projecting from the top of the standard, a detent-pawl pivotally mounted on the stud engaging the teeth of the ratchet-wheel, a striker, the hub of which is rotatably mounted on the second stud, an arm depending from the hub of the striker, a pin connected to the side face of the ratchet-wheel to engage the said arm to lift the striker into an elevated position, a pin connected to the standard to arrest the return movement of the striker and arm, a gong adapted to be sounded by the fall of the striker, and an auxiliary pawl connected to the line-spacing lever to actuate the ratchet-wheel, and a spring connected to the pin and to the striker to prevent its movement when the carriage has been upset, substantially as specified.

19. In an attachment for a type-writing machine to automatically intimate or announce the completion of a page of writing, the combination of a ratchet-wheel, a detent-pawl engaging the teeth of the ratchet-wheel, the line-spacing lever, an auxiliary pawl carried by the line-spacing lever, a trip brought into position during the rotation of the ratchet-wheel to be engaged by the auxiliary pawl, and move against the end of the detent-pawl, and lift the detent-pawl out of engagement with the teeth of the ratchet-wheel, substantially as specified.

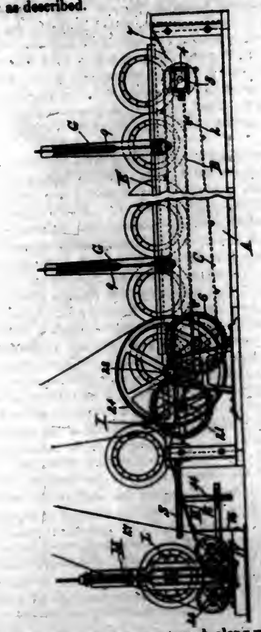
20. In an attachment for a type-writing machine to automatically intimate or announce the completion of a page of writing, the combination of the carriage of the machine, a standard connected to the carriage, a stud projecting from the side face of the standard, a ratchet-wheel revolubly mounted on the stud, a detent-pawl engaging the teeth of the ratchet-wheel, a trip pivoted to the standard eccentric to the ratchet-wheel, a pin connected to the side face of the ratchet-wheel to bring the trip into position during the forward rotation of the ratchet-wheel, an auxiliary pawl connected to the line-spacing lever adapted to engage the trip after the completion of the forward rotation of the ratchet-wheel, and bring it against the detent-pawl to lift the detent-pawl out of engagement with the teeth of the ratchet-wheel to allow of its reverse rotation, substantially as specified.

21. In an attachment for a type-writing machine to automatically intimate or announce the completion of a page of writing, the combination of the line-spacing lever, an auxiliary pawl carried by the line-spacing lever, a ratchet-wheel adapted to be rotated by the auxiliary pawl during the operation of the line-spacing lever, an adjustable stop to limit the reverse rotation of the ratchet-wheel, and means for reversing the ratchet-wheel after completing its forward rotation, substantially as specified.

22. In an attachment for a type-writing machine to automatically intimate or announce the completion of a page of writing, the combination of the carriage of the machine, a standard connected to the carriage, a plate slidably mounted on the said standard, a clamp for holding the plate in any set position, a stop-pin carried by the plate, a stud projecting from the side face of the standard, a ratchet-wheel revolubly mounted on the stud, the web of the ratchet-wheel having a series of step-shoulders cut in it adapted to engage the pin in its set position to limit the reverse rotation of the ratchet-wheel, the line-spacing lever, an auxiliary pawl carried by the line-spacing lever adapted to engage the teeth of the ratchet-wheel and cause its forward rotation, a detent-pawl engaging the teeth of the ratchet-wheel, a trip pivoted to the standard eccentric to the ratchet-wheel, a pin carried by the adjacent side face of the ratchet-wheel to bring the trip into position to be engaged by the auxiliary pawl on the completion of the movement of the ratchet-wheel, to bring it against the detent-pawl, and lift the detent-pawl out of engagement with the ratchet-wheel, to allow of its reversal, substantially as specified.

23. In an attachment for a type-writing machine to automatically intimate or announce the completion of a page of writing, the combination of the carriage of the machine, a standard connected to the carriage, a stud projecting from the outer side face of the standard, a ratchet-wheel revolubly mounted on the stud, a spring connected to the stud and to the ratchet-wheel to reverse it after the completion of its movement, a gong mounted on the outer end of the stud, the web of the ratchet-wheel cut away to form a series of step-shoulders, a second stud extending from the top of the standard, a detent-pawl pivotally mounted on the said stud engaging the teeth of the ratchet-wheel, a striker, the hub of which is mounted on the second stud, an arm depending from the hub of the striker, a pin connected to the side face of the ratchet-wheel to engage the said arm and raise the striker into an elevated position, a pin projecting from the standard to engage the arm and limit the return movement of the striker, a spring connected to the pin and to the striker to hold it when the carriage is upset, a trip pivoted to the standard eccentric to the ratchet-wheel, a pin connected to the adjacent face of the ratchet-wheel to bring the trip into position during the rotation of the ratchet-wheel, the line-spacing lever, an auxiliary pawl carried by the line-spacing lever to engage the teeth of the ratchet-wheel and move it during its forward rotation, adapted to engage the trip when brought into position and move it against the detent-pawl and lift it out of engagement with the teeth of the ratchet-wheel to permit of its reversal and the fall by gravity of the striker on the gong, a plate slidably mounted on the standard a clamp to hold the plate in any set position, a stop-pin projecting from the plate adapted to engage any one of the step-shoulders of the ratchet-wheel, substantially as specified.

605,878. AX. EDWIN J. JOHNSON, Elmore, S. C. Filed Sept. 13, 1897. Serial No. 651,517. (No model.)



Claim.—1. In an ax having a detachable blade the combination of the head having a groove therein, the blade having a projection adapted to enter said groove, a recess in the said head and blade at their intersection, an undercut groove in the wall of said recess and a cam adapted to be pivotally held between the wall of said groove and the projection, of the head and blade, and enter the undercut groove in the recess in the said head and blade, locking them together substantially as shown and described.

2. A detachable ax and blade comprising the head having a groove therein, a blade having a projection corresponding to said groove an incline bearing or double bevel on blade and head and adapted to snugly fit, a recess in the head and blade at their intersection, an undercut groove in the wall of said recess, a cam having a pivotal tapering pin adapted to wedge between the projection of the blade and the wall of the groove of the head and a flange on said cam adapted to enter the undercut groove in the wall of the recess in the head and blade and a spring adapted to hold said cam in place, substantially as described.

3. An ax having a detachable blade comprising the head and blade having tongue-and-groove connections, a recess in said head and blade, an undercut groove in the wall of said recess, a cam adapted to enter the undercut groove in the wall of said recess, a tapering pin formed integral with said cam forming a pivot on which said cam turns when locking and unlocking and a spring adapted to hold said cam in position, substantially as described.

605,879. BARREL-WASHER. CHARLES KAESTNER, Chicago, Ill., assignor to Charles Kaestner & Co., same place. Filed June 1, 1897. Serial No. 638,972. (No model.)

Claim.—1. In a keg or barrel cleaner, a trough along which the kegs or barrels are moved; means for moving the kegs or barrels; longitudinally-extending guides arranged to lie opposite the ends of the kegs or barrels and adjustable with reference to kegs or barrels of different sizes; and means for simultaneously adjusting the guides, substantially as described.

2. In a keg or barrel cleaner, a trough along which the kegs or barrels are moved; means for moving the kegs or barrels; longitudinally-extending guides arranged to lie opposite the ends of the kegs or barrels and adjustable laterally with reference to kegs or barrels of different sizes; and means for adjusting the guides, comprising bent levers having pendent arms to which the guides are attached, and means for operating and holding the levers in adjustment, substantially as described.

3. In a keg or barrel cleaner, a trough along which the kegs or barrels are moved; means for moving the kegs or barrels; longitudinally-extending guides arranged to lie opposite the ends of the kegs or barrels and adjustable laterally with reference to kegs or barrels of different sizes; and means for adjusting the guides comprising a pair of pivotally-supported bent levers P having pendent arms to which the guides are attached; a hinge connection between the upper arms of the levers; and an adjustable operating-lever connected with the hinge connection between said upper arms of the bent levers, substantially as described.

4. In a keg or barrel cleaner, the trough containing a track which is adjustable in width and along which the kegs or barrels are moved, means for moving the kegs or barrels along the trough and guides arranged to lie opposite the ends of the kegs or barrels on said track and adjustable laterally, whereby the track and guides can be correspondingly adjusted with reference to kegs or barrels of different sizes, as set forth.

5. In a keg or barrel cleaner, the trough containing a longitudinally-extending track; means for moving the kegs or barrels along such track; a rotary transfer device comprising a plurality of arms arranged to engage the kegs or barrels and deliver them in succession from the soaking-trough; suitable means for rotating said transfer device, and an incline along which the kegs or barrels are rolled by the transfer device, as set forth.

6. A keg or barrel cleaner comprising a brushing or scouring device provided with a brush or brushes and means for revolving a keg or barrel which has been delivered to the brushing or scouring device; and an ejector arranged to eject a keg or barrel from the brushing or scouring device and automatically actuated by the weight of a keg or barrel delivered to the brushing or scouring device, substantially as described.

7. A keg or barrel cleaner comprising a soaking-trough wherein the kegs or barrels are soaked; a brushing or scouring device provided with a brush or brushes and means for revolving a keg or barrel which has been delivered to the brushing or scouring device from the soaking-trough; means for successively transferring kegs or barrels from the soaking-trough to the brushing or scouring device; an automatic ejector arranged to eject a keg or barrel from the brushing or scouring device; and means for successively operating the automatic ejector by the weight of the kegs or barrels passing from the soaking-trough to the brushing or scouring device, substantially as described.

8. In a keg or barrel cleaner, rolls for rotating a keg or barrel; suitable means for operating the rolls; a brush or brushes for acting upon the keg or barrel while the latter is under rotation; means for bringing the brush or brushes into position to thus act upon the keg or barrel; an ejector which serves both to move the brush or brushes away from the keg or barrel and to eject the latter from the rolls; and means for operating the ejector from the weight of a keg or barrel passing to the rolls which serve to rotate the keg or barrel, substantially as described.

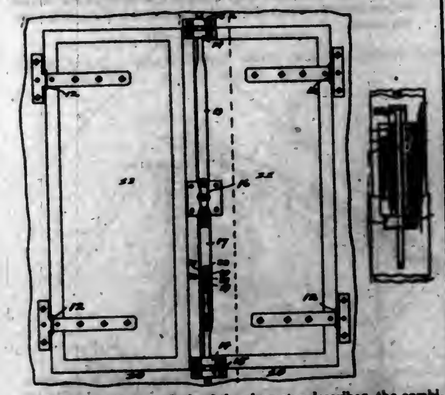
9. In a keg or barrel cleaner, means for rotating a keg or barrel; an ejector for removing the keg or barrel from the rotating means; means for operating the ejector; an incline leading downwardly to the latter; and a movable abutment arranged in the path of a keg or barrel rolling down from the incline, and connected with the ejector-operating means, so as to operate the same when actuated by a keg or barrel rolling upon the incline, as set forth.

10. In a keg or barrel cleaner, means for rotating a keg or barrel; a vertically-movable ejector adapted for lifting the keg or barrel from the rotating means and provided with an operating-lever; an incline leading downwardly to the latter; and a vertically-swinging track-section having its free end arranged normally in the path of a keg or barrel passing down the incline and connected with the operating-lever of the ejector so as to operate the same when it is swung downwardly by a keg or barrel upon the incline, substantially as described.

11. In a keg or barrel cleaner, means for rotating a keg or barrel; a brush or brushes for acting upon the ends of the keg or barrel; an overhead gravity-brush for acting upon the sides of the keg or barrel; vibratory levers supporting the side brushes and having upwardly-extending arms; and a chain or cable attached to the said arms of the vibratory levers and passing both over guide-pulleys upon a suitable support, and under guide-pulleys upon the said overhead gravity-brush, substantially as described.

12. In a keg or barrel cleaner, rolls for supporting and rotating a keg or barrel; an ejector Q arranged to rise and fall between the rolls; a lever for operating the vertically-sliding ejector; and a tilting track connected with the said lever and arranged to deliver a keg or barrel to the rolls, substantially as described.

13. In a keg or barrel cleaner, rolls for supporting and rotating a keg or barrel; an ejector arranged to rise and fall between the rolls; means for operating the ejector; levers connected with and operated by said means; brushes upon said levers; and a gravity-brush connected with the upper ends of said levers which latter are caused to swing in a direction to remove the brushes from a keg or barrel upon the rolls when the ejector is moved upwardly, substantially as described.



14. In a keg or barrel cleaner, means for rotating a keg or barrel; a vertically-movable ejector provided with rolls 38 and having a base 41; means for moving the ejector and the base; elbow-levers P having their lower arms 40 connected with the base of the ejector by shifting connections; and a set of brushes operated by the elbow-levers, substantially as described.

15. A keg or barrel cleaner comprising a soaking-trough and a brushing or scouring device; means for successively delivering the kegs or barrels from the soaking-trough to the brushing or scouring device; a track for rolling the kegs or barrels from the soaking-trough to the brushing or scouring device; a movable abutment normally in the path of a keg or barrel passing from the soaking-trough to the brushing or scouring device; an ejector arranged for successively ejecting kegs or barrels from the brushing or scouring device and means for moving the ejector connected with and operated by the movable abutment when the latter is actuated by the weight of a keg or barrel passing from the soaking-trough to the brushing or scouring device, substantially as described.

16. A keg or barrel cleaner comprising a soaking-trough in which the kegs or barrels are soaked; means for moving the kegs or barrels along the soaking-trough; means for successively transferring the kegs or barrels from the soaking-trough to a device for brushing or scouring the kegs or barrels; a brushing or scouring device having means for rotating a keg or barrel which has been transferred from the soaking-trough; a brush or brushes for brushing or scouring such keg or barrel while under rotation; and an ejector arranged to eject a keg or barrel from the rotating means; means for automatically operating the ejector from and by the weight of a keg or barrel passing from the soaking-trough to the brushing or scouring device; and means for automatically moving the brush or brushes away from a keg or barrel upon which they have been operating, simultaneously with the ejector serving to eject such keg or barrel, substantially as described.

17. In a keg or barrel cleaner, the rotary beveled or tapered rolls for rotating a keg or barrel in a horizontal position; a vertically-adjustable brush adapted for application to the side of the keg or barrel; a couple of horizontally-adjustable brushes arranged opposite the ends of the keg or barrel, and adapted for application thereto; a vertically-movable ejector adapted for lifting the keg or barrel from the rotary rolls, and provided with an operating-lever; a couple of pivotally-supported bell-crank levers having vertically-arranged swinging arms to which the horizontally-adjustable brushes are attached, and to whose upper ends the vertically-adjustable brush is connected by means of a flexible connector and having also horizontally-arranged swinging arms connected with the operating-lever of the ejector so as to withdraw the brushes from the keg or barrel being cleaned when the ejector is actuated; an incline leading downwardly toward the rotary rolls; and a vertically-swinging track-section having its free end arranged normally in the path of a keg or barrel rolling down the incline, and connected with the operating-lever of the ejector so as to actuate the same, and thereby withdraw the brushes from the keg or barrel being cleaned when it is swung downwardly by a keg or barrel upon the incline, substantially as described.

605,880. CAR-LOCK. THOMAS B. KENDT, Chicago, Ill. Filed Nov. 15, 1897. Serial No. 658,572. (No model.)

Claim.—1. In a car-lock of the character described, the combination, with the locking-bar having a loop or staple and the hinged slotted operating-lever, of a guide or keeper mounted on said lever adjacent to the slot therein, and a locking-pin mounted to slide in said guide or keeper, substantially as described.

2. In a car-lock of the character described, the combination, with the locking-bar having a loop or staple and the hinged slotted operating-lever, of a guide or keeper mounted on said lever adjacent to the slot therein, a locking-pin mounted to slide in said guide or keeper, and means for holding the said locking-pin in an elevated position clear of the slot, substantially as described.

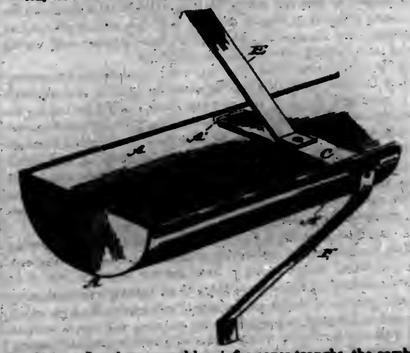
3. In a car-lock of the character described, the combination, with the locking-pin having a loop or staple with a vertical opening and the hinged slotted operating-lever, of a guide or keeper on said lever extending vertically upward from the slot therein, when the lever is in its locked position, and provided with a notch, and a locking-pin mounted to slide vertically in said guide or keeper and having a projection to engage the notch thereof whereby said pin may be held in an elevated position, substantially as described.

4. In a car-lock of the character described, the combination, with the locking-bar having a loop or staple, of the hinged slotted operating-lever having a keeper or guide thereon composed of integral inclined flanges provided with notched slots, and a locking-pin adapted to engage said flanges, and provided with projections to engage the slots and notches, substantially as described.

605,881. RUBBER TIRE. ALVIN V. KNOX, Springfield, Ohio. Filed June 4, 1897. Serial No. 638,902. (No model.)

Claim.—1. In a rubber-tire attachment for vehicle-wheels, the combination with two rings or cheek-pieces adapted to engage with the ordinary iron tire of a wheel, of keys or rivets insertible in perforations in said rings or cheek-pieces and at one end riveted to one of said cheek-pieces and at their other end spread apart to engage with the other cheek-piece, and having shoulders between said cheek-pieces and engaging therewith respectively.

2. In a rubber tire attachment for vehicle-wheels, the combination with rings or cheek-pieces adapted to engage with the ordinary iron tire and having perforations and plates secured to the rings or cheek-pieces to hold their ends together, of rings or keys in said perforations and having shoulders engaging the inner faces of said rings or cheek-pieces respectively, and also engaging their outer faces, a rubber tire fitted between said rings or cheek-pieces, one or more retaining-wires extending through said rubber tire and fastened at their ends.

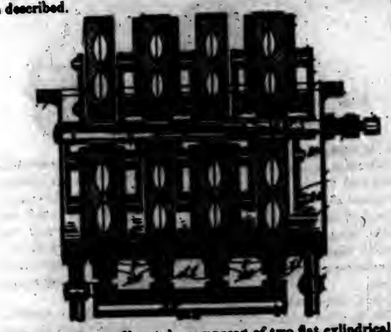


3. In a rubber-tire attachment for vehicle-wheels, the combination with the rings or cheek-pieces adapted to engage with the ordinary iron tire and having perforations, of keys adapted to pass through said perforations and at one end to be riveted to one ring or cheek-piece and at the other end to be spread to interlock with the other ring or cheek-piece, and means to hold the same spread.

4. In a rubber-tire attachment for vehicle-wheels, the combination with rings or cheek-pieces adapted to engage with the ordinary iron tire, one of them having plain perforations and the other having perforations with a struck-up leg, of keys insertible through said perforations and adapted to be riveted at one end to one ring or cheek-piece and slitted at the other end and having a neck adapted to be spread to bind the same in the adjacent perforations and being held and protected by said leg.

5. In a rubber-tire attachment for vehicle-wheels, the combination with rings or cheek-pieces adapted to be connected at their ends, and having perforations, those of one ring or cheek-piece having struck-up legs, of keys adapted to fit in said perforations and to be riveted at one end and spread at the other end and held and protected by said leg at the latter end.

6. In a rubber-tire attachment for vehicle-wheels, the combination with a ring or cheek-piece having perforations with a struck-up leg having a tooth, of a key having a neck with a slit, shoulders at one end of the neck and projections at the other, the neck being spreadable to receive said tooth in the slit.



605,882. EAVES-TROUGH HANGER. CHARLES KNOWLES, Chilton, Wis. Filed Feb. 16, 1898. Serial No. 670,590. (No model.)

Claim.—In a hanger and bracket for eaves-troughs, the combination with the trough, the forked member formed by bending the wire upon itself, passing the same horizontally through registering apertures on opposite sides of the trough, the ends of the fork being clenched on the outside of the trough, a bracket mounted on the arms of the fork, a strap for supporting the trough, and a loop outside of the trough, to which a strap may be connected, as shown and for the purpose specified.

605,888. FILTER. HUGO R. KUEHNERT, Chicago, Ill., assignor to Andrew M. Knabe, same place. Filed Nov. 20, 1897. Serial No. 659,093. (No model.)

Claim.—1. In a filter, a filter-tube composed of two flat cylindrical disks of clay each provided on one of its flat faces with annular and radial grooves which when said disks are fitted together to form a tube, form annular and radial passages therein, substantially as described.

2. In a filter, a filter-tube composed of two flat cylindrical disks of clay each provided in one of its flat faces with wide annular grooves bordered by narrow grooves adapted to receive material to cement said disks together to form said tube, said wide annular grooves forming annular passages in said finished tube, and radial passages connecting said annular passages and forming an outlet from said tube, substantially as described.

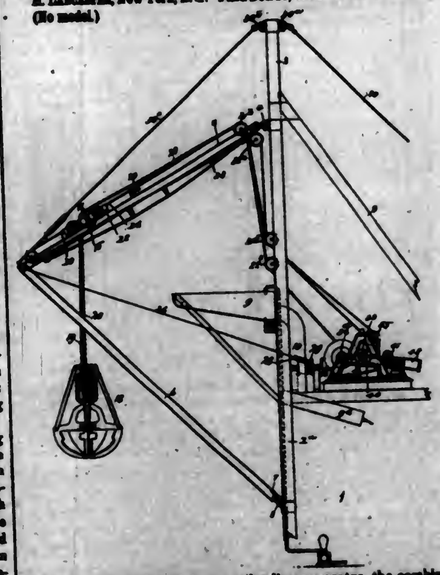
3. In a filter, a filter-tube comprising a flat cylindrical disk having internal annular passages and radial passages connecting said annular passages and forming an outlet from said tube, a metal ring or band around said tube, and a nipple on said band having an opening adapted to communicate with the outlet of said tube, substantially as described.

4. In a filter, a filter-tube comprising a flat cylindrical disk having internal annular passages and radial passages connecting said annular passages and forming an outlet from said tube, a metal ring or band around said tube, an exteriorly-screw-threaded nipple on said band communicating with said outlet of said tube, a casing adapted to contain said tube and having an opening through which said nipple is adapted to pass and means for securing said tube firmly within said casing, substantially as described.

5. In a filter, a filter-tube comprising a flat cylindrical disk having internal annular passages and radial passages connecting said annular passages and forming an outlet from said tube, a metal ring or band around said tube, an exteriorly-screw-threaded nipple on said band communicating with said outlet of said tube, a casing adapted to contain said tube and having an opening through which said nipple is adapted to pass and means for securing said tube firmly within said casing comprising a union adapted to couple said nipple with an outlet-pipe and clamp said ring or band firmly against said casing around said opening, substantially as described.

6. In a filter, a casing, a filter-tube within said casing comprising a hollow flat cylindrical disk having a central opening therethrough and a peripheral outlet, a ring or band around said tube having an outwardly-extending nipple provided with an opening communicating with said peripheral outlet, an opening in said casing through which said nipple is adapted to pass, means for coupling said nipple with an outlet-pipe and serving to firmly secure said tube within said casing, valve-controlled inlet and outlet pipes for said casing, and an exhaust-valve on said casing adapted to permit the exit of air therefrom, substantially as described.

7. In a filter, a casing, a filter-tube within said casing comprising a hollow flat cylindrical disk having a central opening therethrough and a peripheral outlet, a ring or band around said tube having an outwardly-extending nipple provided with an opening communicating with said peripheral outlet, an opening in said casing through which said nipple is adapted to pass, means for coupling said nipple with an outlet-pipe and serving to firmly secure said tube within said casing, a shaft passing centrally through said casing and through said central opening in said tube, and devices carried by said shaft adapted to remove sediment from the outer faces of said tube when said shaft is revolved, substantially as described.



8. In a filter, the combination with a plurality of parallel filter-tubes comprising hollow flat cylindrical disks having central openings and firmly mounted within a casing, of a shaft passing longitudinally through said casing and through said central openings in said tubes and carrying devices adapted to scrape the outer faces of said tubes to clean the same when said shaft is revolved, substantially as described.

9. In a filter, the combination with a plurality of parallel filter-tubes comprising hollow flat cylindrical disks having central openings and firmly mounted within a casing, of a shaft passing longitudinally through said casing and through said central openings in said tubes and carrying arms extending outwardly between said tubes, and devices carried by said arms and bearing against said tubes to clean the same when said shaft is revolved, substantially as described.

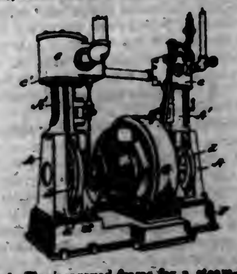
10. In a filter, the combination with a plurality of parallel filter-tubes comprising hollow flat cylindrical disks having central openings and firmly mounted within a casing, of a shaft passing longitudinally through said casing and through said central openings in said tubes and carrying arms extending outwardly between said tubes, and movable spring-actuated scrapers carried by said arms and bearing against said tubes to clean the same when said shaft is revolved, substantially as described.

11. In a filter, a casing made in two parts, a plurality of filter-tubes mounted within said casing and consisting of hollow flat cylindrical disks surrounded by peripheral bands having nipples communicating with the outlets of said tubes and passing through openings in said casing, means for coupling said nipples with branches of an outlet-pipe for filtered water, central openings in said tubes, a crank-shaft passing through said casing and through said central openings in said tubes, arms on said shaft, scrapers carried by said arms and bearing against said tubes to clean the same when said shaft is revolved, valve-controlled inlet and waste pipes for said casing, and an air-outlet valve on said casing adapted to be closed automatically by the rise of water in said casing, substantially as described.

605,884. HOISTING AND CONVEYING APPARATUS. JAMES H. LANCASTER, New York, N. Y. Filed Dec. 26, 1894. Serial No. 532,923. (No model.)

Claim.—1. In a dredging or unloading apparatus, the combination with a vertical standard or support, of an inclined trolley-way pivotally connected thereto at its higher end to swing laterally, a rectangular boom-frame supporting the free end of the trolley-way and also pivotally connected to swing coincident therewith without changing its shape, together with a sheave-equipped carriage on said way, grapple-operating chains guided through the carriage and suspending a grapple, and an independently-controlled cable for propelling the carriage and adapted to hold the same at any point on the way to permit the operation of the grapple, substantially as set forth.

2. In a dredging or unloading apparatus, the combination with the inclined trolley-way and supporting rectangular boom both pivotally secured at their inner ends to coincidently swing laterally without altering the shape of the boom, of a sheave-equipped carriage movably mounted on said way, means for laterally adjusting the trolley-way and boom, a grapple and grapple and carriage operating connections disposed with reference to the carriage, together with operating mechanism for said connections adapted to positively hold the carriage at any point throughout the length of the trolley-way, substantially as set forth.



3. In a dredging or unloading apparatus, the combination with an inclined trolley-way and supporting rectangular boom both pivotally secured at their inner ends to coincidently swing laterally without alteration in the shape of the boom, of a sheave-equipped carriage on said way, means for laterally adjusting the trolley-way and boom, a grapple, and grapple and carriage operating cables, together with drums therefor adapted for both independent and joint rotation, substantially as set forth.

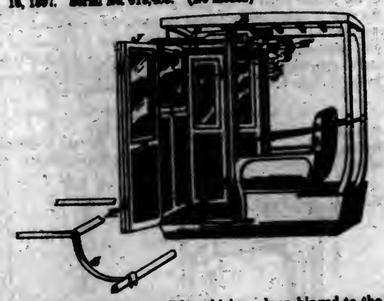
4. In a dredging or unloading apparatus, the combination with the laterally-swinging inclined trolley-way pivotally secured at its inner end and braced by a lower boom-frame pivoted in vertical line with the trolley-way, means for horizontally adjusting said boom and way, a sheave-equipped carriage movably mounted on the latter, a grapple, and grapple and carriage operating connections disposed with reference to the carriage together with operating mechanism for said connections adapted to positively hold the carriage at any point throughout the length of the trolley-way and cause the ascent or descent of the grapple, substantially as set forth.

5. In apparatus substantially as described, the combination with suitable conveying and discharge means, of a receiving-hopper 9, having a lower deep-formed portion $9^{\times}$, closed at the rear by a pivotally-depending door, and a jointed brace secured to said door to swing the same to an open position when the brace breaks joint, substantially as set forth.

6. The combination with the inclined trolley-way, carriage and grapple as described, of operating mechanism including the wheel 87, having double friction-disks, and independently-movable drums at each side thereof, and carriage and grapple operating cables guided to the rear of the trolley-way, led around inclined rollers contiguous thereto and thereby diverted to their drums, substantially as set forth.

605,885. STEAM-ENGINE. HENRY M. LANE, Cincinnati, Ohio. Filed July 9, 1896. Serial No. 598,502. (No model.)

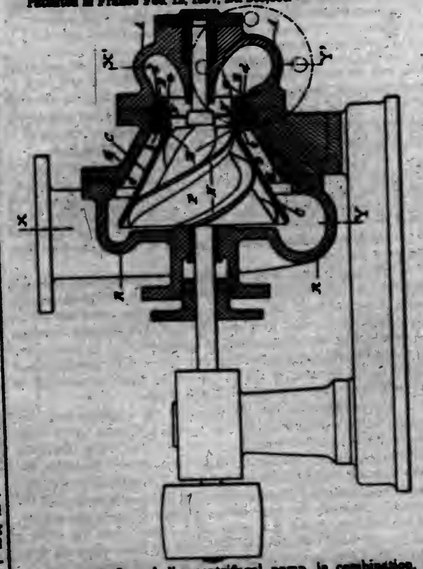
Claim.—1. The improved frame for a steam-engine embodying an extended base in combination with a hollow pedestal extending symmetrically about the projected axis of the cylinder supported upon and above the base and having a lateral vertical slot extended oppositely through the sides of the pedestal for the reception and play of the crank-plate, a recess at the bearing side of the frame opening outwardly from the shaft-bearing to admit the shaft and crank-plate without disconnection, and an upward axial tubular extension of the pedestal for supporting the working cylinder and carrying the cross-head guides, substantially as set forth.



2. The improved frame for a double, vertical, reciprocating engine coupled to the same shaft, embodying two independent, hollow, columnar frames, supported above and upon a common base and extended above by tubular prolongations supporting the cylinders centrally, respectively; the lower part of each frame being oppositely slotted to permit the play of the crank-plates, and the proximate sides of the frames adjacent to the slots being provided with recesses opening outwardly to contain the journal-bearings, of the shaft and permit the removal of the latter without disconnecting the crank-plates, substantially as set forth.

605,886. BURNER FOR ACETYLENE OR OTHER GASES. GUSTAVE LEBRUN and FERDINAND CORMBAULT, Paris, France. Filed Oct. 6, 1897. Serial No. 654,102. (No model.) Patented in France Mar. 4, 1897, No. 264,602, and in Belgium Mar. 5, 1897, No. 126,720.

Claim.—A burner for acetylene gas and other gases rich in carbon, consisting of a hollow cylindrical body having thin walls, and made of a material which is a poor conductor of heat, and having its upper rounded extremity made of parabeloidal form and provided with an eminion-orifice for the gas made trumpet-shaped on the exterior and rounded on the interior, the walls of the nose of the burner at the center of which is the orifice being made of less thickness, so that the heating of the burner during combustion and the accumulation of carbon deposits are minimized, said burner being sealed in a metal socket having a central perforation at its base to act as a moderator and insure the interior of the burner being kept clean and free from deposit.

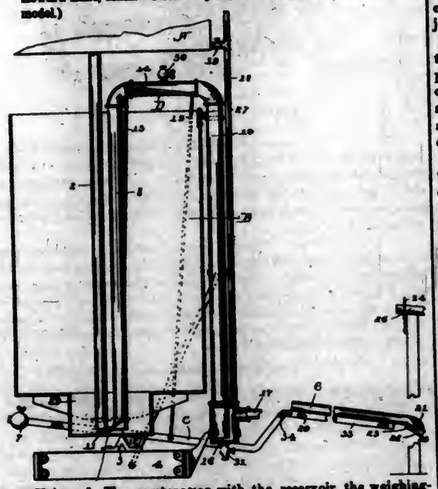


605,887. VEHICLE. GERAV LEWIS, Belleville, Ill. Filed Jan. 16, 1897. Serial No. 619,403. (No model.)

Claim.—1. In a convertible vehicle, a door hinged to the body thereof, another door hinged to said first-named door, an auxiliary hinge connected with the second-named door and with a sliding sleeve, and a support on the body on which said sleeve is mounted, said doors being adapted to be folded on each other and project from the body outside of the same.

2. In a convertible vehicle, a door adapted to be folded outside of the body thereof and formed in sections hinged together, one of said sections being hinged to said body, an auxiliary sliding hinge connected with the other section, a sleeve attached to said hinge and a support on said body, on which said sleeve is adapted to slide, in combination with thills which are depressed, so as to turn under said door when so folded outside of said body.

605,888. HELICO-CENTRIFUGAL PUMP. ALBERT MARIOT, Vesoul, France. Filed Dec. 14, 1897. Serial No. 661,883. (No model.) Patented in France Feb. 12, 1897, No. 262,880.



Claim.—1. In a helico-centrifugal pump, in combination, the casing, the helical chamber removably bolted thereto, the propeller within the casing, the jacket fitted to the propeller and turning with

the same, and the ring B removably clamped between the casing and helical chamber and having a bell-mouth projecting into said chamber, substantially as described.

2. In a helico-centrifugal pump, in combination, the casing, the helical chamber removably bolted thereto, the propeller within the casing, the jacket fitted to the propeller and turning with the same, and the ring B removably clamped between the casing and helical chamber and having a bell-mouth projecting into said chamber and the removable flange plate or ring E carried by the jacket and co-acting with the ring B, substantially as described.

3. In a helico-centrifugal pump, in combination, the casing, the helical chamber removably bolted thereto, the propeller within the casing, the jacket fitted to the propeller and turning with the same, and the ring B removably clamped between the casing and helical chamber and having a bell-mouth projecting into said chamber and a ring E removably connected to the jacket, said rings E and B having interlocking tongues and grooves adapted to form a packing and also permit a slight lateral play, substantially as described.

605,889. MILK-WEIGHING MACHINE. ROBERT C. MEALEY, Howard Lake, Minn. Filed July 26, 1897. Serial No. 645,916. (No model.)

Claim.—1. The combination with the reservoir, the weighing-tank, and the supply-pipe leading from the reservoir to said tank, of the siphon-pipe leading from said tank, the connections for allowing an inlet of liquid to start said siphon, the valves closing said supply and siphon pipes, and means actuated by the weight of the liquid in said tank to close said supply-pipe and open said siphon-pipe.

2. The combination with the reservoir, the weighing-tank, and the supply-pipe leading from the reservoir to said tank, of the siphon-pipe leading from said tank, the valve closing said supply and siphon pipes, the means adapted to be actuated by the weight of the liquid in said tank to close said supply-pipe and open said siphon-pipe, and the connections for allowing an inlet of milk to said siphon-pipe independent of the tank.

3. The combination with the reservoir, the weighing-tank and supply-pipe leading from the reservoir to said tank, of the siphon-pipe leading from said tank, the chamber inclosing the outlet end of the siphon-pipe, and provided with an outlet-pipe, the connection between said chamber and the source of supply adapted for use in starting the siphon, the valves closing said supply and siphon pipes and the means adapted to be actuated by the weight of the liquid in said tank to close said supply-pipe and open said siphon-pipe.

4. The combination with the reservoir, the weighing-tank, and the supply-pipe leading from the reservoir to said tank, of the lever supporting said tank, the pivotal point for said tank being offset from the fulcrum-point of said lever to give the desired leverage, the means upon the end of the lever for holding a weight, the outlet-pipe for said tank, the valves closing said supply and outlet pipes, and the connections between the same and said lever, whereby the supply-pipe valve is opened and the outlet-valve closed when the lever is tilted by said weight, the reverse action taking place when the lever is oppositely tilted by the weight of the milk in the tank.

5. The combination with the reservoir, the weighing-tank, and the supply-pipe leading from the reservoir thereto, of the lever fulcrumed below said tank, the tank being supported upon said lever at a point offset from its fulcrum, the outlet-pipe leading from said tank, the valves closing said supply and outlet pipes, the connection between said valves and lever, the means upon the power end of said lever for holding a weight, and the means for releasing said weight when said lever is tilted by the overbalancing weight of the milk in the tank.

6. The combination with the reservoir, the weighing-tank, of the lever supporting said tank, the pivotal point of said tank being offset from the fulcrum-point to give the desired leverage, the pipe for supplying liquid to, and the port for discharging the liquid from, the tank, the valves for closing the same, the connection between said valves and lever, the means for tilting said lever to open the supply-pipe valve, said outlet-port valve being opened by means of the weight of milk in said tank.

7. The combination with the reservoir, the weighing-tank, and the supply-pipe leading from said reservoir thereto, of the lever fulcrumed below said tank and supporting the same, the siphon-pipe leading from said tank, the valves closing said supply and siphon pipes, and operatively connected with said lever, the means for lowering the power end of said lever to actuate said valves and allow inlet of fluid to the tank, the valves being actuated to allow an escape of such fluid by the reverse motion of the lever, and the adjustable weight upon the opposite end of said lever.

8. The combination with the reservoir, the weighing-tank and the supply-pipe leading from the reservoir thereto, of the lever supporting said tank, the siphon-pipe leading from said tank, the valves closing said supply and siphon pipes, and the connections between said valves and lever whereby the supply-pipe valve will be closed and the siphon-pipe valve opened when said lever is tilted by a predetermined weight of milk in said tank.

9. The combination with the reservoir, the weighing-tank and the supply-pipe leading from said reservoir thereto, of the lever fulcrumed below said tank and supporting the same, the siphon-pipe leading from said tank, the valves closing said supply and siphon pipes, and the connections between said valves and lever whereby when the lever is turned to lift the tank the supply pipe valve will be opened and the siphon-valve closed, and when the lever is oppositely tilted by the weight of the milk in the tank, the supply-pipe valve will be closed and the siphon-pipe opened to cause the siphonage of the milk from the tank.

10. The combination with the reservoir, the weighing-tank and the supply-pipe leading from the reservoir thereto, of the lever fulcrumed below said tank and supporting the same, the means upon the power end of said lever for holding a weight, the siphon-pipe leading from said tank, the valves closing said supply and siphon pipes, the connections between said valves and lever whereby the supply-pipe valve is opened and the siphon-valve closed when said lever is tilted by said weight, said siphon-pipe valve being opened and the supply-pipe valve closed when the lever is oppositely tilted by the overbalancing weight of the milk in the tank.

605,890. ANIMAL-DESTROYER. ORA J. MERRITT, Genesee-town, Idaho, assignor of one-half to Andrew A. Merritt, same place. Filed Dec. 13, 1897. Serial No. 661,688. (No model.)

Claim.—1. In an animal-destroyer, the combination of a base, a lever pivotally supported intermediate of its ends, a blade carried by one arm of the lever, and a treadle mounted on the other arm of the lever and adapted to be depressed by an animal, whereby the blade will be thrown upward and disembowel said animal, substantially as described.

2. In an animal destroyer, the combination of a base, a lever pivotally supported intermediate its ends on said base, a treadle on one end of the lever, a curved and pointed blade on the opposite end, the blade end of the lever being normally depressed, and means to secure the base in position, substantially as described.

3. In an animal-destroyer, the combination of an oblong base, a plate secured to the base and having upwardly-extending spaced ears, a lever pivoted intermediate its ends between said ears, a treadle on one end of the lever, a curved blade secured to the other end of the lever, said blade being pointed and having a knife-edge on the inside of the curve, the end of the lever carrying the blade being normally depressed, and means to secure the base in position, substantially as described.

605,891. STEAM-PACKING. CHARLES H. MEDWARTH, South Bethlehem, Pa. Filed Jan. 4, 1898. Serial No. 665,555. (No model.)

Claim.—1. A packing for steam and hydraulic joints comprising an annular compressible metal portion of less diameter than the exterior diameter of the pipe ends to be joined, and a thin comparatively wide retaining and centering portion of less thickness than said compressible portion united thereto as a separate piece and adapted to hold the latter in proper position for compression concentric with the interior diameter of the pipe ends without itself being compressed, substantially as described.

2. A packing for steam and hydraulic joints comprising an annular compressible soft-metal portion of less diameter than the exterior diameter of the pipe ends to be joined, and a series of eyes or loops to receive the fastening bolts by which the pipe ends are joined together and adapted to retain the annular packing concentric with the interior diameter of the pipe ends, substantially as described.

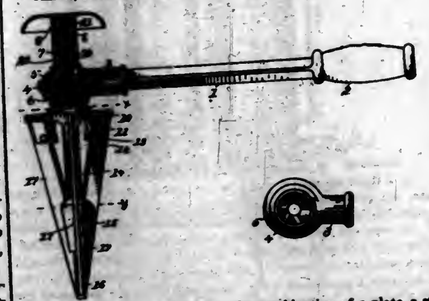
3. A packing for steam and hydraulic joints comprising an annular compressible soft-metal portion of less diameter than the exterior diameter of the pipe ends to be joined, and an annular portion of this metal having a series of correspondingly thin eyes or loops arranged exteriorly of the soft-metal packing to receive the fastening-bolts by which the pipe ends are joined together, and adapted to retain the annular packing concentric with the interior diameter of the pipe ends without itself being compressed, substantially as described.

4. A packing for steam and hydraulic joints comprising an annular soft-metal portion of less diameter than the exterior diameter of the pipe ends to be joined, and a thin metal ring inclosing and joined to said packing-ring and having thin exterior eyes or loops for receiving bolts by which the packing may be retained concentric with the interior of the pipe, substantially as described.

5. A packing for steam and hydraulic joints comprising an annular copper ring comparatively large in cross-section but of less diameter than the exterior diameter of the pipe ends to be joined, and a thin metal ring inclosing and joined to said packing-ring and having thin exterior eyes or loops integral therewith for receiving bolts by which the packing may be retained concentric with the interior of the pipe, substantially as described.

6. A packing for steam and hydraulic joints comprising a soft-metal ring arranged within a larger soft-metal ring, and an intermediate ring of thin metal encircling and secured to the inner ring and provided with integral eyes or loops spanning the space between the two packing-rings and secured to the outer ring, substantially as described.

605,892. EYELET. GEORGE B. MILLER, Waterbury, Conn., assignor to the American Ring Company, same place. Filed Dec. 24, 1896. Serial No. 616,932. (No model.)



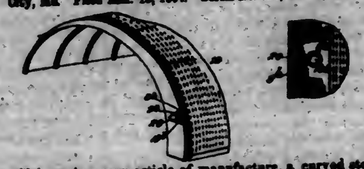
Claim.—1. An eyelet composed of a metal part and a ring of hardened plastic material, the metal part consisting of a tubular body, and a top having the outline of a convex polygon, the top being embedded in the ring, and having the outermost portions of its perimeter near the outer margin of the ring, and the innermost portions nearer to the inner than to the outer margin of the ring, substantially as described.

2. An eyelet comprising a head which is composed of the top of the metal part of the eyelet and an annular covering of hardened plastic material, said top having the outline of a polygon and having some of its sides longer than others, whereby some of the sections of the covering surrounding the top are rendered broader than others, substantially as described.

3. An eyelet composed of a metal part and a ring of hardened plastic material, the metal part consisting of a tubular body and a thin top or flange, the top having a polygonal perimeter comprising sides 11 bearing to each other the relations of the sides of a square, and the ring covering both the upper and under faces and the perimeter of the top, and the layers of material on the faces of the top, and the sections 20 in contact with the sides 11 of the top, being an integral mass, substantially as described.

605,893. PIPE-REAMER. PHILIP MUELLER, Decatur, Ill. Filed Jan. 27, 1898. Serial No. 668,110. (No model.)

Claim.—1. In a pipe-reamer the combination of a plate, a stem extended from the center of the plate at right angles therewith, and cutting-blades secured to the plate and resting against the stem, substantially as set forth.



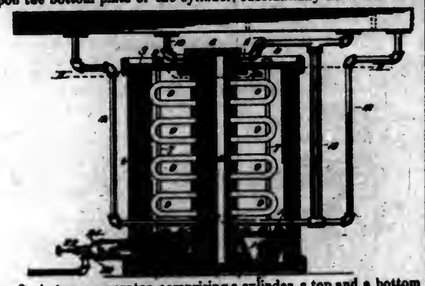
2. In a pipe-reamer, the combination of a plate grooved in its periphery, a stem extended from the center of the plate at right angles therewith and grooved near its extended end in directions coinciding with the grooves of the plate, and cutter-blades fastened in the grooves of the plate and resting in the grooves of the stem, substantially as set forth.

3. In a pipe-reamer, the combination of a plate grooved in its periphery, a stem extended from the center of the plate at right angles therewith, a grooved enlargement of the stem near the termination thereof, a diminished extension of the stem beyond the enlargement thereof and cutter-blades fastened in the grooves and bearing against the diminished extension, substantially as set forth.

4. In a pipe-reamer, the combination of a plate grooved in its periphery of the plate, a stem extended from the center of the plate at right angles therewith, a grooved enlargement on the stem near the end thereof, a diminished extension of the stem beyond the enlarged portion and cutter-blades fastened in the grooved lugs and resting in the grooves of the enlargement of the stem, substantially as set forth.

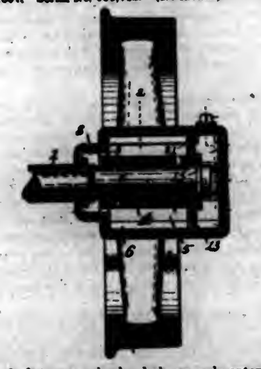
5. In a pipe-reamer, the combination with a stock having cutter-blades, of shaft 7 forming an axial extension of the stock, ratchet-collar 6 on the shaft near the stock, handle-head 4 fitting around the shaft and over the collar 6, ratchet-teeth in the head adapted to engage the teeth of the collar, boss 18 having a sleeve 19 fitting over the end of the shaft, grooved collar 8 on the end of the shaft, pin 21 extending through the sleeve and into the groove of the collar 8 and spring 20 around the shaft between collar 8 and head 4, substantially as set forth.

605,894. STEREOTYPE-PLATE. CHARLES T. MURRAY, Kansas City, Mo. Filed Mar. 15, 1897. Serial No. 627,726. (No model.)



Claim.—As a new article of manufacture, a curved stereotype-plate provided with one or more legs projecting outwardly from its edge, and pins provided with cavities projecting upwardly from said legs, substantially as described.

605,895. STEAM-GENERATOR. CHARLES T. MURRAY, Kansas City, Mo. Filed Sept. 10, 1897. Serial No. 651,194. (No model.)

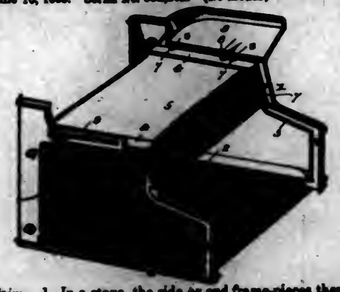


Claim.—1. A steam-generator, comprising a cylinder, a top and

a bottom plate clamped thereon, a cap stepped into the bottom plate, a cap stepped into the top plate, a generating-tube screwed into and closed by said caps and arranged centrally of the cylinder, pipes communicating with said tube and projecting laterally therefrom, outlet and inlet pipes communicating with the upper and lower end of the tube, respectively, and a burner surrounding said tube and resting upon the bottom plate of the cylinder, substantially as described.

2. A steam-generator, comprising a cylinder, a top and a bottom plate clamped thereon, a cap stepped into the bottom plate, a cap stepped into the top plate, a generating-tube screwed into and closed by said caps and arranged centrally of the cylinder, pipes communicating with said tube and projecting laterally therefrom, outlet and inlet pipes communicating with the upper and lower ends of the tube, respectively, a gas-burner, and a valve controlling the passage of gas into said burner, substantially as described.

605,896. CAR-WHEEL. JAMES H. MCEWEN, Du Bois, Pa. Filed Sept. 7, 1897. Serial No. 650,712. (No model.)



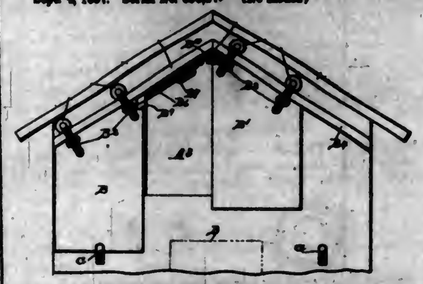
Claim.—1. In a car-wheel a hub, an axle entering the bore of the hub and projecting beyond the outer end thereof, a chamber integral with the hub and surrounding the projecting end of the axle but not the hub, a removable collar on the axle within said chamber, a pin passing through the axle and retaining the collar in place, and a plug closing an opening in the peripheral wall of the chamber, said opening being of less diameter than the axle, substantially as described.

2. In a car-wheel, the combination, substantially as set forth, of a hub, a shell forming a chamber surrounding said hub and forming a chamber at the outer end of said hub and forming a chamber at the inner end of said hub, all said chambers and the bore of the hub being in communication through apertures for the passage of oil, the inner wall of the inner chamber having an outwardly-projecting lip within said inner chamber, an axle projecting through said inner chamber and through the bore of said hub and into said outer chamber, a removable collar on said axle within said outer chamber and bearing against the outer end of said hub, and a pin through said axle at the outer face of said collar.

3. In a car-wheel, the combination, substantially as set forth, of an axle having at its end a journal and having a collar and groove at the inner end of the journal, a hub free to revolve on said journal and having a surrounding shell forming an oil-chamber around the hub, said hub and shell having formed at their inner ends an oil-chamber in communication with said surrounding chamber, the end wall of said end chamber freely encircling the body of the axle inwardly beyond said collar and groove and having an annular outwardly-projecting lip upon its inner surface.

605,897. COOKING STOVE OR RANGE. JOHN J. MCGOWN, Lexington, Ky., assignor of one-half to O. W. Snyder, same place. Filed June 10, 1895. Serial No. 552,302. (No model.)

Claim.—1. In a stove, the side or end frame-pieces thereof provided with inwardly-extending flanges corresponding approximately to the configuration of the oven, in combination with an oven sheet or plate disposed around said flanges, and separable binding-frames surrounding said oven, said frames being arranged in approximal relation to the edges of said oven sheet or plate and secured to the stove-frame, substantially in the manner and for the purpose described.



2. In a stove, the end frame-pieces thereof provided with integral inwardly-projecting flanges corresponding to the configuration of the oven, in combination with an oven plate or sheet extending around said flanges, and separable binding-frames extending around said oven and removably secured to the stove-frame, said binding-frames being formed with tapering notches which cooperate with beveled or inclined inwardly-projecting spurs on the stove-frame, substantially in the manner and for the purpose specified.

3. The combination with a cooking-stove having its side plates provided with bolts adjacent to the oven-space, of a sheet-metal oven composed of a single sheet of metal corresponding to the contour of the oven-space, and binding-frames extending continuously about the exterior of the oven on each edge thereof, said binding-frames being formed with lugs to take over the bolts of the side plates, substantially as set forth.

605,898. COMPOSITION OF MATTER FOR PLASTERING. HENRY C. MCMILLIN, Lima, Ohio. Filed July 20, 1897. Serial No. 645,420. (No specimens.)

Claim.—A composition of matter to be used to form a coating on walls, consisting of plaster of paris, Louisville cement, Portland cement, sand, cream of tartar, borax, lime, hair and water, and combined in the proportions and manner substantially as hereinbefore specified.

605,899. GABLE-DOOR. ALEXANDER MCGEE, Salem, N. Y. Filed Sept. 4, 1897. Serial No. 650,579. (No model.)

Claim.—1. The combination with the side wall of a building provided with a door-aperture, and a projecting inclined roof overhanging said wall, of a track parallel with and adjacent to said overhanging inclined roof, and a door movable along said track to and from the door-aperture and having an inclined upper edge parallel with and adapted to fit up immediately under said inclined, overhanging roof, substantially as described.

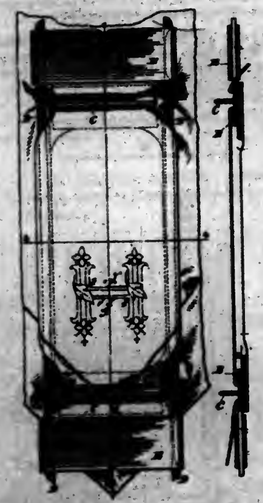
2. The combination with the side wall of the gable end of a building, and the oppositely-inclined eaves overhanging said wall, of a pair of tracks parallel and adjacent to the respective inclined eaves, and a pair of doors movable along the respective tracks to and from each other, the upper edges of the doors being parallel with the respective eaves of the gable and adapted to fit up immediately thereunder, substantially as described.

3. The combination with the side wall of a building provided with a door-aperture, and a projecting inclined roof overhanging said wall, of a track parallel with and adjacent to said overhanging inclined roof, a door movable along said track to and from said door-aperture and having an inclined upper edge parallel with and adapted to fit up immediately under said roof, an inclined way on the inner side of said door, and a roller pivotally mounted upon said wall and engageable with said way, said way and roller being located wholly between said door and wall, substantially as described.

605,900. BAKER'S OVEN. WERNER HEUSS, Cleveland, Ohio. Filed Feb. 28, 1898. Serial No. 671,813. (No model.)

Claim.—In a baker's oven, a base A of masonry, a fireplace A' at the back, a central arched flue A^2 extending forward with branches A^3 leading into the upward side flues A^4, longitudinal bars C supported in the front and back walls, a sheet-metal plate D, forming the oven-bottom, supported on said bars, posts d also supporting said plate and bars, longitudinal bars E supported by front and rear walls, a covering-plate F supported on said bars E, a metal plate G, forming top of oven, hangers g suspended from said bars E and supporting said plate G, downward openings A^5 A^5 connecting the space under the oven with the oven outlet-flue K, all constructed to operate substantially as and for the purpose specified.

605,901. PIPE-WRENCH. JOHN G. HOWELL, New Haven, Conn., assignor of one-half to Frederick B. Street and Charles B. Seville, same place. Filed Apr. 5, 1897. Serial No. 630,726. (No model.)



Claim.—1. In a pipe-wrench, the combination of a handle member having an integral toothed jaw upon its outer end, an adjustable jaw provided with an integral arm, a frame or box surrounding the handle member and said arm, a filling-block rigidly secured to the sides of the said frame or box, a pawl having a vertical motion within said block, a lever pivotally secured to said block, one end of which engages with said pawl, a pin rigidly secured to said handle member and operating in a slot within the sides of said box or frame, a spring secured to said handle member and bearing on said frame or box so as to keep it in an upright position, substantially as described.

2. In a pipe-wrench, the combination of the handle member 17, having the toothed jaw 3 upon its outer end, the jaw 2 and integral arm 4, having teeth upon its outer side, the frame or box 1 surrounding said handle member and said arm, and having a slot in either side in which the pin 14 is movable, a filling-block 21, pawl 6 operating in said block, a lever 10 secured to said block and engaging with said pawl, the spring 16 secured to said handle member and pressing against the bottom of said frame or box to keep the same in an upright position, substantially as described.

605,902. FABRIC-HOLDING FRAME FOR EMBROIDERING-MACHINES. JOHN J. EISENMAN, New York, N. Y. Filed Sept. 13, 1898. Serial No. 690,988. (No model.)

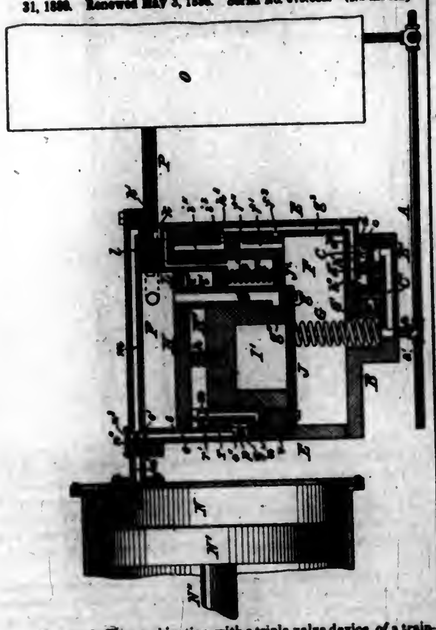
Claim.—1. A fabric-holding frame for embroidering-machines, comprising a main frame, removable bowed side bars independent of the main frame and clasps for uniting the bowed side bars at the ends thereof and causing a pressure to be exerted thereby to hold the fabric in place.

2. A fabric-holding frame for embroidering-machines, comprising a main frame, a C-shaped locking-frame carried upon each end thereof, the outer arm of each of said C-shaped locking-frames being shorter than the inner arm, and a clamping-strip movable laterally in and cooperating with each of the C-shaped locking-frames to hold the fabric in place so that a movement of the clamping-strip in one direction will cause a locking of the parts, whereas a movement of the strip in an opposite direction will allow of the parts being disconnected.

3. A fabric-holding frame for embroidering-machines, comprising a main frame, bowed side bars, removable clasps at each end for uniting said bowed side bars and causing a pressure to be exerted thereby to hold the fabric in place, a C-shaped locking-frame carried upon each end of the main frame and a clamping-strip of sufficient size to be received within each of the C-shaped locking-frames and to extend across an opening in a wall thereof to hold the fabric in place.

4. A fabric-holding frame for embroidering-machines, comprising a main frame, a rigid C-shaped locking-frame and a clamping-strip independent of the main frame and of sufficient size to be received and move laterally in said locking-frame and to extend across an opening in a wall thereof to hold the fabric in place.

605,908. METHOD OF AND APPARATUS FOR ENAMELING. ALBERT P. OTTO, Trenton, N. J. Filed Oct. 16, 1897. Serial No. 655,478. (No model.)



Claim.—1. In the art of enameling the method of applying finely divided enamel by heating the article to be enameled, confining the article, projecting throughout the space surrounding the same the ingredients of enamel in a finely-divided condition, and then in more closely confining the article, thereby limiting the quantity of enamel applied, and allowing the enamel ingredients to settle on the article, substantially as described.

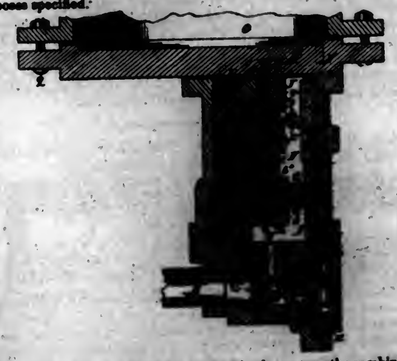
2. An apparatus for enameling comprising a closed apartment, a receptacle adjacent to the apartment for receiving the ingredients of the enamel, means for projecting the ingredients throughout the apartment, and movable shutters for decreasing the size of the apartment, substantially as described.

3. An apparatus for enameling comprising a closed apartment, movable shutters for decreasing the size of the apartment, a receptacle arranged below the apartment for receiving the ingredients of the enamel, a perforated partition separating the apartment and the receptacle, and revolvable wings arranged in the receptacle whereby the ingredients of the enamel are projected through the perforations

in the partition and throughout the apartment, substantially as described.

605,904. AIR-BRAKE. HARVEY S. PARE, Chicago, Ill., assignor to the Westinghouse Air Brake Company, Pittsburg, Pa. Filed Dec. 31, 1888. Renewed May 3, 1898. Serial No. 679,652. (No model.)

Claim.—1. The combination, with a triple-valve device, of a train-pipe release-valve for releasing fluid under pressure to the atmosphere, a supplemental piston for opening the release-valve, which is normally exposed on its opposite sides to fluid under pressure, and means whereby the release-valve may be closed automatically when a limited quantity of fluid has been released from the train-pipe, substantially as set forth.



2. The combination, with a triple-valve device, of a train-pipe release-valve for releasing fluid under pressure to the atmosphere, a supplemental piston for opening the release-valve, and means for closing the release-valve automatically when the pressure of the train-pipe has been reduced sufficiently to effect a full application of the brakes and before the fluid is completely exhausted from the train-pipe, substantially as set forth.

3. The combination, with a triple-valve device, of a train-pipe release-valve for releasing fluid under pressure to the atmosphere, a supplemental piston for opening the release-valve, and means for closing the release-valve automatically when a portion of the fluid is released from the train-pipe and a reduction of pressure is effected on one side of the supplemental piston, substantially as set forth.

4. The combination, with a triple-valve device, of a train-pipe release-valve for releasing fluid under pressure to the atmosphere, a supplemental piston for opening the release-valve which is normally exposed on its opposite sides to fluid under pressure, a spring tending to close the valve, and means whereby the pressures on opposite sides of the supplemental piston may be equalized so as to permit the spring to close the valve after a limited quantity of fluid has been released from the train-pipe, substantially as set forth.

605,905. AIR-BRAKE. HARVEY S. PARE, Chicago, Ill., assignor to the Westinghouse Air Brake Company, Pittsburg, Pa. Filed Mar. 7, 1889. Renewed May 3, 1898. Serial No. 679,653. (No model.)

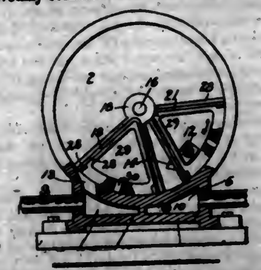
Claim.—1. The combination in an air-brake mechanism, of a train-pipe, a chamber communicating with the train-pipe and with the main-valve chamber, a main-valve chamber, a piston in such chamber, a slide-valve carried by the piston, a passage in the slide-valve, a port in the valve-casing communicating with the brake-cylinder and controlled by the slide-valve, two ports and passages leading from the main-valve chamber in front of its piston, one to a vent-chamber and the other to the main-valve chamber back of the piston, a vent-chamber, a piston in the vent-chamber which is normally exposed to fluid under pressure, a vent-opening, a valve carried by the piston and controlling the vent-opening, and a passage between the vent-chamber and the train-pipe chamber, substantially as and for the purposes specified.

2. In an automatic fluid-pressure brake system, the combination, with a triple valve, of a vent-valve controlling a passage through which fluid under pressure may be vented from the train-pipe, a piston for operating the vent-valve, which piston is normally exposed to pressure on both sides, and a valve operative by a reduction of train-pipe pressure for releasing pressure from one side of the piston to the train-pipe and thereby effecting closing movement of the vent-valve, substantially as set forth.

3. In an automatic fluid-pressure brake system, the combination, with a triple valve, of a vent-valve controlling a passage through which fluid under pressure may be vented from the train-pipe, a piston for operating the vent-valve, which piston is normally exposed on one side to auxiliary-reservoir pressure and on the other side to train-pipe pressure, and a valve for releasing the reservoir-pressure from one side of the piston to the train-pipe, substantially as set forth.

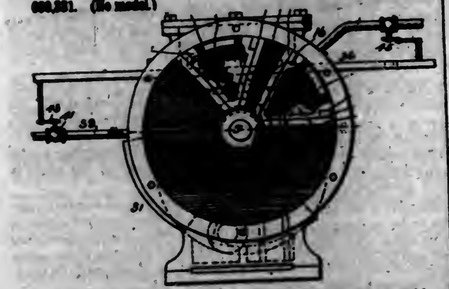
4. In an automatic fluid-pressure brake system, the combination, with a triple valve, of a vent-valve controlling a passage through which fluid under pressure may be vented from the train-pipe under each car, a piston for operating the vent-valve, and a valve operative by a reduction of train-pipe pressure and controlling the admission of fluid under pressure to the piston and its release therefrom to the train-pipe, substantially as set forth.

5. In an automatic fluid-pressure brake system the combination, with a triple valve, of a vent-valve controlling a passage through which fluid under pressure may be released from the train-pipe, a piston for operating the vent-valve and which is exposed on one side to train-pipe pressure and on the other side to auxiliary-reservoir pressure, and a valve controlling communication between one side of the piston and the train-pipe, substantially as set forth.



6. In an automatic fluid-pressure brake system, the combination, with a triple valve, of a vent-valve controlling a passage through which fluid under pressure may be released from the train-pipe, a piston working in a chamber for operating the vent-valve, and passages from the valve-chamber of the triple valve to one side of the piston and to the train-pipe respectively, which passages are controlled by the main valve of the triple valve, substantially as set forth.

7. In an automatic fluid-pressure brake system, the combination, with a triple-valve device, of a vent-valve controlling a passage through which fluid may be released from the train-pipe, a piston for operating the vent-valve, which is normally exposed to fluid under pressure, and a valve operated by a reduction of train-pipe pressure for releasing pressure from one side of the piston and thereby effecting closing movement of the vent-valve, substantially as set forth.



605,906. ROTARY ENGINE. JOHN H. PARSONS, Wilmington, Del., assignor of one-half to Charles Wilmer Gosling, Alfred D. Warner, and Charles Warner, Jr., same place. Filed Aug. 3, 1897. Serial No. 646,866. (No model.)

Claim.—1. In a rotary engine, the combination with the stationary cylinder, the base of which is formed with an inlet and exhaust chamber communicating therewith, of the rotatable shaft, the sleeve journaled thereon, the hollow pistons adapted to receive steam from the inlet-chamber and formed with inlets in the rim, the eccentric driving-shaft, the disk secured thereto, the links pivotally connected with said disk at diametrically opposite points, and the cranks secured to said shaft and sleeve and pivotally connected with the links, substantially as described.

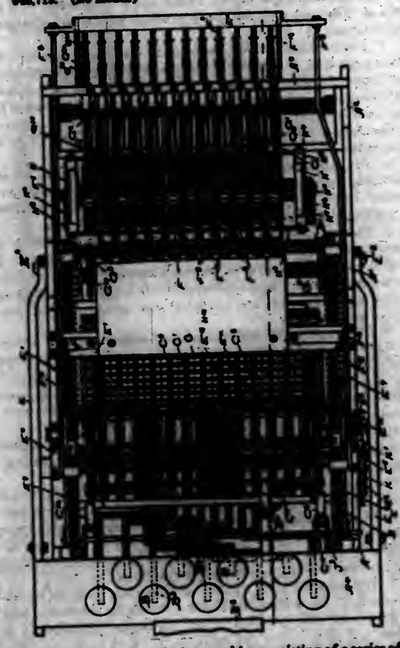
2. In a rotary engine, the contemboss with the cylinder, the base formed with an inlet and exhaust chamber, and the rim formed with an exhaust-opening, and the cylinder-head formed with an inlet-opening with a contracted end, and the inlet-pipe communicating therewith and with the inlet-chamber, of the rotatable shaft, the sleeve, the alternately-operating pistons formed with steam-chambers and with openings in the rims, the eccentric driving-shaft, the disk secured thereto, the links pivotally connected with said disk at diametrically opposite points, and the cranks secured to said shaft and sleeve and pivotally connected with said links, substantially as described.

605,907. ROTARY ENGINE. JOHN H. PARSONS, Wilmington, Del., assignor of one-half to Charles Wilmer Gosling, Alfred D. Warner, and Charles Warner, Jr., same place. Filed Nov. 30, 1897. Serial No. 660,351. (No model.)

Claim.—1. In an alternating-piston rotary engine, the combination with the pistons and the cylinder having inlet-openings and exhaust-pipes and the turning plugs or valves in the exhaust-pipes, of the steam-chest, the slide for opening and closing said inlet-openings and the cranks connected with said slide and turning plugs, substantially as described.

2. In an alternating-piston rotary engine, the combination with the cylinder provided with inlet and exhaust openings, the exhaust-pipes and the turning-plugs in said pipes, the rotatable shaft, the sleeve journaled thereon, and the pistons, of the eccentric driving-shaft, the disk secured thereto, the links pivotally secured thereto at diametrically opposite points, and the counterbalance-cranks secured to the shaft and sleeve, and located opposite the pistons secured to the sleeve and shaft respectively, and the steam-chest, together with a slide and the cranks connected with said slide and turning plugs, substantially as described.

3. In an alternating-piston rotary engine, the combination with the cylinder having inlet-openings and exhaust-pipes, the steam-chest, the slide, the cranks connected therewith and the turning-plugs located in the exhaust-pipes and connected with said cranks, of the rotatable shaft, the sleeve, the pistons secured thereto, cut away at the peripheries and sides, the apertured web, the packing-strips, the counterbalance-cranks secured to said shaft and sleeve, the links and the eccentric driving-wheel, substantially as described.



605,908. BOTTLE-STOPPER. JOHN F. PERRY, Chicago, Ill. Filed Aug. 5, 1897. Serial No. 647,314. (No model.)

Claim.—1. A bottle-stopper consisting of a rigid top portion with lugs on its sides and a lower elastic plug portion with a rigid facing on its lower end, combined with a bottle-neck having vertical channels and transverse locking-grooves, and a shoulder lower down in the bottle-neck adapted to receive the rigid facing on the lower end of the elastic plug to compel the lateral expansion of said plug substantially as and for the purpose described.

2. A bottle-stopper consisting of a rigid top portion with lugs on its sides and a lower elastic plug portion with a rigid facing on the lower end, combined with a bottle-neck provided with vertical channels and transverse locking-grooves having their entering portions inclined and terminating in locking-seats d' substantially as and for the purpose described.

605,909. CALCULATING-MACHINE. GEORGE B. PETERS and EDWIN B. PETERS, Emporia, Kans. Filed Aug. 2, 1897. Serial No. 646,719. (No model.)

Claim.—1. The calculating-machine consisting of a series of keys, several series of digital steps adapted to be adjusted in their operative positions by said keys, means for moving said steps a denominational space at each operation of the keys, means controlled by said steps for actuating the wheels, and said wheels, substantially as specified.

2. The calculating-machine, consisting of digital keys, a series of numeral-wheels, a series of devices for controlling and operating the wheels, each devices being movable by the keys across the denominational field to bring them successively into operative relation with the wheels, and each of them being provided with means for determining when the wheel with which it is in operative relation shall be operated and the extent of the operation, and means for actuating said devices in thus operating the wheels, substantially as specified.

3. The calculating-machine, consisting of digital keys, a series of numeral-wheels, a series of devices for controlling and operating the wheels, each devices being movable from denomination to denomination at each actuation of the keys to bring them successively into operative relation with the wheels to be operated, and each of said devices being provided with means for determining when the wheel with which it is in operative relation shall be operated and the extent of the operation, and means for actuating all said devices simultaneously in thus operating the wheels, substantially as specified.

4. The calculating-machine comprising the following elements in combination: first, a keyboard of nine digital keys; second, a series of slides, each containing nine steps adapted to be set by the keys, and arranged to feed over a denominational space; third, a series of denominational wheels or registers whose movements are determined by said steps, and fourth, means for actuating said wheels, substantially as specified.

5. In a calculating-machine, the combination with a single se-

ries of digital keys, of a series of movable slides carrying stops or pins adapted to be set in operative position by the keys, means for moving the series of slides across the denominational field of the machine a single denominational space at each impulse, a series of numeral-registers one for each denomination, means for operating said numeral-registers adapted to be connected to said slides, and means for operating the slides whose stops have been set, substantially as specified.

6. The calculating-machine wherein are combined a set of nine keys, one for each digit, a series of numeral-wheels one for each denomination, a transversely-moving series of slides each provided with nine adjustable stops and each movable independently in a longitudinal direction, means whereby the keys set said stops, means whereby the keys move the series of slides transversely, mechanical connections between said slides and the wheels, and a bar movable over the series of slides and engaging the stops which have been set, substantially as specified.

7. The combination with the numeral-wheels and keys of a calculating-machine, of a series of slides one for each denomination, each carrying stops adapted to be set by the keys, and each mechanically connected to the corresponding wheels so as to operate the latter, and a hand-operated device engaging the set stops and moving the slides to the extent determined by the position thereon of set stops, substantially as specified.

8. The combination with the keys, of several series of adjustable digital stops all movable over a common setting-point, and levers operated by the keys and acting to adjust the stops when the latter are positioned at the setting-point, substantially as specified.

9. The combination with the keys, of several series of stops all adjustable by power from the keys and all movable stop by stop, in one of the pauses of which movement they are positioned over a common setting-point, and levers operated by the keys and acting to adjust the stops when they are located at said setting-point, substantially as specified.

10. The combination with the keys, of several series of adjustable digital stops all movable over a common setting-point, means whereby the keys may adjust said stops when the latter are positioned at said setting-point, means whereby the keys may also move the several series over said point, and numeral-wheels whose movements are controlled by said stops, substantially as specified.

11. The combination in a calculating-machine, with the adjustable stops C, of means for adjusting said stops and means for depressing them, substantially as specified.

12. The calculating-machine consisting of a series of keys, several series of digital stops adapted to be adjusted in their operative positions by said keys, means for moving said stops a denominational space at each operation of the keys, means controlled by said stops for actuating the wheels, said wheels, and means for returning the stops to their normal position, substantially as specified.

13. The combination in a calculating-machine, with the adjustable stops C, of the pusher-bar E' and a device for depressing said stops positioned over the stops by said pusher-bar, substantially as specified.

14. The combination with the adjustable stops of slides carrying said stops and notched as at C^3, and a notched plate engaging said notches in the slides and acting to depress the stops, substantially as specified.

15. The combination with the adjustable stops of slides carrying said stops and notched as at C^3, the pusher-bar E' and a notched plate positioned by the pusher-bar and engaging said notches in the slides and acting to depress the stops, substantially as specified.

16. The calculating-machine consisting of a series of keys, several series of digital stops adapted to be adjusted in their operative positions by said keys, means for moving said stops a denominational space at each operation of the keys, means controlled by said stops for actuating the wheels, said wheels, and means for returning the stops to their normal position, said returning means being also adapted to be thrown out of operation at will, substantially as specified.

17. The combination with the keys and numeral-wheels, of a series of slides each carrying digital stops, rods upon which said slides are movably supported, means for adjusting the stops and means for moving the slides along the rods, substantially as specified.

18. The combination with the keys and numeral-wheels of a calculating-machine, of an endless series of devices carrying stops for controlling the movements of the wheels, and means for moving said devices across the denominational field of the machine, substantially as specified.

19. In a calculating-machine, the series of slides in combination with the rods supporting and forming ways for said slides, and links uniting the rods, substantially as specified.

20. In a calculating-machine, the series of slides in combination with the rods supporting and forming ways for said slides, links uniting the rods in an endless chain, sprocket-wheels meshing with the rods, and means for operating the chain, substantially as specified.

21. In a calculating-machine, the series of slides in combination with the rods supporting and forming ways for said slides, links uniting the rods in an endless chain, sprocket-wheels meshing with the rods, means for operating the chain, the keys actuating said operating means, and denominational wheels to whose spaces the slides are carried by the movement of the chain, substantially as specified.

22. The combination with numeral-wheels having peripheral notches, of pins for arresting the wheels, a bar passing across the series of pins and provided with a spring-bumper opposite each pin, and means for actuating said bar, substantially as specified.

23. The combination with the numeral-wheels, of duplicate pinions for each wheel, pawls for locking the pinions to their corresponding numeral-wheels, a separate rack for each pinion, means for throwing either series of racks into operation at will, and a series of slides movable across the denominational field and engaging the racks, and also capable of a sliding movement in which they operate said racks, substantially as specified.

24. The combination with the numeral-wheels of duplicate carrying-pawls acting thereon in opposite directions, and means for shifting said pawls at will to bring one set into and throw the other out of operation, substantially as specified.

25. The combination with the numeral-wheels of duplicate actuating devices and duplicate carrying devices adapted to rotate the wheels in opposite directions, and means for shifting the same to bring one set into operation and to throw the other set out of operation, substantially as specified.

26. The combination with the numeral-wheels, of the duplicate series of operating-racks, the guide-plates H^3 and H^4, supported from the numeral-wheel shaft, and means for raising and lowering said plates, substantially as specified.

27. The combination with the numeral-wheels, of the duplicate series of operating-racks, the guide-plates H^3 and H^4, and the eccentrics and hand-lever for raising and lowering said plates, substantially as specified.

28. The combination with the numeral-wheels and duplicate carrying-pawls for each wheel, either of which can be used at will, of a shaft having spirally-arranged pins adapted to operate successively a series of levers corresponding to the wheels, mechanical connections between the pawls and said levers, and means for imparting a sufficient amount of rotation to said shaft to operate all the levers at each actuation substantially as specified.

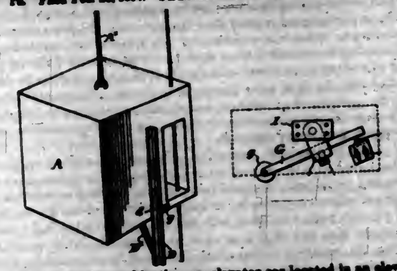
29. The combination with the numeral-wheels, of a series of carrying-pawls for carrying the wheels in a reverse direction as in subtraction, and means other than the numeral-wheels for actuating either series of said pawls in succession one after another, substantially as specified.

30. The combination with the series of stop-carrying slides, of duplicate devices adapted to move the same in opposite directions, and means controlling said devices and whereby either device may be put into operation while the other is kept out of operation, substantially as specified.

31. The combination with the series of stop-carrying slides, of duplicate devices adapted to move the same in opposite directions and also adapted to be used in alternation, substantially as specified.

32. The calculating-machine having a series of stops movable across the denominational field and acting to control the actuations of the registering devices, and means for reversing the direction in which the stops move, substantially as specified.

33. The calculating-machine wherein are combined a series of registers adapted to be moved in either direction according to the nature of the calculation being made, means for actuating said registers, and a series of controlling devices movable both transversely and longitudinally of the machine, the transverse movement serving to position the controlling devices and the longitudinal movement serving to operate said register-actuating devices, substantially as specified.



34. The combination with the numeral-wheels and carrying-pawls, of the cams on the wheels, the connecting-rods G^{11}, the levers actuated by said cams and acting to shift the connecting-rods G^{11} into operative position, means for actuating said rods, and means for carrying motion from said rods to the pawls, substantially as specified.

35. The combination with the numeral-wheels and carrying-pawls, of the cams on the wheels, the levers actuated by said cams and acting to shift the connecting-rods G^{11} into operative position, said rods, the springs and pins for shifting the rods back to their normal position, means for actuating said rods, and means for carrying motion from said rods to the pawls, substantially as specified.

36. The combination with the peripherally-notched register-wheels, the hand-lever giving the power for actuating the wheels, of arresting-pins F^7 and means whereby said pins are moved into operative position at the close of the downstroke of said lever, substantially as specified.

37. The combination with the peripherally-notched register-wheels, of the arresting-pins F^7, means for carrying said pins into operative position, and springs whereby the contact of the pins with the wheels is made yielding, substantially as specified.

605,910. ELEVATOR. ADRIAN L. PIERE and GEORGE H. NOBLE, Bryn Mawr, Pa., assignors of one-third to Walter Bevan, Rosemont, Pa. Filed Feb. 26, 1897. Serial No. 624,692. (No model.)

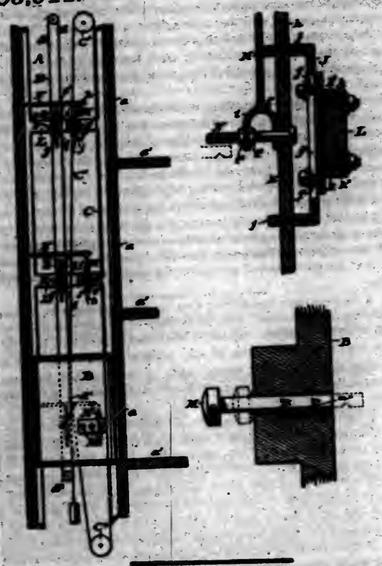
Claim.—1. In combination, an elevator car located in an elevator shaft and provided with a rib or flange extending down its side and for some distance below its floor, a notch or recess being formed in said flange, a door to the elevator shaft, and a horizontally-disposed bar carried by said door and adapted in the movement of said door to pass through said notch, substantially as set forth.

2. In combination, an elevator car, a shaft door, a controlling device, a block or jaw mounted on said car in the vicinity of said controlling device, a lever mounted on said car and adapted to be operated by the movement of the shaft door to engage the controlling device between itself and said block, and a bar mounted upon said shaft door, the car being provided with a notch or recess which registers with said bar when the car is in a predetermined position,—substantially as set forth.

3. In combination, an elevator car, a controlling device, a block fixedly secured to said car in the vicinity of said controlling device, an oscillating block pivotally secured to said car, a lever adjustably mounted on said oscillating block, and means for occasioning the throw of said lever, to grip the controlling device between itself and said block, substantially as set forth.

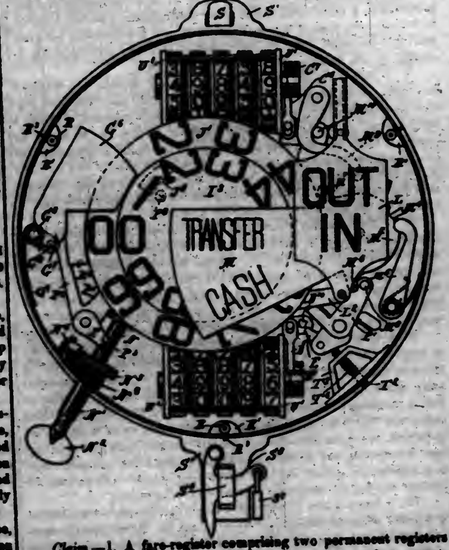
4. In combination, the elevator shaft provided with doors each carrying a horizontally extending bar, an elevator car provided with a vertically extending rib embodying a notch adapted to be engaged by said bars, a controlling device, a fixed jaw or block, a lever operating in connection with said block to bind upon the controlling device, said lever having a protruding end adapted to be encountered by said bars in the movement of the elevator shaft doors, substantially as set forth.

605,911. SAFETY DEVICE FOR ELEVATORS. ADRIAN L. PIERE and GEORGE H. NOBLE, Bryn Mawr, Pa., assignors of one-third to Walter Bevan, Rosemont, Pa. Filed May 13, 1897. Serial No. 637,022. (No model.)



Claim.—1. In combination, an elevator car, an operating rope, an automatic rope connected with said operating rope, a lever mounted in the elevator shaft and connected to said automatic rope, a trip stud, connections between said trip stud and said lever, and a key mounted in the elevator car and adapted to be protruded to encounter said trip stud,—substantially as set forth.

2. In combination, an elevator car in the wall of which are situated a series of keys adapted to be protruded, an operating rope, an automatic rope connected therewith a series of levers connected to said automatic rope, a series of trip studs, connections between each trip stud and one of the levers, each trip stud being arranged in vertical alinement with one of the keys of the car,—substantially as set forth.



3. The combination, in an elevator shaft, of the operating rope, the automatic rope secured thereto, a lever, a clamp mounted upon the automatic rope, a link connecting said clamp and lever, a guide rod for said clamp, a trip stud, a link connecting said trip stud and said lever, a guide rod for said trip stud, and guide plates for said guide rods,—substantially as set forth.

4. In combination, the operating rope, the automatic rope, the levers F, the driver links, the driven links, the trip studs, a guide rod for each driver link, and to which the driver link is connected, guide plates in which said guide rods are mounted for vertical movement, base plates upon which said guide plates are mounted free for vertical adjustment, and frames upon which said base plates are secured free for lateral adjustment,—substantially as set forth.

605,911.

605,912. FARE-REGISTER. CHARLES H. PRATT, Chicago, Ill., assignor, by mesne assignments, to the International Register Company, same place. Filed Apr. 17, 1897. Serial No. 632,669. (No model.)

Claim.—1. A fare-register comprising two permanent registers adapted to register different classes of fares, an independent operating-lever for each of said permanent registers, a locking-dog associated with said operating-levers and so positioned that a movement of one of said levers moves the dog to lock the other lever, a trip-register adapted to register the total number of fares during a trip, and a connection between said trip-register and each of said operating-levers whereby the trip-register is operated each time each of said permanent registers is operated.

2. A fare register comprising a case containing two permanent registers adapted to register different classes of fares, and a trip-register for registering the total number of fares during a trip, two con-

trolling-levers within said case connected respectively with said permanent registers so as to operate the same, and a connection between said controlling-levers and the trip-register, a locking-dog for said controlling-levers so positioned that the movement of one moves the dog to lock the other and prevent its movement, an operating-lever for each controlling-lever outside the case and operatively connected therewith.

3. A fare-register comprising a case containing two permanent registers adapted to register different classes of fares, and a trip-register for registering the total number of fares during a trip, two controlling-levers within said case connected respectively with said permanent registers so as to operate the same, and a connection between said controlling-levers and the trip-register, a locking-dog for said controlling-levers so positioned that the movement of one moves the dog to lock the other and prevent its movement, an operating-lever for each controlling-lever outside the case and operatively connected therewith, a locking-dog for said operating-levers so positioned that the movement of one moves the dog to a position to lock the other.

4. A fare-register comprising two register mechanisms, means for operating the same, two toothed portions relatively movable and located in different planes, one above the other, one of said toothed portions connected with each of said register mechanisms, and a single safety-dog adapted to engage both of said toothed portions and prevent their backward movement before the registers have been actuated.

5. A fare-register comprising two permanent registers for registering different classes of fares, a controlling-lever for each of said registers, two toothed portions, relatively movable and located in different planes, one above the other, one of said toothed portions connected with each of said controlling-levers, a single safety-dog adapted to engage both of said toothed portions on both of said controlling-levers and prevent their backward movement before the registers have been actuated, a trip-register adapted to register the total number of fares for all classes during a trip, and operating-levers for actuating either one of said permanent registers and the trip-register at will.

6. A fare-register comprising two permanent registers adapted to register different classes of fares, a bell associated with each permanent register, a bell-hammer operated by each permanent register mechanism, a visual fare-indicator or distinguishing device adapted to indicate the class of fare last registered and a connection between said fare-indicator and the bell-hammers whereby said indicator is shifted by the movement of said bell-hammers.

7. A fare-register comprising two register mechanisms adapted to register different classes of fares, a bell associated with each register mechanism, said bells both mounted upon a common support, a bell-hammer connected with each register mechanism so as to be operated when said register mechanism is operated, a fare-indicator or distinguishing device adapted to indicate the class of the fare last registered and mounted upon the bell-support, a connection between said fare-indicator and the bell-hammers whereby said indicator is shifted by the movement of said bell-hammers.

8. A fare-register comprising a registering device, means for operating the same, a blind connected with said operating means so as to be moved to a position to conceal the registrations each time the register is actuated, and a resetting or canceling device for said register, and a connection between said resetting device and said blind so that the blind is moved to a position to conceal the registrations of the register during the operation of resetting or canceling.

9. A fare-register comprising two permanent registers adapted to register the different classes of fares, a trip-register for registering the total number of fares of all kinds during a trip, means for actuating either one of said permanent registers and the trip-register at will, a resetting or canceling mechanism for said trip-register, a blind connected with the register-actuating mechanism so as to be moved to conceal the fares indicated by the trip-register each time said register is operated, and a connection between said blind and said resetting mechanism so that the blind is moved and held in its concealing position during the operation of resetting or canceling.

10. A fare-register comprising two permanent registers adapted to register different classes of fares, means for independently-operating said registers, a trip-register for registering the total number of fares during a trip, a blind for said trip-register adapted to be moved so as to conceal the registrations of the trip-register, each time the trip-register is operated, a connecting-piece between the trip-register and the two permanent registers adapted to be connected with either of said permanent register mechanisms so as to be moved thereby, an actuating-dog for the trip-register attached to said connecting-piece and a connection from said connecting-piece to the blind.

11. A fare-register comprising a trip-register, a blind adapted to be moved so as to conceal the registrations of the trip-register each time a fare is registered, a canceling or resetting mechanism for said trip-register, a locking-piece associated with said canceling or resetting mechanism and adapted to lock the register so that it cannot be operated during the operation of resetting or canceling, and a connection between said resetting mechanism and said blind so that the blind is moved to its concealing position and held in such position during the operation of resetting or canceling.

12. A fare-register comprising two permanent registers adapted to register different classes of fares, a trip-register adapted to register the number of fares during a trip, means for actuating either one of said permanent registers and the trip-register at will, a blind adapted to be moved so as to conceal the registrations of the trip-register, a canceling or resetting mechanism for said trip-register comprising a longitudinally-movable shaft, a three-part lever associated therewith, one of said parts connected with the shaft, another of said parts connected with the blind so as to move it to its concealing position during the resetting or canceling operation, the remaining part adapted to engage the register mechanism during the resetting operation and prevent it from being operated.

13. A fare-register, comprising a trip-register, a blind adapted to be moved so as to conceal the registration of the trip-register, a canceling or resetting mechanism for said trip-register comprising a longitudinally-movable shaft, a three-part lever associated therewith, one of said parts connected with the shaft, another of said parts connected with the blind so as to move it to its concealing position during the resetting or canceling operation, the remaining part adapted to engage the register mechanism and prevent it from being operated.

14. A fare-register comprising a case containing the register mechanism, a glass or dial for the same, and an adjusting device interposed between said glass or dial and the register.

15. A fare-register comprising a base-plate containing the register mechanism, a lid or cover for the same, a dial-plate interposed between said base-plate and said lid or cover, and a series of springs interposed between said base-plate and said dial-plate so as to normally force the dial-plate toward said lid or cover.

16. A fare-register comprising a base-plate supporting the register mechanism, a lid or cover for the same, a glass interposed between said base-plate and said lid or cover, and supported upon a series of movable parts, said movable parts being provided with springs which normally tend to force the glass toward the lid.

17. A fare-register comprising a base-plate supporting the register mechanism, a lid or cover for the same, a lock to connect said base-plate and lid or cover together, comprising a movable spring-actuated pin connected with the base-plate adapted to engage said lid or cover when in position.

18. A fare-register comprising a base-plate supporting the register mechanism, a lid or cover for the same, a lock for locking the base-plate and lid or cover together, comprising a movable spring-actuated pin connected with the base-plate and adapted when in its locking position to engage said lid or cover, said lid or cover provided with a glass seal opposite said pin so that the pin is accessible when the glass seal is broken.

19. A fare-register comprising a base-plate supporting the register mechanism, a lid or cover for the same, a lock for locking the base-plate and lid or cover together, comprising a movable spring-actuated pin connected with the base-plate and adapted when in its locking position to engage said lid or cover, said lid or cover provided with a glass seal opposite said pin so that the pin is accessible when the glass seal is broken, and an arm connected with said pin and adapted to engage a holding device and hold said pin in its unlocking position.

20. A registering device comprising a hollow counting-wheel, actuating mechanism therefor contained within said hollow wheel and completely inclosed thereby, said actuating mechanism comprising an actuating-dog adapted to engage a ratchet-wheel connected with the counting-wheel and rotate the wheel step by step when operated, a locking-dog to prevent the backward movement of said wheel, and a holding device associated with one of said dogs, and adapted to engage it and prevent it from being freed from said ratchet-wheel while the other dog is changing position thereon.

21. A fare-register comprising a permanent register provided with a series of counting-wheels rotatably mounted upon a shaft, an actuating-dog connected with the shaft and adapted to engage a ratchet-wheel associated with one of said counting-wheels so as to actuate the same, a locking-dog to prevent the backward movement of said wheel, and a holding device associated with each of said dogs, each adapted when in a predetermined position to hold its associated dog in contact with said ratchet-wheel, said holding devices so positioned that when one is operative, the other is inoperative so that one dog is at all times held in contact with the ratchet-wheel, said dogs and associated parts completely inclosed within one of said counting-wheels so that they cannot be tampered with.

22. A fare-register comprising a permanent register provided with a series of counting-wheels rotatably mounted upon a shaft, a dog connected with the shaft and adapted to engage a ratchet-wheel connected with one of said counting-wheels, a locking-dog adapted to engage the ratchet-wheel and prevent backward movement of the counting-wheel, said dogs completely inclosed within said counting-wheel so that they cannot be tampered with, a holding device for each of said dogs separate therefrom, each holding device adapted to engage its associated dog at predetermined times, said holding devices so positioned that one of the dogs is always held in contact with the ratchet-wheel so that the counting-wheels cannot be moved except in the process of registering fares.

23. A fare-register comprising a base-plate supporting the register mechanism, a base-plate rim projecting therefrom, a series of pins projecting from said base-plate rim, a cover adapted to fit loosely over the rim and tightly over the pins, a series of lugs on said cover adapted to pass back of said pins when the cover is given a partial rotation and a locking device adapted to lock said cover against rotation.

24. A fare-register comprising a permanent register provided with a hollow units-wheel, two dogs associated with said wheel, one the actuating-dog and the other the locking-dog, a movable or rocking plate contained within said wheel with which said actuating-dog is connected, a ratchet-wheel adapted to be engaged by said dogs and two holding devices, one associated with each of said dogs, said holding devices so positioned that when one dog is free to be disengaged from the ratchet-wheel, the other is held in position, whereby the shaft can only be rotated one tooth at a time.

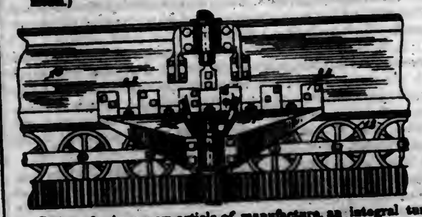
25. A fare-register comprising a permanent register provided with a hollow units-wheel, actuating mechanism therefor contained within said wheel so that it cannot be tampered with, said actuating mechanism comprising a movable or rocking plate, an actuating-dog connected therewith, a ratchet-wheel adapted to be engaged by said dog, a locking-dog also adapted to engage said ratchet-wheel, two pins relatively movable and associated one with each dog, each pin so positioned as to engage its associated dog and hold it in engagement with the ratchet-wheel when the other dog is moving from one tooth to the other whereby the register cannot be actuated except in the process of registering fares.

605,918. TELEPHONE-TRANSMITTER. PERRY A. RAY, Boston, Mass. Filed Aug. 18, 1897. Serial No. 648,714. (No model.)

Claim.—1. In a telephone-transmitter, the combination with the fixed and vibratory electrodes consisting of substantially plane conducting-plates; of an oblong coil formed of insulating material, closely confining comminuted resistance-varying material between the said electrodes, the long axis of said coil being horizontally positioned and parallel to said plates, substantially as described.

2. In a telephone-transmitter, the combination with an outer case, of a vibrating electrode and a fixed electrode both within the said case, a flattened ring of yielding material between and in contact with the said electrodes, the longer axis of said ring being horizontal, and comminuted resistance-varying material completely filling the space inclosed by the said electrodes and the said ring, substantially as described.

3. In combination with a telephone-transmitter, a coil for comminuted resistance-varying material, said coil comprising a flattened ring of soft spongy material, said comminuted material to be contained within a narrow oblong space having one or more upright extensions, for purposes described.



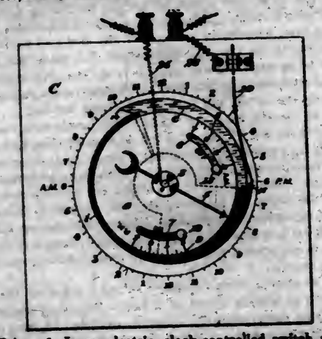
4. In a telephone-transmitter, an outer casing, a vibrating electrode, a fixed electrode, both within the casing, a bridge to support the fixed electrode, combined with a second bridge transversely of the first, means for securing the second bridge to the arm of the instrument, and a flattened ring to create a coil for comminuted resistance-varying material, said coil to have its longer axis horizontally positioned, as set forth.

5. In a telephone-transmitter, an outer casing composed of two separable parts, back and front, a bridge diametrically of but within the casing, combined with a screw-threaded boss to receive the arm of the instrument, and a screw which unites the bridge with the boss to hold back and front of the casing together as a unit.

6. In a telephone-transmitter, a separable case comprising a back and front part, two bridges transversely of each other secured to the front part, an interiorly-screw-threaded boss to admit the arm of the instrument, and a screw which unites said boss with one of the bridges, combined with a fixed electrode secured to the other bridge, a vibrating electrode attached to the front part of the case, and a flattened ring of felt interposed between the two electrodes to contain comminuted resistance-varying material, the longer axis of the ring to be horizontally positioned, substantially as described.

7. In a telephone-transmitter, the combination with a front casing member, of means for securing the vibratory electrode thereto, a bridge-piece secured thereto provided with an opening to receive the supporting-block for the fixed electrode, a set-screw in said bridge-piece to secure said supporting-block, another bridge-piece also secured to said front casing member, a threaded opening in the bridge-piece last named, said opening being in line with the supporting-block for the fixed electrode, a rear casing member provided with a socket to receive the arm of the instrument, and a screw extending through an opening at the bottom of the socket into said threaded opening, substantially as described.

605,914. PINION-BRACKET FOR TURN-TABLES. JULIUS E. ROTHERS, Chicago, Ill. Filed Nov. 5, 1897. Serial No. 657,563. (No model.)



Claim.—1. As a new article of manufacture, an integral turn-table pinion-bracket of cast-steel, comprising a downwardly-inclined web or body portion which is V-shaped or of increasing width from its free end, which carries the bearing of the pinion-shaft, to its base, which is provided, with a horizontal flange whereby it may be secured to the turn-table, substantially as set forth.

2. As a new article of manufacture, an integral turn-table pinion-bracket of cast-steel, comprising a downwardly-inclined web or body portion which is V-shaped or of increasing width from its free end, which carries the bearing of the pinion-shaft, to its base, which is provided with a horizontal flange adapted to be bolted to the bottom flange of the turn-table drum and vertical lugs intermediate the vertical bolts adapted to bear against and be bolted to the face of said drum, substantially as set forth.

3. As a new article of manufacture, an integral turn-table pinion-bracket of cast-steel, comprising a downwardly-inclined web or body portion V-shaped or of increasing width from its free end to its base, a bearing for the pinion-shaft on said free end, ribs radiating from said free end to the base, and a horizontal base-flange having vertical bolt-apertures and intermediate vertical projections, substantially as and for the purposes set forth.

605,915. ELECTRIC CLOCK-CONTROLLED SWITCH MECHANISM. ROBERT W. ROLLINS, Hartford, Conn. Filed Sept. 27, 1897. Serial No. 653,194. (No model.)

Claim.—1. In an electric, clock-controlled switch mechanism, the combination, with an electric circuit, of a clock controlling said circuit and embodying three cooperative circuit-controllers two of

which are separately adjustable relatively to each other and are connected with one side of the circuit and control, respectively, the making and the breaking of the latter, and the other of which is connected with the other side of the circuit, indicating means having a pair of slots for receiving, and controlling the adjustments of, the adjustable circuit controllers, and means for rotating at least one of the circuit-controllers.

2. In an electric, clock-controlled switch mechanism, the combination, with an electric circuit, of a clock controlling said circuit and embodying three cooperative circuit-controllers two of which are separately adjustable relatively to each other and are connected with one side of the circuit and control, respectively, the making and the breaking of the latter and the other of which is connected with the other side of the circuit, indicating means having a pair of slots disposed in concentric arcs and adapted for receiving, and controlling the adjustments of, the adjustable circuit-controllers, and means for rotating at least one of the circuit-controllers.

3. In an electric, clock-controlled switch mechanism, the combination, with an electric circuit, of a clock controlling said circuit and embodying three cooperative circuit-controllers two of which are adjustable and are connected with one side of the circuit and the other of which is connected with the other side of the circuit, a rotary indicating-dial having a pair of slots controlling the adjustments of the adjustable circuit-controllers, and means for rotating the adjustable circuit-controllers and the dial.

4. In an electric, clock-controlled switch mechanism, the combination, with an electric circuit, of a clock controlling said circuit and embodying a rotary indicating-dial, an adjustable circuit-controller connected with one side of the circuit and movable in unison with said dial, a contact-arm in the path of said circuit-controller and connected with the other side of said circuit, and means for rotating the dial.

5. In an electric, clock-controlled switch mechanism, the combination, with an electric circuit, of a clock controlling said circuit and embodying a rotary slotted indicating-dial, an adjustable circuit-controller connected with one side of the circuit and movable in unison with said dial and adjustable with respect to said slot, a contact-arm in the path of said circuit-controller and connected with the other side of said circuit, and means for rotating the dial.

6. In an electric clock-controlled switch mechanism, the combination, with an electric circuit, of a clock controlling said circuit and embodying a rotary indicating-dial; a pair of cooperating circuit-controlling elements connected with opposite sides of the circuit, one of said elements embodying a pair of members adjustable relatively to each other and each having a long gradually-rising circuit-controlling cam-face defined by a curve eccentric to the axis of said dial, and the other of said circuit-controlling elements having a contact-face spanning the cam-faces of both members of the other circuit-controlling element; and means for rotating the dial and one of said circuit-controlling elements in unison.

7. In an electric clock-controlling switch mechanism, the combination, with an electric circuit, of a clock controlling said circuit and embodying a rotary indicating-dial; a pair of circuit-controlling cams adjustable relatively to each other and connected with one side of the circuit and movable in unison with the dial, and each having a long gradually-rising circuit-controlling cam-face defined by a curve eccentric to the axis of rotation of the dial; a contact-arm having a contact-face spanning the cam-faces of both of said cams, and connected with the other side of the circuit; and means for rotating the dial.

8. In an electric, clock-controlled switch mechanism, the combination, with an electric circuit, of a clock controlling said circuit and embodying a rotary indicating-dial, a pair of adjustable circuit-controlling cams movable in unison with the dial and having cam-faces eccentric to the axis of rotation of the dial, one of said circuit-controllers being connected with one side of the circuit, a contact-arm cooperative with said circuit-controlling cams and connected with the other side of the circuit, and means for rotating the dial.

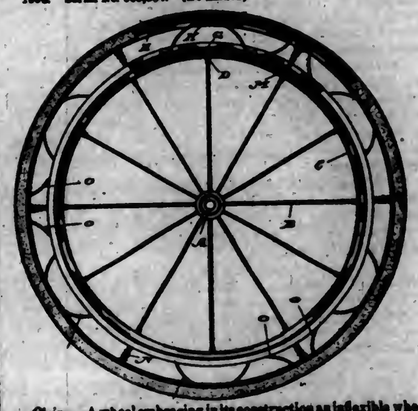
9. In an electric, clock-controlled switch mechanism, the combination, with an electric circuit, of a clock controlling said circuit and embodying a rotary indicating-dial, a circuit-controlling conducting-cam movable in unison with the dial and having a peripheral cam-face eccentric to the axis of rotation of the dial and connected with one side of the circuit, an insulating-cam also movable in unison with the dial and adjustable independently of the conducting-cam and having a peripheral cam-face eccentric to the axis of rotation of the dial, a contact-arm cooperative with the cam-faces of said cams, and means for rotating the dial.

10. In an electric, clock-controlled switch mechanism, the combination, with an electric circuit, of a clock controlling said circuit and embodying three cooperative circuit-controllers at least one of which is rotatable and one of which circuit-controllers is connected with one side of the circuit, and a pair of relays connected with two of said circuit-controllers and with the other side of the circuit and in parallel of said circuit and having coacting pivoted armatures interlocking at their free ends and controlling a third circuit.

11. In an electric, clock-controlled switch mechanism, the combination, with an electric circuit, of a clock controlling said circuit and embodying three cooperative circuit-controllers at least one of which is rotatable and one of which circuit-controllers is connected with one side of the circuit, and a pair of alternately-energized relays connected with two of said circuit-controllers and with the other side of the circuit and in parallel of said circuit and having coacting interlocking armatures controlling a third circuit.

12. In an electric, clock-controlled switch mechanism, the combination, with an electric circuit, of a clock controlling said circuit and embodying three cooperative circuit-controllers at least one of which is rotatable and one of which circuit-controllers is connected with one side of the circuit, and a pair of relays connected with two of said circuit-controllers and with the other side of the circuit and in parallel of said circuit and having coacting pivoted armatures interlocking at their free ends and controlling a third parallel branch of the main circuit.

13. In an electric, clock-controlled switch mechanism, the combination, with a pair of electric circuits, of a clock controlling said circuits and embodying a driving-arbor and two independently-regulable circuit-controlling mechanisms mounted on said arbor and insulated from each other, one for each of said circuits.

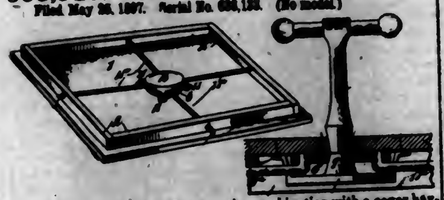


605,916. BINDER FOR LOOSE SHEETS. WILLIAM H. RUSSELL, Chicago, Ill., assignor to Moses C. Baker, same place. Filed July 19, 1897. Serial No. 645,186. (No model.)

Claim.—1. The temporary binder for perforated slitted sheets, consisting of the covers provided with telescoping standards, part of which have the exterior tube attached to one cover and part to the other cover, substantially as and for the purpose specified.

2. The combination with the covers, of the telescoping standards, two of which are provided with stop-bolts and springs for causing and limiting the separation of said covers, and the other two of which are provided with locking devices, substantially as specified.

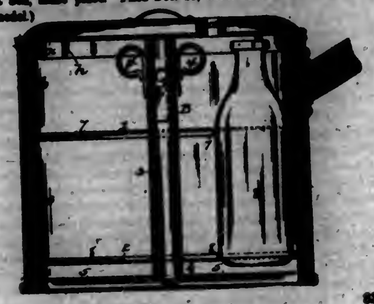
605,917. TIRE. ARMITH RYAN, Preston, Canada. Filed Jan. 3, 1898. Serial No. 665,807. (No model.)



Claim.—A wheel embracing in its construction an inflexible wheel-rim, having its perimeter channeled circumferentially, a ribbon of anti-friction metal located in the channel, a supplemental rim concentric with the wheel-rim having an annular channel in its inner face corresponding to the channel in the perimeter of the wheel-rim, a plurality of undulated ribbon-springs interposed between the rims, each having its bolted portion fastened in the groove of the supplemental rim and its ends freely resting on the antifriction metal in the groove of the wheel-rim, a series of helical springs interposed between the rims, each held in position by a stud projecting inwardly from the under side of the adjacent undulated spring holding its outer end, and a socket in the antifriction-ribbon holding its inner end, a plurality of chains connected to the wheel-rim and supplemental rim, to prevent the supplemental rim creeping on the wheel-rim, a flexible shoe secured to the perimeter of the supplemental rim, and a curtain depending from each side of the shoe, covering the opening between the concentric rims, the inner edge of which is fitted with a wire sprung into grooves cut in the inner faces of the wheel-rim, the ends of each wire connected by springs, substantially as specified.

605,918. YARN GUIDE, TENSION, AND CLEARER. PARDON A. SAWYER, Fall River, Mass. Filed July 10, 1897. Serial No. 644,051. (No model.)

Claim.—In a yarn guide, tension and cleaner, the combination with an inclined stationary surface, of a loose flat weight rotatable thereon, and a pair of thin elastic metal blades having rounded edges lying in the plane of said inclined surface, substantially as described.



605,919. BOX-FASTENER. THOMAS E. SAYRE, Janesville, Wis. Filed May 25, 1897. Serial No. 638,128. (No model.)

Claim.—1. In a box-fastener, the combination with a cover having a central opening, of a rotary hub provided with a central opening and having an annular flange or sleeve fitting in the opening of the cover, said hub being adapted to be engaged by a key, a casing secured to the cover, receiving the hub and provided with a stud fitting in the central opening of the same and forming a pivot said casing being provided with a series of openings, and sliding bolts guided on the cover and having their inner portions extended through the openings of the casing and connected with the hub, substantially as described.

2. In a box-fastener, the combination with a cover provided with a depending flange having perforations, a casing provided with a central vertical pivot-stud and having feet forming openings and secured to the cover, a hub provided with an annular sleeve or flange and having a central opening to receive the pivot-stud and provided with perforations, said hub being journaled on the stud and in an opening of the cover, and pointed rods guided in the perforations of said flange and having upturned inner ends arranged in the perforations of the hub, substantially as described.

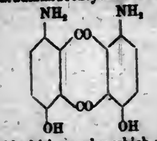
605,920. APPARATUS FOR PASTEURIZING AND STERILIZING MILK, &c. OSCAR R. SOMERS, Baltimore, Md., assignor to H. P. Miller & Son, same place. Filed Dec. 28, 1897. Serial No. 663,970. (No model.)

Claim.—1. The combination with a boiler, of a rack adapted to contain bottles and support them above the bottom of the boiler, a pipe within the boiler and open at both ends, the lower end of said pipe terminating above the bottom of the boiler, a cover on the boiler and extending over the upper end of said pipe and means for confining heat within the boiler, substantially as set forth.

2. The combination with a boiler, of a rack adapted to support bottles in the boiler, and a tubular post forming part of said rack and communicating with the boiler under the rack, said tubular post having holes above the supporting-disks of the rack, substantially as set forth.

3. The combination with a boiler, of a rack adapted to support bottles above the bottom of the boiler, a tubular post open at both ends forming part of the rack, a bent pipe adapted to be detachably connected with said tubular post and a funnel at the upper end of said pipe, substantially as set forth.

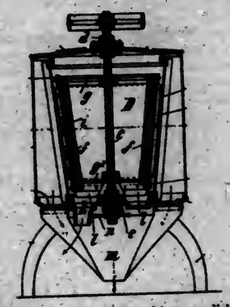
4. The combination with a boiler, of a rack adapted to be removably placed therein, said rack comprising perforated disks, spaced apart and an unperforated disk below the lower perforated disk, uprights connecting said disks and projecting below the lower disk and adapted to form legs for the rack, and a tubular post secured to said disk and open at both ends, substantially as set forth.



5. The combination with a boiler comprising two shells and interposed heat-non-conducting material, of a cover for the boiler having a depending flange and a groove between said depending flange and the body of the cover, and two disks placed in said groove, one of said disks being of metal and the other being of heat-non-conducting material, substantially as set forth.

605,921. BLUE ANTHRAQUINONE DYE. ROBERT E. SCHMIDT and PAUL TIED, Elberfeld, Germany, assignors to the Farbenfabriken of Elberfeld Company, of New York. Filed Dec. 29, 1897. Serial No. 664,482. (No specimens.) Patented in France May 17, 1897, No. 266,966, and in Italy June 30, 1897, XXXIII, 44,886, and LXXXVII, 382.

Claim.—1. The production of paradiamidochrysazin-monosulfo-acid by a sulfonation of paradiamidochrysazin.

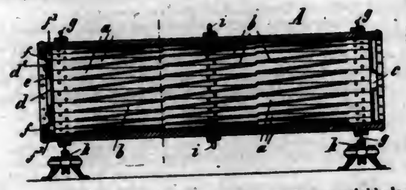


2. The process for producing a monosulfo-acid of paradiamidochrysazin which process consists in sulfonating the said body by means of fuming sulfuric acid with the addition of boric acid, substantially as hereinbefore described.

3. As a new article of manufacture the new dyestuff, being a monosulfo-acid of paradiamidochrysazin of the formula

and representing a blackish powder which when rubbed assumes a metallic luster, soluble in anilin, pyridin and in dilute alkalies with blue color, yielding with concentrated sulfuric acid (66° Baumé) a yellow solution which assumes a violet-red color on the addition of boric acid, dyeing unmordanted wool in acid-baths beautiful blue shades very fast to light, yielding on chrome mordanted wool greenish-blue shades very fast to light and milling.

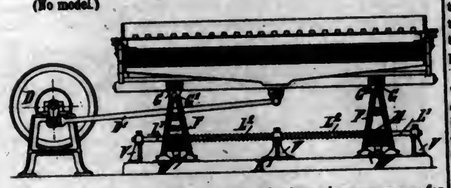
605,922. GRAIN-POLISHING APPARATUS. FRIEDRICH H. SCHULZ, Hamburg, Germany, assignor to Pembroke Jones, New Hanover County, N. C. Filed Apr. 17, 1897. Serial No. 632,625. (No model.)



Claim.—1. In a grain-polishing machine, a polishing drum composed of two heads, the upper head provided on its under face with

a circular groove the inner wall of which is higher than the outer wall and forms a bearing, the lower head provided with a stepped peripheral seat and with a downwardly-projecting peripheral flange, staves stepped in said seat and having bearing on the inner flange of the peripheral groove in the upper head, a polishing fabric clamped between said staves, and clamping hoops or bands detachably secured to the outer peripheral flanges of the heads, for the purpose set forth.

2. In a grain-polishing machine a polishing-drum composed of two heads, staves having bearing on said heads, and clamping devices for clamping the staves removably to the heads; in combination with a flexible strip of polishing material between each two staves of such a width relatively to the thickness of said staves as to project from opposite faces thereof, whereby said strips can be drawn out from between the staves, for the purpose set forth.



605,923. DRUM FOR GLAZING GRAINS, &c. FREDERICH H. SCHULE, Hamburg, Germany, assignor to Pembroke Jones, New Hanover County, N. C. Filed Apr. 17, 1897. Serial No. 632,636. (No model.)

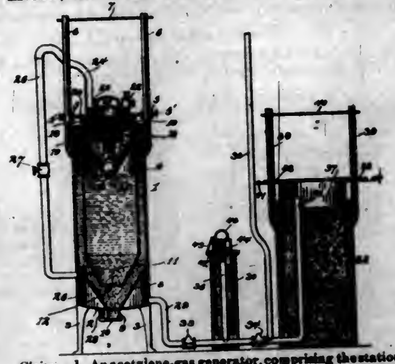
Claim.—1. A grain-glazing machine comprising a revolvable drum made up of suitable heads provided with feed and discharge apertures, and of wooden staves each provided on its inner face with a plurality of ribs *b* extending lengthwise across said inner face from edge to edge, so that when assembled about the said heads the said ribs will form unbroken spirals, and the receiving end of a rib of a stave will lie immediately below and in contact with the delivery end of a preceding rib on an adjacent stave, for the purpose set forth.

2. A grain-glazing machine comprising a revolvable drum made up of suitable heads each provided with an axial aperture of different cross-sectional area, the cross-sectional area of the larger or discharge aperture adapted to be decreased, and auxiliary apertures adapted to be more or less obstructed arranged around said discharge-aperture, and of wooden staves each provided on its inner face with a plurality of ribs *b* extending lengthwise across said inner face from edge to edge, so that when assembled about said heads the said ribs will form unbroken spirals, and the receiving end of a rib of a stave will lie immediately below and in contact with the delivery end of a preceding rib on an adjacent stave, for the purpose set forth.

605,924. OSCILLATING SUPPORT FOR SHAKING-SIEVES. FREDERICH H. SCHULE, Hamburg, Germany, assignor to Pembroke Jones, New Hanover County, N. C. Filed June 22, 1897. Serial No. 641,782. (No model.)

Claim.—1. The combination with a horizontal screen, means for imparting motion thereto, toothed rocking sectors supporting said screen, and correspondingly-formed supporting-bearings therefor, of a standard or bracket intermediate the sectors, a rod supported by said standard or bracket and in pivotal relation to the sectors, and coiled springs on said rod, substantially as and for the purpose set forth.

2. The combination with a horizontal screen, means for imparting a reciprocating motion thereto, sector-shaped legs pivoted to said screen near opposite ends, a base on which said legs are adapted to rock, and a forked bearing projecting inwardly from the proximate faces of the legs; of rods carrying sleeves, blocks in which said sleeves are journaled, said blocks seated in the aforesaid forked bearings, fixed supports for said rods intermediate of the legs, and coiled springs on said rods intermediate of the sleeves thereon and their fixed supports, for the purpose set forth.



605,925. FAN FOR PNEUMATIC STRAW-STACKERS. JOSEPH K. SHARPE, Jr., Indianapolis, Ind., assignor to the Indiana Manufacturing Company, same place. Filed Mar. 23, 1897. Serial No. 628,811. (No model.)

Claim.—1. The combination, of the fan-casing formed with a central eye as an entrance and a peripheral discharge, a fan mounted therein with its blades extending beyond the edge of said eye, a disk mounted on the outside edge of said blades and formed of a diameter greater than that of said eye, whereby the material entering is prevented from contacting with said blades, and the driving mechanism, substantially as set forth.

2. The combination, of the fan-casing, the fan proper arranged to revolve therein, and a plate or disk secured upon said fan proper and covering the blades thereof, said plate or disk being provided with ribs to accelerate the motion of the straw, substantially as set forth.

605,926. ACETYLENE-GAS GENERATOR. ELMER E. SHULER, Havelock, Nebr. Filed Oct. 6, 1897. Serial No. 654,254. (No model.)

Claim.—1. An acetylene-gas generator, comprising the stationary tank 1, in combination with the movable drum 4 concentrically mounted within said tank, the conical diaphragm 13 fixed in the upper end of said drum, and provided with the orifice 14, the ball-float 15 adapted to close said orifice, and the carbid-basket 16 arranged in said drum above said diaphragm, as and for the purpose set forth.

2. An acetylene-gas generator, comprising the tank 1 provided with the concave bottom 2, the conical diaphragm 8 fixed in the lower end of said tank so as to form an annular chamber 26, and terminating in a pipe 9 extending through the bottom 2 and the gate 10 fixed to its projecting end, in combination with the drum 4, having a closed top, a carbid-receptacle located in said drum, and a pipe connecting the upper end of said drum with the chamber 26, as and for the purpose set forth.

3. An acetylene-gas generator, comprising the tank 1 provided with the concave bottom 2, the conical diaphragm 8 fixed in the lower end of said tank so as to form an annular chamber 26, and terminating in a pipe 9 extending through the bottom 2 and the gate 10 fixed to its projecting end, in combination with the drum 4, having a closed top, and a conical bottom 11, provided with a central orifice 12, a carbid-receptacle located in said drum, and a pipe connecting the upper end of said drum with the chamber 26, as and for the purpose set forth.

4. An acetylene-gas generator, comprising the cylindrical tank 1 formed with the concave bottom 2, provided with the drip-cock 26, the conical diaphragm 8 fixed in the lower end of said tank, so as to form an annular condensing and cooling chamber for the gas, and provided with an outlet-pipe 9, extending through the bottom 2 and terminating in a gate-valve 10, and the vertical parallel guide-rods 6, 6, fixed to the upper end of said tank and connected at their upper ends by the transverse brace 7, in combination with the concentric drum 4 formed with the converging bottom 11 provided with the central orifice 12, the conical diaphragm 13 fixed in the upper end of said drum and provided with the central orifice 14 and the float-valve 15 seated in said diaphragm, the reticulated or foraminous carbid-basket 16, fixed in said drum between its closed top 20 and the diaphragm 13 and formed with a series of shelves for containing the calcic carbid in different horizontal planes, the guide-eyes 5, 5 fixed to said drum and provided with set-screws 5', 5', the vent-cock 22, and the screw-cap 21 secured to the top 20 of said drum, the flexible pipe 24 leading from said top and the fixed pipe 25 leading from the cooling-chamber 26 and provided with the valve 27 and communicating with said flexible pipe 24, as and for the purpose set forth.

605,927. LAWN-MOWER. NEAL P. SHULER, Butte, Mont. Filed July 22, 1897. Serial No. 645,551. (No model.)

Claim.—1. In a lawn-mower, the combination with the frame consisting of two side pieces mounted on driving-wheels and provided with outwardly-projecting flanged, downwardly-projecting arms at the rear thereof, a roller adjustably journaled in said arms, a brace-rod connecting them and extending across the frame, downwardly-projecting arms at the front of said pieces, a finger-bar secured near the lower ends of the front arms and extending across the frame, and a cutter-bar movable thereover; of levers pivoted to the front arms, connections between the lower ends of the levers and the reciprocating cutter-bar, a cross-bar connecting the upper ends of the levers, rollers on the inner face of this bar in proximity to each other, a shaft journaled in and across the frame above the main axles and rotated by the driving-wheels, a cam-wheel on said shaft and standing between the rollers, collars on the shaft inside the side pieces, and set-screws for clamping said collars to their shaft so as to hold them against the side pieces and the latter distended, substantially as described.

2. In a lawn-mower, the combination with a frame, geared drive-wheels journaled therein, outwardly-extending flanges on the frame above the wheels, arms projecting downwardly from the rear thereof, a roller adjustably journaled in the arms and across the frame, and downwardly-extending arms at the front of the frame; of a shaft journaled in and extending across the frame above the main axles, gear-wheels on the ends of this shaft meshing with the geared driving-wheels, a double-faced cam-wheel secured to the shaft between its ends, a backing-ratchet between one gear and drive wheel, a finger-bar secured to the lower ends of the front arms, a cutter-bar moving thereover and provided on its upper face with a rounded projection near each end, levers pivoted to the front arms and provided in their lower ends with bifurcations standing astride said projections, a cross-bar connecting the levers, and rollers on said cross-bar one on either side of and in engagement with the cam-wheel, all substantially as described.

3. In a lawn-mower, the combination with the frame mounted on driving-wheels, a cam-wheel rotated thereby, a finger-bar carried by the frame and having a dovetailed rib on its upper face, a cutter-bar having a longitudinal groove fitting over said rib, and rounded projections on the upper face of the cutter-bar; of levers pivoted to the frame and having arc-shaped bifurcations in their lower ends receiving said projections, a cross-bar connecting said levers, bolts mounted in said cross-bar, and rollers journaled thereon on opposite sides of the cam-wheel, as and for the purpose set forth.

605,928. DEVICE FOR METAL STRAIGHTENING AND CUTTING-OFF MACHINES. FRANKLIN B. SHUMWAY, New Haven, Conn. Filed May 21, 1897. Serial No. 637,503. (No model.)

Claim.—1. In a machine for feeding and cutting off metal strips or rods into predetermined lengths, of independently-operating feeding and cutting-off mechanisms adapted to operate alternately, a system of electric wires connected with a battery or other source of electrical energy, a circuit-closer adapted to be engaged by the end of the metal strip or rod and thereby close the circuit and bring the feeding mechanism to a standstill, while the cutting-off mechanism is operating to sever a section from such strip or rod for the purpose set forth.

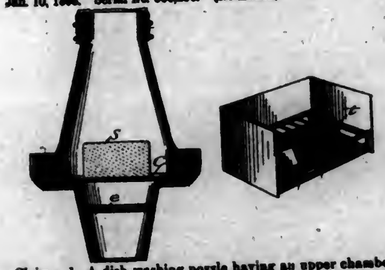
2. In a machine for feeding and cutting off metal into predetermined lengths, of independently-operating feeding and cutting-off mechanism adapted to operate alternately, a circuit-closer adapted to close an electric circuit when the metal has been fed a predetermined distance and instantly bring the feeding mechanism to a standstill, mechanism for bringing the cutter into operation to sever a section from such metal, and mechanism for restarting the feed-rolls, for the purpose set forth.

3. In an automatic machine for alternately feeding and cutting off sections from a metal strip or rod, of feeding-rolls and cutting-off mechanism, a circuit-closer adapted to close an electric circuit when the metal has been fed a predetermined distance and instantly bring the feed-rolls to a standstill, mechanism for bringing the cutter into operation to sever a section from such metal, a delivery-table over which such metal is fed, said table adapted to deliver such severed section, means for restarting the feed-rolls, for the purpose set forth.

4. In an automatic machine for alternately feeding and cutting off sections from a metal strip or rod, of feeding-rolls and their operating mechanism, a cutter and its operating mechanism, a delivery-table and its operating mechanism, a system of electric wires connected with a source of electrical energy, a circuit-closer adapted to close the electric circuit when the metal has been fed a predetermined distance and instantly bring the feed-rolls to a standstill, means for instantly bringing the cutter into operation to sever a section therefrom, means for restarting the feeding-roll mechanism so as to feed forward another section, for the purpose set forth

5. In an automatic machine for alternately feeding and cutting off sections from the end of a metal strip or rod, of feeding-rolls and their operating mechanism, a cutter and its operating mechanism, a delivery-table and its operating mechanism, a system of electric wires connected with a battery or other source of electrical energy, a circuit closer adapted to be engaged by the end of the metal strip or rod and close the electrical circuit and bring the feed-rolls to a standstill, means for bringing the cutter into operation to sever a section from such strip or rod, means for resetting and restarting said feed-rolls so as to feed forward another section, for the purpose set forth.

6. In an automatic machine for alternately feeding and cutting off sections from the end of a metal strip or rod, of feeding-rolls and their operating mechanism, a cutter and its operating mechanism, a delivery-table and its operating mechanism, a system of wires connected with a source of electrical energy, fulcrumed levers pivotally and adjustably connected together, the end of one of said levers adapted to engage with a cam on the cutter-driving shaft, the other lever adapted to engage with means connected with an electric latch or other like device, means, substantially as shown, for connecting one of said levers with the feed-roll-driving mechanism, a circuit-



closer adapted to close the circuit when the metal has been fed a predetermined distance and thereby release the levers held by the said latch and bring the feed-rolls to a standstill, and means for releasing the cutting-off mechanism to sever a section from the metal strip, and means for stopping said cutting-off mechanism and restarting the feed-rolls, for the purpose set forth.

7. In an automatic machine for alternately feeding a metal strip or rod and cutting off sections therefrom, of feeding-rolls and their operating mechanism, a cutter and its operative mechanism, a delivery-table and its operative mechanism, shipping mechanism for alternately bringing the feeding-rolls and cutting-off mechanism into operation, combined with a system of wires connected with a battery or other source of electrical energy, a circuit-closer adapted to close the circuit when the metal strip or rod has been fed a predetermined distance and stop the feed-rolls through the medium of the said shipping mechanism and bring the cutter into operation, said shipping mechanism adapted to restart the feed-rolls for the feeding of another section, for the purpose set forth.

8. In an automatic machine for alternately feeding a metal strip or rod and cutting off sections therefrom, of feeding-rolls and their operating mechanism, a cutter and its operating mechanism, shipping mechanism for alternately bringing the feeding-rolls and cutting-off mechanism into operation, a shaft carrying on its outer end a loose clutch-face driving-gear, a pinion-gear to register with one of the feed-roll gears, a shipping-rod passing through said shaft and connected with the shipping mechanism—one end of said rod adapted to engage the said clutch-face of the loose driving-gear, a spring-buffer on such rod, for the purpose set forth.

9. The combination, in a two part table, of a feeding and cutting-off machine for sheet-metal, of longitudinal narrow strips or rods attached to the upper surface of such table to reduce the friction of the metal sheets, and a trip-plate whose lower edge is shaped to conform to such strips, so that very thin metal sheets may be fed without getting between the lower edge of such trip-plate and said strips, substantially as set forth.

605,929. DISH-CLEANER. ISAAC D. SHEAD, Toledo, Ohio. Filed Jan. 10, 1898. Serial No. 666,290. (No model.)

Claim.—1. A dish-washing nozzle having an upper chamber for holding a piece of soap, and a lower chamber to receive the soapy water, and having its lower or delivery end provided with a limited number of small perforations for the purpose of delivering the water in a series of forcible jets, substantially as shown and described.

2. An apparatus for washing and rinsing dishes, comprising a nozzle adapted to receive and hold a piece of soap, said nozzle being secured to a flexible tube and provided at its delivery end with a limited number of small perforations, and a tray provided with a perforated bottom and a rack having two or more rows of horizontal bars arranged in different vertical planes, for holding the dishes in an inclined position, whereby the dishes can be both washed and rinsed by one continuous operation, substantially as shown and described.

605,930. WIRE-PICKET-TWISTING DEVICE. JOHN H. STAUFFER, Gap, Pa. Filed Sept. 21, 1897. Serial No. 652,436. (No model.)

Claim.—1. In a wire-picket-twisting device, the combination of a base provided with a fixed head at one end and a longitudinal slot at the other, an adjustable head and a hook thereon mounted over said slot, bolts passing through the hook, the head and the slot and secured on the under side of the base by nuts, a longitudinal shaft journaled in the fixed head, a clamp secured upon the inner end of the shaft, and means for turning the shaft, substantially as described.

2. In a wire-picket-twisting device, the combination of a base provided with a fixed head at one end and a head and hook adjustable longitudinally of the base at the other end a longitudinal shaft seated in a semicircular groove in the fixed head, a clamping-plate provided with a semicircular groove secured to the fixed head and forming the upper half of the shaft-bearing, a plate secured upon the inner end of the shaft and provided with a central opening, a second plate parallel with the shaft-plate having a screw-threaded stem to pass through the opening in the shaft-plate, a thumb-nut engaging the screw-threaded stem to draw the two plates together, a clamping-ring to prevent the shaft from being drawn inward, and a handle for turning the shaft, substantially as described.

3. In a wire-picket-twisting device, the combination of a base provided with a fixed head at one end and a longitudinal slot at the other, an adjustable head and a hook thereon mounted over said slot, bolts passing through the hook, the head, and the slot and secured on the under side of the base by nuts, a longitudinal shaft seated in a semicircular groove in the fixed head, a clamping-plate provided with a semicircular groove secured to the fixed head and forming the upper half of the shaft-bearing, a plate secured upon the inner end of the shaft and provided with a central opening, a second plate parallel with the shaft-plate having a screw-threaded stem to pass through the opening in the shaft-plate, a thumb-nut engaging the screw-threaded stem to draw the two plates together, a clamping-ring to prevent the shaft from being drawn inward, and a handle for turning the shaft, substantially as described.

605,931. PROCESS OF PURIFYING NITROCELLULOSE. JOHN H. STEVENS, Newark, N. J., assignor to The Celluloid Company, New York, N. Y., a Corporation of New Jersey. Filed Oct. 9, 1897. Serial No. 654,688. (No specimens.)

Claim.—1. The process for the purification of nitrocellulose which consists in subjecting the nitrocellulose to an aqueous solution of urea, substantially as described.

2. The process for purifying nitrocellulose which consists in washing the nitrocellulose with water and then subjecting it to an aqueous bath containing urea, substantially as described.

3. In the manufacture of a purified nitrocellulose, the process which consists of the following steps: (a) removing the acids by washing with water, (b) subjecting it to an aqueous bath containing urea, (c) drying the pyroxylin by removing the urea solution.

605,932. FIRE-EXTINGUISHER. SAMUEL M. STEVENS, Manchester, N. H. Filed May 26, 1898. Serial No. 680,807. (No model.) Patented in Canada May 3, 1898, No. 48,579.

Claim.—1. A portable tank having the plate secured on its upper end with the flange depending into and held in the tank-top, a seat in the upper surface in said plate, a soft-metal suction-pipe extending into the tank and through said plate with its upper end upset into said seat, and the pump-body secured to said plate so that said upset end of the soft-metal pipe forms a bearing and packing, substantially as described.

2. The fire-extinguishing apparatus comprising the portable tank having the hand-pump on its upper end, supporting-rollers at its bottom, and springs carrying a foot-stirrup at their free ends provided with points on its under side and arranged at the rear side of the tank for the purpose set forth.

3. In a fire-extinguisher, the combination of a tank, a hole in the upper end thereof, the plate secured on the tank-top with an opening registering with said tank-opening and countersunk at its upper end, said plate provided with upwardly-extending bolts, suction-pipe *i'* from the lower portion of the tank with its upper end upset into said countersunk portion, and the pump secured on said plate by said bolts, substantially as described.

4. A portable house-fire-extinguisher tank, comprising in combination, the vertical tank having the bottom supporting-rollers, a hand-pump rigidly mounted on the tank, a foot-operated floor-lock arranged beneath and secured to the bottom of the tank and located between the supporting-rollers, and provided with a spring device yieldingly and normally holding the lock up from engagement with the floor so that the tank is instantly released, when the foot is removed from the lock, and can be easily rolled about on the floor, substantially as described.

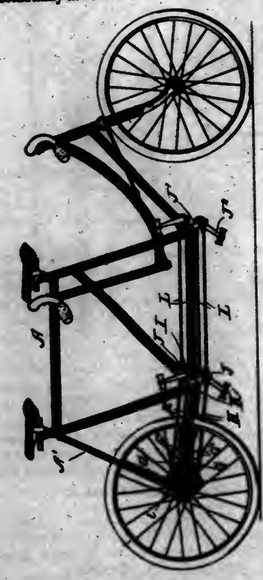
5. A portable fire-extinguisher tank having bottom supporting-rollers, and a hand-pump, and arranged to be pushed along the floor to the location desired for operation of the pump, in combination with a foot-operated floor-lock carried by the tank and normally raised from the floor, and arranged to lock the tank to the floor against movement on its supporting-rollers, during the operation of the pump, substantially as described.

6. The portable fire-extinguisher comprising the movable upright tank having rolling supports at its bottom or lower end, a hand-pump at its upper end, and a normally-elevated foot-operated floor-lock arranged beneath and secured to the bottom of the tank so that the tank can be pushed along the floor, and the lock and the pump operated from behind, substantially as described.

7. The portable fire-extinguisher tank having a pump and bottom rolling supports, in combination with a foot-operated floor-lock arranged beneath and secured to the bottom of the tank and comprising horizontally-arranged spring-arms rigidly secured to the under side of the tank with their free ends springing upwardly and carrying the foot-piece or stirrup elevated from the floor in a position to be easily engaged and forced down by the foot of the operator to lock the tank to the floor and against movement, substantially as described.

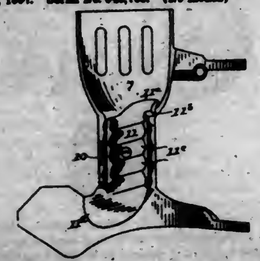
8. A portable fire-extinguisher tank having a pump and bottom rolling supports, in combination with a foot-operated floor-lock carried by the tank and provided with a spring mechanism normally holding the lock elevated from the floor, said lock so arranged as to be easily forced down to lock and hold the tank against movement on its supports and to immediately move up and release the tank, automatically, when the foot is removed from the lock, substantially as described.

9. The vertical fire-extinguisher tank, in combination with a pump on the upper end thereof provided with an operating-handle, the handle at the rear side of the tank, the bottom supporting-rollers arranged with the single central forward roller with the remaining rollers in rear thereof at the bottom of the tank, and a floor-lock carried by the tank and normally elevated from the floor, so that the tank can be pushed forward by a single person, who by grasping said rear handle can tilt the tank onto said single roller and turn it quickly in any direction and force said lock down to the floor and hold the tank against movement while the pump is being operated with one hand and the hose directed with the other hand, substantially as described.



10. A tank having a plate thereon with a transverse opening into the tank, said plate countersunk or recessed around the upper end of the opening, in combination with a suction-pipe passing through said opening and having a soft-metal upper end upset down into said recess, and a pump having its base secured rigidly on said plate and onto said upset soft-metal end of the pipe, for the purpose stated, and having a passage in continuation of the suction-pipe, substantially as described.

605,933. GEARING FOR VELOCIPEDES. JESSE W. SUTHERLAND, Chicago, Ill., assignor of one-half to Andrew J. McDuffee, same place. Filed Feb. 26, 1897. Serial No. 625,110. (No model.)

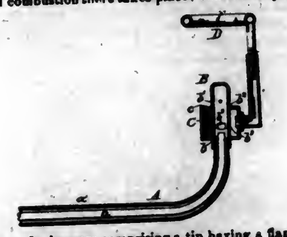


Claim.—1. In a velocipede, the combination with the frame and a threaded drive-wheel shaft, of a ball-bearing interposed between said frame and shaft, a closed housing provided at its inner side with a shaft-opening and at its outer side with a gear-hub opening, a pinion within the housing rigidly attached to said shaft, ball-bearings between the housing and shaft, a gear meshing with the pinion and antifrictionally journaled in the housing, a rod rigidly joined to the outer side of said gear at said hub-opening, and means for reciprocating the rod, substantially as and for the purpose set forth.

2. In a velocipede, the combination with the frame and a threaded drive-wheel shaft, of a ball-bearing interposed between said frame and shaft, a housing, a housing-cone fitted in the inner shaft-opening of said housing, a bearing-cone on the shaft cooperating with said inner housing-cone, an outer housing-cone fitting a recess in the inner surface of the opposite side of the housing, a bearing-cone on the end of the shaft cooperating with said housing-cone, a pinion fixedly secured to the shaft within said housing, a gear-wheel mounted in ball-bearings at opposite sides in said housing and engaging the pinion, and an operating-rod fixedly secured to said gear-wheel, all substantially as set forth.

3. In a velocipede, the combination with the frame and a threaded drive-wheel shaft, of a bearing interposed between said frame and shaft and comprising a race member carried by the frame and bearing-cones on said shaft, a housing, a flanged bearing-cone fitted in the shaft-opening of said housing, a bearing-cone on the shaft cooperating with the flanged cone, a bearing-cone fitting a recess in the opposite side of the housing, a bearing-cone on the end of the shaft cooperating with said housing-cone, a pinion fixedly secured to the shaft within said housing, a gear-wheel mounted in ball-bearings at opposite sides in said housing and engaging the pinion, a crank-shaft journaled in the frame and provided with a crank-arm, a pedal-arm removably secured to said crank-arm and carrying a bearing-sleeve, and a connecting-rod fixedly secured to the gear wheel and journaled on said crank-arm and provided with bearing-cones cooperating with said sleeve, all substantially as set forth.

605,934. CORN-SHELLER. FELIX B. TAFF, Decatur, Ill. Filed Aug. 18, 1897. Serial No. 648,705. (No model.)

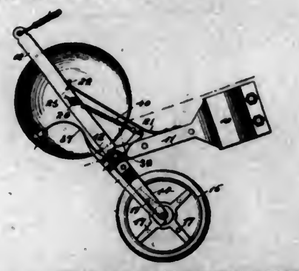


Claim.—The combination with a disk-and-concave sheller, of the concaved shell 11 transversely corrugated and having the flared upper end 11^a, the inward-extended tooth-like part 11^b and the sidewise lower extension 11^c, together with a bolt for securing the shell in the throat of the concave of the sheller, substantially as set forth.

605,935. BLOWPIPE. WILLIAM M. TILLMAN, Salt Lake City, Utah. Filed Mar. 13, 1896. Serial No. 582,131. (No model.)

Claim.—1. In combination with a blowpipe or the like, a tip, a primary burner located a considerable distance from said tip, and in the direction toward which the gas flows after passing through the tip, means for supplying gas to the primary burner and means for varying the distance between the tip and the primary burner, whereby a flame is maintained at the primary burner, and the gas which passes through the tip, after leaving said tip, passes through the air to the primary burner and combustion there takes place; substantially as described.

2. A burner comprising in combination, a gas-receiving chamber having means for attachment to the pipe, a tip upon said chamber, a pipe leading from said chamber, and a primary burner supported by said pipe a considerable distance from the tip but in the direction toward which the gas passes after leaving the tip, whereby a flame is maintained at the primary burner, and the gas which passes through the tip, after leaving said tip, passes through the air to the primary burner and combustion there takes place: substantially as described.



3. A cap for burners comprising a tip having a flame-opening, a drum surrounding said tip and communicating therewith and provided with openings c and a primary burner situated above the drum, the said drum and burner producing concentric flames, substantially as described.

4. A cap for burners comprising a tip having a flame-opening, a drum surrounding said tip and communicating therewith and provided with openings c and a primary burner situated above the drum, the said drum and burner producing concentric flames, said tip having also auxiliary openings b', substantially as described.

5. A burner comprising in combination, a receiving-chamber having means for attachment to the pipe, a tip upon said chamber, a pipe leading from said chamber, a second pipe adjustably telescoping with the first-mentioned pipe, and a primary burner supported by said second pipe a considerable distance from the tip but in the direction toward which the gas passes after leaving the tip, whereby a flame is maintained at the primary burner, and the gas which passes through the tip, after leaving said tip, passes through the air to the primary burner and combustion there takes place; substantially as described.

605,986. BICYCLE-BELL. WILLIAM G. TOEPFER, New York, N. Y., assignor to himself and Ella M. Sanger, same place; Antoinette Toepfer administratrix of said William G. Toepfer, deceased. Filed Dec. 30, 1896. Serial No. 617,479. (No model.)

Claim.—1. In a bicycle-bell, a rocking support, a gong attached to said support, a trip-wheel carried by said support and adapted for engagement with a supporting or driving wheel of the bicycle, means for carrying the trip-wheel into engagement with the bicycle-wheel, a striking-arm for the gong, and a spring-actuated lever fulcrumed upon the pivot of the said rocking support and connected with the said striking-arm, the trip-wheel serving to operate the said striking-arm, substantially as described.

2. In a bicycle bell, a rocking support, a gong attached to said rocking support at one side of its pivot-point, a trip-wheel carried by said support at the opposite side of the pivot-point and adapted to operate by engagement with a wheel of the bicycle, a striking-arm for the gong, and a spring-actuated lever fulcrumed upon the pivot of the said rocking support and connected with the said striking-arm, the striking-arm of the gong being operated by the said trip-wheel, as and for the purpose set forth.

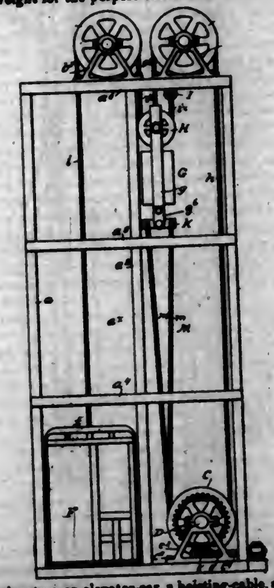
3. In a bicycle bell, a rocking support adapted for attachment to the frame of a bicycle, gongs attached to opposite sides of the said support, a trip-wheel carried by the said support and adapted for engagement with a wheel of the bicycle, a striking-arm for each gong, levers connected with the striking-arms and fulcrumed on the pivot of the said rocking support, springs connected with the levers and with a fixed support and controlling the movement of the striking-arms, and trip devices carried by the trip-wheel at opposite sides thereof and extending into the paths of the said striking-arms and arranged to operate the latter in one direction, as and for the purpose specified.

4. In a bicycle-bell, a rocking support, gongs attached to opposite sides of said support and facing each other, the said gongs being spaced apart a predetermined distance, a trip-wheel carried by said support and adapted for engagement with the tire of a bicycle-wheel, a spring having sliding engagement with the said rocking support and normally holding said trip-wheel out of engagement with the tire, and pivoted and spring-actuated striking-arms for the said gongs the said striking-arms being fulcrumed upon the pivot of the said rocking support and having their lower ends extending at opposite sides of the trip-wheel, the striking-arms being operated alternately from the said trip-wheel, as and for the purpose specified.

5. In a bicycle-bell a rocking support, a gong attached to said support, a trip-wheel carried by said support and adapted to operate by engagement with a supporting or driving wheel of the bicycle, and a spring-actuated striking-arm for the gong fulcrumed upon the pivot of the said rocking support and adapted to be operated from the said trip-wheel, substantially as described.

6. A bicycle-bell, consisting of a support, a clip adapted to be secured to the frame of a bicycle and having a rearwardly-extending bifurcated arm to which the said support is pivoted, gongs attached to opposite sides of the said support, a trip-wheel journaled at the lower end of the said support, hammers for the gongs extending at opposite sides of the said trip-wheel and adapted to be actuated thereby, spring-controlled levers connected with the said hammers and fulcrumed on the pivot of the said support, and means for moving the said support to carry the trip-wheel to and from the bicycle-wheel, as and for the purpose specified.

7. A bicycle-bell, consisting of a rocking support arranged for attachment to a bicycle-frame, the said rocking support having a bifurcated lower end, gongs attached to opposite sides of the said rocking support, a trip-wheel journaled between the members of the bifurcated portion of the said rocking support and adapted to engage with the periphery of a bicycle-wheel, hammers for the gongs extending at opposite sides of the said trip-wheel and adapted to be actuated thereby, spring-controlled levers connected with the said hammers, and fulcrumed on the pivot of the said rocking support, and means for moving the trip-wheel to and from the bicycle-wheel, as and for the purpose specified.



8. In a bicycle-bell, a rocking support, a gong attached to said support, a trip-wheel carried by said support and adapted for engagement with a supporting or driving wheel of the bicycle, a shifting device, means for attaching the shifting device to the handle-bar of the machine, a connection between the said shifting device and the said rocking support, and a spring-actuated striking-arm for the gong fulcrumed upon the pivot of the said rocking support and adapted to be operated from the said trip-wheel, substantially as described.

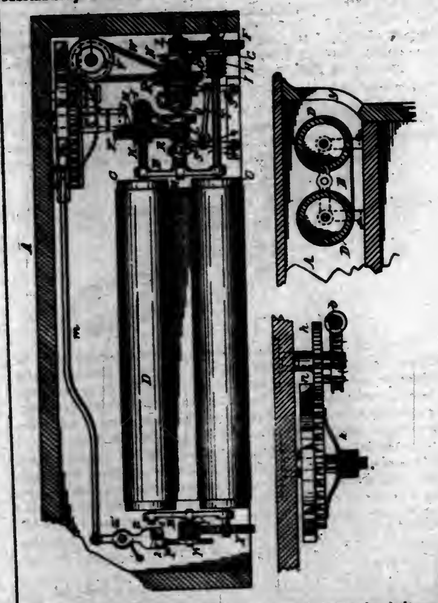
9. The combination with an adjustable clamp adapted for attachment to a bicycle-frame and having a rearwardly-extending arm, a rocking support pivoted to the said arm, a spring controlling the movement of the support in one direction, gongs carried by the said rocking support at opposite sides thereof and facing each other, a trip-wheel also carried by the said rocking support and arranged for engagement with the periphery of a bicycle-wheel, the said trip-wheel being provided with pins projecting from opposite sides, and striking-arms for the gongs fulcrumed upon the pivot of the said rocking support and having their lower ends extending at opposite sides of the trip-wheel, the said striking-arms being operated alternately from the said trip-wheel, of a shifting device, means for attaching the shifting device to the handle-bar of the machine, and a flexible connection between the shifting device and the said rocking support as and for the purpose set forth.

10. In a bicycle-bell, a rocking support, a gong attached to said support, a trip-wheel carried by said support and adapted for engagement with a supporting or driving wheel of the bicycle, means for moving said trip-wheel into and out of engagement with the bicycle-wheel, and a spring-actuated striking-arm for the gong fulcrumed upon the pivot of the said rocking support and having a head at one end, the other end of said arm extending at the side of the trip-wheel and adapted to be engaged by a trip device carried by said trip-wheel, substantially as described.

605,987. ELEVATOR. FREDERICK H. TURNER, Kansas City, Mo. Filed Dec. 17, 1897. Serial No. 662,358. (No model.)

Claim.—1. The combination with an elevator-car of car operating devices comprising hoisting-cables and suitable carrying-pulleys therefor having stationary bearings, said cables each having one end secured to a fixed point, said hoisting-cable having loops a counterweight suspended in said loops, and a winding-drum adapted to control the movement of said weight means for operating said drum and separate cables one of which is wound in one direction around said drum and connected with said counterweight and the other cable wound around said drum in the other direction and extended over another carrying-pulley having suitable bearings and connected with said counterweight for the purpose described.

2. In elevators, an elevator-car, a hoisting-cable, separate carrying-pulleys, each having stationary bearings, one end of which carrying-cable is secured to a fixed point and the other end extended over one of said carrying-pulleys and connected with said elevator-car, said cable having a loop, a sheave suspended in said loop, a counterweight connected with said sheave, a motor and alternate cable winding and unwinding mechanism and separate weight-controlling cables the upper end portion of one of which cables is extended over the other cable-carrying pulley and connected with said counterweight and the upper end of the other cable connected direct with the counterweight and the lower ends of said cables connected with the said winding and unwinding mechanism and adapted to be wound and unwound in a corresponding degree as described.



605,988. STATION-INDICATOR. HERBERT C. TURNER, San Francisco, Cal., assignor to the American Indicator Company, same place. Filed Jan. 2, 1894. Renewed Nov. 12, 1897. Serial No. 658,208. (No model.)

Claim.—1. Station-indicating mechanism driven from a car-axle so arranged as to be operated periodically during the trip of a conveyance, and provided with automatic means for positively stopping it at or within a limited distance from the end of the route without affecting the movement of the means for driving it, substantially as set forth.

2. Station-indicating mechanism arranged so as to indicate a prescribed number of streets or stations upon a route with approximate accuracy to a point near the terminus, and having a positive stop automatically operated for holding it stationary at the said point, whereby it is placed in correct position for commencing the indication upon the return trip, substantially as set forth.

3. In a street or station indicator the combination with a shaft geared to the axle of a car of a rotary controlling-disk driven from said shaft by frictional gearing, a traveling indicator-belt deriving its motion from said shaft, a latch for holding the belt stationary, and a connection from the controller to said latch for releasing the belt and permitting it to derive motion at intervals from the main shaft, substantially as set forth.

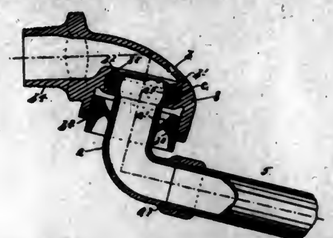
4. In a street or station indicator a controller geared frictionally to a continuously-moving shaft, an indicator-belt geared frictionally to said shaft, a latch for holding the indicator-belt stationary, a connection from the latch to the controller for periodically releasing the belt and permitting it to move, and a stop for limiting the movement of the controller and belt without affecting the rotation of the shaft, substantially as set forth.

5. In a street or station indicator a movable indicating-belt geared to a driving shaft, a controlling-disk having its periphery provided with devices spaced according to the points in a route to be indicated, and frictionally geared to said driving-shaft, a latch for alternately holding and releasing the belt and operated by the controller, and a stop whereby the controller and belt are stopped at or near the end of a route without affecting the rotation of the driving-shaft substantially as set forth.

6. The combination with the rollers carrying the indicating-belt of a driving-shaft a, a shaft M, a shaft for each roller geared frictionally to said shaft M, and a sliding clutch upon the shaft M connected to the driving shaft and communicating motion to either roller according to the direction of rotation of the driving-shaft a, substantially as set forth.

7. In combination with the reversibly-movable driving-shaft and the rollers carrying an indicating-belt, the shaft M, having gearing for driving the rollers independently, a sliding clutch upon the shaft M, connected to the driving-shaft, a worm upon the shaft M and connected levers $8'$ 8^2, engaging respectively with said worm and said clutch, substantially as and for the purposes set forth.

8. A street or station indicator comprising a reversibly-rotatable driving-shaft geared to a car-axle; reversibly-movable rollers carrying an indicating-belt and driven by gearing from the driving-shaft which includes a frictional connection; a movable latch for temporarily stopping the rollers, a reversibly-movable toothed controlling-disk driven by gearing, part of which is frictional, from the driving-shaft, and a lever operated by the controlling-disk and connected to said latch, substantially as set forth.



9. In a street and station indicator the combination with driven rollers carrying an indicating-belt of a latch for periodically stopping said rollers, a driving-shaft, a train of gearing driven by said shaft, a loose controlling-disk in frictional contact with one member of said train, a spring for increasing the frictional contact and a lever connected to said latch and operated by said disk, substantially as set forth.

10. In a street or station indicator rollers carrying a belt and geared partly by friction-gearing to driving-shaft, a latch for alternately holding and releasing the rollers, and a controller operated independently of the rollers by the common driving-shaft and having means for periodically moving said latch to release said rollers, substantially as set forth.

11. In a street or station indicator of the continuous type and in combination with a box or case adapted to be mounted within a car and with an actuating rod or shaft geared to an axle of the car, an indicating-belt carried by rollers and driven by said actuating-rod, a latch for alternately holding and releasing said rollers, and a con-

troller connected to said latch, all contained within said case or box substantially as set forth.

605,939. BALL-JOINT FOR BRAKE-COUPLINGS OR OTHER USES. HENRY H. VAUGHAN and JOSEPH O. PATTEE, St. Paul, Minn. Filed Oct. 29, 1896. Serial No. 610,468. (No model.)

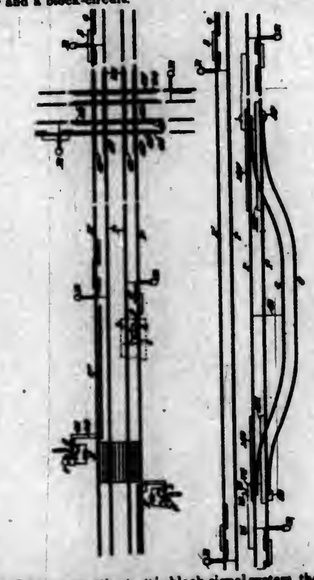
Claim.—1. A ball-and-socket joint constructed for a limited oscillation, one member of which has two concentric spherical surfaces of different radii, which are acted on, respectively, by a packing and a bearing surface carried by the other joint member, with said packing and the joint-surface packed thereby located inward of said bearing-surfaces, substantially as and for the purposes set forth.

2. The ball-and-socket joint comprising the ball member having the two concentric spherical surfaces a' and a^2 separated from each other with the latter inward of the former, the socket member having the ring-seat or groove b', the packing-ring c seated in said groove and bearing against said surface a^2 on the ball member, and the nut b^2 forming part of the socket member and provided with the bearing-surface b^3 for coöperation with said surface a' on the ball member, all substantially as described.

3. In metallic brake-pipe coupling connections, a ball-joint uniting the angle-cock or fixed car pipe-section to the primary or adjacent section of the coupling-pipes through a nipple or fitting on one member of said joint set at such an angle to the axis of the joint that, when the pipes are coupled together, in working position, the angle of oscillation of the couplings will be substantially equal on either side of the vertical plane through the two angle cocks or the normal line of said coupling connections, substantially as described.

605,940. BEARING. BYRON A. WALKER, Erie, Pa. Filed Jan. 4, 1898. Serial No. 574,372. (Model.)

Claim.—1. In a ball bearing, a bearing-box comprising two centrally-apertured halves secured together face to face and each flared outwardly around its central opening, thereby forming the annular space or raceway for the balls; substantially as described.



2. In a ball-bearing, a bearing-box comprising two centrally-apertured rectangular plates secured together face to face and each having its central portion flared outwardly concentric with its aperture to form the annular raceway; openings being formed in the marginal edges of the box and leading into said raceway; substantially as described.

3. A bearing comprising a sleeve provided with an annular groove, a box having an internal annular groove coinciding with the sleeve-groove, and balls in the raceway thus formed; the said box being formed of two halves secured together face to face and flared outwardly around their central sleeve-opening; substantially as described.

4. A bearing consisting of an annularly-grooved sleeve, a box having an internal annular groove coinciding with the sleeve-groove, and balls in the raceway thus formed; the said box being formed of two centrally-apertured halves secured together face to face at diagonally opposite points, flared outwardly around their sleeve-openings and spaced apart between their connecting portions to form openings leading into the internal groove or raceway; substantially as described.

605,941. ELECTRIC BLOCK-SIGNAL SYSTEM FOR RAILWAYS. LOUIS C. WEBBER, Broad Brook, Conn. Filed July 22, 1897. Serial No. 645,496. (No model.)

Claim.—1. In an automatic electric block-signal system, the combination, with a track having a sectional conductor forming insulated blocks, of a vehicle movable along said track; a primary electrical register controlled by a block-circuit; and a separately-operative secondary electrical register controlled conjointly by the primary register and a block-circuit.

2. In an automatic electric block-signal system, the combination, with a track having a sectional conductor forming insulated blocks, of vehicles movable along said track; a primary electrical register for each block and controlled by the block-circuit; and a separately-operative secondary electrical register for each block and controlled conjointly by the primary register and the block-circuit.

3. In an automatic electric block-signal system, the combination, with a track having a sectional conductor forming insulated blocks, of vehicles movable along said track; a primary electrical recorder for each block and controlled by the block-circuit; and a separately-operative secondary electrical recorder for each block and controlled conjointly by the primary recorder and the block-circuit.

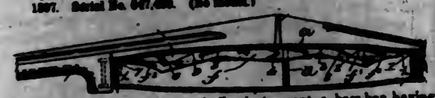
4. In an automatic electric block-signal system, the combination, with a track having a sectional conductor forming insulated blocks, of vehicles movable along said track, and electrical recorders one for each block and each embodying separately-operative primary and secondary recording devices controlled by the block-circuit, each secondary recording device being controlled also by its respective primary recording device.

5. In an automatic electric block-signal system, the combination, with a track having a sectional conductor forming insulated blocks, of vehicles movable along said track; and electrical recorders, one for each block, and each embodying a primary recording device in a circuit controlled by said block, and a separately-operative secondary recording device in another circuit controlled conjointly by the primary recording device and by said block.

6. In an automatic electric block-signal system, the combination, with a track having a sectional rail forming insulated blocks, of sectional conductors one at the beginning of each block; vehicles movable along said track; contact-makers carried by said vehicles and adapted to make traveling contact with said sectional conductors; and electrical recorders one for each block and each embodying a primary recording device in circuit with the track-rails, an auxiliary recording device in circuit with the sectional conductor and with one of said rails, and an automatic circuit-closer controlling the circuit of the auxiliary recording device and controlled by the primary recording device.

7. In an automatic electric block-signal system, the combination, with a track having a sectional rail forming insulated blocks, of pairs of sectional conductors at the beginning of each block one connected with the block-rail and the other with an auxiliary recording device; vehicles movable along said track; contact-makers carried by said vehicles and adapted to make traveling contact with said sectional conductors; a signaling device on each vehicle and in circuit with its contact-maker and with the track-rails; and electrical recorders one for each block and each embodying a primary recording device in circuit with the track-rails, an auxiliary recording device in circuit with one of the sectional conductors and with one of said rails, and an automatic circuit-closer controlling the circuit of the auxiliary recording device and controlled by the primary device.

8. In an automatic electric block-signal system, the combination, with a track having a sectional conductor forming insulated blocks, of vehicles movable along said track; and electrical recorders, one for each block, and each embodying a primary recording device in a circuit controlled by said block, a separately-operative secondary recording device in another circuit controlled conjointly by the primary recording device and by said block, a recording-tape, and tape-feeding means controlled by one of said recording devices.



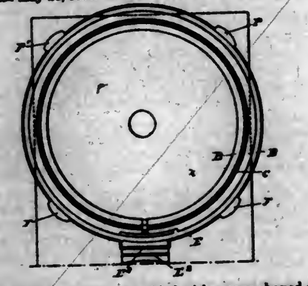
9. In an automatic electric block-signal system, the combination, with a track having a sectional conductor forming insulated blocks, of vehicles movable along said track; and electrical recorders, one for each block, and each embodying a primary and a secondary puncturing recording device disposed in fixed positions longitudinally of the tape to puncture said tape in corresponding positions, the primary recording device being located in a circuit controlled by such block, and the secondary recording device in another circuit controlled conjointly by the primary recording device and by each block, a recording-tape, and tape-feeding means controlled by one of said recording devices.

10. In an automatic electric block-signal system, the combination, with a pair of tracks running in the same direction, side by side, and crossing each other, one having a sectional rail forming insulated blocks and the other having an interfering track-section electrically connected with a section of the first track to form therewith a common block, of sectional conductors connected with the block-rails of the first track, one at the beginning of each block; vehicles movable along said tracks; contact-makers carried by said vehicles, respectively, and adapted to make traveling contact with said sectional conductors; and signaling devices on said vehicles, respectively, and in circuit with said respective contact-makers and with the track-rails.

11. In an automatic electric block-signal system, the combination, with a pair of tracks running in the same direction, side by side, and crossing each other, each having a sectional rail forming insulated blocks and both having interfering track-sections electrically connected to form at each a point a common block, of sectional conductors connected with the block-rails of each tracks, one at the beginning of each block; vehicles movable along said tracks; contact-makers carried by said vehicles, respectively, and adapted to make traveling contact with said sectional conductors; and signaling devices on said vehicles, respectively, and in circuit with said respective contact-makers and with the track-rails.

12. In an automatic electric block-signal system, the combination, with a track having a sectional rail forming insulated blocks, of sectional conductors at opposite sides of the center of the track and connected with said sectional rail alternately at the beginning and at the end of each block; a vehicle movable along said track; a pair of contact-makers carried by said vehicle and adapted to make traveling contact, respectively, with said respective sectional conductors; a pair of automatic circuit-closers carried and controlled, respectively, by said respective contact-makers and operative alternately in opposite directions from their respective open positions to close their respective circuits in accordance with the direction of movement of the vehicle; and a pair of signaling devices on said vehicle and in circuit with the track-rails and controlled by said circuit-closers.

605,942. VIOLIN. HARRISON W. WEBB, Somerville, Mass., assignor of one-half to Frederick A. Gatt, Boston, Mass. Filed Aug. 7, 1897. Serial No. 647,609. (No model.)



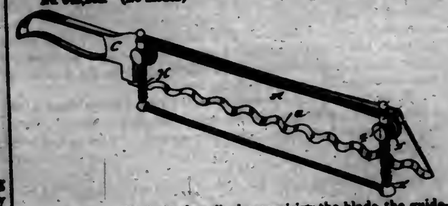
Claim.—1. In a violin or similar instrument, a bass-bar having end portions each consisting of a foot or brace attached to the belly of the instrument and extending from a point adjacent to the end block to a point distant therefrom one-third of the inside length of the belly between said end block and the bridge, and a middle portion attached to the belly, the bar being separated from the belly between the middle portion and the end portions.

2. In a violin or similar instrument, a bass-bar extending for substantially the whole length of the belly of the instrument and attached thereto at all portions of its own length excepting two portions, each of which begins at a point distant from the end block one-third of the inside length of the belly between the end block and the bridge, and ending at a point nearer the bridge.

3. In a violin or similar instrument, an arched belly, in combination with a bass-bar attached along its middle and end portions to the belly and having at each end a recess forming a gap in the line of attachment which extends from a point distant from the end block one-third of the inside length of the belly between the end block and bridge to a point distant from said end block one-half of that length, the said recesses extending on either side of the straight line joining the ends of the belly.

4. In a violin or similar instrument, a bass-bar having reduced portions each distant from the bridge one-third of the inside length of the belly between said bridge and the end block and having two recesses forming gaps in the line of attachment between said reduced portions and the ends of the bar.

605,948. BALANCED VALVE. JOHN T. WILSON, Jersey Shore, Pa. Filed May 13, 1897. Serial No. 636,355. (No model.)

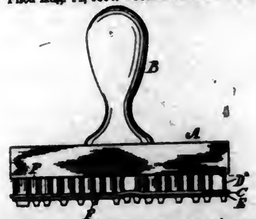


Claim.—1. A slide-valve provided with a cone-shaped extension on its upper surface the sides of which are beveled inward toward the apex, in combination with a ring having a corresponding internal bevel and adapted to fit snugly the beveled surface of the cone, said ring being divided at one point and recessed on its under side at the point of division and a joint-plate attached to one end of the ring thus divided and overlapping the other end to close the joint, the said joint-plate being provided with an inwardly-extending flange D', which fits into the said recess and extends inwardly to the said cone substantially as set forth.

2. In combination with a slide-valve having a cone-shaped extension on its upper surface, a ring having a corresponding internal bevel and adapted to fit snugly the said cone and a metal ring E of greater diameter than the said beveled ring and provided with inwardly extended flanges E' divided by slots or cuts yet forming a practically continuous guard for the purpose set forth.

3. In combination with a slide-valve having a cone-shaped extension on its upper surface, and raised lugs F provided with inward flanges, a metal ring internally beveled to fit the said cone and an exterior sheet-metal ring provided with a practically continuous inwardly-presented guard or flange and held in place by said lugs and their overlapping flanges F' substantially as set forth.

605,944. KNIFE. AARON WEBSTER, Hudson, N. Y., assignor of two-thirds to William H. Hearn, same place. Filed July 20, 1897. Serial No. 645,282. (No model.)



Claim.—1. The knife described comprising the blade, the guide-arms connected to and extending laterally from the blade and having apertures disposed in a plane parallel to that of the blade, hanger-rods arranged in said apertures of the guide-arms and having stops above the arms, a gage carried by said hanger-rods, and coiled springs, surrounding the hanger-rods below the guide-arms, for normally holding the gage in a plane below the cutting edge of the blade, substantially as specified.

2. The knife described comprising the blade, the guide-arms connected to and extending laterally from the blade, and having apertures disposed in a plane parallel to that of the blade, the sleeves coöperating in said apertures and having their lower ends reduced in di-

ameter, hanger-rods arranged in said sleeves and having stops adapted to engage the upper ends of the sleeves, a gage carried by said hanger-rods, and coiled springs for normally holding the gage in a plane below the cutting edge of the blade: the said springs surrounding the hanger-rods and having their upper ends seated in the spaces afforded between the reduced lower ends of the sleeves and the walls of the apertures in the guide-arms, substantially as specified.

605,945. PRINTING-STAMP. LAWRENCE R. BLACKMORE, Newark, N. J. Filed Aug. 11, 1897. Serial No. 647,772. (No model.)

Claim.—1. A hand-stamp having the type-plate supported upon a series of independent yielding hollow columns with interspaces F adapting the columns to yield laterally, as and for the purpose set forth.

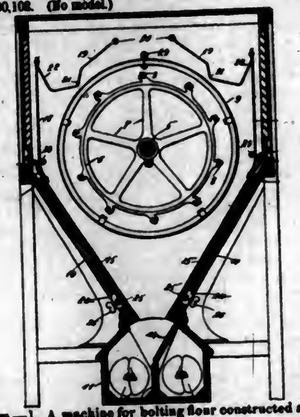
2. A hand-stamp having a stamp-block A and a yielding bed-plate C with a series of independent yielding hollow columns having interspaces F and cemented air-tight to the stamp-block, and forming independent pneumatic cushions beneath the bed-plate, substantially as herein set forth.

3. In a hand-stamp, the combination, with a stamp-block A, of an elastic rubber bed-plate C having a series of independent hollow rubber columns integral therewith, and cemented air tight to the stamp-block, and a type-plate attached to the bed-plate, as and for the purpose set forth.

4. A bed-plate for hand-stamps formed of elastic rubber having integral therewith parallel series of square hollow columns with interspaces F, substantially as herein set forth.

5. A bed-plate for hand-stamps, formed of elastic rubber having integral therewith parallel series of independent square hollow columns with interspaces F and their longitudinal and transverse sides in alinement, as and for the purpose set forth.

6. In a hand-stamp, the combination, with a stamp-block A, of an elastic rubber bed-plate C having integral therewith parallel series of independent square hollow columns having interspaces F with their longitudinal and transverse sides in alinement, the ends of the columns being cemented air-tight to the stamp-block, and a type-plate being cemented to the surface of the bed-plate, as and for the purpose set forth.



7. In a hand-stamp, the combination, with a stamp-block A, of a rubber bed-plate having yielding cells formed upon the back, and attached to such stamp-block, with an opening from one of said cells through the said bed-plate, a type-plate secured to a portion of such bed-plate, and a removable dating attachment having an elastic hollow shank fitted through such opening to the interior of such cells, as and for the purpose set forth.

8. In a hand-stamp, the combination, with a stamp-block A, of a rubber bed-plate having yielding cells formed upon the back and attached to such stamp-block, with openings from certain of said cells through the said bed-plate, a type-plate secured to a portion of such bed-plate, and a removable dating attachment having a plurality of elastic hollow shanks fitted through said openings to the interior of such cells, as and for the purpose set forth.

9. In a hand-stamp, the combination, with a stamp-block A, of a rubber bed-plate having yielding square cells formed upon the back and attached to such stamp-block, with an opening from one of said cells through the said bed-plate, and a removable dating attachment having an elastic square shank adapted to fit within such cell and to be held from turning by the flat sides of the same, as and for the purpose set forth.

10. In a hand-stamp, the combination, with a stamp-block A, of a rubber bed-plate having yielding cells formed upon the back and attached to such stamp-block, with square openings from certain of said cells through the said bed-plate, a type-plate secured to a portion of such bed-plate, and separate dating attachments having rubber type-plates with hollow square elastic shanks fitted detachably through such openings to the interior of the said cells, the attachment for the name of the month having a plurality of said shanks, and the attachment for the day of the month having a single square shank adapted to hold it from turning when fitted through the square opening, substantially as herein set forth.

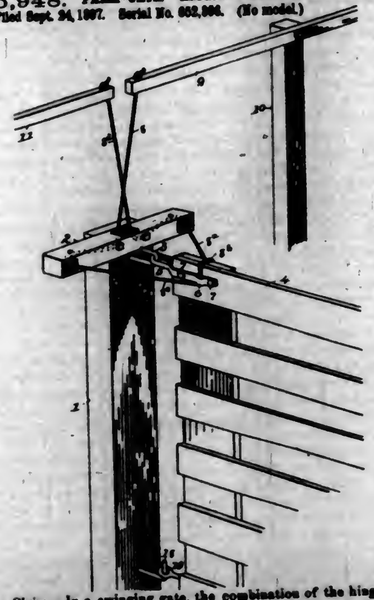
605,946. BOLTING-MACHINE. ALEXANDER BOSANKO, Mariner's Harbor, N. Y., assignor of one-half to Edward John Dawson Mountford and William Morgan Pindar, same place. Filed Mar. 31, 1897. Serial No. 630,102. (No model.)

Claim.—1. A machine for bolting flour constructed as herein described, and provided with stationary cant-boards and supplemental, movable cant-boards mounted thereon and provided with arms or projections adapted to be engaged by similar devices on the reel, whereby the said cant-boards may be reciprocated, substantially as and for the purpose described.

2. A machine for bolting flour constructed as herein described, and provided with a reel, and stationary cant-boards, and movable cant-boards mounted on said stationary cant-boards, said movable cant-boards being provided at their upper edges with spring-arms which are connected with levers which are adapted to be operated by said reel, substantially as shown and described.

3. In a machine for bolting flour constructed as herein described, and provided with a reel, stationary cant-boards, and a conveyer or conveyers, supplemental movable cant-boards mounted on said stationary cant-boards, and provided with arms adapted to be engaged by lugs or projections on said reel, during a part of its revolution, substantially as and for the purpose described.

4. In a machine for bolting flour, constructed as herein described, and provided with a reel, stationary cant-boards, and a conveyer or conveyers, and supplemental movable cant-boards mounted on said stationary cant-boards and adapted to be operated by said reel, said supplemental cant-boards being provided at their upper edges with arms which are connected with levers which are adapted to be operated by a roller secured to the casing of the reel, substantially as shown and described.



5. In a machine for bolting flour, constructed as herein described, and provided with a reel, stationary cant-boards, and a conveyer or conveyers, and supplemental movable cant-boards mounted on said stationary cant-boards and adapted to be operated by said reel, said supplemental cant-boards being provided at their upper edges with arms which are connected with levers which are adapted to be operated by a roller secured to the casing of the reel, and said supplemental cant-boards being provided at their upper edges with strips of canvas or similar material which are secured thereto, and to the frame of the machine, substantially as shown and described.

605,947. NECKTIE. CHARLES W. T. DAVIES, San Francisco, Cal., assignor of one-half to Stephen Loring Harris, same place. Filed July 29, 1897. Serial No. 646,367. (No model.)

Claim.—As an article of manufacture, a necktie consisting of a neckband and two end portions, these end portions being adapted to form a knot, and the connections, C, C, secured to the inner face of the band portion adjacent to each end portion, and provided at their free ends with rings adapted to fit over a collar-button, substantially as set forth.

605,948. FARM-GATE. ANDREW A. DOWNEY, Armstrong, Ill. Filed Sept. 24, 1897. Serial No. 652,898. (No model.)

Claim.—In a swinging gate, the combination of the hinge-post 1 having the cross-head 2, the gate 4 having the permanent lower hinge 18, 19, the upper hinge composed of the hooked rod 3 attached to the post and the loop 5 engaging the hooked portion of the rod and fitting on opposite sides of the gate, and the rope extending from the cross-head over the gate and between the gate and the bars of the loop, substantially as described.

605,949. ELECTRIC METER. THOMAS DUNCAN, Fort Wayne, Ind. Filed June 24, 1897. Serial No. 642,212. (No model.)

Claim.—1. An electric meter provided with a cylindric armature, a series field without the armature, and a shunt-field within the armature comprising a cross-shaped core, and shunt-coils upon said core.

2. An electric meter provided with a cylindric armature, a core extending around the armature and having inserting poles on opposite sides thereof and series coils upon said poles, a cross-shaped core within the armature, and shunt-coils upon the several poles of said cross-shaped core.

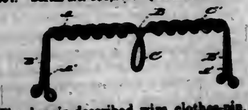
3. An electric meter provided with a cylindric armature, series coils without the armature, and two pairs of shunt-coils within the armature, one pair adjacent to each series coil, and the two members of each pair being arranged on opposite sides of the common axis of the series coils.

4. An electric meter provided with a cylindric armature, a core extending around the armature and having inserting poles on opposite sides thereof and series coils upon said poles, a cross-shaped core within the armature, and two pairs of shunt-coils upon the poles of said cross-shaped core, one pair adjacent to each of the field-poles and the two coils of each pair being arranged on opposite sides of the axis of said field-poles.

5. An electric meter provided with a cylindric armature, a series field without the armature and a shunt-field within the armature, drag-magnets exerting a retarding influence on the armature, and a magnetic shield apertured for the passage of the armature inserted between the series field and drag-magnets.

6. The combination with the meter-frame A, the armature B', and the series and shunt coils C and D, of the series core C', the standard C^3 supporting said core, tubes c^4 upon said standard, magnetic plate F resting on the upper ends of said tubes, upper tubes c^5 upon the standard, and cap-nut c^6 clamping the core C' down upon said upper tubes.

7. The combination with the meter-frame and armature, of the series and shunt fields and drag-magnets, the core G projecting from the base of the meter-frame up into the cylindrical armature, the tubular standard d' screwed into the upper side of said core and supporting a shunt-field, the screw B^3 seated in a screw-threaded bore of the core and projecting upward into the tubular standard, the enlarged counterbore and registering aperture in the base of the frame giving access to said screw, the spring-supported jewel in said screw, the armature-spindle B' resting upon said jewel, and the detachable upper bearing of said armature.

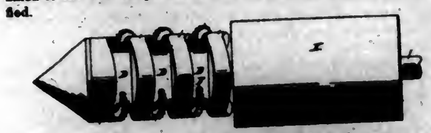


8. In an induction-motor meter, the combination with a rotary armature and two fields for actuating said armature, of an impedance-coil provided with a U-shaped core having a separable keeper, non-magnetic space-blocks inserted between the keeper and the poles of the core and means for detachably clamping the parts in this relation.

9. In an induction-motor meter, the combination with the rotary armature and two fields for actuating said armature, of an impedance-coil provided with a U-shaped core having a detachable keeper, non-magnetic space-blocks inserted between the keeper and core, and a screw-bolt r' and nut r^2 for adjustably clamping the keeper in place.

10. A meter for three-wire systems of electric distribution, comprising a cylindric armature, a series coil without the armature connected in each of the outer main leads and two pairs of volt-coils within the armature, one pair connected in shunt between one of the main leads and the neutral wire and the other in shunt between the other main lead and the neutral wire.

11. A meter for three-wire systems of electric distribution, comprising a cylindric armature, a core and coil without the armature connected in series in each of the main leads, a cross-shaped core within the armature having two pairs of volt-coils upon its poles, one pair of volt-coils being connected in shunt between one main lead and the neutral wire and the other pair in shunt between the other main lead and the neutral wire.



605,950. WIRE CLOTHES-PIN. SOPHIE B. FAVELL, Statesville, N. C., assignor of one-half to Elizabeth Abernathey, same place. Filed May 12, 1897. Serial No. 636,262. (No model.)

Claim.—The herein-described wire clothes-pin, consisting of a piece of wire bent to form depending ends A', spiral coils C' and downward-depending loop C between said coils, in combination with a piece of wire bent to form depending ends B', and a straight connecting-bar B, said connecting-bar being passed through the coils C' and the loop C, depending below said coils and parallel with and between the depending ends A' and B', whereby the pin may be strung upon a clothes-line by passing the line through the loop C, the ends A' and B' passing downward over the line and being pressed together by the torsional resiliency of the wire, substantially as described.

605,951. BOILER-TUBE CLEANER. WILBER D. FORSYTH and ROSS T. BELL, Pittsburg, Pa., assignors to the Union Boiler Tube Cleaner Company, same place. Filed Sept. 17, 1897. Serial No. 652,041. (No model.)

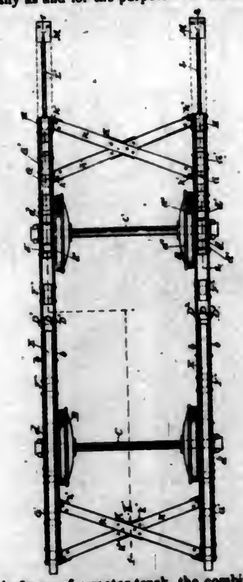
Claim.—1. In a pipe or tube cleaner, the combination with a plate or carrier having a rearwardly-inclined face, of a cutter-carrying arm pivoted to the said face to move in a plane parallel with the plane of inclination of said face, and one or more rotary cutters journaled to the free end portion of the said arm, substantially as specified.

2. In a pipe or tube cleaner, the combination with a plate or carrier having a rearwardly-inclined face, and a pin or stud projecting perpendicularly therefrom, of an arm pivoted to the said stud to move in a plane parallel with the plane of inclination of the said face, and one or more cutter-wheels journaled to the free end portion of the said arm and working in a plane or planes parallel with the plane of movement of the said arms, substantially as specified.

3. In a pipe or tube cleaning device, the combination with a shaft or hub, of a plate or carrier secured thereto and adapted to be moved through and rotated within the pipe or tube to be cleaned, said plate or carrier having an inclined face, a number of arms pivoted to the said plate or carrier upon its inclined face and capable of swinging outwardly in planes parallel with the plane of the inclination of the face to which they are pivoted, stops for limiting the movement of the said arms, and one or more toothed cutters journaled to the free end portion of each of the said arms, substantially as specified.

4. In a pipe or tube cleaning device, the combination with a suitable shaft or hub, of a number of pyramidal plates or carrying devices secured thereto at intervals and having parallel front and rear faces, one or more arms pivoted eccentrically to each of said plates or carriers and arranged to swing outwardly in planes parallel with the planes of the inclination of the said faces, and one or more rolling cutters journaled to the free end portion of each of the said arms, substantially as specified.

5. In a pipe or tube cleaning device, a pyramidal carrier-plate whose plane outer or forward faces are inclined rearwardly, a stud projecting perpendicularly from each of the said faces, and a cutter-carrying arm pivoted to each of the said studs to move in a plane parallel with the plane of the face which carries the stud, substantially as specified.



6. In a pipe or tube cleaning device, a shaft, a number of trihedral pyramidal plates secured thereto at short intervals from each other, cutter-carrying arms pivoted to the inclined faces of said plates to swing outwardly and rearwardly in the planes thereof, and cutter journaled to the free end portions of the said arms, the rear faces of the plates adjacent to said arms being of concave pyramidal form, substantially as specified.

605,952. TRUCK FOR MOTOR-CARS, &c. HORACE L. GEE, Kingston, N. Y., assignor to the Diamond Truck and Car Gear Company, same place. Filed Jan. 10, 1896. Serial No. 574,998. (No model.)

Claim.—1. In a motor-truck, a side frame formed by the combination with two duplicate frames D' D², comprising each the two bar members *b b* rigidly secured together at a point midway in the length of said frames and having their outer end portions *c* extended horizontally forward, and the bar members *b' b'* at an angle to the outer end portions of bar members *b b* and having each an extended horizontal end portion *c* arranged parallel with portion *c* of bars *b* with the lower edge of the latter bearing against the upper edge of the former, of pedestals *d d* rigidly secured by their outer and inner side flanges to the respective bar members of said duplicate frames, spring seating-blocks serving as ties between the horizontal end portions *c c* of the said bar members of said frames, and spring-blocks G' serving as tie-pieces between the inclined portions of the bar members *b b'* which are between portions *c c* and the pedestals, substantially as and for the purposes set forth.

2. In a car-truck, the combination with the bar members *b b'* of the two duplicate side frames D' D² having their respective end portions *c c* horizontal and parallel, with an edge of each said end portions bearing against an edge of the other, of a block and rivets rigidly securing together the said end portions of the respective bar members, of each duplicate frame, and those of each duplicate frame with those of the other, substantially as and for the purposes set forth.

3. In a side frame of a motor-truck, the combination with two pedestals and two duplicate frames having in each outer end portion of each said frames bracing bar members *b' b'* secured to the lower and forward side flanges of said pedestals and having their forward end portions *c* extended horizontally and with their upper edges bearing against the lower edges of the outer end portions *c* of the bar members of said duplicate frames, of spring seating-block and rivets holding said outer end portions *c c* of the said two bar members together, edge to edge in each duplicate frame and also holding the outer ends of each duplicate frame rigidly secured to those of the other, substantially as and for the purposes set forth.

4. In a side frame of a motor-truck, the combination with two pedestals and two duplicate frames comprising each similar bar members *b b'* rigidly secured respectively to the outer and inner side flanges of the said pedestals and arranged in such relation to each other that the bar members *b'* may brace the forward portions of the bar members *b* and have their horizontal outer end portions *c* bear against the lower edges of the outer end portions of the respective bar members *b* of spring seating-blocks and rivets rigidly securing together the outer ends of the respective bar members of both duplicate frames, and blocks between said pedestals and spring seating-blocks and arranged and secured by means of rivets between the respective bar members *b* and *b'* of the duplicate frames, whereby the respective bracing bar members may be rigidly secured to the respective bar members above them, in said duplicate frames, and rigidly secure each duplicate frame with the other at points, in the side frame, between said pedestals and outer end spring seating-blocks, substantially as and for the purposes set forth.

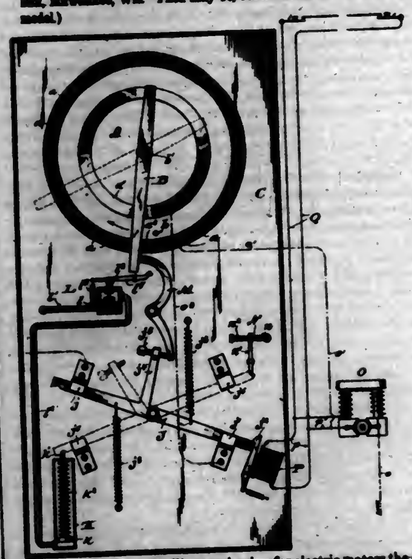
5. In a motor-truck, the combination with a dual side frame D comprising duplicate frames D' D², formed each by the combination with pedestals *d d* of bar members *b b* and *b' b'*, which have their horizontal end portions *c c* parallel in each duplicate frame and also the dual side frame, and have said horizontal portions in each duplicate frame edge against edge, of blocks secured by rivets and serving as ties rigidly holding the assembled said horizontal parallel end portions together, and spring-seats arranged and rigidly secured by rivets between the said two bar members *b b'* of said duplicate frames at points between the respective pedestals and tie-serving blocks, substantially as and for the purposes set forth.

6. In a motor-truck, in each end portion of each side frame thereof from the respective pedestals outward, the combination with a pedestal of two parallel longitudinal bar members *b b* secured each to the upper inner and outer flanges of said pedestal, two parallel inclined bar members *b' b'* having their outer end portions C extended horizontal and parallel with the extended end portions *c* of bar members *b b*, with their edges bearing against edges of the latter, and having their rearward ends rigidly secured to outer and inner flanges integral with the lower end of the pedestal, of a spring seating-block rigidly secured between the assembled pairs of parallel end portions *c c* of said bar members *b b'*, a spring-block having a body which is rigidly secured, by means of rivets, to and between the parallel pair of inclined bar members and to and between the parallel longitudinal bar members *b b*, and two guiding-sleeves which are secured each in alinement with each other, with one between each pair of bar members *b b* and the other between the inclined bar members *b' b'*, the said spring-blocks being adapted to support, one, an elliptic spring and the other a spiral spring between said end portion of the truck-frame and a bolster-plate above, and the said sleeves being adapted to jointly receive and hold with a vertically extended guiding-post secured to the said bolster-plate, substantially as and for the purposes set forth.

7. In a motor-truck, in each end portion thereof outward from the respective pedestals, the combination with a pedestal, bar members *b* secured to the upper end flanges of the pedestal, inclined bar members *b'* secured by their lower ends to the lower end of the pedestal and bracing the bar members *b*, a block rigidly secured to the outer ends of the said bar members *b* and those of the inclined bracing bar members *b'* and adapted to serve as a vertical sleeve, of a jointed brace, comprising an oscillating bar member and an inclined bar member which has its forward end secured to the sill of a car-body at a point forward of the truck, a vertically-moving post serving as a king-post and working in said vertical sleeve and secured to a plate adapted to be secured to the car body and having its lower end secured to the lower end of said inclined bar member of the jointed brace, a fixed forwardly and downwardly incline faced abutment L^4 rigidly secured between the inclined bracing bar members of the end portion of the truck, and a forwardly and downwardly incline faced abutment L^4 secured to the lower end of the said inclined bar member of the jointed brace; the said oscillating bar member of said brace having its respective ends provided with rocker-form faces which bear, respectively against the said inclined faced abutments L^2 L^4, substantially as and for the purposes set forth.

8. In a motor-truck, the combination with the portion of the truck-frame forward of the pedestal *d*, a sleeve rigidly secured to the outer end of said forward frame portion and the forwardly and downwardly incline faced abutment L^2 which is rigidly secured to said forward frame portion at a point near the lower end of said pedestal, of a vertically-movable post secured to a plate adapted to be secured to the sill of a car-body and freely working in said sleeve, a jointed brace comprising the inclined bar L, having its forward end secured to the sill of a car-body and its rearward end to the said post and having with its rear end a forwardly and downwardly incline faced abutment L^4, the oscillating bar L^2, having its opposite ends provided with rocker-form faces which abut against the inclined faces of the said abutments, substantially as and for the purposes set forth.

9. In a motor-truck, the combination with an inclined bracing-bar which has its forward end adapted to be secured to a sill of a car-body and is provided at its rear end with the downwardly and forwardly inclined bearing-face l', of a vertical post which is fixed from moving in relation to inclined bracing-bar and sill of a car-body to which said post may be secured, yet movable in relation to the truck-frame, the oscillating bar L^2 having its opposite ends provided with similar rocker-form faces, and piece L^3 rigidly secured to the frame of the truck, at a point near the lower end of the pedestal in the frame, and provided with the downwardly and forwardly inclined bearing-face *l*, substantially as and for the purposes set forth.



10. In a motor-truck, the combination with the bar members of the truck-frame, a spring seating-piece which is rigidly secured to said bar members, and holding with their assembled outer ends and having in its body below the seat thereof a spring-receiving chamber *i*, a load-bearing spring seated on said spring seating-piece for support of the sill of a car-body, a reacting spring I, wholly contained within said spring-receiving chamber, and the vertical movable spring seating piece I', of the reacting spring I, of diameter corresponding with that of said chamber and also wholly contained within the same, of the upper spring seating-piece H^3, vertical post H^3 secured by its upper end to said upper seating-piece and supporting the said vertically-movable spring seating-piece within the said spring-receiving chamber and against the compressed reacting spring therein, an inclined bracing-bar having its forward and upper end adapted to be secured to the sill of a car-body and having its lower end secured to said vertical post, and a vertical oscillating bracing-bar interposed between the rear end of said inclined bracing-bar and the truck-frame, substantially as and for the purposes set forth.

11. In a motor-truck and arranged as a tie-piece between two parallel bar members of the truck-frame, a block having in it a vertical perforation for passage of a vertical moving post and also having with its forward side of body a bearing-face adapted to abut against a vertical oscillating bracing-bar, substantially as and for the purposes set forth.

12. In a motor-truck, the combination with the two side frames of the truck, of a horizontal X-form brace formed by the combination of the two bars *k k*, crossing each other at their middle, the reinforcing tie-plate K', rivets k^3 rigidly securing the said reinforcing tie-plate to the crossed bars at their crossing portions, and tie-pieces *k' k* rigidly secured by means of rivets to the said side frames of the truck, substantially as and for the purposes set forth.

13. In a motor-truck; the combination with the two side frames of the truck in which two pedestals are secured to bar members of each side frame for receiving the journal-bearings of the wheel-axles, of two horizontal X-form bracing mechanisms, comprising, each, two bars crossing each other at their middle, a reinforcing tie-piece K' provided with flanges k^3 k^3 and secured to the crossing portions of said bars by means of rivets and the flanged tie-pieces *k'* which are respectively rigidly secured, by means of rivets, to the outer ends of said crossed bars and to the portions of both the said side frames which are extended forwardly from said pedestals, substantially as and for the purposes set forth.

605,953. CONTROLLING MECHANISM FOR ELECTRIC MOTORS. GUSTAV GEIGER, WARREN S. JOHNSON, and HENRY WINKELMANN, Milwaukee, Wis. Filed May 10, 1897. Serial No. 636,888. (No model.)

Claim.—1. In controlling mechanism for electric motors the combination with a rheostat comprising a movable contact-arm of a switch in circuit with the armature of the motor, means tending to open said switch, a detent for holding said switch closed, a releasing-magnet having a winding of high resistance in a shunt of the motor-circuit, a circuit-breaker through which said magnet is normally short-circuited, and means for automatically returning said rheostat-arm to starting position whenever the switch is opened, substantially as and for the purposes set forth.

2. In controlling mechanism for electric motors the combination with a rheostat comprising a series of contacts and connected resistances and a movable contact arm, of an emergency-switch, means tending to open said switch, a detent for holding the switch normally closed, means for disengaging said detent and releasing said switch and means for automatically shifting the rheostat-arm into starting position when said switch is opened and for closing the switch when the rheostat arm is returned, substantially as and for the purposes set forth.

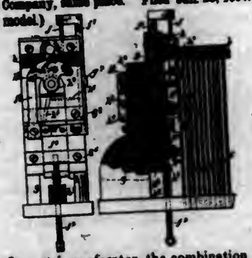
3. In mechanism for controlling electric motors, the combination with a rheostat comprising resistance and a movable arm for bringing more or less of said resistance into circuit, of a fluid-motor for operating the rheostat-arm consisting of a chamber, a movable part in said chamber connected with the rheostat-arm, an air-supply connection with the motor, a liquid medium between said supply connection and the movable part of the motor and valve mechanism for controlling the operation of the fluid-motor, substantially as and for the purposes set forth.

4. In mechanism for controlling electric motors, the combination with a rheostat comprising resistance and a movable arm for bringing more or less of said resistance into circuit, of a fluid-motor for operating the rheostat-arm consisting of a cylinder provided with a piston which is connected with said arm, two reservoirs connected with opposite ends of said cylinder, and each having an air-supply and waste connection, and valve mechanism controlling an air connection of each reservoir, substantially as and for the purposes set forth.

5. In mechanism for controlling electric motors, the combination with a rheostat comprising resistance and a movable arm for bringing more or less of said resistance into circuit, of a fluid-motor consist-

ing of a cylinder containing a liquid and provided with a piston which is connected with said arm, and two chambers or reservoirs connected with opposite ends of said cylinder, and each having a restricted air-supply connection and a waste connection of larger area provided with a valve, substantially as and for the purposes set forth.

6. In mechanism for controlling electric motors, the combination with a rheostat comprising resistance and a movable arm for bringing more or less of said resistance into circuit, a fluid-motor for operating said arm, a valve in a fluid connection of said motor, a switch in the motor-circuit having a tendency to open and arranged when opened to shift said valve and cause the fluid-motor to return the rheostat-arm to starting position, and a detent holding said switch normally closed, substantially as and for the purposes set forth.



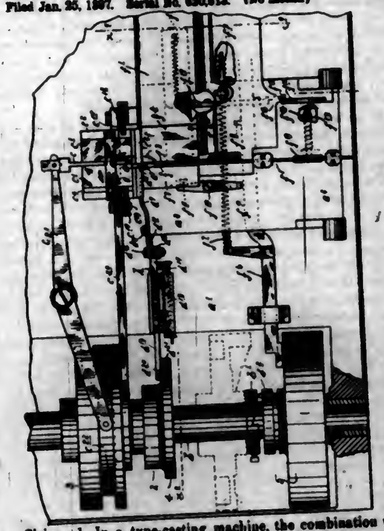
7. In mechanism for controlling electric motors, the combination with a rheostat comprising resistance and a movable arm for bringing more or less of such resistance into the motor-circuit, of a fluid-motor for operating said arm, an emergency-switch in the motor-circuit having a tendency to open, and arranged when opened to start said fluid-motor and to return the rheostat-arm into starting position, a detent holding said switch normally closed, a fluid-motor for closing said switch, and a valve controlling the operation of the switch closing motor arranged to be operated by the return of the rheostat arm to its starting-point, substantially as and for the purposes set forth.

8. In mechanism for controlling electric motors, the combination with a rheostat comprising resistance and a movable arm for bringing more or less of said resistance into the motor-circuit, a fluid-motor for operating said arm, a switch in the motor-circuit having a tendency to open and arranged when opened to start said fluid-motor and cause it to return the rheostat-arm to starting position, a detent for holding said switch normally closed, a fluid-motor for closing said switch, a supply and waste valve mechanism in the fluid connection of said motor arranged to be operated by the return of the rheostat-arm into starting position to open the supply and close the waste port, and a lever operated by the closing of said switch to advance the rheostat-arm and permit said valve mechanism to resume its normal position, closing the supply and opening the waste port, substantially as and for the purposes set forth

9. In mechanism for controlling electric motors, the combination with a rheostat comprising resistance and a movable arm for bringing more or less of said resistance into circuit, a fluid-motor for operating said arm, a valve in a fluid connection of said motor, a switch in the motor-circuit arranged when opened to shift said valve and cause the fluid-motor to return the rheostat-arm to starting position, substantially as and for the purposes set forth.

10. In mechanism for controlling electric motors, the combination with a rheostat comprising resistance and a movable arm for bringing more or less of such resistance into the motor-circuit, of a fluid-motor for operating said arm, an emergency-switch in the motor-circuit arranged when opened to start said fluid-motor and to return the rheostat-arm into starting position, a fluid-motor for closing said switch and a valve controlling the operation of the switch-closing motor, arranged to be operated by the return of the rheostat-arm to its starting-point, substantially as and for the purposes set forth.

605,954. COMPOSING-MACHINE FOR TYPE CASTING AND SETTING MACHINES. George A. Goodson, Minneapolis, Minn., assignor, by mesne assignments, to the Goodson Type Casting and Setting Machine Company, same place. Filed Jan. 25, 1897. Serial No. 620,612. (No model.)



Claim.—1. In a strip-perforator, the combination with a resistance-roller, of a cooperating feed disk mounted for rocking and sliding motion against retracting-springs, and a reciprocating punch-plunger cooperating with said springs to impart the strip-releasing and strip-feeding movements to said feed-disk, substantially as described.

2. In a strip-perforator, the combination with a strip guide and resistance-roller, of a spring-held disk-carrier sliding substantially at right angles to the strip, a spring-held feed-disk pivoted to said carrier for rocking motion in the line of feed, and a reciprocating punch-plunger subject to a magnet and a spring, with said plunger arranged to slide said carrier against its retracting-spring and to rock said disk against its retracting-spring, at opposite limits of the plunger's stroke, substantially as and for the purposes set forth.

3. In a strip-perforator, the combination with a strip-guide, of the resistance-roller h, the rocking feed-disk h', the sliding carrier h^2 for said disk, the stop-arm h^3 on the journal of said disk and working against one or more adjustable stops h^4, the spring h^5 applied to said disk, the pin h^3 on said disk, the spring h^6 applied to said carrier, the punch-plunger f^6 mounted for a longer stroke than the carrier and engageable therewith at the opposite limits of the plunger's stroke, the arm f^5 on the plunger engageable with the pin h^3 on the disk, the magnet f^4 and the spring f^7, all arranged and cooperating substantially as described.

605,955. TYPE CASTING AND SETTING MACHINE. George A. Goodson, Minneapolis, Minn., assignor, by mesne assignments, to the Goodson Type Casting and Setting Machine Company, same place. Filed Jan. 25, 1897. Serial No. 620,613. (No model.)

Claim.—1. In a type-casting machine, the combination with a type-body mold and a type-receiving ledge, with its face at a lower level than the bottom of the mold-cell, of a type-seating device, and means for operating the same with a four-motion action, to wit, first to retreat from the last seated type, second, to rise into an idle position, third, to move forward and engage the last cast type as ejected, and fourth, to move downward, thereby seating and holding the engaged type on said ledge until the next cast type is being ejected, substantially as and for the purposes set forth.

2. In a type casting and setting machine, the combination with the body-mold and a type-receiving ledge, with its face at a lower level than the bottom of the mold-cell, of a yielding abutment against which the cast type are ejected, and a type-seating device arranged to engage with the cast type as ejected, and seat and hold the same on their feet on said ledge, against said abutment, until the next cast type is being ejected, substantially as described.

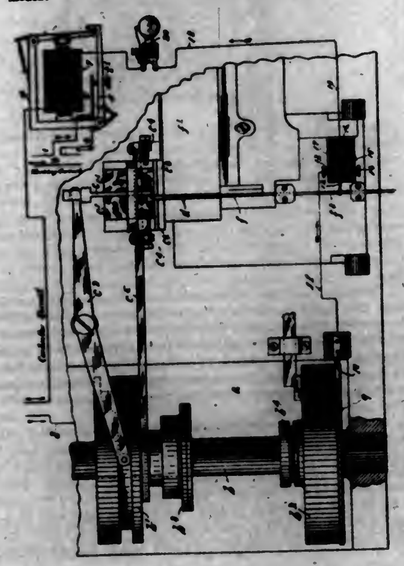
3. In a type-casting machine, the combination with the body-mold and a type-receiving ledge, at a lower level than the mold, of a type-seating device operative to engage the cast type as ejected and seat the same on said ledge, comprising an arm carried by a pivoted lever, for the in-and-out motion, and subject to a second lever, for the up-and-down motion, a cam with a double face and a pair of spring-held slides operative on said levers and subject to said cam, substantially as described.

4. In a type-body mold, the combination with the movable members c c', of the fixed angle-block member c^3 having a delivery-channel d^6 extending outward beyond the side of the mold-cell, and a type-seating device mounted to move through one wall of said channel, at substantially right angles to the type, for engaging the type against the opposite wall of said channel as a base of resistance, substantially as and for the purposes set forth.

5. The combination with the movable mold members c c', of the fixed angle-block mold-section c^3 having the delivery-channel d^6 extending outward beyond the bottom face-plate of the mold, and provided on its back with the countersunk guideway d^5 intercepting one wall of said channel, the type-receiving ledge d^3 located with its face at a lower level than the bottom of the mold-cell, the type-seating lever-arm d^3 working in said guideway d^5, and means for imparting to said arm d^3 a four-step motion, substantially as and for the purposes set forth.

6. The combination with the fixed mold-section and a suitable base of resistance, of the movable mold-sections c' yieldingly clamped together, with the plunger e embraced by the blocks c', and a stop-bar secured to one of said blocks c', for cooperation with the base of resistance when the mold is clamped in its ejecting position, substantially as and for the purposes set forth.

7. The combination with the mold-plunger e and the blocks c' embracing the same, of the draw-bolt c^9 and spring c^8 yieldingly clamping the said parts together, the stop-bar c^{10} fixed to one of said blocks c' and working in a guideway c^{11} of the other, and a stop c^{12} in the path of said bar c^{10}, for cooperation in taking the clamping action from the mold-shifting device when the mold is in its ejecting position, substantially as and for the purposes set forth.

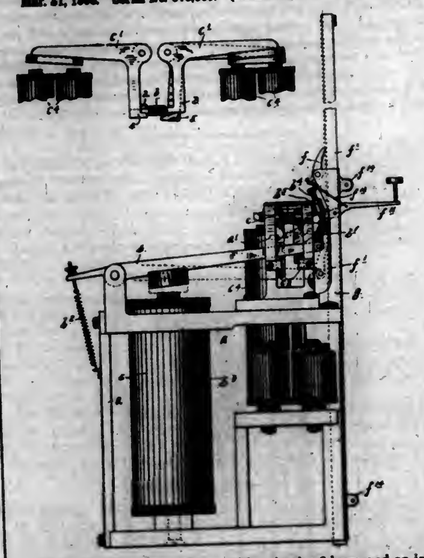


8. The combination with the fixed mold-section, of the movable mold-sections c c', movable on the said fixed section and the spring-top bar c^3 operating to yieldingly clamp the said movable sections to the said fixed section, substantially as described.

9. In a type casting and setting machine, the combination with the mold including a movable plunger, of an abutment-rack against which the type are ejected by the mold-plunger, a spring tending to throw said rack to its innermost position, and a friction device for holding the said rack, without backlash, in whatever position it may be set, under the type-ejecting action, substantially as described.

10. In a type casting and setting machine, the combination with the mold including a movable plunger, of the spring-held abutment-rack against which the type are ejected by the mold-plunger, a pinion-shaft having a friction-disk, and a spring-held friction-pawl engaging said disk, substantially as and for the purposes set forth.

11. In a type casting and setting machine, the combination with the mold, of a spring-held abutment-rack against which the type are ejected by the mold-plunger, a friction-disk and friction-pawl, cooperating to hold the said rack, without backlash, in whatever position it may be set, a movable galley-head with slide for forcing the assembled line into the galley, and a releasing device for said friction-pawl, operative by the galley-head slide for releasing the said abutment-rack, substantially as and for the purposes set forth.



605,956. CONTROLLER FOR TYPE CASTING AND SETTING MACHINES. George A. Goodson, Minneapolis, Minn., assignor, by mesne assignments, to the Goodson Type Casting and Setting Machine Company, same place. Filed Jan. 26, 1897. Serial No. 620,614. (No model.)

Claim.—1. The combination with an electrically-operated type casting and setting machine and its supply or working circuit, of an electric controller in said supply or working circuit, and circuit connections for said controller including a pair of contacts normally separated to open the controller-circuit, during the casting action, but which engage to close the controller-circuit, at that point, during the line-delivery action, and a switch, operated by the type-delivery devices, for cooperation with said pair of contacts to close the controller-circuit if the line of type be of other than normal length, and to open the controller-circuit, at the switch, if the line of type be of normal length, substantially as and for the purposes set forth.

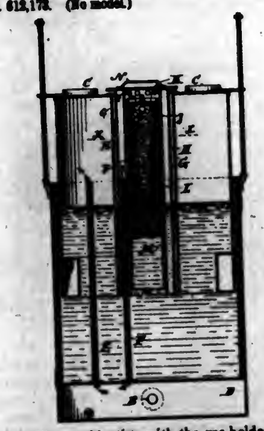
2. The combination with an electrically-controlled type casting and setting machine and its supply or working circuit, of a controller in said supply or working circuit and connections for said controller, including the switch-contacts 12, 13 and 14, with the pivoted member 13 thereof subject to the abutment-rack f against which the type are ejected, as described, and the pair of contacts 9 and 10 with the member 9 carried by the cam-wheel h^2 and separated from the contact 10 during the casting action, but engaging with the contact 10 under the movement of the cam-wheel, in the line-delivery action, all substantially as and for the purposes set forth.

605,957. DIFFERENTIAL LETTER-SPACE REGISTER FOR COMPOSING-MACHINES. George A. Goodson, Minneapolis, Minn., assignor, by mesne assignments, to the Goodson Type Casting and Setting Machine Company, same place. Filed Jan. 25, 1897. Renewed Mar. 31, 1898. Serial No. 676,009. (No model.)

Claim.—1. The combination with a bank of keys and an indicator, of differential feed devices for the same, comprising a spring-actuated driver operative on a movable part of the indicator, and electric devices, under the control of said keys, adapted to variably set said driver against its actuating-spring, when the keys are depressed for variably feeding the movable part of the indicator when the keys are released, substantially as described.

2. The combination with a bank of keys and an indicator, of a spring-actuated feed or driving lever operative on the movable part of the indicator, a retracting-magnet for said feed or driving lever adapted to set the same for a maximum feed stroke, spring-held stop-levers operative to variably intercept said feed-lever, on its return or idle stroke, for variably setting the same to make feed strokes of different lengths, magnets for said stop-levers, and electric connections for all of said magnets, under the control of said keys, substantially as described.

3. The combination with a bank of keys and an indicator, of a spring-actuated feed or driving lever operative on the movable part of said indicator, a magnet tending to retract said feed-lever to a maximum distance, for setting the same to make its greatest feed stroke, spring-held stop-levers operative to variably intercept said feed-lever on its idle or return stroke, for variably setting the same to make feed strokes of different lengths, magnets for said stop-



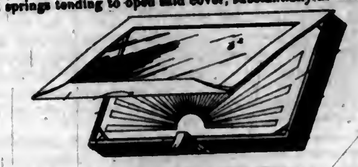
levers a relay, an electric circuit controlled by said keys, with branches through said stop and relay magnets, and an electric circuit through said feed-lever magnet controlled by said relay, for timing the action, substantially as described.

4. The combination with a bank of keys, of a differential letter-space register comprising a differential driving or feed mechanism, and a pair of indicators operated thereby, the primary member of which indicators, operates throughout the entire line of composition, for denoting the distance from the beginning of the line in units of type-face, and the secondary of which indicators operates only through a predetermined final part of the line of composition, for denoting distance from the end of the line in units of type-face, substantially as and for the purpose set forth.

5. In a differential letter-space register, the combination with a differential feed or driving mechanism, of a pair of indicators operated thereby, the primary member of which indicators is constantly subject to said driving or feed mechanism for denoting distance in units, from the beginning of the line, and the secondary member of which indicators is controlled from said primary member, during only a predetermined final part of the primary indicator's movement, for denoting distance, in units, from the end of the line, substantially as described.

6. In a differential letter-space register for composing-machines, the combination with the differential driving mechanism, of a divided or two-section rack operated thereby, and a corresponding pair of scales and pointers operated by said rack-sections, the primary member of which rack-sections is constantly subject to said driving mechanism, for indicating the distance in units of type-face, from the beginning of the line, and the secondary member of which rack-section is operated by the primary member only through a definite final part of the primary rack-section's travel, for indicating the distance in type-units from the end of the line, with the primary rack movable beyond the line-limit, and with the secondary dial graduated in positive numbers within the line-limit, and in negative numbers beyond the line-limit, substantially as described.

605,958. APPARATUS FOR GENERATING ACETYLENE GAS. ARTHUR R. GRIFFEN, Verona, N. J., assignor to the Acetylene Apparatus Manufacturing Company, of West Virginia. Filed Nov. 16, 1896. Serial No. 612,178. (No model.)

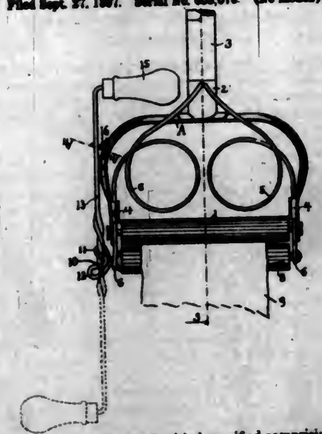


Claim.—1. The combination with the gas-holder of the removable bell H and a cylinder J, a carbid-receptacle supported by the cylinder J, an annular chamber between the walls of the cylinder J and the bell H, the pipe F, the pipe E, and an intermediate chamber D communicating with said pipes, substantially as specified.

2. The combination of a series of gas-holders, each of which is provided with a removable bell H and a cylinder J, and having an annular chamber between them, a carbid-receptacle supported by the said bell, the pipe F, the pipe E, and a chamber D intermediate said pipes and with which they communicate, and a supply-pipe with which each of the chambers D of the holders are in communication through a valved connection, substantially as specified.

605,959. MUSIC OR COPY HOLDER. ARTHUR S. HENDERSON, London, Tenn. Filed Aug. 12, 1897. Serial No. 648,062. (No model.)

Claim.—In a music or copy holder, the combination of a receptacle of appropriate form having sides and a bottom, a transparent cover hinged to one of its sides, separable means for holding the cover closed, a false bottom arranged within the receptacle under the transparent cover thereof and adapted to form a rest for one or more sheets or a book, springs arranged between the bottom of the receptacle and the false bottom adapted to normally press the latter outward, and springs tending to open said cover, substantially as described.



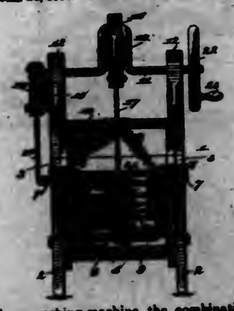
605,960. INCANDESCENT GAS-LIGHT TASSEL. LEVI HOOKER, Sydney, New South Wales. Filed Sept. 24, 1897. Serial No. 652,915. (No model.)

Claim.—An attachment for a gas-burner consisting of a fibrous material saturated with a compound while in solution, consisting of liquid acetate of magnesium, sulfate of chromium, and calcine of magnesia, in the proportion, substantially as described.

605,961. MOP HOLDER AND WRINGER. OTTO KUHL, Chicago, Ill. Filed Sept. 27, 1897. Serial No. 653,078. (No model.)

Claim.—1. A device of the kind specified comprising an arched frame provided with a socket-piece on its upper or arched portion and recessed at its ends, spiral springs mounted within said frame and provided with loops projecting beyond the ends of said frame, a roller journaled in said recessed ends of said frame, a roller journaled in said loops of said springs and adapted normally to be held in engagement with said first-named roller, and a crank-handle on one of said rollers to turn the same.

2. A device of the kind specified, comprising an arched frame provided with a socket-piece on its upper or arched portion adapted to receive a handle, spiral springs mounted within said frame the upper ends of which enter openings in said socket-piece and recesses in said handle to hold the latter against removal, and the lower ends of which form loops which project below the recessed ends of said frame, a roller journaled in said recesses in said frame, a roller journaled in said loops and adapted to be held by said springs normally



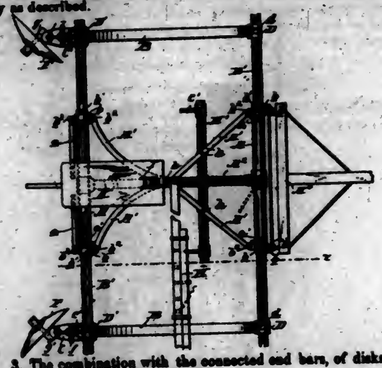
in engagement with said first-named roller, and a crank-arm on one of said rollers to turn the same.

3. A device of the kind specified, comprising an arched frame provided with a socket-piece on its upper or arched portion adapted to receive a handle, spiral springs mounted within said frame the upper ends of which enter openings in said socket-piece and recesses in said handle to hold the latter against removal, and the lower ends of which form loops which project below the recessed ends of said frame, a roller journaled in said recesses in said frame, a roller journaled in said loops and adapted to be held by said springs normally in engagement with said first-named roller, and a crank-arm pivotally mounted in one ear of a key on one of said rollers and provided with a slot adapted to receive the other ear thereof whereby said crank-arm can be placed in rigid engagement with said key to turn said roller.

4. A device of the kind specified, comprising an arched frame provided with a socket piece on its upper or arched portion adapted to receive a handle, spiral springs mounted within said frame the upper ends of which enter openings in said socket-piece and recesses in said handle to hold the latter against removal, and the lower ends of which form loops which project below the recessed ends of said frame, a roller journaled in said recesses in said frame, a roller journaled in said loops and adapted to be held by said springs normally in engagement with said first-named roller, and a crank-arm pivotally mounted in one ear of a key on one of said rollers and provided with a slot adapted to receive the other ear thereof, and a lug on said frame adapted to enter a slot in said arm and engage the same to lock said arm against said frame, substantially as described.

5. In a mop holder and wringer, a roller journaled within a frame and provided at one end with a key having two ears, a crank-handle pivoted in one of said ears and provided with a slot adapted to receive said other ear, a projection on the frame of said device, and a slot in said crank-arm adapted to receive said projection and engage the same to lock said crank-arm in a position folded against said frame when out of engagement with said last-named ear of said key.

605,962. WASHING-MACHINE. THOMAS LAUDER, Kutztis, Pa. Filed Jan. 28, 1897. Serial No. 621,071. (No model.)



Claim.—In a washing-machine, the combination of a washing-machine body provided at its sides with vertical slots, a lower rubber having an inner concave rubbing-surface and provided with journals arranged in said slots, an upper rubber mounted in the slots of the washing-machine body and provided with a convex rubbing-surface consisting of a series of transverse bars 10 provided at their lower edges with longitudinal curves substantially sigmoidal, the projections of one bar being disposed opposite the depressions of the adjacent bars to form enlarged pockets, the rubbing-surface of the upper rubber being more pronounced than that of the lower rubber and capable of obtaining a greater hold on the clothes to cause them to be carried by the upper rubber, the arms 17 and 20 connected with and extending upward from the upper and lower rubbers, the arm 17 of the upper rubber being shorter than that of the lower rubber, whereby the said upper rubber is caused to travel faster and farther than the lower one, a double-crank shaft, and pitmen connecting the arms 17 and 20 with the crank-shaft, substantially as and for the purpose described.

605,968. COMBINED FURROWER, MARKER, AND COVERER. SWINNER LAWRENCE, Jr., Wolfman's Cross Roads, Md. Filed Apr. 6, 1897. Renewed Feb. 24, 1898. Serial No. 671,541. (No model.)

Claim.—1. In a combined marker and furrower, the combination with connected end bars, of adjustable extensions at the sides, runners on the extensions, and disks adjustable and loosely secured to the extensions, substantially as described.

2. The combination with the connected end bars, of adjustable extensions carried thereby, runners on the extensions, disks adjustably and loosely secured on an extension, and a bar secured intermediate the end bars, and to which the disks can be adjusted, substantially as described.

3. The combination with the connected end bars, of disks carried by a bar, and means for adjustably and loosely securing the disks to the bar, substantially as described.

4. The combination with a supporting-bar, of disks, arms for supporting the disks, a hook connection between the arm and bar, and means for maintaining the arm in adjusted positions.

5. The combination with a supporting-bar, of a disk, arms pivotally and loosely connected with the bar, and means for maintaining the arm in adjusted positions, and retaining the same on the bar, substantially as described.

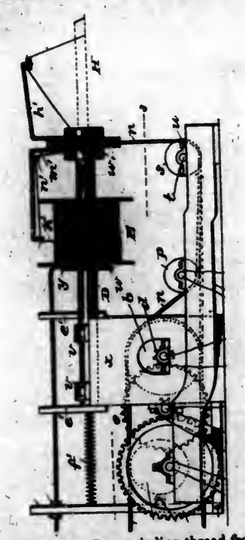
6. The combination with the connected end bars, of the bar H', the adjustable and removable disks, and the angular and curved braces A', substantially as described.

7. The combination with the end supporting-sections, of boxes D removably secured to the sections, and having depending flanges formed with side ribs, the runners having their ends resting against the flanges, and means for securing the runners to the flanges, substantially as described.

8. The combination with a supporting-bar, of a disk-carrying arm having hook-shaped branches, engaging over the bar, a bolt between the branches, a segment on the box, and a pin engaging the segment, and carried by the arm.

9. The combination with a supporting-bar, of a disk-carrying arm adjustably secured thereon, and having an upwardly-extending outer end, a horizontal spindle adjustably secured to the outer end of the inclined portion of the arm, and a disk on the spindle.

10. The combination with the hollow end bars, of the reducing-castings consisting of the portions b engaging over the ends of the bars, the reduced portions b', the ears b^2, the oppositely-located axes b^3, the braces A', and the seat-braces a, substantially as described.



605,964. TRACK FRICTION-BRAKE. EDWARD B. LOOMIS, Hoosick, N. Y., and THOMAS J. MOORE, Hamburg, Pa. Filed Feb. 7, 1898. Serial No. 669,902. (No model.)

Claim.—1. A brake mechanism comprising a reciprocating brake-shoe holder, a guideway therefor, a cam operating in an L-shaped slot in the holder, and a lever to operate the cam to set and release the brake, substantially as described.

2. A brake mechanism, comprising a pair of side brackets, brake-shoe holders guided in the brackets and provided with L-shaped slots, a shaft journaled in the brackets, cams attached to the shaft to operate upon the holders within said slots, and an operating-lever attached to the shaft, substantially as described.

605,965. MACHINE FOR UNWINDING WARP-THREADS. ENOS H. MASON, Chester, S. C. Filed Dec. 27, 1897. Serial No. 663,604. (No model.)

Claim.—1. A machine for unwinding thread from a chain, consisting of a non-revoluble spool or receiver, means for reciprocating said spool, in combination with a revoluble head provided with arms extending from both sides thereof in opposite directions and having suitable eyes and a passage through said head for supporting and winding the thread upon the spool.

2. A machine for unwinding thread from a chain, consisting of a non-revoluble spool or receiver, a fixed tube supporting said spool, a revoluble head on said tube beyond the spool and provided with arms extending from both sides of the head in opposite directions, one toward the chain and the other toward the spool and having eyes through which the thread passes, and a passage through the head for supporting and winding the thread upon the spool, in combination with means for reciprocating said spool.

3. A machine for unwinding thread from a chain, consisting of a fixed tube, a non-revoluble reciprocatory spool or receiver supported on said tube, a revoluble head on the tube beyond the spool and provided with arms extending from both sides thereof in opposite directions, one toward the chain and the other toward the spool and having eyes through which the thread passes and a passage through the head for supporting and winding the thread upon the spool, in combination with a rod engaging the spool at one end, an arm or lever engaged by said rod at its opposite end and means for operating said arm.

4. A machine for unwinding thread from a chain, consisting of a fixed tube, a non-revoluble reciprocatory spool or receiver supported on said tube and having a flange at one end, a revoluble head on said tube provided with arms extending from both sides thereof in opposite directions, one toward the chain and the other toward the spool and a passage through the head for supporting and winding the thread upon the spool, in combination with a rod having a yoke at one end engaging the flange on the spool, an arm or lever to which said rod is connected, means for adjusting the length of said rod, means for applying friction to the spool through the medium of said yoke and means for operating said lever.

5. A machine for unwinding thread from a chain, consisting of a fixed tube, a non-revoluble reciprocatory spool supported on said tube, a revoluble head on the tube having a thread-passage therethrough and provided with suitable arms which revolve with the head for supporting and winding the thread upon the spool, a flange on one end of the spool, a rod having a yoke engaging the spool between one of its ends and said flange, a screw-thread at the opposite end of the rod, and an arm or lever to which said rod is adjustably connected, in combination with a cam for operating the lever and a spring connected to the lever and the frame of the machine for regulating tension of the wrapped thread on the spool.

605,966. BOTTLE-STOPPER. GEORGE W. MASON, Sharon, Pa. Filed Apr. 16, 1898. Serial No. 677,812. (No model.)

Claim.—In combination with a bottle, a stopper arranged in the neck of the same, consisting of an annular shell 3, having a suitable packing, a valve-seat formed at the base of the said shell, a valve 6, and stem having bearings within the shell 3, a spring 13, to hold the said valve to its seat, a concaved plate 8, attached to the valve 6 projecting into the body of the bottle, a weight 19 to open the said valve, when the bottle is inverted, a removable wire 18, attached to the valve as a means of elevating the same from its seat, a cover 14, placed over the mouth, the meeting edges of which are fused, to make the same integral with the bottle, perforations formed through the neck of the bottle, and a cap 16, said cap having a contracted neck 17, in which a cork is placed, all arranged and combined for service, substantially as and for the purpose described.

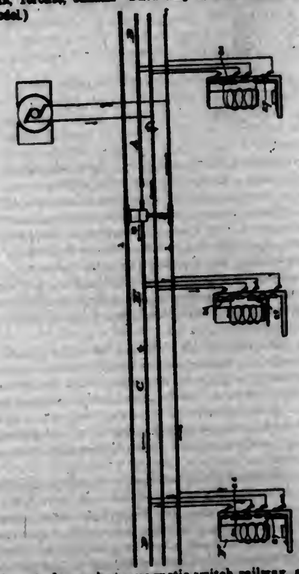
605,967. CURTAIN-POLE RING. JAMES E MILLER, Hinton, W. Va. Filed Feb. 15, 1897. Serial No. 623,516. (No model.)

Claim.—A curtain-pole ring made from a single piece of wire which is formed into the ring E at its center, and which has one of its ends given an outward bend d', and then formed into the loop d, while the other end of the wire is given an outward bend d^2 and is then formed into the end D which is provided with a downward bend d^3 at its center, substantially as described.

605,968. GATE-VALVE. ARTHUR J. MCKEAN, Lorain, Ohio, assignor to the Cochran Company, same place. Filed Dec. 15, 1897. Serial No. 661,969. (No model.)

Claim.—1. The combination in a gate-valve, of the pipes A and A', the annular gaskets, the gate, the collars engaging the pipes and the gaskets, the flanges E and E', and the bolts connecting said flanges.

2. A gate-valve comprising the combination of the pipe ends, a gasket bearing against each of the same, a collar secured to each pipe, an annular recess in each collar engaging the periphery of one of the gaskets, projections H and H' on the collars forming a guideway, a gate having an orifice and sliding in said guideway, flanges engaging said collars, and bolts and nuts connecting said flanges.

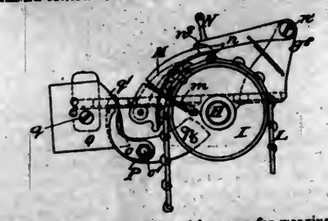


605,969. MAP-HOLDER. HARRY C. MCCAFFERTY, Montclair, N. J. Filed July 13, 1897. Serial No. 644,203. (No model.)

Claim.—1. An improved map-holding device for attachment to a bicycle or similar vehicle, comprising an open framework embodying the open rectangular ends, means for attaching the frame to a bicycle or similar vehicle, the transverse bearing-rods extending across said open ends and formed of wire provided with a central loop forming a bearing-eye, the rollers mounted in said bearing-eyes of the transverse rods, and the map wound upon the rollers, whereby the map may be detachably arranged in and carried by said open framework, substantially as and for the purpose set forth.

2. An improved map-holding device for attachment to a bicycle or similar vehicle, comprising an open or skeleton framework embodying side pieces connected together at their ends by bars forming open end portions, two transverse connecting-rods extending across the open ends of said framework and between said bars, said rods being formed of wire and provided centrally with an open loop forming a bearing-eye, and the rollers mounted in said bearing-eyes of the transverse rod and provided with projecting end heads or knobs by means of which the rollers may be turned, substantially as and for the purpose set forth.

605,970. ELECTROMAGNETIC-SWITCH RAILWAY. ADONIS NORMAN, Toronto, Canada. Filed July 3, 1897. Serial No. 643,698. (No model.)



Claim.—1. In an electromagnetic-switch railway, a supply-conductor, a sectional working conductor, switch-boxes containing an L-shaped arm, four spring-arms carried by the box and the arm respectively having a contact with each other in pairs, and two plates and means for moving the plates vertically in an upward direction by the bridging of two of the sections of the working conductor and lowering the same by gravitation, substantially as described.

2. In an electromagnetic-switch railway, the combination of the rails, the supply-conductor and a sectional conductor, of switch boxes, each containing four bars connected respectively with the rail, the supply-conductor and two of them with the working conductor, an electromagnet having a winding, each end connected with a similar bar, and plates adapted to form two alternate circuits, one from the sectional conductor in rear of the box to the rail, and another from the supply-conductor to the rail, substantially as described.

3. In an electric railway the combination of switch-boxes, each containing four springs which are attached to but insulated from them for the purpose of connecting up the electromagnetic switches, placed therein, with the rails and conductors and having wires attached to each spring, two of said wires passing to the working conductors and being secured to them, and one each in like manner to the rail and supply-conductor as set forth.

605,971. FRINGE-MAKING ATTACHMENT FOR HAMMOCK-LOOMS. ISAAC R. PALMER, Middletown, Conn. Filed Jan. 2, 1897. Serial No. 617,790. (No model.)

Claim.—1. The combination with means for weaving a strip of fabric, of means for introducing a separate thread into the edge of the strip as it is being woven and means for looping the separate thread in the body of the fabric at a distance from the edge of the fabric independently of the weft-threads of the fabric, substantially as set forth.

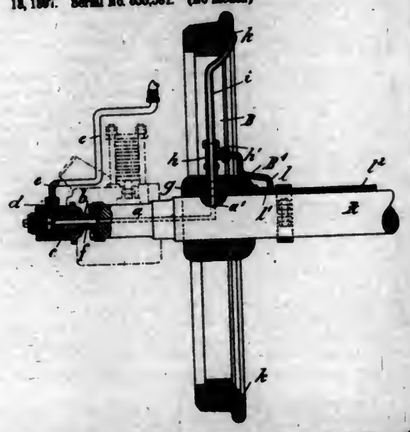
2. The combination with means for weaving a strip of fabric, of means for introducing a separate thread into the weave to form a fringe, comprising a swinging needle, a rocking plate for moving the thread-carrying needle into and out of engagement with the edge of the strip of fabric, hooks carried by the rocking plate in position to engage the said thread and draw it out into looped form as the plate is rocked and means for rocking the plate, substantially as set forth.

3. The combination with means for weaving a strip of fabric, of means for introducing a separate thread into the edge of the fabric to form a fringe, comprising a swinging thread-carrying needle, a rocking plate for moving the needle into and out of engagement with the fabric, hooks carried by the rocking plate in position to engage the thread and draw it out into looped form as the plate is rocked, a cutting-blade in position to sever the thread which forms the loops, and means for rocking the said plate, substantially as set forth.

4. The combination with means for weaving a strip of fabric, of means for introducing a separate thread into the edge of the fabric to form a fringe, comprising a suitable supporting-plate, the thread-carrying needle hinged thereto, a rocking plate, a spring-actuated cam carried by said plate in position to move the said needle into and out of engagement with the fabric, a cutting-blade carried by said supporting-plate, hooks carried by the rocking plate in position to engage the thread and draw it out into looped form as the plate is rocked, the said hooks bringing the thread into engagement with the cutting-blade as the thread is drawn outwardly to sever the thread and means for rocking the said rocking plate substantially as set forth.

5. The combination with means for weaving a strip of fabric, of means for introducing a separate thread into the edge of the strip of fabric to form a fringe comprising a swinging thread-carrying needle, a rocking plate for moving the needle into and out of engagement with the strip of fabric, hooks carried by the rocking plate in position to engage the thread and draw it out into looped form as the plate is rocked, a guard located in position to protect the fabric from being engaged by the hooks, and means for rocking the said plate, substantially as set forth.

6. The combination with means for weaving a strip of fabric, of means for introducing a separate thread into the edge of the strip of fabric as it is being woven, to form a fringe, comprising a swinging thread-carrying needle, a rocking plate in position to move the said needle into and out of engagement with the fabric, a pair of hooks in position to engage the thread upon one side of the needle to draw it outwardly into a loop as the plate is rocked, a cutting-blade in position to enter the space between the pair of hooks as they are swung outwardly to sever the thread at the outer end of the loop and means for rocking the said plate, substantially as set forth.

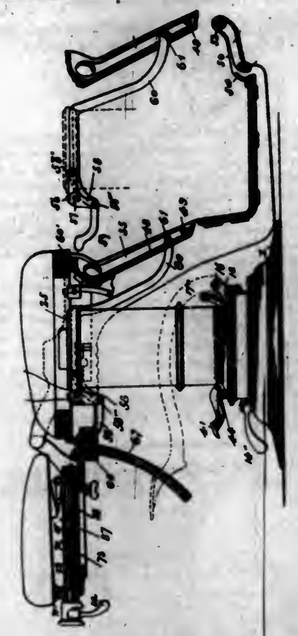


605,972. FLUSHING-CISTERN. EDGAR H. PARKINSON, Bradford, England. Filed Aug. 17, 1896. Serial No. 602,942. (No model.)

Claim.—In a flushing-cistern, the combination with a tank, and

two siphons having an air-trap between them, of a pipe communicating at one end with the air-trap, a vessel into which the other end of the pipe leads, said vessel containing mercury surrounding and sealing the said end of the pipe, a second vessel containing mercury into which latter the first vessel dips and in which it floats, means for depressing the first vessel to break the seal around the end of the pipe, an annular shield or baffle-plate carried by the first vessel and surrounding the sealed end of the pipe and having openings, and an annular shield on the said end of the pipe surrounding the shield on the vessel.

605,973. CONTRIVANCE FOR AUTOMATICALLY STOPPING TRAINS, &c. STEFFAN POJARKOW, Yekaterinoslav, Russia. Filed Oct. 13, 1897. Serial No. 655,581. (No model.)



Claim.—In a contrivance for automatically stopping trains at the breakdown of rolling parts means for connecting the latter with the air-brake suitably-arranged pipings *c b*, a stuffing-box *c*, borings *a a'* provided in the axle-head, pipings *l' k* embedded into the body of the wheel and means *i k l* for connecting those pipings with each other, substantially as and for the purpose set forth.

605,974. DENTAL CHAIR. FRANK RITTER, Rochester, N. Y. Filed Jan. 18, 1897. Serial No. 619,008. (No model.)

Claim.—1. In combination the rotatable pedestal, opposite ways situated in a vertical flange of the base and an oil-reservoir wall respectively, and rotating friction-wheels movable around the base in said ways, said wheels having their axes extended upwardly and attached to and movable with the pedestal, substantially as described.

2. In combination the rotatable pedestal, the base provided with ways, friction-wheels movable in said ways and having their axes attached to and movable with the pedestal, and devices for locking a wheel to the base to prevent its rotation, said devices being also adapted to hold the pedestal stationary in the base, substantially as described.

3. The combination of the rotating pedestal, the base provided with oppositely-situated ways, a plurality of antifriction-wheels movable in said ways, wheel-axes having bearings in the pedestal, a cam secured to an axis, and a bearing for the cam on the pedestal, whereby the antifriction-wheels prevent the pedestal from tipping and whereby one of the wheels can be forced against the walls of its ways to prevent its rotation and also lock the pedestal and base together, substantially as described.

4. In combination, the pedestal, the pump-cylinder, the piston-rod fitting an opening in the pedestal, a ring sliding on the exterior of the cylinder, the operating-lever pivoted to the rod outside the pedestal, a rigid connection between the rod and ring, and a like connection of the rod and piston whereby the rod is moved through the pedestal-wall in a straight line, substantially as described.

5. In combination the pump-cylinder, the piston-rod, a flanged ring sliding on the exterior of the cylinder and a rigid connection between the rod and ring, and returning-springs connecting the ring-flange and pedestal-wall on opposite sides of the cylinder, substantially as described.

6. The combination of a chair-base, a rotatable pedestal having telescoping sections, a bearing on the base for one of said sections, separate telescopic plunger-tubes comprising a cylinder connected to the seat-frame, a device to lock together the telescoping pedestal-sections, and a device to lock the upper pedestal-section to the said cylinder, said locking devices being operative at any desired elevation of the upper pedestal-section and cylinder respectively, substantially as described.

7. The combination of a chair-base, a rotary pedestal made in telescoping sections, a cylinder fixed to the seat-frame, and a device to lock the upper pedestal-section to the cylinder at any desired elevation of either the section or cylinder, said locking device comprising a movable part, a rod fixed to said part, a spring to maintain the locking, and devices to overcome the spring and release the lock upon the descent of the said upper section, substantially as described.

8. The combination of a pedestal made in separately-movable sections, a cylinder fixed to the seat-frame, and a device to lock the upper pedestal-section to the cylinder at any elevation of the said section, a spring to maintain the locking, and devices for automatically releasing the lock upon the descent of said section whereby the cylinder and the seat-frame may descend independently, substantially as described.

9. The combination of the fixed plunger-tube, the plunger-tube extension, the plunger, the seat-frame, means for moving the plunger, rods fixed to the movable extension and passing through openings in the fixed plunger-tube, and stops on the lower ends of said rods, substantially as described.

10. In combination with a chair-seat frame, a seat pivoted to said frame, a pivoted foot-rest adapted to be turned into an inoperative position, a bar pivotally connected to said rest and mediately to an oscillating bar pivotally connected to the seat-frame, said bar having arms extended under and approximately parallel with the seat-frame, and a push-bar having a connection below the pivot of the oscillating bar, said arms being adapted to raise the seat when the push-bar and oscillating bar are moved to turn the foot-rest into an operative position, substantially as described.

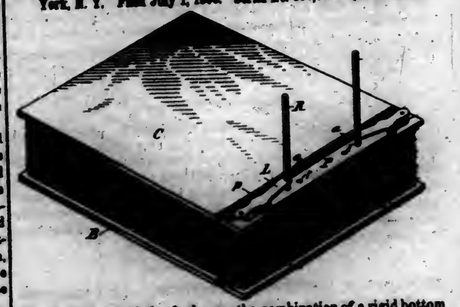
11. In combination with the chair-seat frame, the seat pivoted at its front to the said seat-frame, a pivoted foot-rest adapted to be turned into an inoperative position, a bar pivotally connected to said rest and mediately to an oscillating bar pivotally connected to the seat-frame, said bar having arms extended under the seat, and a push-bar having a connection below a pivot of the oscillating bar, said arms being adapted to raise the seat when the push-bar and oscillating bar are moved to turn the foot-rest into an inoperative position, and also arranged and adapted to receive the pressure due to the weight of the seat and its occupant on their front sides to prevent the return of the parts, substantially as described.

12. The combination in a chair-back having two connected independently-movable extension parts, of a rod supported to turn in one of said parts and provided with a conical point, a block situated between said parts, transverse webs connected to the exterior part to loosely hold the block, said block having a seat for the point of the rod, and means for rotating the rod and moving it endwise relatively to said exterior part to crowd the block laterally, substantially as described.

13. In a ball-and-socket joint of a head-rest, two hemispheres each provided with a pad-supporting arm, a pin fixed in one hemisphere and movably held in the other to connect the hemispheres, and a spring to force said hemispheres together and increase their friction, substantially as described.

14. In combination with the pad-holding plate having lugs, the split block, the wedge situated between the arms of the split block and provided with a stem, the lugs, block and wedge having a common pivot and the wedge and pivot-receiving opening made larger than the diameter of the pivot to permit the wedge to be moved transversely thereof, and a handle adapted to draw the wedge between the arms and thereby lock the parts together, substantially as described.

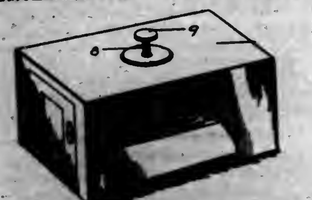
15. In combination with the pad-holding plate having lugs, the split block, the wedge situated between the arms of the split block and provided with a stem, said parts having a common pivot, and a handle adapted to draw the wedge between the arms and thereby lock the parts together, and a pad-supporting arm embracing the split block, said arm and block being adapted to be locked together by the said operation of the handle, substantially as described.



16. In combination the block having a socket in its top and a recess in its bottom separated from the socket by a perforated diaphragm, means for securing it to a chair, the swinging bracket-arm having a stud to fit the block-socket said stud having a screw-threaded opening, a screw for the said opening situated in the recess having a diameter less than that of the perforation in the diaphragm to pass freely therethrough, and a spring surrounding the screw below said diaphragm and bearing against the same to pull the screw and hold the stud in its socket in a yielding manner, substantially as described.

17. The hollow bracket-arm in combination with the spittoon-supporting ring provided with a grooved stem to enter said arm, a transverse stop normally situated in the groove, a push-pin to move the stop transversely to the stem, and a retaining-spring, the spring being adapted to be compressed and the stop pushed into an inoperative situation by the thumb acting against the push-pin and mediately against a finger of the same hand to support the bracket-arm against the thumb-pressure whereby one hand can be used to disengage the ring without disturbing the arm, substantially as described.

18. In combination a bracket, a spittoon-holder comprising a ring situated within the wall of the spittoon and bearing on its interior, said ring having an extension 96 passing through said wall, a separate fastening passing through the wall to secure the ring and spittoon together, and means for detachably connecting the extension to the bracket or the like, said means being operative and the spittoon removable from the bracket with its mouth maintained in a horizontal plane, substantially as described.



19. In combination a bracket, a spittoon-holder comprising a ring situated within the wall of the spittoon, said spittoon having a mouth *a* provided with an extension forming a skirt within the spittoon, said ring being covered by the skirt and situated between it and the wall of the spittoon and having an extension 96 passing through said wall, a separate fastening passing through the wall to secure the ring and spittoon together, and means for detachably connecting the extension to the bracket or the like, said means being operative and the spittoon removable from the bracket with its mouth maintained in a horizontal plane, substantially as described.

605,975. BINDER FOR LEAVES. FRANK B. ROBINSON, New York, N. Y. Filed July 1, 1896. Serial No. 597,573. (No model.)

Claim.—In a binder for leaves, the combination of a rigid bottom piece or back, vertical rods or posts supported thereby, a perforated rigid companion piece or strip threaded upon the vertical rods, and a lever for each post hinged to the companion piece upon a transverse pivot at a point between the vertical rod and the end of the companion piece or strip, a notch in the contact end of each lever conforming to the outline of its vertical rod, the exterior end of each lever forming a thumb contact located near the end of said strip, substantially as and for the purpose described.

605,976. SOAP-RECEPTACLE. CLARA SOMERNER, Brownville, Neb. Filed Mar. 31, 1897. Serial No. 630,091. (No model.)

Claim.—A soap-receptacle, comprising a casing, a wire bottom for the same, a door by means of which the soap is inserted within the casing, a means for locking the door, a board or strip within the receptacle, an operating-handle connected to one side of the board and extending through the casing, and a knob upon the extremity of the operating-handle, the parts adapted to operate substantially as described.

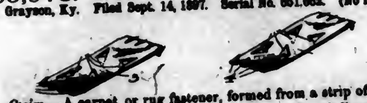
605,977. OXYPHENYL-GUANIDIN AND PROCESS OF MAKING SAME. HUGO R. SCHULZ, Radebeul, Germany, assignor to the Chemische Fabrik von Heyden, Gesellschaft mit Beschränkter Haftung, same place. Filed Nov. 16, 1897. Serial No. 658,753. (Specimens.)

Claim.—1. The process herein described for the production of oxyphenyl-guanidins of the formula

in which R and R' represent hydrogen or the univalent residue of a fatty or aromatic compound, and R' hydrogen or alkyl or alkylene, said process consisting in the addition of a carbodiimid to an amidophenol $NH_2C_6H_4OR'$, in which R' represents hydrogen, alkyl or alkylene.

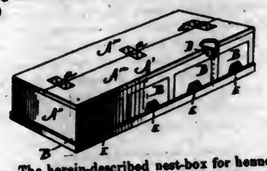
2. The process of making oxyphenyl-guanidins of the formula

in which R and R' represent hydrogen or the univalent residue of a fatty or aromatic compound, and R' represents hydrogen or alkyl or which consists in subjecting the reaction products from carbon bisulfid and amidophenol bodies to the action of desulfurizing agents in the presence of aromatic amido bodies, substantially as herein described.



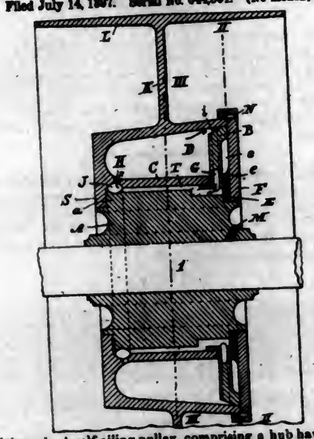
3. The oxyphenyl-guanidins herein described having the formula

in which R and R' represent hydrogen or the univalent residue of a fatty or aromatic compound, and R' represents hydrogen or alkyl or alkylene, and adapted to cause anesthesia, their chlorids forming white crystalline powders soluble in water and alcohol, from which



solutions alkaline lyes precipitate free oxyphenyl-guanidins as oily substances insoluble in water and soon becoming solid.

605,978. CARPET OR RUG FASTENER. GEORGE B. SHEPHERD, Grayson, Ky. Filed Sept. 14, 1897. Serial No. 651,602. (No model.)



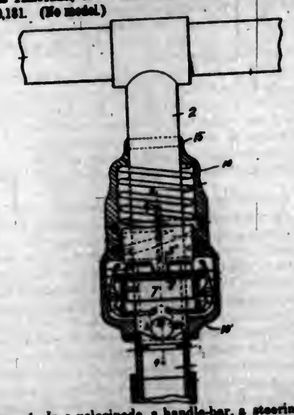
Claim.—A carpet or rug fastener, formed from a strip of sheet metal having pointed teeth at each end, and a series of diagonally-disposed teeth struck up from the strip within its edges near each end, the teeth at one end and the adjacent diagonally-disposed teeth being bent in the opposite direction to the similar teeth at the other end portion of the strip, substantially as described.

605,979. NEST-BOX FOR HENNERIES. ALEX J. SILBERSTEIN, Framingham, Mass. Filed Oct. 23, 1897. Serial No. 656,141. (No model.)

Claim.—The herein-described nest-box for henneries, consisting of the top A‴ provided with the lid or cover A⁴; front wall A′ provided with doors B hinged at their upper ends to said wall and adapted to swing inward only; rear wall A provided with doors C hinged at their upper ends to said wall and adapted to swing outward only; end walls A″; and transverse partitions dividing the interior of the box into compartments each furnished with an inwardly-opening door and an outwardly-opening door, said doors B being provided with openings or perforations whereby the nest can be seen from the outside, substantially as described.

605,980. SELF-OILING PULLEY. FRED H. SPEAR, Burlington, Vt. Filed July 14, 1897. Serial No. 644,501. (No model.)

Claim.—1. A self-oiling pulley, comprising a hub having therein an oil-chamber of greater diameter at one end than at the other, and having a bearing-surface and a separate bushing or sleeve within said surface and adapted to be fixed on a shaft or support, one of said parts having a longitudinal duct along said bearing-surface, and said parts having at the inner portion of the smaller end of the chamber a communication with one end of said duct and at the outer portion of the larger end of the chamber a communication with the other end of said duct.



2. In a self-oiling pulley, the combination with a bushing having a disk formed with inwardly-extending ducts leading from its periphery, and transverse ducts or grooves leading longitudinally across its bearing-face, of a pulley having a hub fitting on said bushing, an oil-chamber of larger diameter at one end than at the other inclosing said disk at its larger end, the smaller end of said chamber communicating with the rear ends of the said ducts in the bushing, substantially as set forth.

3. In a self-oiling pulley, the combination of a bushing having the disk B and formed with the ducts G, the grooves T, and the annular groove J, the pulley fitting on said bushing and having the oil-chamber D of greater diameter at one end, than at the other, and formed with the openings H by which said chamber communicates at its smaller end with said groove J, and an inclosing cap engaging the bushing and secured to the hub of the pulley, substantially as set forth.

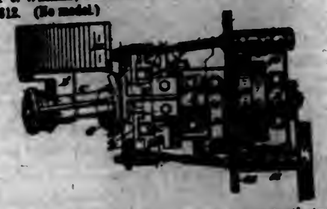
4. The combination with the pulley having the oil-chamber D, of the bushing having the disk B, inclined ducts G formed in the disk, transverse grooves leading from the inner ends of said ducts across the hub and bushing between their bearing-surfaces, and means whereby the rear ends of said grooves communicate with the smaller end of the oil-chamber D, substantially as set forth.

5. In a self-oiling pulley, the combination of the bushing having the disk B formed on its outer face with the chamber O, ducts formed in the bushing and extending from the outer portion of the disk inwardly and across the bushing and communicating with the rear end of the oil-chamber, the ring E situated at the outer side of the disk and serving to cover the ends of the ducts, holes G formed in the disk and leading from the chamber O to the chamber D and an inclosing cap F secured to the hub of the pulley and having the filling-aperture, substantially as set forth.

605,981. DEVICE FOR TEMPORARILY DISABLING BICYCLES. CHARLES TRAUTNER, Terre Haute, Ind. Filed Jan. 22, 1897. Serial No. 620,181. (No model.)

Claim.—1. In a velocipede, a handle-bar, a steering-post made in sections one of which is rotatable, a clutch member movable on one of the sections, a fixed counterpart clutch member, a case inclosing the clutch, devices intermediate the case and a clutch member to release the clutch, mechanism for automatically locking said clutch member from operative engagement, and a lock for said mechanism, the handle-bar and a post-section being freely rotatable when the clutch members are uncoupled, substantially as described.

2. In a bicycle, a steering-post, or the like, made in sections, one having fixed thereto a clutch member, a counterpart clutch member movable on the other section whereby the two sections may be coupled or uncoupled, mechanism for separating said clutch members at will, comprising an exterior rotatable case operatively connected to the movable clutch-section and inclosing the same, substantially as described.



3. In a bicycle, a steering-post, or the like, made in sections, one having fixed thereto a clutch member, a counterpart clutch member movable on the other section whereby the two sections may be coupled or uncoupled, mechanism for separating said clutch members at will, comprising an exterior rotatable case operatively connected to the movable clutch member and inclosing the same, a lock for said mechanism, a key to unlock the separating mechanism, and a spring to move the movable clutch member into engagement with its counterpart, substantially as described.

4. The sectional steering-post provided with clutch members one of which is movable for engaging and disengaging the post-sections either to prevent or permit independent rotation of the movable section, in combination with the inclosing case, said case having an independently-rotatable section 10 and connections between the rotatable case-section and the movable clutch member whereby the latter may be moved out of engagement, substantially as described.

5. The sectional steering-post provided with clutch members one of which is movable for engaging and disengaging the post-sections either to prevent or permit independent rotation of the movable section, in combination with the inclosing case, said case having an independently-rotatable section 10 and connections between the rotatable case-section and the movable clutch member whereby the latter may be moved out of engagement, and devices for holding said clutch disengaged, substantially as described.

6. The sectional steering-post provided with clutch members one of which is movable for engaging and disengaging the post-sections either to prevent or permit independent rotation of the movable section, in combination with the inclosing case, said case having an independently-rotatable section 10 and connections between the rotatable case section and the movable clutch member whereby the latter may be moved out of engagement, and devices for holding said clutch disengaged, a lock to keep said devices operative, said lock being concealed and also operative until unlocked by a key, substantially as described.

605,982. MACHINE FOR GENERATING GEAR-TEETH. HERBERT C. WARREN, Hartford, Conn. Filed June 26, 1897. Serial No. 643,612. (No model.)

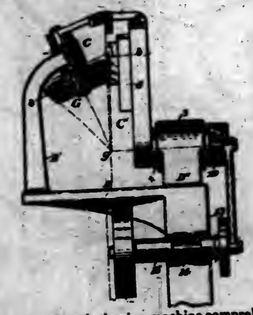
Claim.—1. In a machine for generating gear-teeth, two carriers supported for oscillatory movements, in combination with an actuating-connector between said carriers and comprising two members in direct operative engagement with each other and fixedly secured one to each carrier, and means for actuating one carrier, and, through the connector, the other carrier.

2. In a machine for generating gear-teeth, two oscillatory carriers having their axes of oscillation in intersecting lines, in combination with two intermeshing gear segments fixed one to each carrier, and means for actuating one of said carriers.

3. In a machine for generating gear-teeth, two oscillatory carriers having relatively oblique axes of oscillation, in combination with two intermeshing gear-segments fixed one to each carrier, and means for actuating one of said carriers.

4. In a machine for generating gear-teeth, the combination, with two oscillatory carriers having relatively oblique axes located in the same plane, of two intermeshing gear-segments fixed one to each carrier, and means for actuating one of said carriers.

5. In a machine for generating gear-teeth, the combination, with two oscillatory carriers having their axes of oscillation in intersecting lines, of two bevel-gear segments connected one to each carrier with the apex of their angles coincident with the point of intersection of the axial lines of the two carriers, and means for actuating one of said carriers.



6. The combination, with an oscillatory cutter-carrier and an oscillatory gear-blank carrier, of two intermeshing bevel-gear segments connected one to each carrier, and a carrier-actuating device in operative connection with one of said carriers and embodying means for changing the range of movement of said carrier.

7. In a machine for generating gear-teeth, the combination, with a cutter-carrier supported for oscillatory movement, of a gear-blank carrier supported for oscillatory movement with its axis oblique to the axis of movement of the cutter-carrier; means for effecting a change in the angular relation of the axis of the two carriers; two removable gear-segments carried one by each carrier with their teeth in intermeshing relation; and actuating means in connection with one carrier.

8. In a machine for generating gear-teeth, the combination, with two oscillatory carriers having their axes of movement in intersecting lines, of an actuating-connector between, and directly connecting, the two carriers and embodying two cooperative oscillatory members one of which is fixed to each carrier; means in connection with one carrier for adjusting the same with its axis at different angles relatively to the other carrier; and an actuating device in connection with one carrier and embodying means for changing the range of movement of said carrier.

9. In a machine for generating gear-teeth, the combination, with a cutter-slide carrier supported for oscillatory movement, of a cutter-slide mounted on said carrier for reciprocatory movements in a path intersecting the path of oscillatory movement thereof; a rotary cutter supported on the cutter slide; means for rotating the said cutter; a gear-blank carrier with its axis oblique to the axis of movement of the cutter-slide carrier; means for changing the angle of the gear-blank-carrier axis relatively to the angle of the cutter-slide-carrier axis; two intermeshing gears carried one by the cutter-slide carrier and the other by the gear-blank carrier; and means for actuating one carrier to impart synchronous oscillatory movements to both carriers.

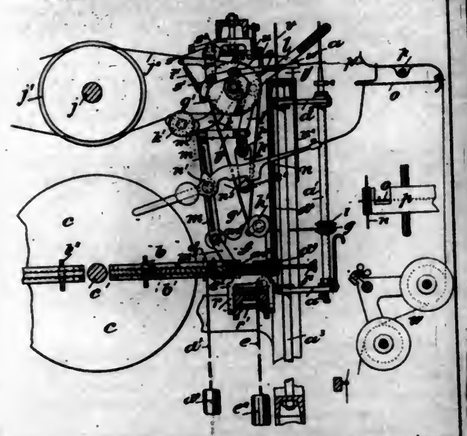
605,988. GEAR-TOOTH-GENERATING MACHINE. HERBERT C. WARREN, Hartford, Conn. Filed Dec. 15, 1897. Serial No. 661,966. (No model.)

Claim.—1. A gear-tooth-shaping machine comprehending a carrier for the gear-blank; a non-rotary shaping-tool mounted, with respect to the blank, to have a working stroke in a curvilinear path transverse to the longitudinal plane of the tooth being operated upon; and means for actuating the tool.

2. An apparatus of the class specified comprehending an oscillatory gear-blank carrier; an oscillatory tool-carrier; a non-rotary shaping-tool mounted on the tool-carrier in position to operate upon toothed portions of the blank carried by said blank-carrier; and actuating means for imparting to the tool a curvilinear working stroke along the side face of the tooth from the crown to the base, and in a plane transversely of the length of, said tooth, and for concurrently oscillating the gear-blank carrier on its axis.

3. The combination, in a machine of the class specified, of an oscillatory blank-carrier; an oscillatory tool-carrier; a planing-tool mounted on the tool-carrier in position for operating upon the side face of the tooth of the blank carried by the blank-carrier, and having a serrated cutting-face; and actuating mechanism embodying a connector between the two carriers, and effective for simultaneously oscillating said carriers in a manner whereby the gear-blank and tool will have a rolling action, one upon the other, and whereby the tool simultaneously will have an advancing working stroke crosswise of the length of the tooth, and from the top toward the bottom of the tooth-face, whereby to remove successive face portions of said tooth at successive points in such movement.

4. An apparatus of the class specified comprehending a carrier for the gear-blank; a tool-carrier; a non-rotary shaping or dressing tool mounted on the tool-carrier in position for operating on the blank; and means, embodying a connector between the two carriers, for imparting to the tool a tooth-shaping stroke in a path transverse to the longitudinal plane of the tooth operated upon, and from the crown toward the base of said tooth, and for simultaneously imparting to the gear-blank a rocking motion relatively to the tool.



5. An apparatus of the class specified comprehending a carrier for the gear-blank; a tool-carrier; a planing-tool mounted on the tool-carrier in position to operate upon the side face of a tooth of the gear-blank, and having a serrated cutting or dressing face; and actuating means for imparting to the tool a working stroke in a curvilinear path transverse to the longitudinal plane of said tooth, and from the crown to the base thereof.

6. An apparatus of the class specified comprehending a gear-blank carrier; a tool-carrier; a planing-tool mounted on the tool-carrier in position to operate upon the side face of a tooth of the gear-blank carried by the carrier, and having a serrated cutting-face of a length not less than the length of the tooth-face being operated upon; and actuating means operatively connecting the two carriers and effective for imparting to the tool a curvilinear working stroke transversely of the length of the tooth-face, without movement of said tool longitudinally of the tooth, and from the crown to the base thereof, and for concurrently oscillating the gear-blank carrier whereby to effect a rolling action between the blank and tool.

7. A gear-tooth-shaping machine embodying, in addition to a carrier for the gear-blank, a non-rotary shaping-tool mounted to have a curvilinear working stroke, with respect to the tooth to be shaped,

in the direction of curvatures of said tooth and transverse to the longitudinal plane thereof, and means embodying an actuating-connector between the two carriers for effecting a motion of the gear-blank concurrently with, and corresponding to, the curvilinear motion of the tool.

605,984. YARN-WINDING MACHINE. JOHN D. WHITE, Urmston, England. Filed Sept. 22, 1897. Serial No. 652,580. (No model.) Patented in England Oct. 5, 1896, No. 21,992.

Claim.—1. In combination in a yarn winding apparatus, a movable frame, a spindle carried thereby, a cord and winding-drum, said cord being connected to the movable frame, a friction-pulley connected to said cord-winding drum, a weight acting to raise the frame and a weight acting in opposition thereto to hold the frame in equilibrium, and the driving-disk for engaging the friction-pulley, substantially as described.

2. In combination with the spindle, the frame carrying the same and movable vertically, a yarn-guide, a swinging support therefor to which said yarn-guide is pivoted, said support comprising the finger e^3, a copping-plate r arranged to reciprocate with the spindle-carrying frame and having connection with the finger e^3 for canting the same, and the device having an inclined surface for giving the yarn-guide different lengths of throw when brought into engagement with different parts thereof by the canting of the finger e^3, substantially as described.

3. In combination, the vertically-movable spindle, the carrier therefor, means for moving the carrier comprising the friction-disk c and the adjustable pulley with connections to the movable frame, the bracket r carrying the friction-pulley adjustably, the pivotal support for said bracket by which the friction-pulley may be swung to and from contact with the friction-disk, means for rotating the spindle comprising the pulleys and belts, the tension device acting on the said belt and means for controlling said tension device and the pivoted bracket of the friction-pulley comprising a drop-lever controlled by the thread, a device for operating the same when in its lowest position and the connections between the said drop-lever and the said tension device and bracket, substantially as described.

4. In combination, the vertically-movable spindle, the carrier therefor, means for moving the carrier comprising the friction-disk c and the adjustable pulley with connections to the movable frame, the bracket r carrying the friction-pulley adjustably, the pivotal support for said bracket by which the friction-pulley may be swung to and from contact with the friction-disk, means for rotating the spindle comprising the pulleys and belt, the tension device acting on the said belt and means for controlling said tension device, and the pivoted bracket of the friction-pulley comprising a drop-lever controlled by the thread, a device for operating the same when in its lowest position and the connections between the said drop-lever and the said tension device and bracket comprising the lever m carrying the drop-lever pivotally, the incline and roller between the lever m and the bracket, the upper end of said lever m engaging the said tension device, substantially as described.

605,985. APPARATUS FOR FILTERING OR PURIFYING AND AERATING WATER. JOHN A. WIESENEGGER, Philadelphia, Pa. Filed Feb. 25, 1898. Serial No. 671,907. (No model.)

Claim.—1. A casing containing filtering or purifying material or both such materials, a supply-pipe leading thereinto from below, a well above said material communicating with said casing, and an auxiliary supply-pipe leading to said well above the same, the top of said well being open to the atmosphere.

2. A casing containing filtering or purifying material or both such materials, a well above said material or materials communicating with said casing, a supply-pipe for said casing, provided with a two-way cock, a supplemental supply-pipe leading from said cock to the top of said well, a two-way cock interposed between the first-named cock and the bottom of said casing, and a discharge-pipe connected with the second-named cock.

3. A casing containing filtering or purifying material or both such materials, a well on the casing above said material or materials, a supply-pipe connected with a casing below said material or materials, a terrace around said well and a splash-bed on said terrace.

4. In an apparatus for filtering or purifying or both filtering and purifying water, a well for receiving the filtered or purified water, and discharging it in running condition therefrom, a terrace around said bed, and a splash-bed on said terrace.

5. In an apparatus for filtering or purifying or both filtering and purifying water, a casing with a filter or purifying bed therein, a main supply-pipe connected with the bottom of said casing below said bed, a well above said bed communicating with said casing, an auxiliary supply-pipe connected with said main supply-pipe, a two-way cock connected with said pipes, a discharge-pipe connected with the main supply-pipe, a two-way cock connected with the main supply and discharge pipes, and a terrace around said well, the auxiliary supply-pipe having its discharge end above said well.

6. In a filter and purifying apparatus adapted to discharge the filtered or purified water or fluid above the filtering or purifying bed through a well or reservoir, and in running condition from the latter, a terrace around said well, and a splash-bed on said terrace.

7. In a filter, a casing, a well thereover, a terrace around said well, a supply-pipe leading to the bottom of said casing, the top of said well forming an overflow for filtered or purified water or both adjacent to the top of said terrace and a discharge for unfiltered water and deposits leading from the bottom of said casing, said terrace being above a storage-basin, into which said water, as filtered or purified or both filtered and purified water is discharged.

8. A storage-basin, a filter or purifying device, a well above said device in communication therewith, a terraced wall surrounding said well and means for directing water in opposite directions into said device.

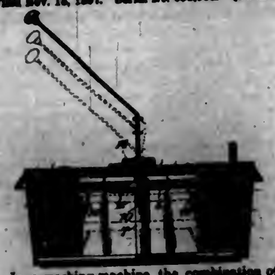
9. A storage-basin, a filter or purifying device, a well above said device in communication therewith, a terraced wall surrounding said well and means for directing water into said device, said terraced wall being sustained on the support of said filtering or purifying device, and forming an upward continuation thereof.

10. A storage-basin, a filtering or purifying device, a well above said device in communication therewith, and an elevated wall around said well and sloping from the top of said wall toward said basin, the latter containing said filtering or purifying device and surrounding said well.

605,986. TIRE. WILHELM AAS, New Ulm, Minn. Filed Feb. 14, 1898. Serial No. 670,573. (No model.)

Claim.—1. In a vehicle-tire, the combination with a tire, blocks secured to the ends of said tire, and a sleeve arranged to extend over said blocks, said sleeve and blocks having coacting wedge surfaces, of means for moving the sleeve with relation to said blocks, substantially as described.

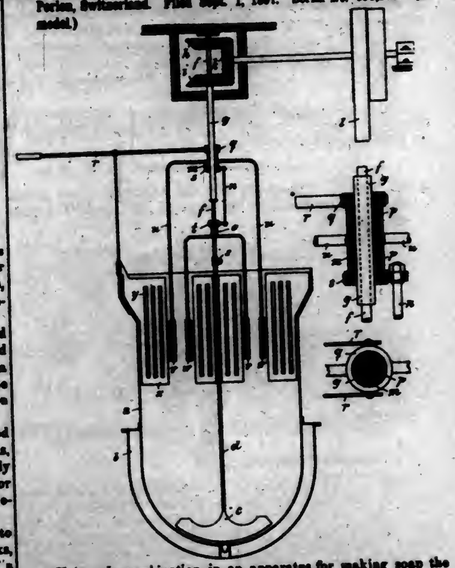
2. In a vehicle tire, the combination, with a tire, blocks secured to the ends of said tire, and a sleeve arranged to extend over said blocks, said sleeve and blocks having coacting wedge surfaces, of a tire-plate, a bolt extending through the tire-plate and between the blocks, and a nut on the bolt and arranged to draw up the sleeve on the blocks, substantially as described.



3. In a vehicle-tire, the combination, with a tire, blocks secured to the ends of said tire, a sleeve arranged to extend over said blocks, said sleeve and blocks having coacting wedge surfaces, and a felly provided with a slot arranged to receive the blocks, of means for moving the sleeve with relation to the blocks, substantially as described.

4. In a vehicle-tire, the combination, with a tire, blocks secured to the ends of said tire, a sleeve arranged to extend over said blocks, and means for moving the sleeve with relation to the blocks, of a filling-block between said blocks and within the sleeve, substantially as described.

5. In a vehicle-tire, the combination with a tire, whose ends are chamfered, blocks secured to the end of the tire and arranged to project beyond said ends, a sleeve arranged to extend over said blocks, said blocks and sleeve having coacting wedge surfaces, and a tire-plate provided with sloping ends corresponding to the chamfered ends of the tire, and resting on the projecting portions of the blocks, of means connected to the tire-plate for drawing the sleeve toward it, substantially as described.



6. In a vehicle-tire, the combination, with a tire, blocks secured to the ends of the tire, and a sleeve arranged to extend over said blocks, said sleeve and blocks having coacting wedge surfaces, of a tire-plate arranged between the ends of the tire, a felly having a slot into which the blocks project, a bolt passing through the tire-plate, through the slot in the felly, between the blocks and through the sleeve, a washer-plate on the bolt, and engaging the sleeve, and a nut for pressing the washer-plate and sleeve toward the tire-plate substantially as described.

605,987. WASHING-MACHINE. REASBUS W. ALLEN, Holton, Kans. Filed Nov. 18, 1897. Serial No. 658,961. (No model.)

Claim.—In a washing-machine, the combination of a washing-machine body having a rubbing-surface, a cover having a bearing-opening, an agitator, and a shaft extending through the bearing-opening of the cover and having its upper portion bent at an angle and arranged at an inclination to form a crank, the lower end of the shaft being passed through the agitator and bent at an angle to form a substantially L-shaped arm or hook arranged on the lower face of and supporting the agitator and extending into and engaging the same, whereby the agitator is rigidly connected with the shaft, substantially as described.

605,988. APPARATUS FOR MAKING SOAP. FRITZ ARLOVEN, Perlen, Switzerland. Filed Sept. 1, 1897. Serial No. 650,268. (No model.)

Claim.—In combination, in an apparatus for making soap the boiler, the slitted plates extending vertically therein, the two sets of agitators movable in the boiler in opposite directions, the shafts carrying the said agitators, one shaft passing through the other, means for rotating the shafts and means for raising and lowering the agitators consisting of the sleeves about the shafts and connected together with means for raising and lowering the said sleeves, substantially as described.

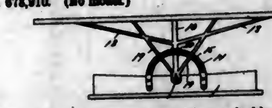
605,989. VALVE. IVORY BEAN, Brookline, Mass. Filed Oct. 30, 1897. Serial No. 656,949. (No model.)

Claim.—1. A tank having in its bottom an outlet-tube, and a valve located in the upper end of said tube, provided with a flange or ledge presenting a square or plane surface for the direct impinging action of the liquid, in combination with a cushioning-shank or tapering portion for closing the open end of the tube, whereby the same outlet-opening which cooperates with the ledge cooperates with the shank to cushion in one and the same valve-piece, substantially as described.

2. The combination with a tank and its tubular outlet-pipe, the latter being provided at its upper end within the tank with a flange containing a valve-seat, of a valve, means suspending the same within the tank above said valve-seat, said valve comprising a heavy columnar body, a reduced and long conical portion secured to and projecting downward from the lower end of said body and adapted to enter the upper end of said tubular outlet-pipe, and having at its lower end a transverse collar slightly smaller than the outlet-tube, and a casing corresponding in shape to said body and fitting close about said body and secured to said flange, said casing having inlet-ports for the water at its lower end, said body sliding over said ports, opening them as it lifts and gradually closing them as it lowers, and the long tapered conical portion gradually cutting off the flow of water through the outlet-pipe, as the valve is pulled down by the uniform choking of the tubular outlet by the said collar, substantially as described.

605,990. HAND-STRAP FOR CARS. FRANCIS E. BENTON, Stoughton, Mass. Filed Nov. 19, 1897. Serial No. 659,143. (No model.)

Claim.—A car-handhold consisting of two straps A B and a two-plate hinge with a coil-spring on the pivot thereof substantially as and for the purpose described



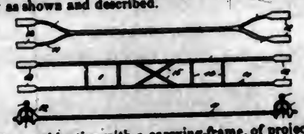
605,991. APPARATUS FOR GAS ANALYSIS. OTTO BLEIER, Vienna, Austria-Hungary. Filed June 10, 1897. Serial No. 640,276. (No model.)

Claim.—1. An apparatus for complete analysis of gas mixtures comprising the measuring vessel, the plurality of absorbing vessels, the valve-casing connected with the measuring vessel, an independent pipe connection from each absorbing vessel to said valve-casing, and a turning cock adapted to place each of said absorbing vessels separately in communication with said measuring vessel, substantially as described.

2. An apparatus for complete analysis of gas mixtures comprising the measuring vessel, the plurality of absorbing vessels, the valve-casing connected with the measuring vessel, an independent pipe connection from each absorbing vessel to said valve-casing, and a turning cock adapted to place each of said absorbing vessels separately in communication with said measuring vessel and a separate cock for each pipe connection, substantially as described.

605,992. CARRYING-FRAME. HENRIK R. H. BORGSTRÖM, Helsingfors, Russia. Filed Feb. 12, 1897. Renewed Apr. 26, 1898. Serial No. 678,910. (No model.)

Claim.—1. The combination with a suitable bar or frame, of a support for carrying persons, objects or things, which is connected therewith, and adapted to retain a horizontal position, regardless of the position in which the ends of the bar or frame are held, substantially as shown and described.

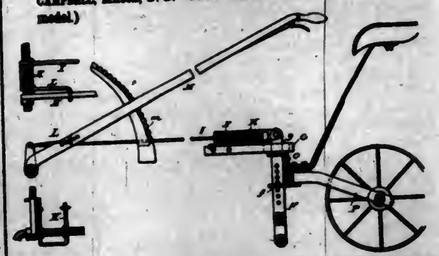


2. A carrying-frame provided with a suitable support for the object to be carried, said support being connected therewith, and adjustable therein or thereon, so that it will remain in a horizontal position, regardless of the position in which the ends of the carrying-frame are held, substantially as shown and described.

3. The combination with a suitable carrying-frame, of a support pivotally connected therewith, and suspended therefrom, said support being also provided with devices whereby it may be held in a horizontal position, at all times, regardless of the position of the frame, substantially as shown and described.

4. A carrying-frame, consisting of two separate side frames, between which is mounted a suitable support for a person or object to be carried, said support being provided with a curved or segmental plate adjacent to the frame in which is formed a curved or segmental slot, and a set-screw which passes through said frame, and said slot, whereby the support may be adjusted to, and held in a horizontal position, regardless of the position of the frame, substantially as shown and described.

605,993. CARRYING-FRAME. HENRIK R. H. BORGSTRÖM, Helsingfors, Russia. Filed Feb. 12, 1897. Renewed Apr. 26, 1898. Serial No. 678,911. (No model.)



Claim.—1. A carrying-frame provided at each end with two or more projecting rods or bars, said rods or bars being each provided at their outer ends with curved or yoke-shaped shoulder-pieces, said shoulder-pieces being provided with adjustable pads on their under sides or surfaces, which are also curved or yoke-shaped in form, substantially as shown and described.

2. The combination with a carrying-frame, of projecting rods or bars connected with the ends thereof, each of said rods or bars being provided with yoke-shaped shoulder-pieces, and semicircular or segmental pads, substantially as shown and described.

3. The combination with a carrying device, from which a load of any kind may be suspended, or to which a load may be attached or secured, of a plurality of shoulder-pieces at each end thereof, said shoulder-pieces being curved or yoke-shaped in form, substantially as shown and described.

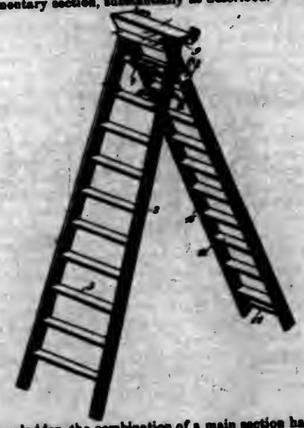
605,994. SEAT ATTACHMENT FOR PLOWS. WILLIAM J. CAMPBELL, Milton, N. D. Filed Jan. 7, 1898. Serial No. 666,572. (No model.)

Claim.—1. In a plow, the combination with a plow-beam, a plowshare, front wheels and a rear or furrow wheel, of an adjustable connection between said rear wheel and said plow-beam, whereby said rear wheel can be brought closer to or removed farther from said plow-beam, and the position of the plowshare relative to the ground correspondingly altered, substantially as described.

2. In a plow, the combination with a plow-beam, a plowshare, front wheels, and a rear wheel, of a rod attached to the landside of the plowshare, an adjustable bracket mounted thereon, and connection between said bracket and said rear or furrow wheel, substantially as described.

3. In a plow, the combination with a plow-beam, a plowshare, front wheels and a rear wheel, of a rod attached to the landside of said plowshare, an adjustable bracket mounted thereon, a seat secured thereto, and pivotal connection between said rear wheel and said seat-support, substantially as described.

4. In a plow, the combination with a plow-beam, a plowshare, front wheels and a rear wheel, of a vertical rod attached to the landside of said plowshare, means for permitting vibration of the upper end of said rod, an adjustable bracket mounted thereon, and a seat secured to said bracket, substantially as described.



5. In a plow, the combination with a plow-beam, a plowshare, front wheels and a rear wheel, of a vertical rod attached to the landside of said plowshare, means for permitting vibration of the upper end of said rod, an adjustable bracket mounted thereon, a seat secured to said bracket, and pivotal connection between said rear wheel and said seat-support, substantially as described.

6. In a plow, the combination with a plow-beam, a plowshare, front wheels and a rear wheel, of a vertical rod pivotally attached to the landside of said plowshare, a bracket attached to the upper end of said rod, a rod passing through said bracket, a spring mounted on said rod and bearing against said bracket, and means for controlling the position of said rod and consequently the strength of said spring, substantially as described.

7. In a plow, the combination with a plow-beam, a plowshare, front wheels and a rear wheel, of a vertical rod pivotally attached to the landside of said plowshare, a bracket attached to the upper end of said rod, a rod passing through said bracket, and the hand-lever M, U-shaped bracket K, and rod L for controlling the position of said rod and consequently the strength of said spring, substantially as described.

605,995. COMBINED STEP AND EXTENSION LADDER. EMILIO CARBARELLI, Boston, Mass. Filed Oct. 18, 1897. Serial No. 655,578. (No model.)

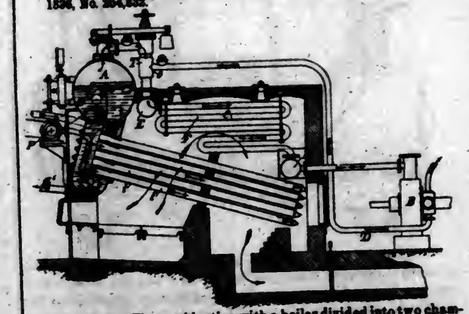
Claim.—1. In a ladder, the combination of a main section having a step secured upon the upper ends of its side rails, clips hinged to the main section below the top step, a supplementary section slidably supported between the clips, and its upper end engaging the lower face of said upper step when the lower ends of the sections are spread apart, and means to limit the inward movement of the upper end of the supplementary section, substantially as described.

2. In a ladder, the combination of a main section having a step secured upon the upper ends of its side rails, and provided with a downwardly-extending flange, clips hinged to the main section below the top step, and a supplementary section slidably supported between the clips, and its upper end engaging the said upper step and flange when the lower ends of the sections are spread apart, substantially as described.

3. In a ladder, the combination of a main section, clips hinged thereto near its upper end, clips rigidly secured thereto above the hinged clips and having vertically-disposed grooves, a supplementary section slidably supported by the said clips, pins projecting from the side rails of the supplementary section near its upper end and adapted to engage the hinged clips and to pass through the grooves in the fixed clips, and a catch on the lower end of the supplementary section adapted to engage the step on the main section, when the ladder is extended, substantially as described.

4. In a ladder, the combination of a main section having inclined shoulders on the inner faces of the side rails between two steps near its upper end, a supplementary section adapted to pass between the rails of the first section and be supported on said shoulders, and set-screws in the rails of the main section above said shoulders adapted to engage the rails of the supplementary section, substantially as and for the purpose specified.

605,996. JOURNAL AND BEARING. JOHN R. CARTER, Cincinnati, Ohio. Filed Apr. 1, 1898. Serial No. 676,107. (No model.)



Claim.—1. The combination with a bearing having a curved bottom and an inwardly-projecting curved lip, of a hanger having a journal adapted to rest in the bearing and a curved recess to receive the lip on the bearing.

2. The combination with a bearing having an open top and a lip projecting inwardly from adjacent the bottom of the bearing, of a hanger having a journal and a recess below the journal to receive the lip on the bearing.

3. The combination with a bearing having an open top, side flanges and an inwardly-projecting lip, of a hanger having a journal and curved recess below the journal to receive the lip on the bearing.

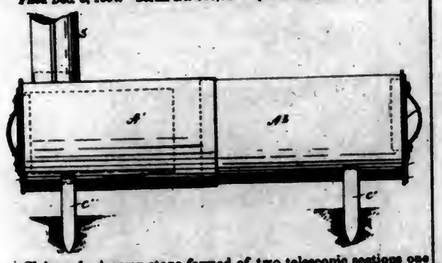
4. The combination with a bearing having an open top and an inwardly-projecting curved lip, of a hanger having a journal and a lip below the journal, the lip on the hanger adapted to rest below the lip on the bearing.

605,997. STEAM-GENERATOR. DOMINGUE A. CABALLERO, Paris, France. Filed Dec. 28, 1897. Serial No. 663,940. (No model.) Patented in England Sept. 17, 1895, No. 17,276, and in France Mar. 17, 1896, No. 254,832.

Claim.—1. The combination with a boiler divided into two chambers, of concentrically-arranged heating and circulating tubes, the outer tubes communicating with one of the boiler-chambers, and the inner tubes communicating with the other boiler-chamber and being perforated whereby jets of water are projected at right angles against the heating-surfaces of the outer tubes, and a pump connected respectively with said chambers and through which they communicate and by which a mechanical circulation of the liquid from one chamber to the other and through the heating and circulating tubes is maintained, substantially as described.

2. The combination with a boiler divided into two independent chambers by an internal partition, of concentrically-arranged heating and circulating tubes projecting at one end into said boiler, the outer tubes communicating with one chamber, and the inner tubes communicating with the other chamber, said inner tubes being perforated so as to project jets of water at right angles against the inner surfaces of the outer heating-tubes, and a pump connected respectively with said chambers and through which they communicate and by which a mechanical circulation of the liquid from one chamber to the other and through the heating and circulating tubes is maintained, substantially as described.

605,998. BUTTON OR STUD. CHARLES C. CHAMPENOIS, Newark, N. J. Filed Nov. 6, 1897. Serial No. 657,804. (No model.)



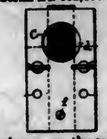
Claim.—1. A button or stud, comprising a back-plate or shoe and a tubular post formed integral therewith, said post having slots a^3, and a pair of clamping lugs or jaws a^4, a bracket or bearing having a post portion arranged in said tubular post and fitted in said slots a^3 and said lugs or jaws being clamped and secured against the sides of said post portion of the bracket or bearing, and a head pivotally connected with said bracket or bearing, substantially as and for the purposes set forth.

2. A button or stud, comprising a back-plate or shoe and a tubular post formed integral therewith, said post having slots a^3, and a pair of clamping lugs or jaws a^4, a bracket or bearing having a post portion arranged in said tubular post and fitted in said slots a^3 and said lugs or jaws being clamped and secured against the sides of said post portion of the bracket or bearing, a pair of loops or eyes c^4 connected with said bracket or bearing, said loops or eyes having flattened surfaces c^5, a spring plate or disk d, having a loop d' pivotally arranged on a pin or rivet in said loops c^4, and a head b secured to said plate or disk d, substantially as and for the purposes set forth.

3. A button or stud, comprising a back-plate or shoe and a tubular post formed integral therewith, said post having slots a^3, and a pair of clamping lugs or jaws a^4, a bracket or bearing having a post portion arranged in said tubular post and fitted in said slots a^3 and

said lugs or jaws being clamped and secured against the sides of said post portion of the bracket or bearing, a pair of loops or eyes c^4 connected with said bracket or bearing, said loops or eyes having flattened surfaces c^5, a spring plate or disk d, having a loop d' pivotally arranged on a pin or rivet in said loops c^4, and said disk or plate d having slots d^2 contiguous to the ends of the loop d', and a head b secured to said plate or disk d, substantially as and for the purposes set forth.

605,999. CAMP-STOVE. FRANK B. CHARBOIN, Fairhaven, Wash. Filed Dec. 3, 1897. Serial No. 660,647. (No model.)



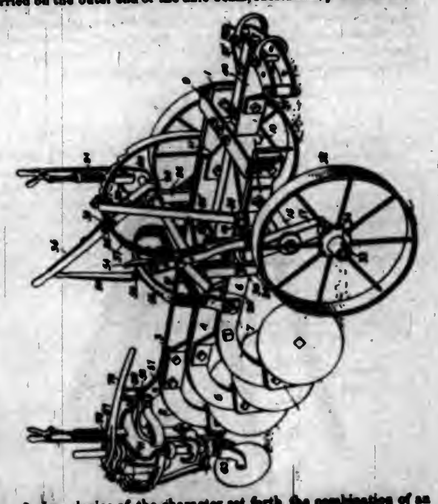
Claim.—1. A camp-stove formed of two telescopic sections one of which is provided with a fuel or fire door and the other with a smoke-outlet and a longitudinally-extending oven spaced from the interior of the oven-section to allow the products of combustion to pass around it and permit telescoping of the sections, substantially as described.

2. A camp-stove comprising a horizontal body formed of two telescopic sections, a door at the front end of the fire-box section, a longitudinally-extending oven within and spaced from the other section, a door closing the front end of the oven, and a smoke-outlet at the front end of the oven-section, substantially as described.

3. A horizontal body-stove formed in two cylindrical telescopic sections having flat top portions, an oven extending inwardly into one section and spaced from the interior thereof, a door or cap for the open front end of the oven and a door or cap for the front end of the fire-box section, substantially as described.

606,000. TOOL-SHARPENER. ALFRED H. CLARK, Athens, Mich. Filed Sept. 18, 1897. Serial No. 652,100. (No model.)

Claim.—1. In a tool-sharpener, the combination with a flat sharpening-surface, and a guide on each side of said sharpening-surface for holding the tool at the proper angle against said surface, whereby the blade of the tool is free and clear of the guides as it passes across said sharpening surface, substantially as set forth.



2. In a tool-sharpener, the combination with a flat sharpening-surface, a guide on each side of said sharpening-surface for holding the tool at the proper angle against said surface whereby the blade of the tool is free and clear of the guides as it passes across said sharpening-surface, and means permitting the adjustment of the sharpener with respect to said guides, substantially as set forth.

3. A tool-sharpener having in combination a sharpener with two or more flat sharpening-faces, blocks rigidly fitting upon said sharpener having guides formed therein for holding the edge of the tool in proper position against the sharpener and free and clear as it passes across the face of the said sharpener, and means permitting the adjustment of the sharpener between the blocks, substantially as set forth.

606,001. HILLSIDE CULTIVATOR OR PLOW. MARK C. DEUSLER, Willow, Cal. Filed Aug. 14, 1897. Serial No. 648,312. (No model.)

Claim.—1. In a device of the character set forth, the combination of a frame, a longitudinal draft-beam pivoted to the frame and adapted to swing horizontally, a transversely-arranged axle-beam having ground-wheels at its ends and pivoted between its extremities to turn in a horizontal plane, and means for connecting and simultaneously adjusting said draft-beam and axle-beam, substantially as set forth for the purpose described.

2. In a device of the character set forth, the combination of a frame, a draft-beam movably mounted thereon, an axle-beam having ground-wheels adjustably carried thereby, means for simultaneously adjusting said draft and axle beams, and apertured segmental plates carried on the outer end of the axle-beam, substantially as described.

3. In a device of the character set forth, the combination of an axle-beam, arms movably mounted on the ends thereof having stub-axles extending therefrom, ground-wheels mounted on said stub-axles, links movably attached to said arms, and a rod adjustably connected to said links, substantially as described.

4. In a device of the character set forth, the combination of an axle-beam, arms movably carried by said axle-beam and having stub-axles projecting therefrom arranged in reverse positions, ground-wheels mounted in said stub-axles, links movably attached to said arms, a rod adjustably connected to one of said links, a lever adjustably connected to the opposite link and adapted to be operated to move one arm independently of the other, and devices attached to said rod for unitedly operating both arms, substantially as and for the purposes specified.

5. In a device of the character set forth, the combination of a frame, an axle-beam adjustably carried thereby, a draft-beam simultaneously movable with said axle-beam, and an adjusting-clamp intermediate of the connections between the said axle-beam and draft-beam to impart an initial adjustment to said axle-beam, substantially as described.

6. In a device of the character set forth, the combination of a frame, a rectangular brace surrounding the front of the frame, posts or bolts mounted in said brace and spaced apart from each other, a draft-beam adjustably carried by said frame and pivoted to the rectangular brace between said posts or bolts, and a lever having connection with the rear portion of the draft-beam for adjusting it laterally and holding it in a located position, substantially as described.

7. In a device of the character set forth, the combination of a frame comprising a series of bars having rear depending curved ends, plows or cultivators attached to said ends, a trailer adjustable laterally and rotatably, an adjustable draft-beam, an adjustable axle-beam having ground-wheels movably attached thereto, and means for adjusting the several parts, substantially as described.

8. In a device of the character set forth, the combination of a frame, an adjustable axle-beam having a post movably engaging a socket on one side of the frame, means for initially adjusting the opposite end of the axle-beam, an adjustable draft-beam, and devices for simultaneously moving said axle and draft beams, substantially as and for the purposes specified.

9. In a device of the character set forth, the combination of a frame a brace-bar extending rearward from a part of said frame, a toothed segment supported by said brace-bar, a curved toothed frame extending to the rear of said toothed segment, a post movably supported by said brace-bar and segment and carrying a trailer, and means for laterally and rotatably adjusting the said post and trailer, substantially as described.

10. In a device of the character set forth, the combination of a frame, a brace bar extendingly rearwardly therefrom, a segment vertically disposed on the said brace-bar, a horizontally-toothed frame movably carried in rear of said segment, a post rotatably mounted in bearings carried by the said brace-bar and toothed frame, and levers for adjusting said devices, substantially as described.

11. In a device of the character set forth, the combination of a frame, a brace-bar extending therefrom, a vertically-disposed toothed segment on said brace-bar having guides, a horizontally-disposed toothed frame movably mounted in said guides and carrying a bearing, another bearing movably carried by the lower part of said brace-bar, a trailer-post rotatably mounted in said bearings adapted to have a lateral adjustment, a shifting-lever attached to the said horizontally-disposed toothed frame and coacting with the said segment, a yoke engaging the post and provided with a rearwardly-extending arm having a flange to engage the teeth of the said toothed frame and also formed with a front tooth, a lever attached to said yoke, a collar secured to the post and having a slot therein adapted to be engaged by the tooth on the yoke, and a spring surrounding the post between a part of the yoke and the upper bearing, substantially as described.

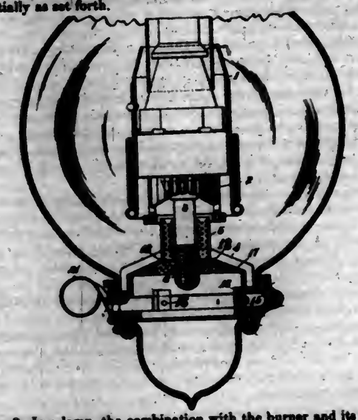
12. In a device of the character set forth, the combination of a frame, an axle-beam carried thereby, arms movably mounted on the ends of said axle-beam and having stub-shafts extending from the same in reverse positions, ground-wheels engaging said stub-shafts, and means for simultaneously adjusting both arms and also for individually adjusting one of the arms, substantially as described.

13. In combination, a frame bearing a gang of earth-treating devices, a transversely-disposed axle having its spindle-arms out of line with and relatively loosely connected to the axle and bearing ground-wheels, a transverse rod having an arm in connection with one of the spindle-arms, means for turning the rod and holding it in an adjusted position, a lever loosely mounted upon the opposite end of the said rod and having connection with the other spindle-arm for independent adjustment thereof, and means for connecting the said lever with the rod, whereby after the ground-wheels have been independently adjusted they may be simultaneously moved, substantially as described.

14. In combination, a frame bearing a gang of earth-treating devices, a transversely-disposed axle, crank-arms loosely connected with the ends of the axle and bearing ground-wheels, a rod parallel with the axle, means for adjustably connecting one of the crank-arms with an end portion of the rod, a lever loosely mounted upon the opposite end of the rod and having adjustable connection with the other crank-arm, and means for connecting the lever with the said rod, substantially as described.

15. In combination, a frame bearing a gang of earth-treating devices, a transversely-disposed axle, crank-arms loosely connected with the ends of the axle and bearing ground-wheels, a rod parallel with the axle, and having one end bent, a link adjustably connecting the bent end of the rod with a crank-arm, a toothed segment secured to the opposite end of the rod, a lever loosely mounted upon the rod and having a latch to engage with the toothed segment, and a link adjustably connecting the said lever with the other crank-arm, substantially as specified.

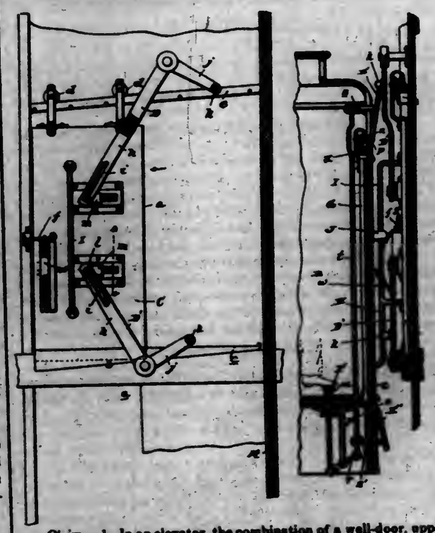
16. In combination, a draft-bar, a gang of earth-treating devices, a transverse bar having pivotal connection with the draft-bar and rigidly attached to the gang, a toothed arched bar secured to the extreme or outer gang-bars, an upright lever fulcrumed to a brace connecting the ends of the arched bar, and having a toothed portion to engage with the teeth of the said arched bar, and means connecting the upright lever with the draft-beam, substantially as described.



17. In combination, a draft-beam, an axle mounted to turn upon a vertical pivot, a lever for turning the draft-beam upon a vertical pivot, a bell-crank lever fulcrumed to the frame and having its longitudinal arm connected with the draft-beam, a clamping-loop adjustably connected with the lateral or transverse arm of the bell-crank lever, and adjustable connections between the said loop and the axle, substantially as and for the purpose specified.

18. In combination, a draft-beam mounted to turn upon a vertical pivot, an axle mounted to swing upon a vertical axis, a bell-crank lever fulcrumed to the frame and having its longitudinal arm connected with the rear end of the draft-beam, a loop, a screw-shank connecting the rear end of the loop with the lateral or transverse arm of the bell-crank lever, and an eyebolt clipped to the aforesaid axle and having its threaded portion making adjustable connection with the front end of the said loop, substantially as and for the purpose described.

606,002. LAMP. ROBERT M. DUNN, East Orange, N. J., assignor to The Safety Car Heating and Lighting Company, of New York. Filed Nov. 11, 1893. Serial No. 611,088. (No model.)



Claim.—1. In a lamp, the combination with a burner and its stem, of a spider and globe-supporting ring, the vertical portion of the spreader carried upon the spider, a hinged frame secured to the ring, and the lower portion of the foraminous spreader carried upon the frame, and adapted to form a continuation of the first-named portion when the frame is closed, substantially as set forth.

2. In a lamp, the combination with the burner and its stem extending centrally below the burner, of a spider supported by the stem below the burner, a globe open at its lower end and supported upon the spider, a frame hinged to the spider, and a closing device carried by such frame for closing the lower open end of the globe, substantially as set forth.

3. In a lamp, the combination with the burner and its stem extending centrally below the burner, of a ring supported from such stem and arranged below the burner, a globe open at its lower end and supported by said ring, a frame hinged to such ring, a cup arranged to close the lower open end of the globe, carried by such frame, and a catch by which the said frame and cup are held in their closed positions, substantially as set forth.

606,008. MEANS FOR OPERATING DOORS FOR ELEVATOR-WELLS. FREDERICK T. ELLINGWOOD, Newark, N. J. Filed Mar 26, 1898. Serial No. 675,212. (No model.)

Claim.—1. In an elevator, the combination of a well-door, upper and lower levers connected with said door, and upper and lower tappets on the elevator-car for engaging the upper and lower levers on the up and down movements, respectively, of the car, substantially as specified.

2. In an elevator, the combination of a well-door, cushioned slides or buffers on said door, upper and lower levers connected with the cushioned slides or buffers, and upper and lower tappets on the elevator car for engaging the upper and lower levers on the up and down movements, respectively, of the car, substantially as specified.

3. In an elevator, the combination of a well-door, upper and

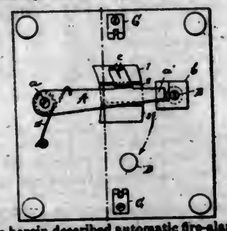
lower levers connected with said door, upper and lower tappets on the elevator-car for engaging the upper and lower levers on the up and down movements, respectively, of the car; said tappets normally resting in a position to pass the levers without engaging the same, and suitable means under the control of the elevator-conductor for extending the tappets when it is desired to have them engage the levers, substantially as specified.

4. In an elevator, the combination of a gravitating self-closing well-door, cushioned slides or buffers thereon, upper and lower levers connected with said slides or buffers, upper and lower tappets on the elevator car for engaging the upper and lower levers on the up and down movements, respectively, of the car; said tappets normally resting in a position to pass the levers without engaging the same, and suitable means under the control of the elevator-conductor for extending the tappets when it is desired to have them engage the levers, substantially as specified.

5. In an elevator, the combination of a well-door, a device thereon movable in the same direction as the door, a spring backing the movable device, a car, and coacting devices on the wall of the elevator-well and the car for opening the door; the device on the wall of the well being connected with the movable device on the door, substantially as specified.

6. In an elevator, the combination of a well-door, a vertically-movable latch therefor, a vertical spring having one end fixed and its opposite end connected directly to the latch; said spring being normally bowed in a direction away from the door, a car, and a shoe arranged on the car in the same vertical plane as the bowed spring so as to engage said spring on the up and down movements of the car, substantially as specified.

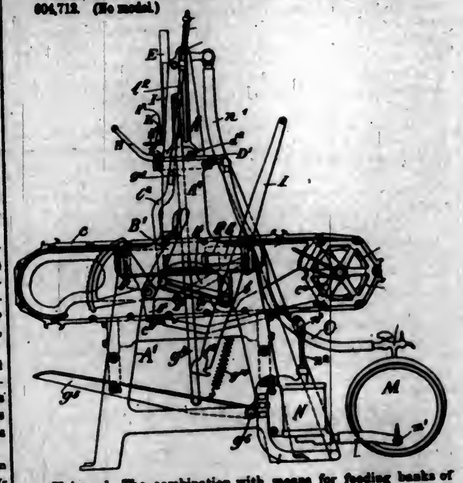
7. In an elevator, the combination of a well-door, upper and lower levers connected with said door, upper and lower, oppositely-disposed tappets pivotally connected with the elevator-car, springs for normally holding the tappets against the car, a pedal and devices connected with the pedal for extending the tappets, substantially as specified.



8. In an elevator, the combination of a well-door, a device thereon movable in the same direction as the door, a spring backing the movable device, a lever having one of its arms connected with the movable device on the door, a car, a tappet on the car normally resting in a position to pass the lever without engaging the same, and suitable means, under the control of the elevator-conductor, for extending the tappet so as to enable the same to engage the lever, substantially as specified.

9. In an elevator, the combination of a well-door, a lever connected with said door, a tappet for engaging the lever pivotally connected with the elevator-car, a spring for normally holding the tappet against the car, a lever fulcrumed on the car and engaging the tappet, and suitable means under the control of the elevator-conductor for rocking said lever.

10. In an elevator, the combination of a gravitating, self-closing well-door, levers fulcrumed above and below and loosely connected with said door, upper and lower tappets on the car for engaging the upper and lower levers on the up and down movements, respectively, of the car; said tappets normally resting in a position to pass the levers without engaging the same, and suitable means under the control of the elevator-conductor for extending the tappets when it is desired to have them engage the levers, substantially as specified.



11. In an elevator, the combination of a track inclined upwardly from its middle, well-doors hung from said track and arranged at opposite sides of the middle thereof, levers connected to said doors, a pitman connecting the said levers, a car, and a tappet on the car for engaging and moving one of the levers, substantially as specified.

606,004. THERMAL CIRCUIT-CLOSER. LAUREL REDEN and JOHN A. DAWSON, Reading, Pa. Filed Nov. 19, 1897. Serial No. 659,082. (No model.)

Claim.—The herein-described automatic fire-alarm, comprising a base having a series of plates secured thereto and in circuit with the alarm system, a lever pivoted to said base and also in circuit with the alarm system, a spring designed to actuate said lever, a fusible block having a shoulder designed to engage and hold said lever in a normally raised position, said lever being provided with depending arms or members having lower curved ends designed to engage said plates, and means adapted to limit the movement of said lever under the action of said spring, substantially as set forth.

606,005. MACHINE FOR FILLING AND CORKING BOTTLES. WILLIAM M. FOWLER, Stamford, Conn. Filed Sept. 3, 1896. Serial No. 604,712. (No model.)

Claim.—1. The combination with means for feeding banks of bottles step by step into position to be filled, of a filling mechanism, a corking mechanism and a cork-fastening mechanism and means for bringing the said filling, corking and cork-fastening mechanisms into and out of alinement with the bank of bottles while held in position, substantially as set forth.

2. The combination with the bottle-filling mechanism and a corking mechanism arranged to coöperate with the filling mechanism, of a reservoir for cork-fasteners and means for conveying the fasteners from their reservoir into position to be operated upon by the corking mechanism, substantially as set forth.

3. The combination with means for feeding bottles step by step into position to be filled and a sealing-plate for receiving the mouths of the bottles, of plungers for forcing the bottles toward the sealing-plate, a hydraulic press for operating the plungers and means for filling and corking the bottles while held in contact with the sealing-plate, substantially as set forth.

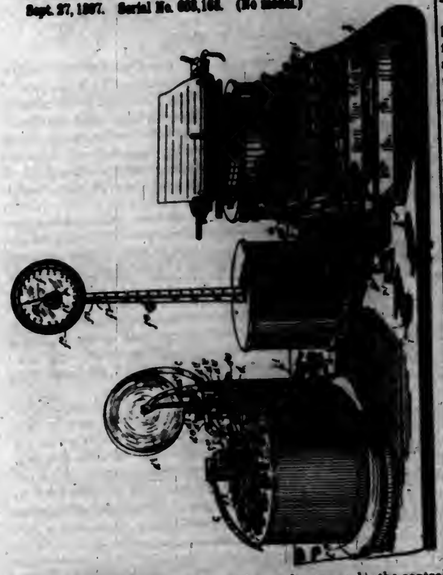
4. The combination with the corking-plunger and means for operating it, of a reservoir for cork-fasteners and a turn-table mounted in position to convey the fasteners successively from the fastener-reservoir to a position beneath the plunger, substantially as set forth.

5. The combination with the filling reservoir mounted to reciprocate, the fillers connected therewith and means for holding the bottles in position to be filled, of a supply-reservoir, a connection between the supply-reservoir and filling-reservoir, a pump interposed in said connection and an operating-lever common to said pump and to the reciprocating filling-reservoir, substantially as set forth.

6. The combination with a corking-plunger comprising a central driving-rod and a sleeve loosely surrounding said rod, of means for reciprocating the plunger and means for automatically locking the sleeve to the plunger throughout a portion of its movement and leaving it free to slide on the plunger throughout a portion of its movement, substantially as set forth.

7. The combination with the filling mechanism and the supply-reservoir, of means for forcing the liquid to the filler comprising a cylinder, a reciprocating piston within the cylinder and an operating-lever arranged to engage the piston during a portion of its stroke only in each of two opposite directions, substantially as set forth.

606,006. HAT-FASTENER. DAVID V. SAGER, Philadelphia, Pa., assignor of one-half to Charles L. Schwarz, same place. Filed Feb. 16, 1897. Renewed Apr. 14, 1898. Serial No. 677,826. (No model.)



Claim.—1. A hat-fastener consisting of a bow having limbs with eyes and provided with a brace continuous of said eyes, and a pin having a head which latter is mounted on said eyes.

2. In a hat-fastener, the bow B having the eyes C and brace and stop D continuous therebof, and the pin F having, on its upper portion, the contracted neck with the confining-clasp G therefor and a head above said neck mounted on said eyes, said pin normally closing toward said bow.

3. A hat-fastener consisting of the limbs B, B, with the eyes C, C, and depending brace D integral with said limbs and eyes, and the pin F having a looped head portion, and depending limbs E, E, said head portion being journaled in the eyes C, C and the clasp G on said limbs E, E.

606,007. COMPOSING-MACHINE FOR TYPE CASTING AND SETTING MACHINES. GEORGE A. GOODSON, Minneapolis, Minn. Filed Sept. 27, 1897. Serial No. 653,168. (No model.)

Claim.—1. The combination with a perforator, under the control of an ordinary keyboard having character and space keys, of a justifier comprising a connection-box, having connections to the perforator for the possible amounts of justification-space in lines of the possible number of spaces, according to an arbitrary predetermined scheme of distribution, and a traveling keyboard having a step-by-step movement, in respect to said box, at word-spaces, and provided with keys representing the different amounts of justification-space, for coöperation with said box, to produce the justification-holes required, substantially as described.

2. The combination with an electrically-controlled perforator, and an ordinary keyboard controlling the connections thereto for characters and word-spaces, of a justifier comprising a contact-box having contacts with wires to the perforator, for the possible amounts of justification-space, in lines of the possible number of spaces, according to an arbitrary predetermined scheme of distribution, and a traveling keyboard having a step-by-step movement, in respect to said box, at word-spaces, and provided with contact-keys representing the different amounts of justification-space, for coöperation with said box, substantially as described.

3. The combination with a perforator, under the control of an ordinary keyboard having character and space keys, of a justifier comprising a connection-box, with connections to the perforator, for the possible amounts of justification-space, in lines of the possible number of spaces, according to a predetermined scheme of distribution, a traveling keyboard with contact-keys representing the different amounts of justification-space, for coöperation with said box, and an escapement, under the control of the space-key of the ordinary keyboard, and adapted to impart a step-by-step movement to said traveling keyboard, at word-spaces, substantially as and for the purposes set forth.

4. The combination with the perforator and the ordinary keyboard, of the justifier comprising the connection-box with connections to the perforator for the possible amounts of justification in lines of the possible number of word-spaces, according to an arbitrary predetermined scheme of distribution, a traveling keyboard representing the different amounts of justification-space, the escapement, for said traveling keyboard, controlled by the space-key of the ordinary keyboard, strip-feeding devices on the perforator, under the control of said ordinary keyboard, for characters and spaces, and a special feed-key, for charging the justifier-keyboard and operating said strip-feed devices, substantially as described.

5. The combination with the electrically-controlled perforator, the ordinary keyboard and the justifier, as described, of the feed-circuit connections for the perforator, the relay-circuit connections for controlling the feed-circuit, with said relay connections arranged to be operated at every key action on the ordinary keyboard, and a special feed-key for closing said relay-circuit, at will, as required for coöperation with the justifier or other purposes, substantially as described.

6. The combination with the electrically-controlled perforator having the bank of punches and punch-magnets, arranged on a bifactored principle one set for making the row-selecting holes in the strip and the other set for making the holes to select the individual type from the row, as described, of an ordinary keyboard having character and space keys, circuit connections from said keyboard to said punch-magnets, arranged on a bifactored principle for coöperation with said sets of punch-magnets, and an electrically-controlled differential letter-space indicator, having the unit-magnets thereof connected up in series, with said row-selecting punch-magnets, substantially as and for the purposes set forth.

7. The combination with the electrically-controlled perforator and the ordinary keyboard, of the differential letter-space indicator, electrically controlled, the strip-feeding devices on the perforator, the feed-magnet for the indicator, the feed-circuit connections for said perforator and said indicator, with the latter connected up in multiple with the former, a relay, in said feed-circuit, and relay-circuit connections controlled by the ordinary keyboard, for controlling said feed-circuit, all substantially as described.

8. The combination with the electrically-controlled perforator, the ordinary keyboard and the justifier-keyboard, of the circuit connections to the punch-magnets of the perforator, controllable by the keys of both of said keyboards, the electric escapement for the traveling keyboard of the justifier, controlled by the space-key of the ordinary keyboard, the feed-circuit connections for the strip-feeding devices of the perforator, the relay and the circuit connections for controlling said feed-circuit, with said relay connections arranged to be operated at every key action of the ordinary keyboard, the special feed-key for charging the justifier-keyboard and closing said relay-circuit, when a justifier-key is to be struck, and the electrically-controlled differential letter-space indicator, with circuit connections for the same, controlled by the key action of the ordinary keyboard, substantially as described.

9. The combination with the perforator and the type-writer, as described, of the justifier comprising the contact-box g, with the stack of insulated contact-plates g^{16} and the hard-rubber face-plate g^{17}, with mercury-wells g^{18}, the contact-pins g^{20} and g^{21}, disposed as described, the separate wires from said several plates to the corresponding punch-magnets of the perforator, the traveling keyboard with the keys g^{14} having the contacts g^{19}, the escapement for said keyboard, including the magnet g^{12}, with circuit connections controlled by the space-key of the type-writer and the special key b', for charging the justifier-keyboard and controlling the feed-circuit of the perforator, all substantially as and for the purposes set forth.

10. The combination with the electrically-controlled perforator and an ordinary keyboard, of the trip-hole punch and punch-magnet on the perforator, the trip-circuit connections for the same, the special trip-key, feed-circuit connections for the perforator and a special

feed-key for operating the same, in cooperation with said trip-key, when required, substantially as described.

11. A slack-provider, for a strip of flexible material, comprising a magnet, a spring-held feed-lever subject to said magnet, a feed-roller subject to said lever, a resistance-roller subject to said magnet, for frictionally clamping said strip against the feed-roller, and circuit connections for said magnet controlled by the slack section in the strip to start the action when the slack is used up and stop the same when a new slack section is accumulated, substantially as described.

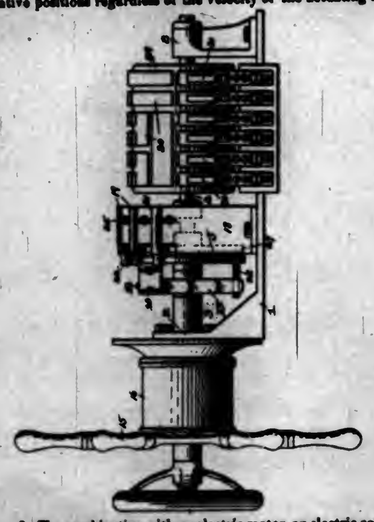
12. A slack-provider, for a strip of flexible material, comprising a magnet, a spring-held feed-lever subject to said magnet, a feed-roller subject to said lever, a resistance-roller subject to said magnet for clamping the strip against the feed-roller, and circuit connections for said magnet, including a circuit-closer, subject to a spring for closing the circuit and subject to the weight of the accumulated slack section of the strip, for opening the circuit, to stop the action, substantially as described.

13. The combination with a magnet, of a resistance and a feed roller, between which passes a strip of flexible material, with said resistance roller subject to said magnet, for frictionally clamping the strip against the feed-roller, a spring-held feed-lever, subject to said magnet and adapted to act on said feed-roller, and a circuit maker and breaker, in the connections for said magnet, operated at the opposite limits of said feed-lever's throw, for making and breaking the circuit, as required, to keep up the motions of said feed-lever, substantially as described.

14. A slack-provider, for a strip of flexible material, comprising a magnet, a spring-held feed-lever, subject to said magnet, a feed-roller subject to said lever, a resistance-roller, subject to said magnet, for clamping the strip against the feed-roller, and circuit connections for said magnet, comprising a circuit-controller, subject to a spring for closing the circuit, and subject to the accumulated slack section for opening the circuit, and a circuit maker and breaker, subject to said feed-lever, at the opposite limits of its strokes, for making and breaking said circuit, to maintain the action of said feed-lever until the circuit is opened by the weight of the slack, acting on said circuit-controller, substantially as described.

15. The combination with the strip-holding spool, of the magnet d, the spring-held feed-lever, subject to said magnet, the feed-roller subject to said lever, the resistance-roller carried by the arms, which are subject to said magnet, and the circuit connections for said magnet, comprising the controller d^{14} d^{15} d^{16}, operating as described, under the control of the strip, and the circuit maker and breaker d^{19} d^{20}, subject to the action of said feed-lever, by means of the parts d^{21}, d^{22}, d^{23} and d^{24}, all substantially as described.

606,008. COIN-FREED AUTOMATIC MACHINE. EDUARD VON HAKEN, Charlottenburg, Germany. Filed Dec. 15, 1897. Serial No. 662,066. (No model.)



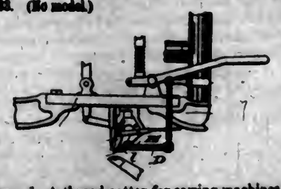
Claim.—1. A device for securing bicycles comprising the box or casing, the swinging arm pivoted thereto and designed to swing down against said box or casing, the swinging member hinged to the inside of said swinging arm and cooperating with said swinging arm to form a loop for engaging the bicycle, and coin-released mechanism within the casing adapted to hold the arm in contact with the casing to prevent the use of the same until a coin has been inserted, substantially as described.

2. In combination, the casing, the swinging arm hinged thereto and adapted to normally hang down against said casing, the swinging member hinged thereto to form a loop and adapted to be held closed by the wall of the casing when the arm is in normal position, the catch projecting from the back of the arm into the casing, the lever pivoted within the casing and having an end adapted to engage said catch, and the coin-chute adapted to deliver a coin upon the opposite end of said lever to release the swinging arm, substantially as described.

606,009. ELECTRIC CONTROLLER. MARSHALL W. HAMER, Madison, Wis. Filed Dec. 17, 1897. Serial No. 662,345. (No model.)

Claim.—1. In an electric controller, the combination with a contact-cylinder mounted on a rotatable shaft, of a second shaft provided with actuating means, and mechanism, interposed between the actuating means and the contact-cylinder, comprising a projecting part on the cylinder-shaft engaging with a spring on the second shaft whereby the contact-cylinder may be instantaneously rotated, in either direction, to its consecutive positions regardless of the velocity of the actuating means.

2. In an electric controller, the combination with a cylinder provided with contact-plates, mounted on a rotatable shaft, of a shaft concentric with the cylinder-shaft and provided with actuating means, and mechanism, interposed between the actuating means and the contact-cylinder, comprising a projecting part on the cylinder-shaft engaging with a spring on the concentric shaft whereby the contact-cylinder may be instantaneously rotated, in either direction, to its consecutive positions regardless of the velocity of the actuating means.



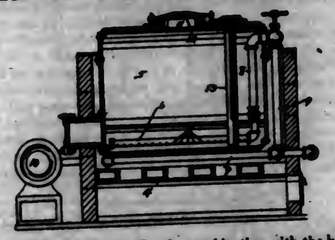
3. The combination with an electric motor, an electric controller, a contact-cylinder provided with contact-plates lying in the path of fixed contact-points, said cylinder revolubly mounted on a rotatable shaft, a shaft concentric with the cylinder-shaft, provided at one end with actuating means and at its other end with mechanism engaging with means on the cylinder-shaft, whereby the cylinder is instantaneously rotated, in either direction, to its consecutive positions, regardless of the rotative velocity of the shaft engaging with the cylinder-shaft.

4. In an electric-controller, the combination with a contact-cylinder mounted on a rotatable shaft, of a second shaft having actuating means and a disk provided with springs, said springs engaging with a pin extending from an arm on the cylinder-shaft, substantially as set forth.

5. In an electric controller, the combination with a contact-cylinder mounted on a rotatable shaft, of a second shaft having actuating means and a disk provided with springs, said springs engaging with a pin extending from an arm on the cylinder-shaft, a trip-arm, and stop-levers to lock the arm on the cylinder-shaft, substantially as set forth.

6. In an electric controller, the combination with a contact-cylinder having contact-plates lying in the path of fixed contacts, said cylinder mounted on a rotatable shaft, of a shaft concentric with the cylinder-shaft and having actuating means at one end and a disk provided with springs at its other end, the springs engaging with a pin extending through the disk from an arm on the cylinder-shaft, a trip-arm, a standard provided with longitudinal slots, and pivoted stop-levers in said slots, substantially as set forth.

606,010. THREAD-CUTTER FOR SEWING-MACHINES. VALENTIN HERRER and SOLOMON B. MOYER, Orwigsburg, Pa., assignors of one-third to H. A. Weller, same place. Filed Aug. 17, 1897. Serial No. 648,533. (No model.)



Claim.—1. A thread-cutter for sewing-machines, consisting of a plate having slots therein, one of which is inclined, a bar having a knife attached thereto, supported by said plate and movable in said slots, and a vertical and oscillatory shaft supported by said plate and connected to the knife-bar for projecting the knife.

2. A thread-cutter for sewing-machines, consisting of a plate having slots therein, one of which is inclined, a bar having a knife attached thereto, supported by said plate and movable in said slots, a vertical and oscillatory shaft supported by said plate and connected to the knife-bar, for projecting the knife, and a spring connected to the plate and the knife-bar.

3. A thread-cutter for sewing-machines, consisting of a plate having slots therein, one of which is inclined, a bar having a knife attached thereto, supported by said plate and movable in said slots, and a vertical and oscillatory shaft supported by said plate and connected to the knife-bar, in combination with the presser below the bed of the machine and to which the supporting-plate is connected.

4. A thread-cutter for sewing-machines, consisting of a bar having an offset at its front end, a knife attached to said bar, a plate provided with slots for directing the knife inward and laterally and in which the knife-bar is movably secured to the plate, and a lug, a vertical and oscillatory shaft supported by said plate and connected to the knife-bar and a bar for connecting the shaft to a sewing-machine, in combination with the presser to which said lug is attached.

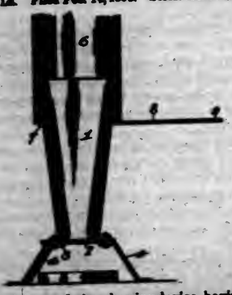
606,011. HEATING-KETTLE FOR PREPARING ASPHALT. FREDERICK A. HAUSSMANN, Indianapolis, Ind. Filed June 24, 1897. Serial No. 642,073. (No model.)

Claim.—In a melting-kettle the combination with the kettle, a suitable setting therefor containing a furnace, means for producing a blast of air or other gas, a pipe leading from said means around within said furnace and into the kettle, the said pipe discharging near the bottom of the kettle, a discharge-pipe leading from near the bottom of the kettle, and means for rendering the kettle air-tight, substantially as described.

606,012. ELECTRIC-CURRENT CONTROLLER. JOHN J. HOGAN, New Haven, Conn., assignor of one-fourth to Thomas W. Corbett, same place. Filed July 15, 1897. Serial No. 644,616. (No model.)

Claim.—1. In a current-controller, an operating-shaft, a resistance-coil concentrically mounted upon said shaft and revolubly therewith, a screw-shaft parallel with said operating-shaft and having a thread corresponding in pitch with that of the convolutions of said resistance-coil, a carrier movable in a plane parallel with the axes of said shafts and actuated by the thread of said screw-shaft, a contact-finger mounted upon said carrier and engaging said resistance-coil, and intermediate connections between said operating-shaft and said screw-shaft for causing the latter to revolve in synchronism with the former, substantially as set forth.

2. In a current-controller, the combination with an operating-shaft carrying a resistance-coil, of a carriage movable in a plane parallel with the axis of said shaft and carrying a contact-finger which engages said coil, a screw feeding mechanism and a rack-and-pinion feeding mechanism both of which are actuated by said operating-shaft, and means for interchangeably connecting said carriage to said feeding mechanisms, whereby either mechanism can be utilized to impart movement to the carriage, substantially as set forth.



3. The combination with the operating shaft carrying the resistance-coil, of the screw-shaft, the toothed wheel, as 36, gear connections between said operating-shaft and said screw-shaft and toothed wheel respectively whereby both of the latter are actuated from the former, the movable carriage carrying a contact-finger which engages said resistance-coil, a half-nut for engaging said screw-shaft and a rack-bar for engaging said toothed wheel, both connected with said carriage, and means for interchangeably engaging said half-nut and said rack-bar with said screw-shaft and toothed wheel respectively, substantially as set forth.

4. In a current-controller, a suitable base having located thereon an incandescent lamp, a plug-socket, two binding-posts, one of which posts is electrically connected to said lamp and the other to said plug-socket, and a switch which opens and closes electrical communication between said lamp and plug-socket, in combination with a suitable frame secured to said base, an operating-shaft journaled on said frame and carrying an insulated resistance-coil, a carriage movable upon said frame in a plane parallel with said shaft and carrying a contact-finger which engages said coil, means for transmitting movement from said shaft to said carriage, and means for electrically connecting the contact-finger on said carriage with one of the binding-posts on the base and for similarly connecting one end of said resistance-coil with the other of said binding-posts, substantially as set forth.

5. The combination with shaft 18 carrying the coil 21, of carriage 24 carrying finger 27 and rack-bar 59, screw-shaft 28 for moving said carriage, dial 55, and shaft 56 carrying pointer 57 and wheel 58 which engages said rack-bar 59, substantially as set forth.

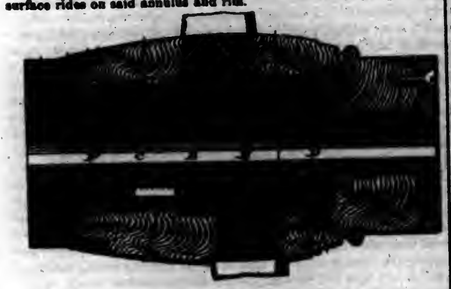
6. The combination with shaft 18 and the cylinder 19 and coil 21 carried thereby, screw-shaft 28, toothed wheel 36, intermediate gear connections substantially as described between said shaft 18 and said screw-shaft and toothed wheel respectively, carriage 24 carrying the finger 27, shaft 26 supporting said carriage at one end of the latter, an arm 33 having a spline-and-groove connection with said shaft 26, said arm carrying at one end the half-nut 34 and at its opposite end the rack-bar 35, substantially as set forth.

606,018. PIPE AND FLUE CLEANER. THOMAS H. KANE, Shreveport, La. Filed Feb. 14, 1898. Serial No. 670,363. (No model.)

Claim.—1. A flue and pipe cleaning device, having a barrel adapted to fit into a flue or pipe, and provided, in communication with its interior, with a priming-receptacle, substantially as specified.

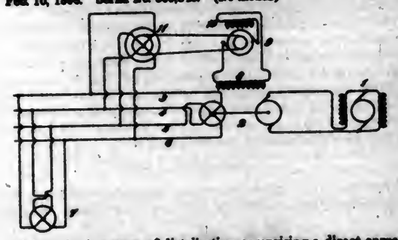
2. A flue and pipe cleaning device having an inverted conical or upwardly-flared barrel, and a communicating priming-receptacle, substantially as specified.

3. A flue and pipe cleaner having an inverted conical barrel closed at its lower end by a head provided with a priming-groove in communication with the interior of the barrel, and supporting-legs depending from said head, substantially as specified.



4. A flue and pipe cleaner having a barrel adapted to be fitted into a flue or pipe, and having a communicating priming-receptacle, and a supporting-rod secured to the barrel at an intermediate point to form a bearing for the lower end of a pipe-section, substantially as specified.

606,014. SPOKE-EXPANDER AND WHEEL-TIGHTENER. JOHN KELLEY, Philadelphia, Pa. Filed Feb. 16, 1897. Serial No. 623,503. (No model.)



Claim.—1. In a spoke-expander and tire-tightener, a sliding sleeve having a wedge connected therewith, a loose annulus and a rim concentric on the outer end of the hub, in combination with a nut which engages said sleeve and has its head bearing against said rim and annulus.

2. A hub having a metal rim on its end, and a recess around the box thereof, a threaded sleeve with a pyramidal wedge connected therewith, adapted to slide on said box, wedge-shaped plates on said wedge adapted to have the spokes bear thereagainst, a nut engaging said sleeve, and a rotatable metallic annulus freely fitted within said

rim and surrounding said nut, the latter having a tread whose inner surface rides on said annulus and rim.

606,015. SYSTEM OF ELECTRICAL DISTRIBUTION AND REGULATION. BENJAMIN G. LAMME, Pittsburg, Pa., assignor to the Westinghouse Electric and Manufacturing Company, of Pennsylvania. Filed Feb. 10, 1898. Serial No. 669,848. (No model.)

Claim.—1. A system of distribution comprising a direct-current generator, a rotary transformer receiving current therefrom and supplying alternating currents to translating devices a generator for exciting the field-magnet of said rotary transformer and means dependent upon changes in the amount of inductive load on the alternating-current circuit or circuits for automatically varying the speed of the exciting-generator.

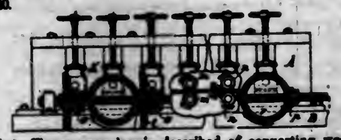
2. An electrical transforming and distributing system, a source of direct currents, a rotary transformer receiving current from said source and supplying alternating-current translating devices, a direct-current generator for exciting the field-magnet of said rotary transformer and means for automatically varying the speed of the exciting-generator as the amount of inductive load on the alternating-current circuit varies.

3. In an electrical transforming and distributing system, the combination with a source of direct current, a rotary transformer, an exciting generator for the field-magnet of such transformer operated to produce an electromotive force corresponding to a field-magnet excitation much below saturation and means for controlling the speed of said exciter in accordance with changes in the amount of inductive load on the alternating-current circuit or circuits supplied by the rotary transformer.

4. The method of maintaining constant speed in a rotary transformer for transforming direct to alternating currents, which consists in exciting its field-magnet by a direct-current generator and varying the speed of such generator as the amount of inductive load on the alternating-current circuit varies.

606,016. DETACHABLE HEEL FOR BOOTS OR SHOES. ALEXANDER MARBERT, Jersey City, N. J. Filed July 24, 1897. Serial No. 645,842. (No model.)

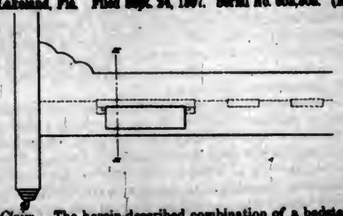
Claim.—1. The combination with a boot or shoe, of a heel-plate secured thereto, and provided at the sides and rear portion thereof, with a downwardly and inwardly directed flange or rim, said plate being also provided centrally thereof, with a downwardly and forwardly directed spring-tongue, and adjacent to each side of said tongue with downwardly and outwardly curved flanges or wings, and a detachable heel which is adapted to be connected with said plate, said detachable heel being provided with a plate which is secured thereto, and which is provided centrally with an opening through which said tongue is adapted to pass, and adjacent to each side thereof, with longitudinal flanges or wings with which the longitudinal flanges or wings formed on said first-named plate are adapted to engage, substantially as shown and described.



2. A shoe or boot provided with a heel-plate, which is secured thereto, and a heel provided with a corresponding plate which is secured thereto, the plate which is secured to the shoe or boot, and the plate which is secured to the heel being provided with interlocking flanges or wings, and the plate which is secured to the boot or shoe being also provided on its sides and rear edge with a downwardly and inwardly directed flange or rim with which the plate which is secured to the heel is adapted to engage, substantially as shown and described.

3. A shoe or boot provided with a heel-plate and a detachable heel also provided with a plate, one of said plates being provided with a centrally-disposed locking-tongue and with an interlocking flange or wing arranged on each side of said tongue, the other of said plates being provided with a central opening for said tongue and a flange or wing on each side of said opening adapted to interlock with said interlocking flanges and means for locking the heel to the heel-plate, substantially as and for the purpose set forth.

4. A shoe or boot provided with a heel-plate, which is secured thereto, and a heel provided with a corresponding plate which is secured thereto, the plate which is secured to the shoe or boot, and the plate which is secured to the heel being provided with interlocking flanges or wings and with a locking-tongue and an opening therefor the plate which is secured to the boot or shoe being also provided on its sides and rear edge with a downwardly and inwardly directed flange or rim with which the plate which is secured to the heel is adapted to engage, substantially as and for the purpose set forth.



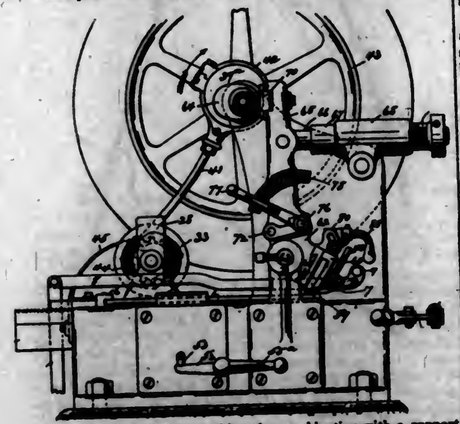
5. A boot or shoe, provided with projecting flanges or wings and a detachable heel constructed to receive said projecting portions and to be thereby secured upon said boot or shoe, said projecting flanges or wings ranging diagonally or at an incline to wedge or tighten the heel upon the shoe in the operation of attaching, and means for locking the heel to the boot or shoe, substantially as and for the purpose set forth.

606,017. PROCESS OF CONVERTING WOOD INTO FIBERS SUITABLE FOR USE IN THE ARTS. ALEXANDER MITSCHERLICH, Freiburg, Germany. Filed Feb. 24, 1894. Serial No. 501,453. (No specimens.) Patented in France Feb. 23, 1891, No. 211,631; in Germany June 9, 1891, No. 66,217; in Switzerland June 27, 1891, No. 4,120; in England July 4, 1891, No. 11,231; in Norway July 6, 1891, No. 2,643; in Italy Sept. 30, 1891, XXV, 30,046, LIX, 305; in Belgium July 5, 1892, No. 100,375, and in Austria-Hungary Sept. 30, 1892, No. 19,145, and No. 38,640.

Claim.—The process herein described of converting wood or woody parts into fibers suitable for use in the arts, which consists in splitting the wood into small boards or slabs, superposing two or more boards or slabs one above the other so that the projecting darker parts of the annual rings are at the outside, and then subjecting the so-arranged superposed boards or slabs by means of quickly-applied blows to a successively-repeated bending or cracking operation until a disintegrated fibrous mass is obtained, substantially as set forth.

606,018. CABINET FOR MEDICINE, &c. GLENN B. MURRAY, Lakeland, Fla. Filed Sept. 24, 1897. Serial No. 653,303. (No model.)

Claim.—The herein-described combination of a bedstead, a slat of considerable width secured therein, a cabinet adapted to pass through an opening in one of the side rails, cleats secured to the under side of the slat for guiding the cabinet, a series of partitions secured within the cabinet for dividing it into compartments, a lamp-support hinged in one of said compartments, and a spring for holding said support in its active position, substantially as shown and described.



606,019. ANTISEPTIC SURGICAL DRESSING. THOMAS W. MCCUE, Akron, Ohio. Filed Sept. 20, 1895. Serial No. 564,103. (No specimens.)

Claim.—1. A composition of matter consisting of a mixture of finely-powdered litharge and cereal flour, substantially as and for the purpose specified.

2. A composition of matter consisting of a mixture of finely-powdered litharge, cereal flour and flint clay, substantially as and for the purpose specified.

3. A composition of matter consisting of a mixture of finely-powdered litharge, cereal flour, flint clay and boracic acid, substantially as and for the purpose specified.

606,020. RASP-MACHINE. JAMES A. MCHARDY, Providence, R. I., assignor, by mesne assignments, to the Nicholson File Company, same place. Filed May 25, 1896. Serial No. 593,093. (No model.)

Claim.—1. In a rasp-machine the combination with a support for the blank, of an oscillating head mounted to oscillate about a fixed axis, a cutter rigidly mounted on said head and having its rear face in or within the arc described by its point, and means for oscillating said head to force said cutter into said blank to lift the metal and form a tooth, substantially as described.

2. In a rasp-machine, the combination with a support for the blank, of an oscillating head mounted to oscillate about a fixed axis, a cutter rigidly mounted on said head and having its rear face in or within the arc described by its point, means for oscillating said head to force said cutter into said blank to lift the metal and form a tooth, and means for regulating the depth to which the cutter shall enter the blank, substantially as described.

3. In a rasp machine, the combination with a support for the blank, of an oscillating head mounted to oscillate about a fixed axis, a cutter rigidly mounted on said head and having its rear face in or within the arc described by its point, means for forcing said cutter into the blank, and a spring for returning said cutter, substantially as described.

4. In a rasp-machine the combination with a support for the blank, of an oscillating head mounted to oscillate about a fixed axis, a cutter rigidly mounted on said head and having its rear face in or within the arc described by its point, means for oscillating said head to force said cutter into said blank to lift up the metal and form a tooth, and means for intermittently changing the relative positions of the cutter and blank, substantially as described.

5. In a rasp-machine the combination with a support for the blank, of an oscillating head mounted to oscillate about a fixed axis, a cutter rigidly mounted on said head and having its rear face in or within the arc described by its point, an arm secured to said head, a cam for rocking said arm, whereby said cutter is forced into said blank and the metal lifted to form a tooth, substantially as described.

6. In a rasp-machine the combination with a support for the blank, of an oscillating head mounted to oscillate about a fixed axis, a tool-carriage mounted on said head, a cutter rigidly secured in said carriage and having its rear face in or within the arc described by its point, means for oscillating said head to force said cutter into the blank to lift the metal and form a tooth, and means for intermittently moving said carriage on said head, substantially as described.

7. In a rasp-machine, the combination of an oscillating head, means for securing a cutter to said head, an arm adjustably secured to said head, means for adjusting said arm without stopping the machine, substantially as described.

8. In a rasp-machine the combination of an oscillating head, means for securing a cutter to said head, an arm pivoted to said head, and an adjustable connection between said arm and head, substantially as described.

9. In a rasp machine the combination of an oscillating head, an arm pivoted to said head, a stud pivoted in said head, a cam on said stud engaging said arm, and means for adjusting said stud, substantially as described.

10. In a rasp-machine the combination of a reciprocating head a tool-carriage mounted on said head, means for feeding said carriage on said head, and means for regulating the action of said feeding means without stopping the machine, substantially as described.

11. In a rasp-machine the combination of a reciprocating head, a tool-carriage on said head, a sliding bar, an adjustable connection between said bar and head, and means for intermittently moving said bar, substantially as described.

12. In a rasp-machine the combination of a reciprocating head, a tool-carriage on said head, a slot in said carriage, a sliding bar, a stud projecting through said slot and adjustably connected to said bar, substantially as described.

13. In a rasp-machine the combination of a reciprocating head, a tool-carriage on said head, a sliding bar, a stud connected to said carriage and mounted in said bar and a handle for regulating the position of said stud, substantially as described.

14. In a rasp-machine the combination of a reciprocating head, a tool-carriage mounted thereon, a cam for moving said carriage on said head, connections between said cam and carriage, means for regulating the action of said cam, and means for adjusting the length of said connections, substantially as described.

15. In a rasp-machine the combination with a reciprocating head, a tool-carriage mounted on said head, a lever, connections between said lever and said carriage, means for adjusting said connections radially and transversely of said lever, and means for oscillating said lever, substantially as described.

16. The combination of an arm, a block adjustably mounted on said arm, and provided with a stud, a second block pivoted on said stud, and a movable part on which said second block is adjustably mounted, substantially as described.

17. The combination with a carriage, of means for feeding said carriage comprising a spring, means independent of the carriage for energizing said spring, and means for restraining and releasing said spring, substantially as described.

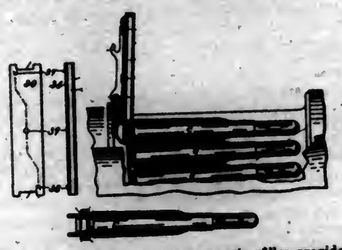
18. The combination with a carriage, of means for feeding said carriage comprising a spring, means independent of the carriage for energizing said spring, a dog for restraining said spring, and means for releasing the dog, substantially as described.

19. The combination with a carriage, of means for feeding said carriage forward comprising a spring, means independent of the carriage for energizing said spring, and means for holding said carriage against the action of said spring and releasing said carriage, substantially as described.

20. The combination with a carriage, of a rack secured to said carriage, a pawl engaging said rack, means for reciprocating said pawl comprising a spring, means for energizing said spring, and means for holding and releasing said carriage, substantially as described.

21. The combination with a carriage, of a rack secured thereto, a pawl engaging said rack, a rock-shaft, a spring connection between said shaft and pawl, means for holding said carriage against the action of said pawl and spring, and means for releasing said carriage by the rocking of said shaft, substantially as described.

22. The combination with a carriage, of a spring for feeding said carriage forward, means independent of the carriage for energizing said spring, a dog for holding said carriage against the action of the spring, and means for releasing said dog, substantially as described.



23. The combination with a carriage, racks secured to said carriage, dogs arranged to engage said racks and tappets directly engaging said dogs for alternately moving the dogs out of engagement with the racks, and means for feeding the carriage forward, substantially as described.

24. The combination with a carriage, of means for feeding said carriage forward, means for stopping and releasing said carriage, and mechanism for throwing said feeding and stopping and releasing means out of operation, substantially as described.

25. In a rasp-machine the combination with a support for the blank, of a head mounted to oscillate about a fixed axis, a cutter rigidly mounted on said head and having its point adjacent a vertical line passing through the axis of the head, and means for oscillat-

ing said head whereby the cutter is carried both downward and with an inward sweep.

606,021. CARTRIDGE-PACKET. EDWARD G. PARKHURST, Hartford, Conn. Filed Feb. 23, 1897. Serial No. 624,538. (No model.)

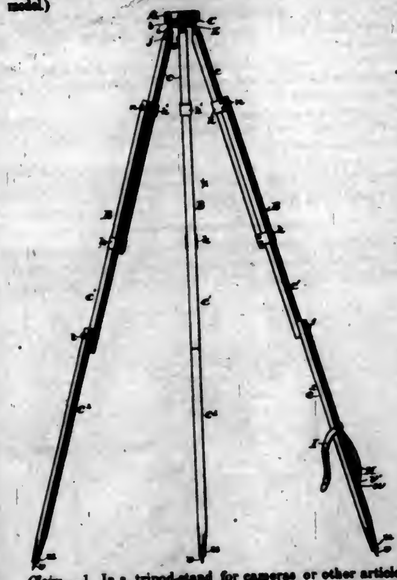
Claim.—1. A cartridge-containing magazine-filler, provided with a clip for engaging with a supporting-lug on the magazine of the gun, so as to form a detachable hinge-like connection therewith, for the purpose specified.

2. A cartridge-containing magazine-filler provided with a flexible clasp for springing over and partially encircling a supporting-lug adjacent to the magazine, for the purpose specified.

3. A magazine-filler, consisting of a body portion having a cartridge-head-receiving channel, a latch which normally projects over an end of the channel, and an actuator for retracting the latch, provided with a clasp for attaching the actuator to the firearm.

4. A magazine-filler consisting of a body portion having a cartridge-head-receiving channel, and provided with latches extending over the ends of the channel, an actuator longitudinally movable with relation to the latches and engaging therewith to independently retract the respective latches by its longitudinal movement in opposite directions, the locker when in its intermediate or central position being disengaged from both latches so as to allow them to remain closed.

5. A magazine-filler, consisting of a body portion having a cartridge-head-receiving channel, a backwardly-movable latch mounted thereon, and normally projecting over an end of the channel, and a latch-actuator supported for longitudinal movement upon the filler-body, and engaging with the latch whereby the latter is laterally retracted by that longitudinal movement.



6. A magazine-filler, consisting of a body portion having a cartridge-head-receiving channel, and provided with latches supported for lateral movement only at the ends of the body portion, and normally extending over the ends of the channel, an actuator supported for longitudinal movement upon the filler-body, provided with clasps for attaching it to the firearm, and operatively engaging with the latches, whereby longitudinal movement of the filler-body and its latches relative to the actuator operates to retract the leading latch from over the end of the channel.

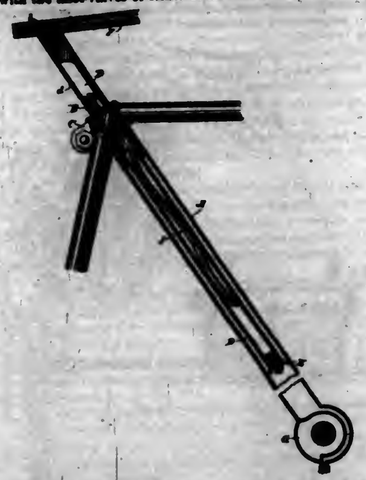
7. In a cartridge-packet, the combination of a body portion provided with a longitudinal channel for receiving the heads of a file of superimposed cartridges, each end of the filler-body being provided with a resilient latch attached thereto and normally projecting over the ends of the cartridge-channel, the latches being bent or curved backwardly from the back plate of the filler-body so as to form recesses and inclined abutments adjacent thereto, and an actuator provided with clasps for attaching it to the firearm, fitted movably upon the back plate of the filler body with its latch-actuating members in the recess of the latch adjacent to the inclined abutments thereof, whereby longitudinal movement of the filler-body and its latches relative to the actuator operates to retract the leading latch from over the end of the cartridge-channel, substantially as described.

8. In a cartridge-packet, the combination of a body portion provided with a longitudinal channel for receiving the heads of a file of superimposed cartridges, a locker therefor attached at or near the center of its length to the back plate of the filler-body, provided with resilient latches extending over the ends of the cartridge-channels and provided with inclined abutments adjacent to the latches, a link-shaped latch-actuator provided with clasps for attaching it to the firearm, its end cross members engaging between the back plate of the filler-body and the latches adjacent to the inclined abutments thereof, whereby the longitudinal movement of the filler-body and its attached locker relative to the actuator operates to retract the leading latch from over the end of the cartridge-channel, substantially as described.

9. The herein-described link-shaped locker-actuator, provided with oppositely-disposed clasps upon its side members for attaching it to a firearm, the opposite end or cross members of the link being adapted to actuate the locker, substantially as described.

606,022. TRIPOD-STAND FOR CAMERAS, &c. ROBERT B. PARSONS, Cambridge, Mass., assignor of one-half to Charles S. Howcomb, same place. Filed Nov. 26, 1897. Serial No. 659,742. (No model.)

Claim.—1. In a tripod-stand for cameras or other articles the combination of a table for supporting said camera or other article having a plurality of hemispherical sockets in its under side; a plurality of legs provided at their upper ends with spherical or ball-like heads fitted to said sockets; a clamping-plate constructed and arranged to bear upon all of said spherical heads below their centers; and a clamping screw and nut constructed and arranged to act upon the center of said plate and equidistant from all of said heads to clamp said plate thereto.



2. The combination in a tripod of the table A having the hemispherical sockets *a a* in its under side the legs B provided with the spherical heads *b* and the shanks *b'*; the tubular screw D set in a fixed position in said table; the plate C provided with the openings *d d'* to receive the heads *b* and shanks *b'*; the nut E fitted to said screw D and bearing upon the plate C; the screw *g* provided with the milled head *g'* and the shoulder *g*^{2}; and the collar *h* fitted tightly in the lower end of the screw D and surrounding the screw *g* below the shoulder *g*^{2} as and for the purposes specified.

3. The combination in a tripod of the leg-sections *c* and *c'*; the loop-strap *k* secured to the section *c* and extending around the section *c'*; the loop-strap *k'* secured to the section *c'* and extending around the section *c*; the nut *m* set in a recess in the section *c'*; the set-screw *n* working in said nut the plate *l* interposed between the inner end of said set-screw and the section *c* and secured at one end to the section *c'* substantially as described.

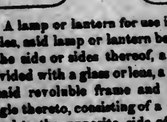
4. The combination in a tripod of the leg-section *c'* provided in its outer face, at its lower end, with the recesses *p*, *p'*, and *p*^{2}, and having secured thereto and partially covering said recesses the metal plate F provided with the slots *o*, *o*, and *o'*; the leg-section *c*^{2} having the metal plate G, provided with the hole *s*, secured to its inner face at its upper end; the headed stud *q* set in said section *c*^{2} through said plate G and arranged to alternately engage each of the slots *o* in the plate F, to lock said section *c*^{2} in extended or folded position; the bolt *r* extending through said section *c*^{2} the hole *s* in the plate G and the slot *o'* in the plate F, with its head beneath said plate F and in the recess *p'*; and the thumb-nut *t*, all arranged and operating as set forth.

606,023. BICYCLE PUMP ATTACHMENT. LEWIS A. PAYNE, San José, Cal., assignor of one-half to Martin V. Davis, same place. Filed July 8, 1897. Serial No. 643,886. (No model.)

Claim.—1. The combination with the seat-post standard of a bicycle-frame, of a vertically-adjustable tubular seat-support, a clamp by which it may be held at any desired point, a supplemental interior tube having the upper end fitted to receive and hold the saddle and the lower end provided with an air-forcing plunger whereby the reciprocation of this tube will compress air within the seat-post standard, a tubular connection curving around the crank-hanger bearing with a connecting-nipple, and a flexible tube adapted to connect said nipple with the inlet-valves of either of the wheel-tires.

2. The combination with the seat-post standard of a bicycle-frame, of a tubular standard slidable therein, a clamp by which it may be adjusted for height, said standard having longitudinally-disposed grooves or channels in the upper end, an interior tubular plunger-rod the lower end of which is adapted to compress air when reciprocated within the seat-post standard and connections from said standard whereby air may be delivered into either of the wheel-tires, the plunger having the approximately-horizontal seat-bar at its upper end, said bar being adapted to fit snugly in the channel at the upper end of the adjustable tubular portion whereby the saddle is held rigidly in place when the pump is not in operation.

3. The combination with the seat-post standard of a bicycle-frame of an interior tubular adjustable post with a clamp whereby it may be held in position, a hollow plunger-rod slidable within said adjustable post having the lower end adapted to compress air in the lower part of the seat-post standard and the upper end carrying the saddle-supporting bar with means for locking the whole together, and an opening in the side of the plunger-tube with a chamber wherein the flexible connecting-tube is stored when not in use.

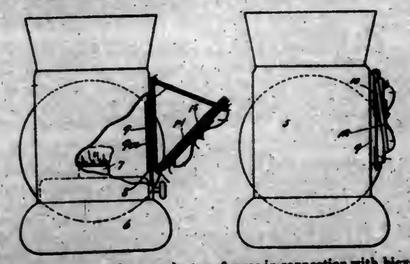


606,024. SOAP-HOLDER. MARTINO PERLMAN and FERDINAND BARNS, New York, N. Y. Filed Apr. 3, 1897. Serial No. 630,590. (No model.)

Claim.—1. The combination with a cake of soap, of a looped band embedded therein the material of the soap lying partially within the band to firmly anchor the latter, a tubular socket secured to the loop and having its outer end flush with the surface of the soap, whereby access to said socket may be had, lateral openings at the inner end of the socket, a spring-catch adapted to enter the socket, consisting of a strip of metal bent upon itself to form an eye, and a flexible connection in said eye, the ends of the strip being bent outwardly to engage the openings in the socket when passed into the latter.

2. The combination with a cake of soap of a looped band having transverse openings and embedded in the cake, the material of the soap entering the openings in the band and lying partially within the loop, a tubular socket lying in the plane of the loop secured to the loop and having its outer end flush with the surface of the soap, whereby access to said socket may be had, lateral openings at the inner end of the socket, a spring-catch entering the socket, consisting of a strip of metal bent upon itself to form an eye, and a permanent flexible connection in said eye, the ends of the strip being bent outwardly and engaging the openings in the socket.

606,025. WATER-FAUCET. JOEL C. PERRY, South River, N. J. Filed Jan. 26, 1898. Serial No. 668,027. (No model.)



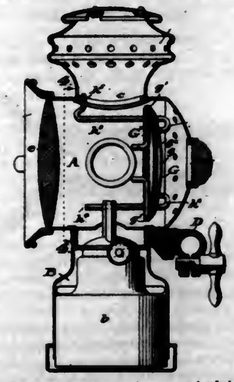
Claim.—A faucet consisting of a faucet-head having a tubular extension and segmental supporting-flange upon its front side, a drip-opening formed in the flange, a pivoted valve-plate having a suitable packing upon its inner side, and a removable segmental collar secured to the segmental flange, substantially as and for the purpose described.

606,026. ANTIREFILLING DEVICE. JOHN H. POOLE, Randolph, Mass., assignor of one-third to Fred S. Hiwell, Malden, Mass. Filed Jan. 10, 1898. Serial No. 666,167. (No model.)

Claim.—A non-refillable bottle having, first, a collar in the inner portion of its neck, said collar being formed internally to present a valve-seat, and a valve-guide above the seat and of greater diameter than the latter, the collar being reduced externally to form the inner wall of an annular pocket surrounding the valve-guide; secondly, a ball-valve formed to move in said guide and fit the valve-seat; thirdly, stops attached to the bottle-neck above the valve seat and guide; and fourthly, a loose spherical valve-guard adapted to play between said stops and the outer end of the valve-guide, said guard being of greater diameter than the valve-guide and adapted to deflect a wire inserted in the bottle-neck into said annular pocket, the guard being proportioned to permit a liquid releasing movement of the valve and to prevent the escape of the valve from the valve-guide.

606,027. REFLECTOR ATTACHMENT FOR LAMPS OR LANTERNS. WILLIAM PREWETT, Cheriton, England. Filed Oct. 28, 1897. Serial No. 656,180. (No model.)

Claim.—1. A lamp or lantern for use in connection with bicycles or similar vehicles, said lamp or lantern being provided with a circular opening in the side or sides thereof, a revoluble frame mounted therein and provided with a glass or lens, a reflector pivoted or hinged at one side of said revoluble frame and means for holding said reflector at an angle thereto, consisting of a supplemental frame or link pivoted or hinged to the opposite side of the revoluble frame, substantially as shown and described.



2. A lamp or lantern for use in connection with bicycles or similar vehicles, said lamp or lantern being provided with a circular opening in the side or sides thereof, a revoluble frame mounted therein and provided with a glass or lens, a reflector pivoted or hinged at one side of said revoluble frame and means for holding said reflector at an angle thereto, consisting of a supplemental frame or link piv-

oted or hinged to the opposite side of the revoluble frame, and a locking-plate pivotally connected with the reflector, substantially as shown and described.

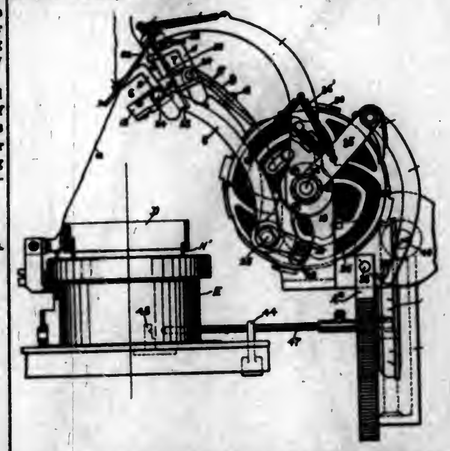
3. A lamp or lantern for use in connection with bicycles and similar vehicles, said lamp or lantern being provided in the side thereof with a circular opening, a revoluble frame mounted therein, a glass or lens in said frame, a reflector-frame pivotally connected with or hinged to one side of said revoluble frame and means for holding said reflector-frame at an angle to said revoluble frame, substantially as shown and described.

4. A lamp or lantern for use in connection with bicycles and similar vehicles, said lamp or lantern being provided in the side thereof with a circular opening, a revoluble frame mounted therein, a glass or lens in said frame, a reflector-frame pivotally connected with or hinged to one side of said revoluble frame and means for holding said reflector-frame at an angle to said revoluble frame, and for locking the same thereover, substantially as shown and described.

606,028. LANTERN. EDWIN M. ROSENBLUTH, Philadelphia, Pa. Filed Nov. 6, 1897. Serial No. 657,590. (No model.)

Claim.—1. In combination, a lamp, embodying a combustion chamber having an opening formed in its wall, a reflector, and a holder for said reflector which consists of wire spring arms at their inner ends connected with the reflector, and a locking projection formed as part of said reflector holder and adapted to engage in said opening in the wall of the combustion chamber, substantially as set forth.

2. In combination, a lamp, embodying a combustion chamber having an opening formed in its wall, a reflector, and a holder for said reflector which consists of wire spring arms at their inner ends connected with the reflector, and a locking projection formed as part of said reflector holder and as a continuation of two of said arms and adapted to engage in said opening in the wall of the combustion chamber, substantially as set forth.



3. In combination, a lamp, a reflector, and a holder for said reflector which consists of a series of spring arms at their inner ends connected with the reflector, and as to their bodies extending away from it, and at its rear formed with return bends which are adapted to make contact with the rear wall of the combustion chamber, substantially as set forth.

4. In combination, a lantern or lamp, a reflector, and a holder for said reflector which consists of a series of wire arms disposed in substantial parallelism with the axis of the reflector, extending to the front and rear of said reflector, at the rear provided with return bends which are connected to the marginal portion of the reflector, and at the front diverging from each other, substantially as set forth.

5. In combination, a lantern or lamp, a reflector, and a holder for said reflector which consists of a series of wire arms disposed in substantial parallelism with the axis of the reflector, extending to the front and rear of said reflector, at the rear provided with return bends which are connected to the marginal portion of the reflector, and at the front diverging from each other, and the front or forward extremity of one of which is equipped with or formed into a locking projection adapted in the predetermined set of the parts to expand to place within a suitable recess in the body of the lantern, substantially as set forth.

606,029. THREAD-CHANGER FOR KNITTING-MACHINES. JAMES R. ROWE, Pawtucket, R. I., assignor to the R. Jenckes Manufacturing Company, same place. Filed Aug. 9, 1897. Serial No. 647,861. (No model.)

Claim.—1. In a knitting-machine, the combination with a traveling carrier for the needle-operating cams, of a plurality of thread-carriers mounted independent of said cam-carrier, and means for operating said carriers successively to carry the threads to the needles, substantially as described.

2. In a knitting-machine, the combination with a rotary carrier for the needle-operating cams, of a plurality of thread-carriers mounted independent of said cam-carrier, and means for operating said carriers successively to carry the threads to the needles, substantially as described.

3. In a knitting-machine, the combination with a rotary carrier for the needle-operating cams, of means independent of the cam-carrier for guiding a plurality of threads, a plurality of thread-carriers, and means for operating said carriers successively to carry the threads to the needles, substantially as described.

4. In a knitting-machine, the combination with a rotary cam-carrier, of means independent of the cam-carrier for guiding a plurality of threads, a thread-guide moving with said carrier, a plurality of thread-carriers, and means for operating said carriers successively to carry said threads to said guide and to the needles, substantially as described.

5. In a knitting machine, the combination with a rotary cam-carrier, means independent of said carrier for guiding a plurality of threads, a thread-guide moving with said carrier, a plurality of thread-carriers, and means for operating said carriers successively to carry said threads to said guides and to the needles, and means for severing the threads, substantially as described.

6. In a knitting-machine, the combination with a traveling cam-carrier, of means independent of said carrier for guiding a plurality of threads, a thread-guide moving with said carrier, a plurality of thread-carriers, and a series of cams for successively reciprocating said carriers to carry said threads to the needles, substantially as described.

7. In a knitting-machine, the combination with a traveling cam-carrier, of means independent of said carrier for guiding a plurality of threads, a thread-guide moving with said carrier, a plurality of pivoted thread-carriers, and means for successively rocking said carriers on their pivots to carry said threads to said guide and to the needles, substantially as described.

8. In a knitting-machine, the combination with a traveling cam-carrier, of means independent of said carrier for guiding a plurality of threads, a thread-guide moving with said carrier, a plurality of pivoted carriers, and a series of cams for successively rocking said carriers on their pivots to carry said threads to said guide and to the needles, substantially as described.

9. In a knitting machine, the combination of a plurality of thread-carriers, each comprising a thread-engaging device, and a thread-holder, and means for successively operating said carriers to carry threads to the needles, substantially as described.

10. In a knitting-machine, the combination of a plurality of thread-carriers each comprising a thread-guide and a thread-holder, and means for successively operating said carriers to carry threads to the needles, substantially as described.

11. In a knitting-machine, the combination of a plurality of pivoted thread-carriers each comprising a thread-guide and a thread-holder, and a plurality of cams for successively operating said carriers to carry threads to the needles, substantially as described.

12. In a knitting machine, the combination of a plurality of thread-carriers each embodying a gripper, a disk, means for intermittently operating said disk, means secured to said disk for reciprocating said carriers, and cams secured to said disk for operating the movable jaws of the grippers, substantially as described.

13. In a knitting-machine, the combination of a plurality of arms, a thread-engaging device and a thread-holder on each arm, and means for moving said arms successively to carry the engaging devices and holders upon opposite sides of the needles, substantially as described.

14. In a knitting-machine, the combination of two thread-carriers each embodying a gripper, means for operating the carrier for the non-knitting thread to carry said thread to the needles, and means for simultaneously carrying the knitting-thread between the jaws of its grippers, substantially as described.

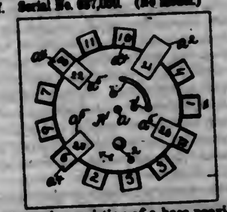
15. In a knitting-machine, the combination of two thread-carriers each embodying a gripper, means for operating the carrier for the non-knitting thread to carry said thread to the needles, means for simultaneously carrying the knitting-thread between the jaws of its gripper, and means for severing the thread, substantially as described.

16. In a knitting-machine, the combination of two thread-carriers each embodying a thread-guide and a gripper, means for operating the thread-carrier for the non-knitting thread to carry said thread to the needles, and return said carrier to active position, means for simultaneously moving the carrier for the knitting-thread, out of active position, and carrying the thread between the jaws of its gripper, substantially as described.

17. In a knitting-machine, the combination of an arm, a thread-engaging device rigidly secured thereto, a holder rigidly secured to said arm, and means for moving said arm to carry said holder and thread-engaging device into position upon opposite sides of the needles, substantially as described.

18. In a knitting-machine, the combination of a pivoted arm, a thread engaging device rigidly secured to said arm, a thread-holder rigidly secured to said arm, and means for rocking said arm about its pivot to carry said holder and engaging device into position upon opposite sides of the needles, substantially as described.

19. In a knitting-machine, the combination of an arm, a thread-guide rigidly secured thereto, a holder rigidly secured to said arm, and means for moving said arm to carry said guide and holder into position upon opposite sides of the needles, substantially as described.

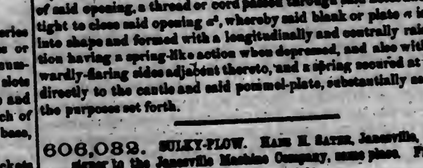


20. In a knitting-machine, the combination of a pivoted arm, a thread-engaging device secured to said arm, a gripper secured to said arm, a cam for rocking said arm, and a cam for operating the movable jaw of the gripper, substantially as described.

21. In a knitting-machine, the combination of a pivoted thread-carrier embodying a gripper, a disk, means for intermittently operating said disk, a cam secured to said disk for rocking said carrier, and a cam on said disk for operating the movable jaw of the gripper, substantially as described.

22. In a knitting-machine, the combination, of a thread-carrier embodying a gripper, an adjustable stop for adjusting the force of the grip upon the thread and means for moving the carrier to and from the needles substantially as described.

23. In a knitting-machine, the combination of a thread-carrier embodying a gripper, an adjustable stop for limiting the approach of the jaws of the gripper to each other and means for moving the carrier to and from the needles, substantially as described.



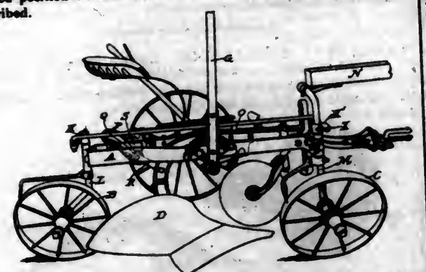
606,030. PUZZLE. SAMUEL C. ROWELL, Boston, Mass. Filed May 13, 1897. Serial No. 637,269. (No model.)

Claim.—1. A puzzle consisting of a base provided with a series of pockets or receptacles, a plurality of distinguishable pieces or parts adapted to fit into said receptacles or pockets said less in number than said pockets, and a carrier provided with a number of slots which is a divisor of the number of pockets less one in the base and having a limited movement in opposite directions to permit each of its slots to register with only a portion of the pockets in the base, substantially as described.

2. A puzzle consisting of a base provided with a series of pockets arranged in a circle, movable parts or pieces adapted to fit into said receptacles, and less in number than the same, a disk or circular carrier pivoted to move within the circle of pockets and provided with slots at its circumference of a number which is a divisor of the number of pockets less one in the base, and means to limit the movement of the said disk in opposite directions to permit each of the slots in said disk to register with only a portion of the pockets in the base, substantially as described.

606,031. BICYCLE-SADDLE. HENRY A. RUSCH, Newark, N. J., assignor of one-half to Nicholas Schrader, Brooklyn, N. Y.; Sarah E. Rusch administratrix of said Henry A. Rusch, deceased. Filed Sept. 22, 1896. Serial No. 606,636. (No model.)

Claim.—1. The improved saddle for a bicycle or the like, consisting, of a main body portion or plate *a* formed from a blank of resilient and flexible material, having the outline of a saddle-seat, supported at the rear by a cantle secured directly to the under surface of said plate and at the front by a pommel-plate, said plate *a* having a longitudinally-arranged opening of a segmental contour, a thread or cord stitched through the opposite edges of said opening, whereby said blank or plate *a* is drawn into shape and formed with a longitudinally-arranged and centrally-raised portion having a spring-like action when depressed, and also with downwardly-flaring sides adjacent thereto, a spring secured at its ends directly to said cantle and the pommel-plate, substantially as and for the purposes set forth.

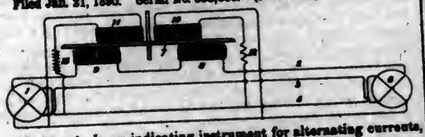


2. The improved saddle for a bicycle or the like, consisting, of a main body portion or plate *a* formed from a blank of resilient and flexible material, having the outline of a saddle-seat, supported at the rear by a cantle secured directly to the under surface of said plate and at the front by a pommel-plate, said plate *a* having a longitudinally-arranged opening of a segmental contour, a thread or cord stitched through the opposite edges of said opening, whereby said blank or plate *a* is drawn into shape and formed with a longitudinally-arranged and centrally-raised portion having a spring-like action when depressed, and also with downwardly-flaring sides adjacent thereto, a spring secured at its ends directly to said cantle and the pommel-plate, and a top cover *a'* secured upon the top of said resilient plate *a* to cover said central row of stitching, substantially as and for the purposes set forth.

3. The improved saddle for a bicycle or the like, consisting, of a main body portion or plate *a* formed from a blank of resilient and flexible material, having the outline of a saddle-seat, supported at the rear by a cantle secured directly to the under surface of said plate and at the front by a pommel-plate, said plate *a* having a longitudinally-arranged opening of a segmental contour, a thread or cord stitched through the opposite edges of said opening, whereby said blank or plate *a* is drawn into shape and formed with a longitudinally-arranged and centrally-raised portion having a spring-like action when depressed, and also with downwardly-flaring sides adjacent thereto, a spring secured at its ends directly to said cantle and the pommel-plate, and a top cover *a'* secured upon the top of said resilient plate *a*, to cover said central row of stitching, said cover *a'* having a depression a^2 to form a recessed portion or indentation, substantially as and for the purposes set forth.

4. The improved saddle for a bicycle or the like, consisting, of a main body portion or plate *a* formed from a blank of resilient and flexible material, having the outline of a saddle-seat, supported at the rear by a cantle secured directly to the under surface of said plate and at the front by a pommel-plate, said plate *a* having a longitudinally-arranged opening a^3 of a segmental contour, and having small holes a^4 contiguous to the opposite edges thereof, said holes being obliquely placed and having their inner ends terminating in the sides a^3 of said opening, a thread or cord passed through said holes and drawn tight to close said opening a^3, whereby said blank or plate *a* is drawn into shape and formed with a longitudinally and centrally raised portion having a spring-like action when depressed, and also with downwardly-flaring sides adjacent thereto, and a spring secured at its ends directly to the cantle and said pommel-plate, substantially as and for the purposes set forth.

606,032. SULKY-PLOW. HANS H. SAUER, Janesville, Wis., assignor to the Janesville Machine Company, same place. Filed July 24, 1897. Serial No. 645,256. (No model.)



Claim.—1. In a sulky-plow, the combination with a main frame, of front and rear furrow-wheels mounted on standards provided with offset arms extending in opposite directions, a connecting-rod having its ends freely secured to, and movable lengthwise of, said arms, and springs adapted to hold the ends of said connecting-rod in the desired position on said offset arms, substantially as shown and described.

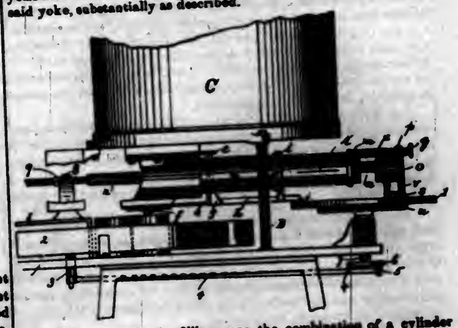
2. In a sulky-plow, the combination with a main frame, of front and rear furrow-wheels mounted on standards provided with offset slotted arms extending in opposite directions, and a connecting-rod having offset ends extending through said slots and engaging eye-bolts having springs mounted thereon, substantially as shown and described.

3. In a sulky-plow, the combination with a main frame, of a plow-beam mounted upon an arched axle having a lever connected therewith, an inclined yoke secured to said frame, a rearwardly-extending arm secured to said beam and provided with a roller or other projection, and an adjustable block adapted to be secured within said yoke so as to bear against said roller or projection and prevent the plow from rising, substantially as shown and described.

606,083. MEANS FOR COMPENSATING FOR TEMPERATURE-RESISTANCE CHANGES. CHARLES F. SCOTT, Pittsburg, Pa., assignor to the Westinghouse Electric and Manufacturing Company, same place. Filed Jan. 21, 1895. Serial No. 535,606. (No model.)

Claim.—1. In an indicating instrument for alternating currents, the combination with the rotatable closed-circuit armature of two actuating-circuits in inductive relation to said armature and containing non-inductive resistances, one of which has a greater value and a higher temperature-resistance coefficient than the other, substantially as described.

2. The combination with a movable armature, of shunt and series connected circuits in inductive relation thereto and non-inductive resistances of different values in the respective shunt-circuits and one of which has a different temperature-resistance coefficient from the other.

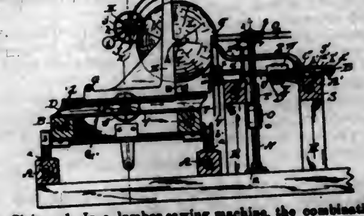


3. The combination with a movable armature, of series and shunt connected actuating-coils therefor and a non-inductive resistance in series with each of said shunt-connected coils one of which has a greater temperature-resistance coefficient than the other, substantially as described.

4. In an electrical indicating or measuring instrument, a movable armature, series-connected coils upon one side of said armature, and shunt-connected coils upon the other side thereof, a resistance having a relatively small temperature-resistance coefficient in series with one of the shunt-coils and a greater resistance having a relatively large temperature-resistance coefficient in series with the other shunt-coil, substantially as described.

606,084. CAN-FILLING MACHINE. FRANK W. SMITH, Portland, Me., assignor of one-half to Frederick O. Conant, same place. Filed Mar. 22, 1897. Serial No. 628,636. (No model.)

Claim.—1. In a machine for filling cans, the combination of a horizontal cylinder having openings upon the upper and lower sides, valves adapted to open and close said openings, both said valves being rigidly connected to a rod or arm operated by a path-cam, a filling-nozzle beneath said lower opening, a plunger within said cylinder, said plunger having a link with a yoke adapted to receive a roller fixed upon the surface of said cam, substantially as described.

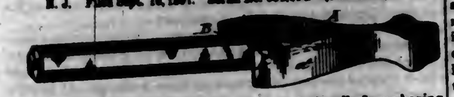


2. In a machine for filling cans, the combination of a cylinder having openings upon the adjacent or opposite sides, valves to open and close said openings, a filling-nozzle registering with one of said openings, a yoke connecting said valves and terminating in an arm provided with a pin, a path-cam adapted to receive said pin, a plunger within said cylinder, said plunger having a link provided with a yoke and a roller upon the surface of said cam adapted to play within said yoke, substantially as described.

3. In a machine for filling cans, the combination of a cylinder having openings upon the adjacent or opposite sides, valves to open and close said openings, a filling-nozzle registering with one of said openings, a yoke connecting said valves and terminating in an arm provided with a pin, a path-cam adapted to receive said pin, a plunger within said cylinder, said plunger having a link provided with a yoke and a roller upon the surface of said cam adapted to play within said yoke and a rod fixed to said plunger and having a threaded end passing through an aperture in an ear fixed to said link, substantially as described.

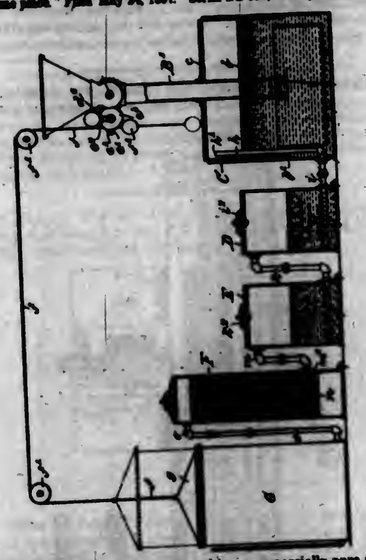
4. In a machine for filling cans, the combination of the cylinder *a* having the port *b* with the valve *c* and the port *d* and nozzle *f* with the valve *e*, the latter being provided with the opening *b'*, the arm *h* connecting said valves and having the pin *i*, the plunger *k* within said cylinder with link *o*, yoke *p*, and cam *l* with path *y* and rollers *s'*, substantially as described.

606,085. SAWING-MACHINE. DAVID S. STEWART, Clintonville, Wis., assignor of one-half to the G. W. Jones Lumber Company, same place. Filed Aug. 4, 1897. Serial No. 647,004. (No model.)



Claim.—1. In a lumber-sawing machine, the combination of a revolvable vertical arbor carrying a pair of horizontally-arranged saws, a revolvable horizontal arbor carrying a pair of vertically-arranged saws, means for varying the distance between the saws of each pair, a log-carriage adapted to reciprocate past said saws, means for moving said carriage laterally toward or from said saws, a frame pivotally secured to the saw-supporting frame and having upwardly-extending side pieces with a front straight-edged bar forming a gage, and means for adjusting the vertical and lateral projection of said gage to correspond to the distance between the saws of each pair, substantially as set forth.

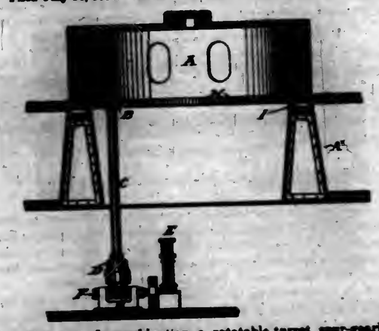
2. In a lumber-sawing machine, the combination with the vertical end pieces of the log-carriage of centering-screws passing through said ends to revolubly support the log, an arm on said carriage carrying a revolvable shaft, a log-turning wheel, ratchet-wheel and hand-wheel on said shaft, and a dog or pawl on said arm for engagement with said ratchet-wheel to lock said shaft against rotation when desired, substantially as set forth.



3. In a lumber-sawing machine, the combination with a suitable frame of a revolvable vertical arbor carrying a pair of horizontally-arranged saws, a revolvable horizontal arbor carrying a pair of vertically-arranged saws, means for varying the distance between the saws of each pair, a frame pivotally secured to the saw-supporting frame and having upwardly-curved side pieces with a front straight-edged bar forming a gage, and means for adjusting the vertical and lateral projection of said gage to correspond to the distance between the saws of each pair, substantially as set forth.

606,086. PENCIL-SHARPENER. LOUIS STOECKEL, Jersey City, N. J. Filed Sept. 16, 1897. Serial No. 651,994. (No model.)

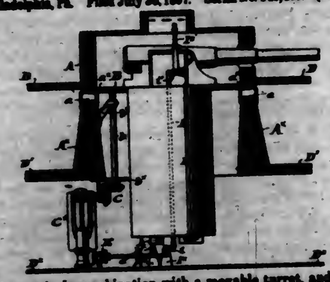
Claim.—A pencil-sharpener, consisting of a handle-frame having an enlarged handle portion and spring-arms diverging therefrom, a cutting-blade sprung in between said spring-arms and having its ends seated in sockets at the outer ends of said arms and its cutting edge toward the handle portion, and a gage for regulating the length of the cut, said gage being formed by said spring-arms between the blade and handle portion, substantially as set forth.



606,087. APPARATUS FOR GENERATING ACETYLENE GAS. HENRY H. SUPPLEE, Philadelphia, Pa., assignor to Cornelius H. Baird, same place. Filed May 24, 1897. Serial No. 637,269. (No model.)

Claim.—1. An apparatus for making commercially-pure acetylene gas, comprising a generating-chamber provided with a feed-hopper having a discharge-chute, a feeding device, consisting of a wheel mounted on a shaft journaled to said chute and provided with paddles, the spaces between two being sufficient to contain a predetermined quantity of carbid delivered thereto from said hopper, a gage-wheel mounted on said paddle-wheel shaft and gearing at intervals with a pinion having teeth on half of the periphery of the same and mounted on a shaft carrying a tumble-bob lever, a ratchet-wheel mounted on said pinion-shaft, an arm carrying a pawl adapted to engage with said ratchet-wheel, means for actuating said feeding device, purifying and drying appliances a gasometer, a pipe connection from said generating-chamber with said purifying and drying appliances and gasometer, the extensions of the pipe connection in said purifying and drying appliances perforated so that in each, the gas is conducted into and through matter in liquid and crystallized form and moisture or liquid is drained off from said drying appliances from the bottom of the same, substantially as and for the purposes described.

2. An apparatus for making commercially-pure acetylene gas, comprising a generating-chamber provided with a feed-hopper having a discharge-chute, feeding device, consisting of a wheel mounted on a shaft journaled to said chute and provided with paddles, the spaces between two of the same being sufficient to contain a predetermined quantity of carbid delivered thereto from said hopper, a gear-wheel mounted on said paddle-wheel shaft and gearing with a pinion mounted on a shaft carrying a tumble-bob lever, a ratchet-wheel mounted on said pinion-shaft, an arm carrying a pawl adapted to mesh with said ratchet-wheel, a piston adapted to slide in a cylinder in communication with said generating-chamber, the rod of said piston provided with a rack meshing with a gear-wheel mounted on said pinion-shaft, purifying and drying appliances, a gasometer, a pipe connection from said generating-chamber with said purifying and drying appliances and gasometer, the extensions of the pipe connections in said purifying and drying appliances perforated so that in each, the gas is conducted into and through matter in liquid and crystallized form and moisture or liquid is drained off from said drying appliance from the bottom of the same, substantially as and for the purposes described.

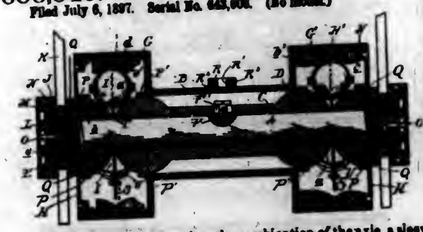


606,088. GUN-TURRET. NATHAN P. TOWNE, Philadelphia, Pa. Filed July 30, 1897. Serial No. 646,469. (No model.)

Claim.—1. In combination, a rotatable turret, spur-gearing for rotating said turret, a motor, a connective gearing between said motor and said turret, and a yielding connection applied to said connective gearing intermediate of said turret and motor which protects both the motor and the connective gearing from injury arising from the abnormal rotation of the turret, substantially as set forth.

2. In combination, a rotatable turret, spur-gearing for rotating said turret, a motor, a connective gearing between said motor and said turret, a yielding connection applied to said connective gearing intermediate of said turret and motor which protects both the motor and the connective gearing from injury arising from the abnormal rotation of the turret, and a locking device applied to said yielding connection for at will positively locking it out of action, substantially as set forth.

606,089. TURRET-DRIVING MECHANISM. NATHAN P. TOWNE, Philadelphia, Pa. Filed July 30, 1897. Serial No. 646,470. (No model.)



Claim.—1. In combination with a movable turret, and a motor and motor controlling devices carried by said turret, stationary devices arranged to trip or throw said controlling devices at predetermined points in the travel of the turret substantially as set forth.

2. In combination with a turret, a motor carried by said turret, a controlling mechanism for said motor also carried by said turret, and a tripping device for said controlling mechanism which consists of two parts one of which is mounted upon and carried by the turret and the other of which is stationary and exterior to the turret, and one of which also is formed as a cam pivotally connected at one end to its support, and as to its body is provided with devices by which it may be set to various positions of adjustment, substantially as set forth.

3. In combination with a turret, a motor, a controlling device for said motor, and a trip consisting of two parts one of which is stationary and formed as a cam pivotally connected at one end to its support, and as to its body provided with devices by which its set may be adjusted, and the other of which travels with the turret and the contact of which two parts trips the controlling device and reverses the motor, substantially as set forth.

4. In combination, a rotatable turret, a motor mounted upon and carried by said turret, a motor-controlling device mounted upon and carried by said turret, a cam supported in the vicinity of said turret, and a train of devices connected with said controller and terminating in a rock arm which depends in such position as to encounter the cam in the travel of the turret, substantially as set forth.

606,040. BALL-BEARING. EDWARD L. TRUBA, Detroit, Mich. Filed July 6, 1897. Serial No. 643,608. (No model.)

Claim.—1. In a ball-bearing, the combination of the axle, a sleeve thereon having at opposite ends oppositely-inclined ends or heads, complementary cones for each end adjustably secured in relation thereto, the sleeve being secured against rotation, but free to have a limited endwise movement, outer ball-races and the balls.

2. In a ball-bearing, the combination with the axle and its inclosing casing or hub, of inner ball-races formed by an endwise-movable sleeve such as C having opposite inclines at the ends, cones adjustable to and from these inclines on the sleeve, rings in the hub or casing opposite the inclines and cones and each having a groove to form an outer double oppositely-inclined bearing-face for the balls, one of these rings having an endwise movement, and the balls between the bearing-faces having four points of contact therewith, substantially as described.

3. In a ball-bearing, the combination with the casing or hub, and ball-races and balls therein, of washers such as Q carried by and moving with the shaft, the dust-rings H secured to the casing or hub and having their inner faces in close proximity to the washers Q, substantially as described.

4. In a ball-bearing, the combination with the shaft and the casing or hub, of the ways, the balls therein, the dust-rings H adapted to close the spaces between the casing and the shaft and having the inwardly-extending flanges P, and the washers Q on the inner members of the ways with which said flanges are in close proximity, substantially as described.

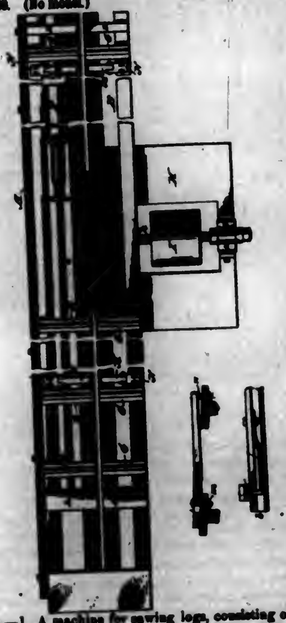
5. In a ball-bearing, the combination with the shaft and the casing or hub, of the sleeve C on the shaft having the end bearing-surfaces, the cones E secured to the ends of the shaft and having exterior grooves, the washers Q in these grooves the dust-rings H secured to the casing or hub and having the flanges P approximately contacting the washers, the balls, and outer bearing-surfaces for the balls, substantially as described.

6. In a ball-bearing, the combination of the axle having an inner bearing-surface for the balls, the casing or hub having an outer bearing-surface therefor, balls between said surfaces, the dust-rings H each having the inwardly-projecting flange P, and the flanges P on the hub or casing B opposite the flanges P for the purpose described.

7. The combination with a vehicle-frame, of a ball-bearing comprising a shaft, the balls, their ways including the outer cones E, each having an outwardly-extending end embraced by the frame, and clamping-nuts J screw-threaded onto the outer ends of the cones securing the bearing to the frame of the vehicle and locking the cones in position, substantially as described.

8. In a ball-bearing, the combination with the shaft, the hub, the balls, and their ways including the outer cones E projecting beyond the ends of the shaft and interiorly screw-threaded, of the nuts L engaging in these interior screw-threads and packing material adapted to be compressed by said nuts, substantially as and for the purpose described.

9. In a ball-bearing, the combination with the shaft, the way including outer cones interiorly screw-threaded, the balls, the centrally-apertured nuts L engaging such interior screw-threads and contacting the ends of the shaft, the dust-caps M having overhanging flanges, and the screws O engaging the screw-threads in the ends of the shaft and passing through the apertures in the nuts L, substantially as described.



10. In a ball-bearing, the combination, with the shaft, the hub, the balls, the ways including interiorly-screw-threaded end cones being adjustable on the shaft and projecting beyond the ends of the same, of the nuts L engaging with the screw-threads and contacting the ends of the shaft and having their inner faces beveled, and packing-rings compressed by such beveled faces against the cones and the ends of the shaft, substantially as described.

11. In a ball-bearing, the combination with the shaft, the hub or casing the balls, and their ball-races, of a spacing-disk having open-sided recesses or notches for the balls, arms or yokes carried by the disk adapted to have side contact with the balls and overhanging bearing portions such as U' on the disk whereby the disk acts as a ball-retainer, substantially as described.

12. In a ball-bearing, the combination with the shaft, the hub or casing, the ball-races and the balls therein, of a spacing-disk recessed to receive the balls and being supported on the shaft or inner bearing-surface, yokes on the disk having side contact with the balls and the convex projections V in the recesses of the disk for the purpose described.

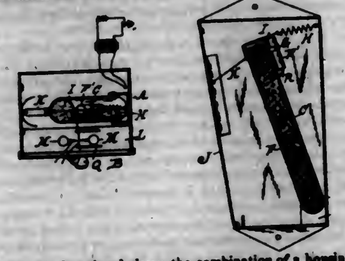
13. In a ball-bearing, the combination of the hub or casing, the shaft, the endwise movable sleeve C having a slot therein, the screw F engaging said slot in the sleeve to permit the endwise movement but to prevent rotation, the hub or casing having an aperture opposite said slot, the bushing in the aperture interiorly screw-threaded, the cap R fitting in the bushing and the packing-ring R^3 fitting in a groove in the under side of the cap, substantially as described.

606,041. MACHINE FOR SAWING LOGS. JAMES ALLEN, Wilmington, and MILTON L. JOHNS, Troy, N. C. Filed Feb. 10, 1898. Serial No. 669,868. (No model.)

Claim.—1. A machine for sawing logs, consisting of two longitudinal and parallel tables connected so that they will move together upon a suitable track one upon each side of the saw, each table near its inner edge having a series of gages normally presenting a rigid gaging-surface toward the plane of the saw but mounted so as to yield downward under the weight of the log, substantially as and for the purpose set forth.

2. A machine for sawing logs, consisting of two longitudinal and parallel tables connected so that they will move together upon a suitable track, each table near its inner edge having a series of adjustable and automatically-operating or spring-actuated gages arranged opposite each other, and a circular saw located between the tables, substantially as and for the purpose described.

3. In a machine for sawing logs, a suitable traveling table upon which the log is supported, and a series of gages to regulate the thickness of the sawed lumber, consisting of a carrier adjustable toward and from the plane of the saw, a gage-arm pivotally connected thereto, and a suitable spring supporting the free end of the arm and adapted to operate substantially as and for the purpose specified.



4. A machine for sawing logs, consisting of two longitudinal and parallel tables connected together at one end only so that they will move as one table and allow the same to run past the saw, adjustable and automatically-acting gages connected to the tables near their inner edges and located opposite each other, V-shaped guide-rails and flat bearing-supporting rails connected to the under side of the tables near their inner and outer edges respectively, and grooved guide-rollers and smooth-faced supporting-rollers with which the rails engage, and a circular saw located between the tables, substantially as and for the purpose set forth.

606,042. DIPHTHERIA ANTITOXIN AND PROCESS OF MAKING SAME. EMIL BEHRING, Halle-on-the-Saale, Germany, assignor to the Farbwerke, vormals Meister, Lucius & Brüning, Höchst-on-the-Main, Germany. Filed Jan. 11, 1890. Serial No. 336,577. (No specimens.)

Claim.—1. The process herein described of producing diphtheria antitoxin, which consists in inoculating horses or other animals capable of being infected with diphtheria with repeated doses of diphtheria poison or living diphtheria bacilli of gradually-increasing quantity and strength, so as to immunize them and form in the blood a counter poison for destroying the poison secreted by said bacilli, drawing off the blood from said animals, separating the serum from the blood-corpuscles, and concentrating the former for use, substantially as set forth.

2. As a new substance, diphtheria antitoxin, consisting of the concentrated serum of the blood of animals treated with diphtheria poison and having the characteristic of immunizing test animals against infection with diphtheria, and curing them when artificially infected with diphtheria, said serum containing a counter poison having the property of destroying the poison secreted by the diphtheria bacilli, substantially as set forth.

606,043. SIGNAL-ALARM. FREDERICK BOSSERT, Detroit, Mich., assignor of one-half to John B. F. Uthes, same place. Filed Dec. 6, 1897. Serial No. 660,944. (No model.)

Claim.—1. In a signal-alarm, the combination of a housing, having an opening in one side, a torch hinged within the housing free to fall in the direction of said opening, a combustible connection securing the torch against falling and adapted to be destroyed by the burning of the torch, and means for lighting the torch.

2. In a signal-alarm, the combination of a housing having an opening in one side, a torch hinged within the housing free to fall in the direction of said opening and project out through the same, a door normally closing said opening and adapted to be opened by the falling of the torch, means securing the torch against falling and adapted to release the same by the burning of the torch and means for lighting the torch.

3. In a signal-alarm, the combination of a housing having an opening formed in one side, a torch hinged within the housing free to fall in the direction of said opening and project out through the same, a torpedo secured to and carried by the torch and adapted to be exploded by the burning of the torch, means securing the torch in inclined position and adapted to release the same by the burning of the torch, a fuse for lighting the torch and means for lighting the fuse operated by the closing of an electric circuit.

4. In a signal-alarm, the combination of a housing, a torch inclosed therein and hinge connected at its lower end, means securing the torch in inclined position within the housing and adapted to release the torch when burning, an opening in the housing through which the torch is adapted to project, a door normally closing said opening and adapted to be opened by the falling of the torch from its inclined position, a fuse for lighting the torch and electrically-operating means for lighting the fuse.

5. In a signal-alarm, the combination of a housing having an opening in one side, a torch comprising an outer metallic tube hinged at its lower end in the housing and adapted to receive a charge of colored fire and a fuse leading into said charge, a door normally closing the opening in the side of the housing and connected to the torch, a torpedo carried by the torch and adapted to be exploded by the burning of the torch, a combustible connection for holding the torch in an inclined position, electrodes and means for producing a spark between the electrodes, the arrangement being such that the spark lights the fuse, the fuse lights the torch, the torch burns the connection holding it in position and allows the torch to fall open the door and show the light outside the housing and fire also the torpedo.

6. In a signal-alarm, the combination of a housing having an opening in one side, a torch movably secured within the housing, and provided with means, operating automatically, for projecting it out through the opening in the housing, a string or like connection of combustible material for holding the torch in its retracted position within the housing and adapted to be severed by the burning of the torch and thereby release the same and means for lighting the torch.

606,044. MECHANICAL MOVEMENT. HENRY F. BRAMER, Davenport, Iowa. Filed Dec. 31, 1897. Serial No. 665,087. (No model.)

Claim.—1. In a mechanical movement, a continuously-revolving shaft and a pinion upon its inner end, combined with a vertical shaft having a rotary movement, and which shaft is made angular at its upper end, a casting loose upon the shaft and provided with teeth of unequal size upon both of its ends, and which casting is adapted to have a rising-and-falling movement upon the shaft; the two toothed wheels of the casting being adapted to alternately come in contact with the pinion, and thus reverse the movement of the shaft, substantially as shown.

2. In a mechanical movement, a continuously-rotating shaft provided with a pinion upon its inner end; the shaft G and the casting N loose upon and adapted to have a rising-and-falling movement upon the shaft, but revolving therewith; each end of the casting being provided with wheels which face toward each other, and having the teeth P Q of greater height than the other teeth, substantially as described.

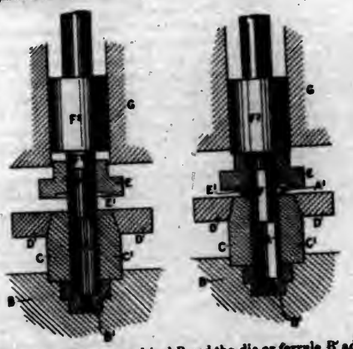
3. The continuously-rotating shaft D, provided with the pinion F, the vertical shaft G, the casting N placed loosely thereon and adapted to have a rising and-falling movement upon the shaft but turning therewith, each end of the casting being provided with wheels which are set facing each other, the teeth being of unequal size; and the flange upon the lower end of the casting; and the supports U, V, upon the frame, substantially as set forth.

606,045. WORK-SUPPORT FOR NAILING-MACHINES. LOUIS A. CASGRAIN, Winchester, Mass., assignor to James W. Brooks, Peterboro, and Frank P. Stanley, Swampscott, Mass., trustees. Filed Aug. 4, 1896. Serial No. 601,576. (No model.)

Claim.—1. In an apparatus of the class described, a spindle, an upturned work-support pivotally mounted thereon, to swing in a vertical plane, and a retaining device at the lower end of and to automatically hold the work-support in operative or inoperative position until released by positive movement of said work-support, substantially as described.

2. In an apparatus of the class described, a spindle a work-support mounted thereon to rock in a vertical plane, and a yielding connection between said spindle and work-support, whereby the latter

may give laterally relatively to the spindle when subjected to positive force, to thereby provide at all times a support for the work, the plane of movement of said support being in line with the path of movement of the device for inserting the fastenings into the work, substantially as described.



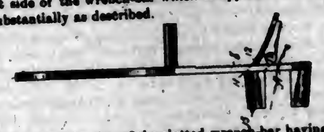
3. In an apparatus of the class described, a spindle, a work-support pivotally mounted thereon to swing in a vertical plane, a spring-controlled plunger carried by and longitudinally movable in the lower end of said support, and a stationary, cooperating member, engagement therewith by the plunger maintaining the work-support in operative or inoperative position, until released by positive movement of the work-support to overcome the force of the spring, substantially as described.

4. A spindle, a hub thereon having laterally-extended bearings, a work-support mounted to be rocked on said bearings, a shouldered abutment on the hub, and a cooperating spring-controlled plunger carried by the work-support and having its outer end shouldered, to retain the work-support in operative or inoperative position, substantially as described.

5. In an apparatus of the class described, a spindle, a work-support bent in the direction of its length and pivotally mounted thereon, a fixed, shouldered abutment extended laterally from the spindle, and a yielding plunger carried by the work-support, having a shouldered end to cooperate with the shoulder of said abutment when the work-support is in inoperative position, and to bear with substantially vertical yielding pressure upon the abutment at one side of the spindle when the work-support is in operative position, substantially as described.

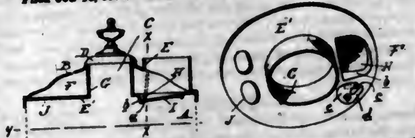
606,046. MEANS FOR MANUFACTURING WHEEL-HUBS.

RUDOLF CHILLINGWORTH, Nuremberg, Germany, assignor to the Standard Weldless Tube and Cycle Components, Limited, London, England. Filed May 27, 1897. Serial No. 638,268. (No model.) Patented in England Dec. 15, 1896, No. 28,696.



Claim.—1. The recessed bed B and the die or ferrule B' adapted to receive the end of the tube that is to be flanged, the two-part casing C C' received at its lower end into a recess in the bed, the ring D having a tapering opening and fitting the upper part of the two-part casing, the plunger having a portion F' corresponding to the exterior of the tube and a portion F fitting the interior of the tube, and the ring-die E surrounding the upper end of the tube and the plunger and having an annular recess E' in its under surface into which the tube is expanded in a folded condition to form a flange, substantially as set forth.

2. The bed B and the die B' received into a recess in the bed, in combination with the two-part casing C^2 C^4 passing at its lower end into a recess in the bed B and of a length adapted to set between the two flanges of the tubular hub, the ring D having a tapering opening and holding the upper ends of the two-part casing C^3 C^4 together, a plunger having a portion F' corresponding to the exterior diameter of the tube to be acted upon, and the portion F to pass into such tube, and the ring-die E having an annular recess in its under surface adapted to the formation of a second flange upon the tubular hub, substantially as set forth.



606,047. AXLE-NUT WRENCH. EDWARD P. CONWAY, Southington, Conn. Filed Sept. 4, 1897. Serial No. 650,562. (No model.)

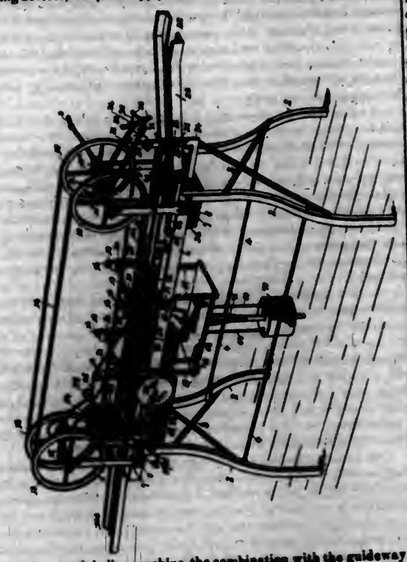
Claim.—1. The combination of the slotted wrench-bar having the fixed jaw on one side thereof and the toothed face on the opposite side of said wrench-bar, with the movable jaw having the offset shank 12 extending through the slot in the wrench-bar, the cross-arm 13 extending from said shank inside of the inner face of said jaw and having an edge for engaging the teeth of the bar, said shank having also a projecting handle portion, the said cross-arm and handle being on that side of the wrench-bar which is opposite the said movable jaw, substantially as described.

2. The combination of the slotted wrench-bar having a toothed face and the fixed jaw with a V-shaped inner face, the movable jaw having a like V-shaped inner face and the offset shank extending through the slot in the wrench-bar, the cross-arm 13 having a thin edge for engaging the teeth of the wrench-bar, and a spring set in the apex of the inner face of one of the jaws and acting in connection with the nut held in the wrench to hold the edge of the cross-bar in engagement with the teeth of the wrench-bar, substantially as described.

606,048. HEATING-STOVE. THOMAS H. CONWAY, Detroit, Mich. Filed Oct. 11, 1897. Serial No. 654,907. (No model.)

Claim.—1. The combination with a heating-stove wherein the body forms the combustion-chamber and which is provided with a top and a stovepipe connection at or near the top, of a plate conformable to the horizontal section of the body and located therein below the stove-top and stovepipe connection and dividing the stove into a lower combustion-chamber and upper smoke-flue communicating directly with each other by means of two apertures in said plate, one of said apertures being in direct-draft relation with the stovepipe connection, a partition in said smoke-flue arranged to cause an indirect passage therein to the stovepipe connection from the other aperture, and a damper for the direct-draft aperture.

2. The combination with a heating-stove wherein the body forms the combustion-chamber and which is provided with a top having a boiler-hole centrally therein and a stovepipe connection, of a plate conformable to the horizontal section of the stove-body and located therein below the stove-top and dividing the stove into a lower combustion-chamber and an upper smoke-flue communicating with each other directly by means of two apertures in said plate, a circular flange or partition surrounding a central opening in said plate and extending to the stove-top and registering with the boiler-hole therein and forming an annular passage in the smoke-flue, one of said apertures in the plate being in direct-draft relation with the stovepipe connection, and the other of said apertures being in indirect-draft relation with said stovepipe connection, and a damper for the direct-draft aperture.



3. The combination with a heating-stove having a top provided with a central boiler-hole, and a stovepipe connection, of a baffle-plate E' located within said stove below the top thereof and dividing an upwardly-extending circular partition above said plate forming an annular passage, said baffle-plate having an aperture J on one side of said partition and an aperture H on the other side of said partition below the stovepipe connection, and a damper for the aperture H.

4. The combination with a stove of a baffle-plate therein having an aperture, a damper for said aperture, a crank *c* secured to said damper, a plate pivotally secured to said baffle-plate and provided with a slot in which said crank loosely engages, and an operating-handle for said slotted plate detachably engaging the same and extending without the stove, substantially as described.

606,049. CAN-LABELING MACHINE. WILLIS J. CONKRAN, Hambleton, Md. Filed May 20, 1897. Serial No. 636,709. (No model.)

Claim.—1. In a can-labeling machine, the combination with a guideway along which the cans move, of vertically-adjustable belt-pulleys supported to revolve at each end of the guideway, spaced upwardly-bowed springs in the guideway below the pulleys at the receiving end of the machine to form a yielding support for the ends of the can at its entrance below the belt-pulleys, a cement-receptacle supported below said springs, devices to apply cement to the can between the springs as the can rolls over them, an upwardly bowed, spring-supported smoothing-pad below the pulleys at the delivery

end of the machine, vertically-adjustable and spring-controlled idle-pulleys intermediate the belt-pulleys, endless belts traveling around said belt-pulleys and under the idle-pulleys, label supporting and guiding devices, and paste-applying devices, substantially as described.

2. In a can-labeling machine, the combination with the guideway, label-supporting devices and the endless propelling-belts, of a cement-receptacle supported below the guideway at the receiving end of the machine, a pair of horizontal rods journaled in the sides of the receptacle, an arm connected to one of said rods and extending above the guideway in the path of the moving cans, a cement-applying bar connected to the other horizontal rod within the receptacle, a spring to normally hold the bar in the cement, and gearing connecting the two horizontal rods to elevate the cement-applying bar into contact with the can when the said arm is depressed by the same can, substantially as described.

3. In a can-labeling machine, the combination with the guideway, the label-supporting devices and the endless propelling-belts, of a cement-receptacle supported below the guideway at the receiving end of the machine, a shaft journaled in the receptacle transversely of the machine, a segmental gear on one end of the shaft, an arm rigidly secured to said shaft and extending above the guideway in the path of the moving cans, a second shaft also journaled in the receptacle parallel to the first shaft, a pinion on the second shaft meshing with the said segmental gear, spaced arms rigidly secured to the second shaft and extending parallel with the said arm on opposite sides thereof, a cement-applying bar connecting the forward ends of said spaced arms, and a spring to normally hold said cement applying bar depressed, substantially as described.

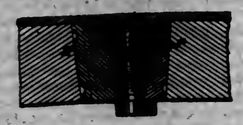
4. In a can-labeling machine, the combination with a paste-applying roller, of a label-supporting plate, a vertical bar to the upper end of which the plate is pivoted, an adjustable link connected to said bar and plate to hold the plate in an inclined position, the depressed end of said plate projecting below the paste-roller, and guide-plates on each side of said supporting-plate to engage the side edges of the labels, each of said guide-plates having an inwardly-projecting flange at its upper edge the inner face of which inclines downwardly and outwardly, and a weight to elevate said bar, the construction being such that the labels will be held against upward movement at one end by the paste-roller and at their other ends by the inclined faces of said flanges, substantially as described.

5. In a can-labeling machine, a label-supporting plate, a bar pivoted at its upper end to said plate and supported in suitable guides to have vertical movement, a link pivoted at its upper end to said plate and adjustably connected at its lower end to the said bar whereby the inclination of the plate may be varied, pulleys connected to a fixed support, a weight, and a rope running over said pulleys and connected to the weight and bar, substantially as described.

6. In a can-labeling machine, a label supporting and guiding mechanism consisting of a vertically-movable plate on which the labels are supported, and side plates each having a flange at its upper end projecting on each side thereof, said flanges being rabbeted at their inner edge to form a guideway for the cans and the outwardly-projecting parts being adapted to rest on the frame of the machine, means to adjustably secure the said flanges to the frame, and the inwardly-projecting parts of said flanges having their inner edges inclined downwardly and outwardly, substantially as and for the purpose described.

7. In a can-labeling machine, the combination of a revoluble pasting-roller beneath which the forward ends of the labels are supported, a paste-receptacle, a rock-shaft, a paste-applying roll connected to said rock-shaft within the said receptacle and adapted to engage the pasting-roller, and suitable means to rock the shaft to apply paste to the pasting-roller at each quarter-revolution of the latter, substantially as described.

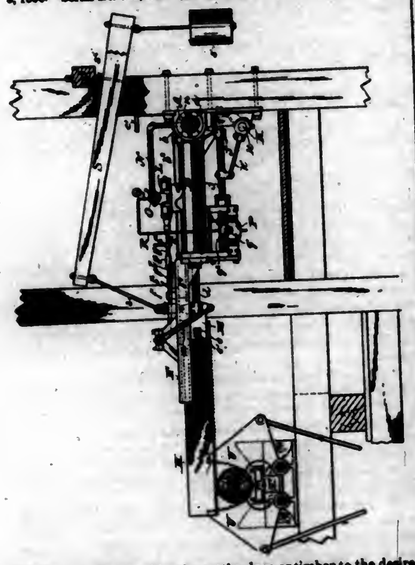
8. In a can-labeling machine, the combination of a revoluble pasting-roller beneath which the forward ends of the labels are supported, a paste-receptacle, a shaft journaled in the frame of the machine, a crank on one end of the shaft, a gear-wheel on one end of the pasting-roller shaft, a pinion journaled on a stub-shaft and meshing with said gear, the teeth on the gear being four times as many as those on the pinion, a crank on the pinion, a link connecting the said cranks, arms extending from said shaft into the paste-receptacle, a paste-applying roll carried by said arms and adapted to engage the pasting-roller, and means to revolve the pasting-roller, substantially as described.



9. In a can-labeling machine, the combination of a vertically-movable inclined plate on which the labels are supported, a revoluble pasting-roller beneath which the labels project at one end, said roller having an annular groove near each end, and vertical bars supported at their lower ends by the machine frame and fitting in said grooves at their upper ends, the said upper ends being bent over and pointed to engage the ends of the labels, substantially as and for the purpose specified.

10. In a can-labeling machine, the combination with can propelling belts, label supporting and guiding devices, and a pasting mechanism, of a brush mounted to revolve in advance of the pasting mechanism in an opposite direction to the movement of the can, and adapted to engage the pasted edge of the label, a smoothing-pad in advance of the said brush, and an upwardly-bowed spring to which said pad is removably attached, substantially as described.

11. In a can-labeling machine, the combination of shafts journaled in vertical standards at each end of the machine, a pair of belt-pulleys on each shaft, means to adjust the said pulleys longitudinally of their shafts, can-propelling belts traveling over said pulleys, a smoothing-pad below the belt pulley at the delivery end of the machine, means to positively rotate one of said shafts, a revolving can-separator at the receiving end of the machine, a revolving brush near the delivery end of the machine, and a revolving paste-roller intermediate said separator and brush, and belt-and-pulley connections between said shafts and the can-separator, pasting-roller, and the brush, to transmit movement from the former to the latter, substantially as described.



12. In a can-labeling machine, the combination with the guideway, the label-supporting devices and the endless propelling-belts, of a cement-receptacle supported below the guideway at the receiving end of the machine, means to adjust the receptacle longitudinally of the guideway toward or away from the label-supporting devices, a pair of horizontal rods journaled in the sides of the receptacle, an arm connected to one of said rods and extending above the guideway in the path of the moving cans, a cement-applying bar within the receptacle connected to the other horizontal rod, gearing connecting the two horizontal rods to each other to elevate the cement-applying bar when the said arm is depressed, and means to normally hold the cement-applying bar in the cement, substantially as described.

606,050. TIRE-TIGHTENER. WILLIAM J. CRAWFORD, Asheville, N. C. Filed Dec. 3, 1897. Serial No. 661,163. (No model.)

Claim.—A tire-tightener, consisting of two metal sections and a movable wedge-shaped block located between the same for moving the sections in a lateral or outward direction, one of said sections having laterally-extending flanges, guide-shoulders at right angles therewith, and inwardly-beveled sides, and the opposite section having recess, guide-mortises upon the side walls thereof which extend inwardly at their lower ends to adapt them to the bevel sides of the opposite section, substantially as and for the purpose set forth.

606,051. DRAG-SAW. ALBERT CUSHINGHAM, Milwaukee, Wis., assignor to the Filer & Stowell Company, of Wisconsin. Filed Nov. 9, 1896. Serial No. 611,499. (No model.)

Claim.—1. In a machine for cutting logs or timber to the desired length, the combination with a suitable support, of a main cylinder pivoted thereto so as to swing vertically, a piston fitted to work in said cylinder, a saw rigidly attached to the piston-rod, an auxiliary cylinder attached to the working cylinder and provided with a piston which is connected with a fixed support, substantially as and for the purposes set forth.

2. In a machine for cutting logs or timber to length, the combination of a hollow trunnion supported horizontally in suitable bearings, a cylinder mounted at one end upon and movable endwise of said trunnion, a piston fitted to work in said cylinder, and a saw rigidly attached to the piston-rod, substantially as and for the purposes set forth.

3. In a machine for cutting logs and timber to length, the combination with a trunnion supported and adapted to turn in suitable bearings, a main cylinder provided at one end with a transverse box fitted to slide endwise upon said trunnion, a piston fitted to work in said cylinder, a saw rigidly attached to the rod of said piston, an auxiliary cylinder attached to the main cylinder and provided with a piston which has a sliding pivot connection with a rod parallel with said trunnion, substantially as and for the purposes set forth.

4. In a machine for cutting logs and timber to length, the combination with a trunnion supported horizontally in suitable bearings and formed or provided with a longitudinal rack, a cylinder having a transverse box at one end mounted upon and movable endwise of said trunnion, a shaft journaled in said box and provided with a pinion engaging said rack, a piston fitted in said cylinder and provided with a rod and a saw attached to the piston-rod, substantially as and for the purposes set forth.

5. In a machine for cutting logs and timber to length, the combination with a trunnion supported horizontally and adapted to turn in suitable bearings, of a main cylinder having a box at one end fitted to slide endwise upon said trunnion, a shaft journaled in said box and provided with a pinion which meshes with a longitudinal rack on said trunnion, an auxiliary cylinder attached lengthwise to the main cylinder and provided with a piston, a stationary rod parallel with said trunnion, a sleeve or collar movable endwise thereon and linked to the auxiliary piston, a piston fitted in the main cylinder and provided with a rod, and a saw attached to the rod of the main piston, substantially as and for the purposes set forth.

6. In a machine for cutting logs and timber to length, the combination of a horizontally-arranged trunnion, a main cylinder having a transverse box mounted upon and movable endwise of said trunnion, an auxiliary cylinder attached lengthwise to the main cylinder and provided with a piston, a stationary rod parallel with said trunnion, a sleeve or collar movable endwise thereon, linked to the auxiliary piston-rod and having a guide loosely engaging it, a piston fitted in the main cylinder and provided with a rod, and a saw attached to the main piston-rod, substantially as and for the purposes set forth.

7. In a machine for cutting logs and timber to length, the combination with a hollow trunnion, a vertically-swinging and laterally-movable cylinder mounted thereon at one end and provided with a piston, a saw attached to the piston-rod, a valve controlling the supply and exhaust of the actuating medium to and from opposite ends of said cylinder, and a telescoping fluid-pressure-supply connection through said trunnion with the valve-chamber, substantially as and for the purposes set forth.

8. In a machine for cutting logs and timber to length, the combination with a hollow or recessed trunnion supported horizontally in suitable bearings, a cylinder having a transverse box mounted upon and movable endwise of said trunnion, a valve-chamber connected with opposite ends of said cylinder by passages, a valve for controlling the supply and exhaust of the actuating medium to and from the cylinder, a fluid-pressure-supply pipe attached to one end of said trunnion, a pipe telescoping with said supply-pipe and connecting it with the valve-case, a piston fitted to work in said cylinder and a saw attached to the piston-rod, substantially as and for the purposes set forth.

9. In a machine for cutting logs and timber to length, the combination with a trunnion supported horizontally and adapted to turn in suitable bearings, a laterally-adjustable cylinder mounted at one end upon said trunnion, a valve-chamber connected by passages with the ends of said cylinder, a valve controlling communication between said chamber and cylinder through said passages, a fluid-pressure-supply pipe, a pipe arranged axially in said trunnion to turn and telescope in said supply-pipe and connecting it with said valve-chamber, a piston fitted to work in said cylinder and a saw attached to the piston-rod, substantially as and for the purposes set forth.

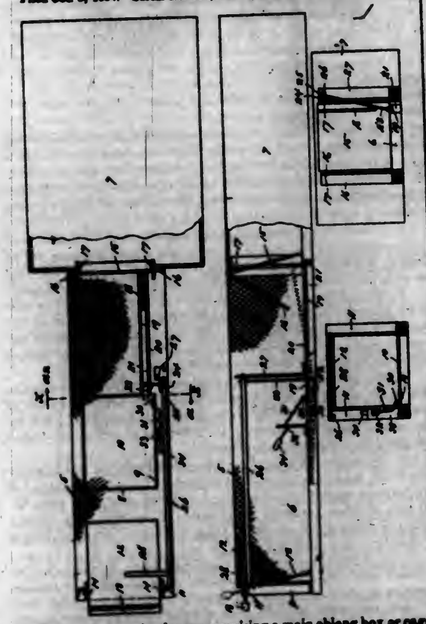
10. In a machine for cutting logs and timber to length, the combination with a cylinder and piston of a slotted head attached to the outer end of the piston rod and formed with a transverse opening through it, a saw having a corresponding opening through one end, a key passing transversely through the opening in the head and saw, two wedge-blocks inserted in said opening on opposite sides of the saw, and a bolt connecting said blocks for drawing them together, clamping the sides of the head against the saw and forcing and holding the key against the back of the opening in the saw and the end of the saw against the end of the slot in the head, substantially as and for the purposes set forth.

11. In a machine for cutting logs and timber to length, the combination of a vertically-swinging cylinder and piston having laterally-adjustable pivot connections with a suitable support, a saw attached to the outer end of the piston-rod, and a lever having a flexible or jointed connection at one end with said cylinder, a counterweight at the other end and a universally-jointed fulcrum connection with a suitable support at an intermediate point, substantially as and for the purposes set forth.

12. In a machine for cutting logs and timber to length, the combination of a vertically-swinging cylinder and piston pivotally connected at one end with a suitable support, a saw attached to the outer end of the piston-rod, a valve controlling the admission and exhaust of the actuating medium to and from opposite ends of said cylinder and having operating connections with the piston-rod, a fluid-pressure-supply connection with the valve-chamber, an auxiliary cylinder attached to the main cylinder and provided with a piston which is connected with a support so as to swing the main cylinder and its attachments on their pivot-bearing, a fluid-pressure-supply connection communicating with opposite ends of the auxiliary cylinder, and a valve in said connection for controlling the admission and exhaust of the actuating medium to or from either end of said cylinder, substantially as and for the purposes set forth.

13. In a machine for cutting logs and timber to length, the combination of a vertically-swinging cylinder and piston having at one end a laterally-movable pivot connection with a suitable support, a saw attached to the piston-rod, an auxiliary cylinder attached to the main cylinder and provided with a piston the rod of which is guided at its outer end in a bearing attached to the main cylinder, a rod parallel with the axis on which the main cylinder swings, a sleeve mounted upon and movable endwise of said rod and having a guiding projection loosely engaging the auxiliary piston-rod, and a link pivoted at the ends to and connecting said sleeve and auxiliary piston-rod, substantially as and for the purposes set forth.

14. In a machine for cutting logs and timber to length the combination with a log way and conveyer and dogging device for immovably holding logs thereon, of a vertically-swinging cylinder pivotally connected with a suitable support, a piston fitted to work in said cylinder, a saw rigidly attached to the piston-rod and extending therefrom transversely over said log way and conveyer, and an auxiliary cylinder attached to the main cylinder and provided with a piston which is connected with a fixed support and is adapted to turn the main cylinder and saw up and down upon their pivot connection, substantially as and for the purposes set forth.



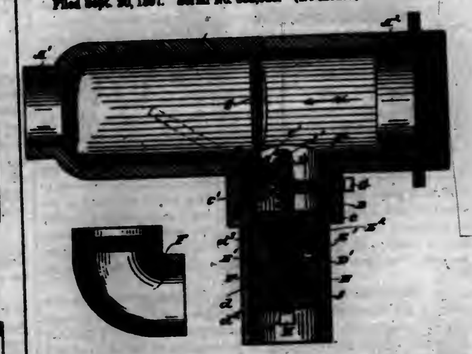
15. In a machine for cutting logs and timber to length, the combination of a vertically-swinging cylinder and piston having a pivot connection at one end with a suitable support, a saw attached at one end to the piston-rod, and an auxiliary cylinder and piston connected with the main cylinder and arranged to swing it and the saw vertically, substantially as and for the purposes set forth.

16. In a machine for cutting logs and timber to length, the combination of a vertically-swinging cylinder and piston having a laterally-adjustable pivot connection with a suitable support, a saw attached to the piston-rod, and an auxiliary cylinder and piston connected with said main cylinder in such manner as to swing it vertically and permit of its lateral adjustment, substantially as and for the purposes set forth.

17. The combination in a log way and conveyer of a vertically-swinging cylinder and piston arranged transversely to and adjustable lengthwise of said logway, and a saw rigidly attached at one end to the piston-rod, substantially as and for the purposes set forth.

18. The combination with a log way, conveyer and dogging device for immovably holding logs upon said logway, of a vertically-swinging cylinder and piston arranged transversely to and adjustable lengthwise of said logway, and a saw rigidly attached at one end to the piston-rod, substantially as and for the purposes set forth.

606,052. ANIMAL-TRAP. JOHN DAVIDSON, Holtham, England. Filed Oct. 5, 1897. Serial No. 654,126. (No model.)



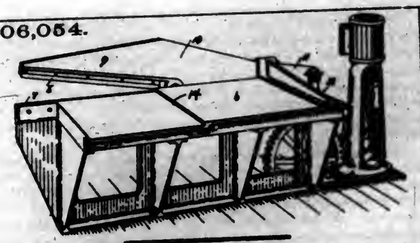
Claim.—1. An animal-trap comprising a main oblong box or cage which is in communication at one end with a supplemental box or cage, a weighted drop-door normally held open at its outer end, a drop-door 15 normally closed at the other end, a revoluble rod pivotally mounted at one side of said first-mentioned door having an arm projecting over said door and connections between said rod and said door 15 whereby the opening of said door 15 will rotate said rod; whereby said first-named door will automatically reopen, substantially as described.

2. An animal-trap, comprising a main oblong box or cage which is in communication at one end with a supplemental box, said main box or cage being provided at its outer end with a weighted drop-door which is normally held in a horizontal position, and which opens inwardly, and at its inner end with a drop door which is normally closed and which opens into the supplemental box, and which is provided with an outwardly-directed arm, said main box or cage being also provided centrally of the bottom thereof with a pivoted table which is normally held in a horizontal position, a lever pivoted in the bottom of the main box or cage, one end of which projects beneath the free edge of said table, and the other beneath the arm of the door at the inner end of said main box or cage, and devices connected with said lever for closing the door at the outer end of the main box or cage when the pivoted table is depressed, said devices being actuated by the door at the inner end of the main box or cage so as to reopen the door at the outer end thereof, substantially as shown and described.

3. An animal-trap comprising a main oblong box or cage which is in communication at one end with a supplemental box or cage, said main oblong box or cage being provided with a weighted drop-door which is normally held in an open position and at its inner end with a drop-door which is normally closed, and which opens inwardly into the supplemental box or cage, and which is provided with an outwardly-directed arm, said main box or cage being also provided centrally of the bottom thereof with a pivoted table, and with a lever which is pivotally supported, and one end of which projects beneath the free edge of said table, and the other beneath the arm of the door at the inner end of the main box or cage, said table being also provided with a pivoted rod which passes upwardly through a seitable support, and by which the table is held in a horizontal position, and a rod pivotally connected with said lever and in operative connection with a horizontal rod by which the door at the outer end of the main box or cage is closed, said parts being constructed, combined and arranged substantially as shown and described.

606,053. RELIEF-VALVE. LOUIS O. DERRER, Sandusky, Ohio. Filed Sept. 20, 1897. Serial No. 652,312. (No model.)

Claim.—1. In a relief-valve of the character described, the combination with the main water-passage having a flap-valve located and operating therein, said flap-valve provided at its upper portion with a segmental gear, of an auxiliary casing extending from and communicating with the main water-passage, said auxiliary casing being provided with a relief-valve having at its lower end a rack meshing with the segmental gear of the flap-valve whereby the movement of the flap-valve will operate to close the valve in the auxiliary chamber when the water has free outlet, substantially as and for the purpose shown and described.



2. A relief-valve for fire-hose and the like comprising, a main waterway, an auxiliary chamber extending from and communicating with said main waterway, a flap-valve located in the main waterway and provided with a segmental gear, a relief-valve located in the auxiliary chamber and provided with a rack meshing with the gear of the flap-valve whereby the valves operate in unison, an adjusting-screw located at the rear of the rack and an adjusting-screw located at the end of the relief-valve, all operating substantially as and for the purpose shown and described.

3. In a relief valve of the character described, the combination with the casing A, of flap-valve C, rack D, and valve or piston D', said valve or piston D' operated by the flap-valve C through the rack D and thus operated to open or close port-holes E' E' in the cylinder E, substantially as shown, for the purpose described.

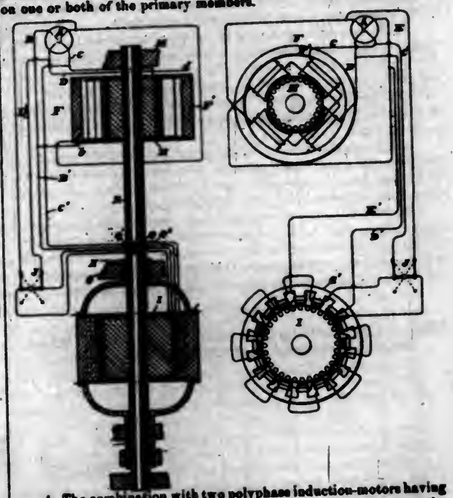
606,054. DOUBLING-SHEARS. FRANK DOSSER, Anderson, Ind. Filed Sept. 3, 1897. Serial No. 650,468. (No model.)

Claim.—The combination with a pair of shears, of a table for supporting the material to be sheared, the said table having one end thereof in a plane lower than the other thus forming a shoulder against which the material to be sheared may be held and presented to the shears.

606,054.

606,055. OFFICE-INDICATOR. THEODORE B. FLOYD, Syracuse, N. Y., assignor of one-half to Stewart S. Ribbens, same place. Filed Mar. 1, 1897. Serial No. 626,537. (No model.)

Claim.—1. The combination of a back plate, an opaque front plate provided with a plurality of transparent panels and secured to said back plate with a space between them, strips attached to the edges of said plates and closing the aforesaid space, display devices in said space and disposed interchangeably opposite one of the transparent panels, and display-disks pivoted to the front plate and arranged to traverse some of the aforesaid transparent panels, as set forth.



2. The combination of a back plate, an opaque front plate provided with a plurality of transparent elongated transverse panels and circular, or approximately circular panels, and secured to the back plate with a space between them, strips attached to the edges of said plates and closing said space and provided in the vertical strips with grooves inclined toward the front plate, a display-roller polygonal-shaped in cross-section and provided on its ends with trunnions riding in the aforesaid grooves, a handle on the protruding end of one of said trunnions for turning said roller, a spring holding said trunnions normally in the lower ends of the grooves, display-disks pivoted to the front plate and traversing the circular panels, a case projecting from the front of the lower portion of the aforesaid back plate and provided with a slot in its top and with a door to afford access to the interior of the case, substantially as described and shown.

606,056. ALTERNATING-CURRENT ELECTRIC MOTOR. ROBERT H. HAMILTON, Pittsburg, Pa., assignor to the Westinghouse Electric and Manufacturing Company, of Pennsylvania. Filed Sept. 6, 1895. Serial No. 561,676. (No model.)

Claim.—1. The combination with two alternating-current induction-motors, one of which comprises primary and secondary independently-movable members, and the other, primary and secondary members, one of which is movable and the other stationary, one of said primary members having a greater number of magnetic poles than the corresponding member of the other motor, of means for mechanically connecting one of the members of the first motor with the movable member of the second, a source of alternating currents and means for electrically connecting the primary member of each motor with said source of currents.

2. The combination with two alternating-current induction-motors, one of which comprises two independently-movable members, and the other, a stationary and a movable member, of means for mechanically connecting one of the members of the first motor with the movable member of the second, a source of alternating currents, means for electrically connecting the primary member of each motor with said source of currents, and a switch for reversing one of the circuits.

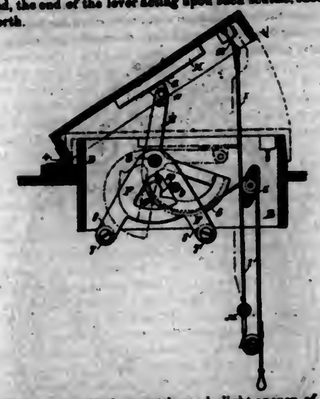
3. The combination with two induction-motors, one comprising two independently-movable members and the other a stationary and a movable member, of means for mechanically connecting one of the members of the first motor with the movable member of the second, means for electrically connecting one member of the first with one member of the second, and means for varying the number of poles on one or both of the primary members.

4. The combination with two polyphase induction-motors having rotatable members which are mechanically connected to rotate at the same speed, and means for electrically connecting one member of one motor to one member of the other, of means for reversing one of the circuits and means for varying the number of magnetic poles in either or both of the primary members.

5. The method of controlling the speed of a rotating shaft or axle which consists in subjecting the same to the resultant torque of two rotating magnetic fields for one rate of speed and changing the number of poles of one of said rotating fields for a different rate of speed.

6. The method of varying the speed of a rotating shaft or axle which consists in subjecting the same to the resultant torque of two rotating magnetic fields having a different number of poles for one rate of speed, and changing the number of poles of either or both of said rotating fields for different rates of speed.

7. The method of regulating the speed of rotation of a shaft or axle which consists in subjecting the same to the resultant torque of two rotating magnetic fields having a different number of poles for one rate of speed and changing the direction of rotation of one of said fields for a different rate of speed.



8. The method of regulating the speed of rotation of a shaft or axle which consists in subjecting the same to the resultant torque of two rotating magnetic fields having a different number of poles for one rate of speed, reversing the direction of rotation of one of the fields and changing the number of poles of either or both of said fields for different rates of speed.

9. In an induction-motor, the combination of a primary member provided with slots and with distributed windings therein, a circuit-changing device, leads for each phase of current, less in number than the slots, connected through such circuit-changing device to such windings, the windings being so arranged and connected to said leads that when the direction of current-flow therein is changed, the number of magnetic poles is changed, substantially as described.

10. In an induction-motor, the combination of a primary member provided with slots and with distributed windings therein, a circuit-changing device, leads for each phase of current, less in number than the slots, connected through such circuit-changing device to such windings, the windings being so arranged and connected to said leads that when the direction of current-flow therein is changed, the number of magnetic poles is changed from x to $3x$ and vice versa, substantially as described.

606,057. SCUTTLE OR SKYLIGHT OPERATOR. FERDINAND HAYES, New York, N. Y. Filed Feb. 12, 1896. Serial No. 579,095. (No model.)

Claim.—1. The scuttle or skylight opener composed of a lever and sheave-segment, a frame and pivot for supporting the lever and sheave-segment, and a cord or chain passing from the sheave-segment and over a pulley by which the parts are moved and the scuttle raised, the end of the lever acting upon such scuttle, substantially as set forth.

2. The combination in a scuttle or skylight opener, of a triangular frame adapted to being connected at either side of the scuttle-way or coaming, a lever and sheave-segment, a pivot for the same passing through the triangular frame, a stop upon the frame for limiting the movement of the lever, a cord or chain connected at one end to the sheave-segment, and a pulley over which such cord or chain passes for raising the scuttle, substantially as set forth.

3. The combination in a scuttle or skylight opener, of a triangular frame adapted to being connected at either side of the scuttle-way or coaming, a lever and sheave-segment, a pivot for the same passing through the triangular frame, a stop upon the frame for limiting the movement of the lever, a cord or chain connected at one end to the sheave-segment, a pulley over which such cord or chain passes for raising the scuttle, a connection upon the scuttle for the other end of the cord or chain, and a clamp for holding the same, substantially as set forth.

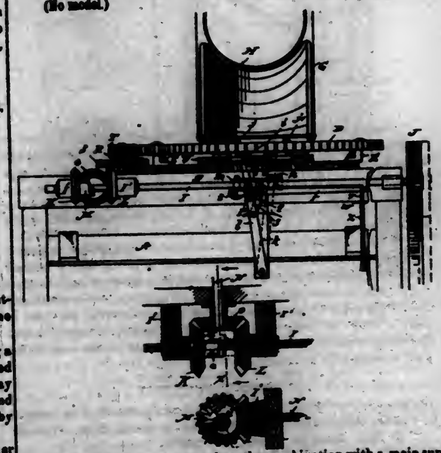
606,058. CARTRIDGE-PACKET. WILLIAM H. HOSER, Hartford, Conn. Filed Feb. 22, 1897. Serial No. 624,057. (No model.)

Claim.—1. In combination with a magazine-filler, a locker mounted to slide thereon, and means coacting between the filler and the locker which retract the latter upon its said movement.

2. A magazine-filler consisting of a body portion for receiving a file of cartridges, provided with a longitudinally-movable latch located at the end of the filler-body and normally projecting into the pathway of the file of cartridges, with means coacting between the filler and the latch which retract the latter when it is moved longitudinally by the cartridges.

3. A magazine-filler consisting of a body portion and of a locker supported thereon for longitudinal movement relatively thereto, the filler-body being provided with a longitudinal cartridge-head-receiving channel, and the locker being provided with latches which normally extend over the opposite ends of the cartridge-channel, the filler-body being provided with a locker-actuator at each of its ends for engaging with and retracting the leading latch as the locker is moved longitudinally.

4. A magazine-filler consisting of a body portion provided with a longitudinal cartridge-receiving channel, and of a locker supported for longitudinal movement upon the filler-body, provided with latches which normally project over the opposite ends of the channel, the locker being provided with inclined abutments adjacent to its ends for engaging with locker-actuating members upon the filler-body, whereby the longitudinal movement of the locker relative to the filler-body operates to retract the leading latch laterally out of the plane of the cartridge-channel, substantially as described.



5. In a magazine-filler, the combination of a body portion provided with a longitudinal channel for receiving the heads of a file of superimposed cartridges, and with a longitudinal channel or space b^2 between the cartridge-channel and the back plate, a locker located in the space b^2, and having its ends bent forward so as to form locking-latches which normally project over the opposite ends of the cartridge-channel, the filler-body being provided with a locker-actuator at each end for engaging with the corresponding ends of the locker, whereby the longitudinal movement of the locker relative to the filler-body operates to retract the leading latch, substantially as described.

6. A magazine-filler, consisting of a body portion having a cartridge-head-receiving channel, and having a clasp for engaging with the receiver of the firearm, a cartridge-locker supported upon the filler-body and movable longitudinally thereof, having locking-faces at its opposite ends, which normally project forward and over the opposite ends of the cartridge-head-engaging channel.

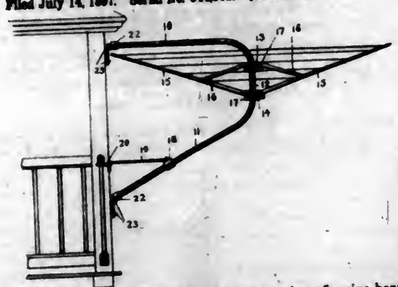
7. A magazine-filler, consisting of a body portion having a cartridge-head-receiving channel formed by the flanged edges thereof, and provided with a clasp for attaching the filler to the firearm, a cartridge-locker longitudinally movable thereon therefor, having locking-faces at its opposite ends which normally project forwardly over the opposite ends of the cartridge-channel, with means for retracting the leading end of the cartridge-locker as it is pushed longitudinally with relation to the filler-body, substantially as described.

8. A cartridge-containing-magazine filler, consisting of a body portion having a cartridge-receiving channel, and of two latches combined in an integral double-ended locker, mounted for longitudinal movement upon the body portion with its latches normally extending over the opposite ends of the cartridge-receiving channels thereof, each end of the filler being provided with means substantially as described for retracting its adjacent latch when the locker is moved toward that end, clearance being provided behind the latch-retracting means, whereby the locker may be moved toward either end without retracting the latch upon the opposite end, substantially as described and for the purpose specified.

606,059. SWINGING STRAW-STACKER. EDWARD HUBER and JACOB W. MILLER, Marion, Ohio. Filed Dec. 20, 1897. Serial No. 662,512. (No model.)

Claim.—1. In a straw-stacker, the combination with a main supporting-frame and a turn-table mounted thereon, of a driving shaft, a double clutch secured thereon, a plurality of gear-wheels loosely sleeved on said shaft, a gear connection between the gear-wheels and the turn-table, and actuating mechanism for shifting the shaft through said gear-wheels, whereby said double clutch engages with a different gear and whereby the direction of rotation of said turn-table is reversed.

2. In a straw-stacker, the combination with the main supporting-frame and a turn-table mounted thereon, of a driving-shaft, a double clutch fixedly secured thereto, a plurality of gear-wheels loosely sleeved on said shaft, said gear-wheels being arranged upon opposite sides of the clutch, and a gear connection between the gear-wheels and the turn-table, and actuating mechanism for shifting the shaft through the gear-wheels.

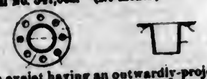


3. In a straw-stacker, the combination with a main supporting-frame and a turn-table mounted thereon, of a driving and a driven shaft journaled in bearings in the frame, said driving-shaft having longitudinal movement, means for transmitting motion from said driv-

ing-shaft to said turn-table, a gear on each end of said shaft one of which is beveled, two bevel-gears loosely mounted upon said driving-shaft and adapted to engage on opposite sides of the bevel-gear on said driving-shaft, a fixedly-mounted double clutch carried by said driving-shaft between its said gears, and actuating mechanism for automatically throwing the clutch alternately into engagement with said adjacent gear-wheels.

4. In a straw-stacker of the kind described, the combination with the supporting-frame and a turn-table arranged thereon, of a driving-shaft mounted in bearings upon the frame, stops secured to the shaft, and a shifting block loosely sleeved thereon between said stops, a shifter mounted upon the frame, a tripping-lever adapted to engage with the shifting block and shifter, and pins arranged on the turn-table adapted to engage with the shifter, substantially as and for the purpose described.

5. In a straw-stacker of the kind described, the combination with the supporting-frame and a turn-table arranged thereon, of a driving-shaft journaled in bearings upon the frame, stops adjustably secured to the shaft, and a shifting block loosely sleeved thereon between the stops, a shifter mounted upon the frame, a tripping-lever engaging with the block and shifter, a spring-lever connected to the tripping-lever for the purpose described, and pins arranged in the turn-table adapted at certain periods to engage with the shifter, all constructed and arranged in the manner described.

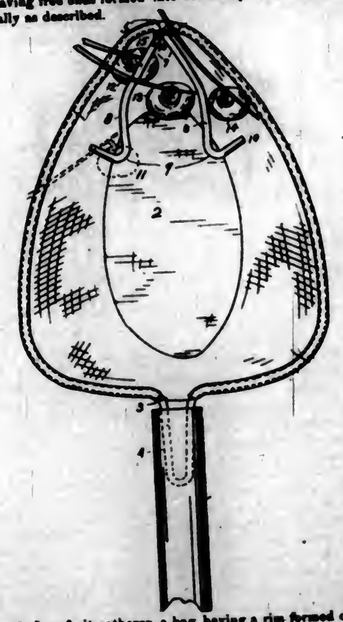


606,060. CLOTHES-DRIER. PIERRE JOBOIN, Worcester, Mass. Filed July 14, 1897. Serial No. 644,503. (No model.)

Claim.—1. In a clothes-drier, the combination of a pipe bent to form outwardly-extending arms, and a vertical section connecting said arms, a reel, supporting-collars for said reel, the bends in the pipe being formed so as to permit the reel and its supporting-collars to be slipped onto the vertical section thereof, and hinge-pieces secured on the ends of the pipe for pivotally supporting the same, substantially as described.

2. In a clothes-drier, the combination of a pipe bent to form a horizontally-extending arm 10, an inclined arm 11, and a vertical section 12 connecting said arms, a reel journaled on said vertical section and comprising castings 13 and 14 carrying reel-arms 15 and supporting-arms 16, supporting-collars 17 for securing the reel in place, a collar 18 secured on the inclined arm 11, an adjusting-link 19 carried thereby, and hinge-pieces 22 secured on the ends of the pipe, substantially as described.

606,061. EYELET. BENAIAH KENDRALL, Sharon, Mass., assignor to the Boston Fast Color Eyelet Company, Boston, Mass. Filed Apr. 26, 1895. Serial No. 547,022. (No model.)



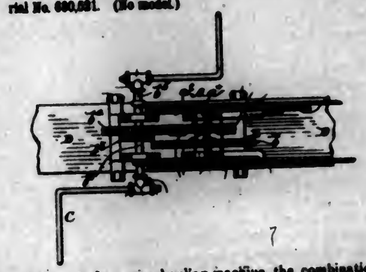
Claim.—1. An eyelet having an outwardly-projecting flange provided with bosses projecting from its inner side, and a covering molded on said flange, the said bosses forming channels under the flange through which the material of the covering finds access to the inner portion of the inner side of the flange.

2. An eyelet having a flange at its outer end, means upon said flange for engaging a die-plate, whereby a covering of plastic material may be molded about the top and bottom of said flange.

3. As an article of manufacture, a fastener-body formed with a flange, and supporting-feet projecting from the under or inner side of said flange, substantially as and for the purpose set forth.

606,062. FRUIT-GATHERER. LEVI B. LAIB, Lyons, N. Y., assignor of one-half to George F. Munn, same place. Filed Dec. 18, 1897. Serial No. 662,465. (No model.)

Claim.—1. In a fruit-gatherer, a bag having a rim formed of wire provided with interned ends joined together and extended backward from their junction to a situation over the bag mouth and rim and having free ends formed into forwardly-extending hooks, substantially as described.



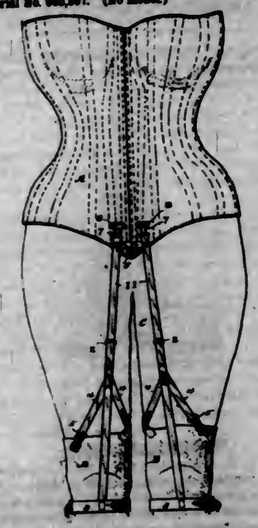
2. In a fruit-gatherer, a bag having a rim formed of wire provided with interned ends joined together and extended backward from their junction to a situation over the bag mouth and rim and having free ends formed into forwardly-extending hooks, said backward wire extensions having bends 8, substantially as described.

3. In a fruit-gatherer, a bag, a rim therefor, hooks situated at the forward end of the rim and integral therewith to engage the stem of the fruit and detach it by a pull, and means integral with said hooks for detaching the fruit from its stem by a push, said means being situated at said forward end above and over the bag-mouth, substantially as described.

4. In a fruit-gatherer, a bag provided with a handle and with a rim having stem-breaking hooks situated at the front end of the rim, and adapted to engage and break stems by a pull, and reversely-situated hooks near the front end of the rim and over the bag adapted to engage and break stems by a push, the mouth of the bag between the latter hooks and handle being unobstructed, substantially as described.

606,068. ROPE-HAULING MACHINE. WILLIAM R. LAPEL, Gloucester, Mass. Filed May 12, 1897. Renewed May 13, 1898. Serial No. 680,881. (No model.)

Claim.—1. In a rope-hauling machine, the combination with a suitable frame, of grooved rope-hauling wheels mounted in said frame, gear-wheels connected with said rope-hauling wheels, a slip-gearing mounted in said frame for actuating the said gear-wheels, a ratchet formed upon one of said rope-hauling wheels, a pawl for engaging said ratchet, the teeth of said ratchet being so formed as to hold the said gear-wheels in the proper position to permit of the change of the slip-gearing, substantially as described.

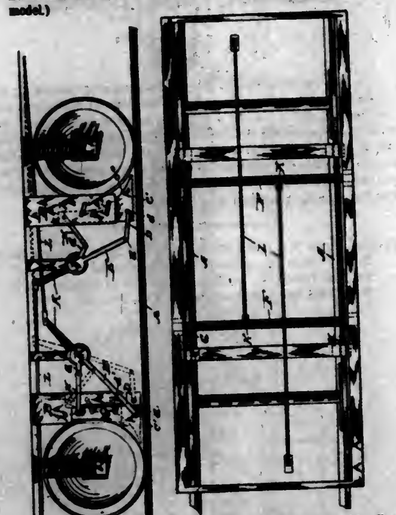


2. In a rope-hauling machine, the combination with a suitable frame, of rope-hauling wheels mounted thereon, gear-wheels of different diameters connected with the said hauling-wheels, a slip-gearing adapted to engage said gear-wheels for changing the power and speed of the machine, and means for closing certain of the intervals between the teeth of one of the said gear-wheels at predetermined points upon one side of the periphery of said gear-wheel to prevent the movement of the said slip-gearing at these points, substantially as described.

3. In a rope-hauling machine, the combination with a suitable frame, of a shaft mounted therein, rope hauling wheels on said shaft, gear-wheels mounted upon said shaft and a slip-gearing also mounted in said frame and adapted to engage the said gear-wheels, for changing the speed and power of the machine, the said gear-wheels being placed so close together that teeth of the slip-gears will always be in engagement with one or the other of said gear-wheels and means for preventing the slip-gearing from being changed except at predetermined intervals, substantially as described.

4. In a rope-hauling machine, the combination with a suitable frame, of a shaft mounted therein, rope-hauling wheels on said shaft, gear-wheels of different diameters secured to said shaft for rotating the same, a slip-gearing for engaging the said gear-wheels to change the speed and power of the machine, the intervals between some of the teeth of one of the gear-wheels being closed at one side so as to leave open teeth at one or more predetermined points upon the periphery of the said gear-wheel, the construction being such that the slip-gearing can only be changed at these intervals, a ratchet secured to the side of one of the rope-hauling wheels, a pawl mounted on the machine and adapted to engage said ratchet, the teeth of the ratchet being so arranged as to hold the gearing only at the points where the slip-gearing can be changed, substantially as described.

5. In a rope-hauling machine, the combination with a suitable frame, of a shaft mounted in said frame, rope-hauling wheels secured to said shaft, a gear-wheel mounted on said shaft and having an elongated hub, a gear-wheel of different diameter mounted upon said hub and keyed thereto whereby the two gear-wheels are adapted to move as one wheel, a second shaft mounted in the said frame, gear-wheels of different diameters mounted upon said shaft and adapted to mesh with the gear-wheels connected with the rope-hauling wheels, the said second shaft being free to move longitudinally in its bearings whereby the gear-wheels secured thereto may be changed with relation to the gear-wheels connected to the rope-hauling wheels and means upon one of said gear-wheels connected to the rope-hauling wheels for preventing the slip-gears upon the said second shaft being changed except at certain predetermined intervals, substantially as described.



606,064. COMBINED CORSET-RETAINER AND STOCKING-SUPPORTER. NELLIE M. LEMON, Bridgeport, Conn. Filed Jan. 7, 1898. Serial No. 666,867. (No model.)

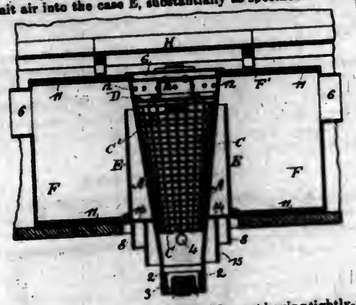
Claim.—1. A combined corset-retainer and stocking-supporter comprising retaining-straps provided at their upper ends with catches for engagement with a corset and at their lower ends with bands which encircle the leg below the knee, and side straps provided with clasps for engaging a stocking on opposite sides of the retaining-straps.

2. A device of the character described comprising retaining-straps adapted to pass centrally over the knee-caps and provided at their upper ends with catches for engagement with a corset and at their lower ends with leg-bands whereby the retaining-straps are held in place and the corset is held down, a connecting-strap between the retaining-straps, and side straps connected to each retaining-strap and adapted to engage a stocking.

606,065. EMERGENCY-BRAKE FOR STREET-CARS. HERMANN LOEFFLER, Pittsburg, Pa. Filed Sept. 8, 1897. Serial No. 650,916. (No model.)

Claim.—1. In a car-brake, the combination of the guides B, provided with the inclined slots b^2 b^2, a brake-shoe C, carrying pins c, c, adapted to operate in said slots b^2 b^2, levers D, H pivotally attached to said brake-shoe, and arms G, and E of the rocker-shaft F, connecting said levers D and H, an operating-lever K, connected to the brake-rods L, all parts being arranged operating substantially as shown and described.

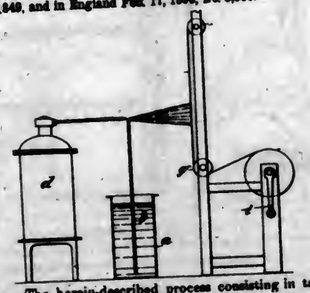
2. In a car-brake, the combination of the guides B, a cross-piece b, extending slightly beyond the sides of said guides, the latter provided with inclined slots b^2 b^2 a brake-shoe C, carrying pins c adapted to operate in the said slots b^2 b^2, the underneath face of said shoe being serrated, levers D and H pivotally secured to said brake-shoe, arms E and G set at an angle of approximately forty-five degrees to each other, and secured to the ends of the rocker-shaft, a lever K secured to said rocker-shaft, and a bracket J, substantially as described and for the purpose set forth.



606,066. CAR-HEATER. JOSEPH A. LOSE and LOWMAN H. LOSE, Brooklyn, N. Y. Filed Apr. 21, 1897. Serial No. 633,126. (No model.)

Claim.—1. The combination with the air-box having an opening at the bottom for admitting air, of a fire-pot with tightly-fitting covers at the upper end and air-inlets at the lower end, the lower end of such fire-pot projecting below the bottom of the car, and a shield 15 surrounding the fire-pot and closely connected to the same at the upper end to prevent any gases passing into the air-box, substantially as specified.

2. The combination with the conical fire-pot having tightly fitting covers at its upper end, of a box with air-inlets at the bottom around the fire-pot, and a case E within the box and surrounding the air-inlets and open at the top, for directing the air against the outside of the fire-pot as it passes into the box, substantially as specified.



3. The combination with the conical fire-pot having tightly-fitting covers at its upper end, of a box with air-inlets at the bottom around the fire-pot, and a case E within the box and surrounding the air-

inlets and open at the top, for directing the air against the outside of the fire-pot and a shield 15 surrounding the lower part of the fire-pot and the openings thereinto, and extending below the openings that admit air into the case E, substantially as specified.

4. The combination with the conical fire-pot having tightly-fitting covers at its upper end, of a box with air-inlets at the bottom around the fire-pot, and a case E within the box and surrounding the air-inlets and open at the top for directing the air against the outside of the fire-pot, a skirt 8 extending below the bottom of the car, and a shield 15 within the same and surrounding the lower part of the fire-pot and its openings and extending below the openings that admit air into the case E, substantially as specified.

606,067. FIBROUS MATERIAL. JULES A. MAQUAIRE, Paris, France. Filed Dec. 3, 1896. Serial No. 614,248. (Specimens.) Patented in France Feb. 14, 1896, No. 253,979; in Belgium Feb. 15, 1896, No. 119,849, and in England Feb. 17, 1896, No. 3,533.

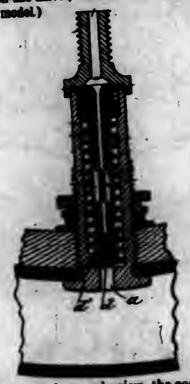
Claim.—The herein-described process consisting in taking the fibrous parts of the eucalyptus plant, subjecting the same to a bath of tepid water, heating to the point of ebullition, then subjecting the material to the action of an alkaline bath, an acid-bath, and a soap-bath, and then restoring the essential principles which have been removed from the fiber in the several baths as the resins by applying the same to the fibers, substantially as described.

606,068. AUTOMATIC WATER-HEATER. WILLIAM I. MILLER, Pittsburg, Pa. Filed Oct. 1, 1897. Serial No. 653,670. (No model.)

Claim.—1. In an automatic water-heater, the combination, with a water-receptacle, having inlet and outlet passages communicating therewith, of a heat-supplying device, a heat-regulator, and direct connections with opposite sides of the regulator, outside of the water-receptacle, from the inlet and outlet passages to the heat-regulator whereby the supply of heat may be controlled by a difference in the inlet and outlet pressures of the water, substantially as set forth.

2. In an automatic water-heater, the combination, with a water-receptacle, of inlet and outlet passages communicating with the receptacle, means for heating the water-receptacle, a heat regulator outside of the direct flow of water, comprising a valve for controlling the supply of heat and a movable abutment for actuating the valve, a direct connection from the outlet-passage to one side of the abutment and a connection from the inlet-passage to the opposite side of the abutment, whereby the abutment may be operated by variations of pressure in the outlet from the water-receptacle, substantially as set forth.

3. In an automatic water-heater, the combination, with a heating-coil, of a heat-supply, a heat-regulator, outside of the direct flow of water, comprising a valve for controlling the supply of heat to the coil and a movable abutment for operating the valve, which is exposed to the pressure of the water at or near the inlet and outlet portions of the coil, substantially as set forth.



4. In an automatic water-heater, the combination, with a water-receptacle provided with an inlet and an outlet, of a heat-supply, a heat-regulator outside of the direct flow of water and subjected on one side to the pressure of water flowing to the water-receptacle and on the other side to the pressure of water flowing from the receptacle, substantially as set forth.

5. In an automatic water-heater, the combination, with a water-receptacle having inlet and outlet passages, of a water-supply pipe, means for heating the water-receptacle, a heat-controlling device outside of the water-supply pipe and the direct flow of water, and connected with the inlet and outlet passages of the water-receptacle whereby variations of pressure between the inlet and outlet passages will operate the controlling device, substantially as set forth.

6. In an automatic water-heater, the combination, with a water-receptacle having inlet and outlet passages, of an unobstructed water-passage from the water-main to the delivery valve, or faucet, a heat-supplying device, a heat-regulating device for controlling the supply of heat to the coil located outside of the water-passage and having connections to the inlet and outlet of the coil, and adapted to be operated by variations of pressure in the outlet-passage of the water-receptacle, substantially as set forth.

606,069. VALVE FOR PNEUMATIC TIRES. JULIUS MOSS, Brandenburg-on-the-Havel, Germany. Filed Aug. 16, 1897. Serial No. 648,453. (No model.)

Claim.—1. In a valve mechanism, the combination, with a valve-casing and a nipple secured therein, of an elastic valve-tube, and a spring engaging the valve-tube at its end adjacent the nipple and arranged to hold said tube against the nipple, substantially as described.

2. In a valve mechanism, the combination, with an elastic tube closed at one end and provided intermediate its ends with a series of slits, of an external ring surrounding the tube and provided with yielding prolongations extending between the slits in the tube, substantially as described.

3. In a valve mechanism, the combination with a valve-casing, and a nipple secured therein, of an elastic tube and means independent of the tube for forming an enlargement on one end of the tube, and a spring engaging the enlargement and arranged to hold the tube in close contact with the nipple.

4. In a valve mechanism, the combination with a valve-casing, and a nipple secured therein and provided with a cup-shaped recess at the inner end, of an elastic tube and means independent of the tube for forming an enlargement at one end of the tube, said enlarged end being in close contact with the nipple and entering the cup-shaped recess.

5. In a valve mechanism, the combination with a valve-casing, and a nipple secured therein, of an elastic tube closed at one end and provided intermediate its ends with a series of slits, an external ring surrounding the tube and provided with yielding prolongations extending between the slits in the tube, and a spring engaging the tube at its end adjacent to the nipple and arranged to hold said tube against the nipple.

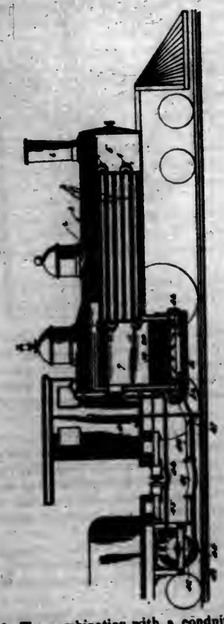
606,070. IMPLEMENT FOR STRETCHING WIRE-FENCE STRANDS. WILLIAM HERR, Cross Plains, Tex. Filed Nov. 26, 1897. Serial No. 659,899. (No model.)

Claim.—1. The herein-described wire-stretching implement, comprising a lever-bar having its lower end bent into a circle that is arranged in the same plane with the shank or body portion of said bar, a double hook pivotally supported in said bar and projecting from each side, and a pawl pivotally attached to the said lever-bar, substantially as and for the purpose specified.

2. A wire-stretching implement comprising a lever-bar having its lower end bent into a circle that is arranged in the same plane with the shank or body portion of said bar, a double hook pivotally supported in said bar at the junction between its body portion and its curved end, and a pawl pivotally attached to said lever-bar at a point above the said circle, substantially as and for the purpose specified.

3. A wire-stretching implement adapted to have a bearing against one side of a fence-post opposite where the fence-wire passes and comprising a lever-bar having a claw at one end and bent at its other end into a circle that is arranged in the same plane with the shank or body portion of said bar, a double hook pivotally supported in said bar, chains to engage with said double hook and with the fence-wire at each side of the fence-post, and a pawl pivotally attached to said lever-bar at a point above the said circle, substantially as specified.

4. In a wire-stretching implement, the combination of a lever-bar adapted to have a bearing against one side of a fence-post opposite where the fence-wire passes and provided with a claw at its upper end and with a circle at its lower end, a double hook pivotally supported in said bar and projecting on each side, chains adapted to adjustably engage said double hook and each provided at one end with a hook to engage the fence-wire, and a pawl pivotally attached to the said lever-bar and provided with a broadened chisel end, substantially as and for the purpose specified.



5. The combination of a lever-bar provided at one end with a circle arranged in the same plane with the shank or body portion of said bar, a double hook supported in said bar near the said circle and projecting from each side, and a pawl pivotally attached to the said lever-bar, substantially as described.

606,071. STEP-LADDER. WILLIAM HERRING, Evansville, Ind. Filed Jan. 26, 1898. Serial No. 668,245. (No model.)

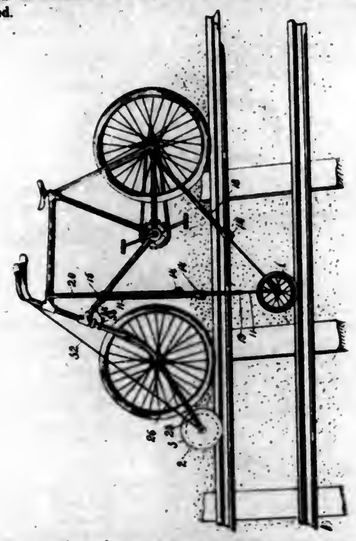
Claim.—In a hinge, the combination with one member comprising a right-angled plate provided with perforated lugs extending from said plate, a second lug also extending from the plate in an opposite direction to that of the first-named lugs, there being a groove formed in the second-named lug, and a slot in the bottom of said groove through the lug, and a bolt secured in said groove by means of a set-screw, of the other member comprising a right-angle plate provided with perforated lugs extending from said plate and a second lug extending in an opposite direction to the first-named lugs and formed with notches or recesses in its edge, substantially as described.

606,072. AIR-FEEDING APPARATUS FOR BOILERS. JOSEPH S. NEWLIN, Crookstville, S. C. Filed July 23, 1897. Serial No. 645,669. (No model.)

Claim.—1. The combination with a conduit and an elongated blast-nozzle, of a series of nozzle-adjusting bolts designed to adjust the relative width of the nozzle to equalize the pressure of the blast from end to end of said nozzle, substantially as specified.

2. The combination with a conduit, and an elongated blast-nozzle, of a deflector supported above said nozzle upon a series of independently-adjustable bolts adapted to adjust the relative distance of the deflector from the blast-nozzle to equalize the pressure of the blast from end to end of said nozzle, substantially as described.

3. The combination with a conduit and an elongated blast-nozzle having a series of independently-adjustable bolts adapted to adjust the width of the nozzle; of a deflector supported above said nozzle upon a series of independently-adjustable bolts adapted to allow of the adjustment of the distance between said deflector and said nozzle, substantially as described.



4. In an apparatus of the character described, the combination with a blast-nozzle extending into the furnace from beneath, of a water-jacket inclosing said blast-nozzle, and means for adjusting the width of said nozzle, substantially as described.

5. In an apparatus of the character described, the combination with an elongated blast-nozzle extending into the furnace through the grate-bars thereof; of a water-jacket inclosing said blast-nozzle; and an adjustable deflector mounted over the mouth of said nozzle, substantially as described.

606,073. RAILWAY ATTACHMENT FOR BICYCLES. CHARLES R. RUSSELL, Milan, Wash. Filed Feb. 15, 1897. Serial No. 623,435. (No model.)

Claim.—1. The combination with a bicycle, of a flanged guiding-

wheel located in advance of the steering-wheel of the machine, spaced rods or bars connecting the axles of said wheels and jointed intermediate their ends to admit of the folding of the guiding wheel, and means on the machine for lifting said guide-wheel, substantially as described.

2. The combination with a bicycle, of a guiding-wheel arranged in advance of the steering-wheel of the machine, spaced rods or bars connecting the axles of said wheels and jointed intermediate their ends, and a cord or flexible connection interposed between said rods or bars and the frame of the machine, whereby the guiding-wheel may be lifted, substantially as described.

3. The combination with a bicycle, of a guiding-wheel arranged in advance of the steering-wheel of the machine, and provision for adjusting the said guiding-wheel laterally, substantially as described.

4. The combination with a bicycle, of a frame extending to a point in advance of the steering-wheel, and a guiding-wheel adjustably mounted on said frame and made laterally movable, substantially as described.

5. The combination with a bicycle, of a frame projecting in advance of the steering-wheel, a guiding-wheel carried by said frame, and means for adjusting said guiding-wheel laterally, substantially as described.

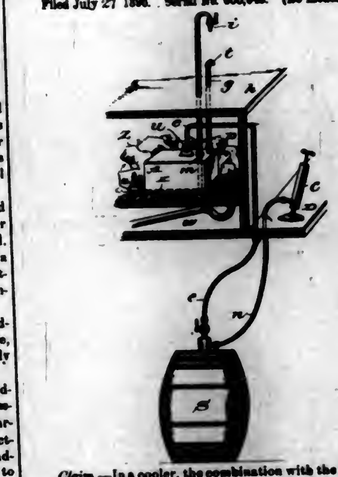
6. The combination with a bicycle, of a frame projecting in advance of the steering-wheel and having a connecting portion or cross-bar, a guiding-wheel, a frame in which said guiding-wheel is journaled having a connecting portion or cross-bar, and a clamp connecting the cross-bars of said frames and adapting the same to be adjusted relatively to each other for permitting the guiding-wheel to be moved laterally or across the plane of the steering-wheel of the bicycle, substantially as and for the purpose specified.

7. The combination with a bicycle, of a balancing-frame extending upon one side thereof, a balancing-wheel journaled on said frame and means whereby said wheel may be tilted vertically, substantially as described.

8. The combination with a bicycle, of an adjustable and extensible frame secured thereto and projecting laterally therefrom, a balancing-wheel, and a plate carrying the axle of said wheel, said plate being pivotally connected to the frame and comprising a segmental slotted portion adapted to receive a clamping-bolt, whereby said plate may be adjustable as to its angle for correspondingly changing the angle of the balancing-wheel, substantially as described.

9. The combination with a bicycle, of an adjustable and extensible frame connected thereto and projecting laterally therefrom, said frame comprising a plurality of bars provided at their inner ends with clips for engaging the frame of the bicycle, said clips being connected to their respective bars or braces by means of ball-and-socket joints, substantially as described.

10. The combination with a bicycle, of a balancing-wheel arranged at one side of the machine frame, diverging braces connecting the axle of said balancing-wheel with the machine-frame, and detachably connected to the latter at the rear axle and upon the reach-bar of the machine-frame, and a brace interposed between the top run of the machine-frame and one of the balancing-wheel braces, substantially as described.



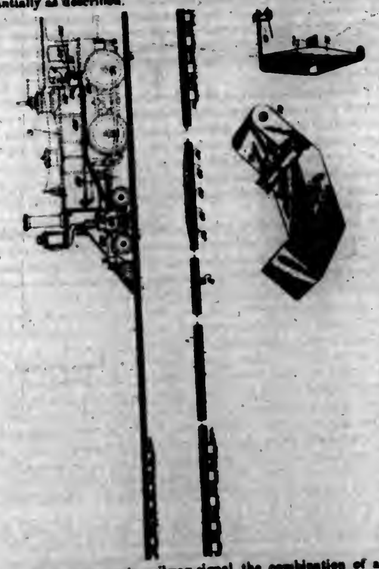
11. The combination with a bicycle, of a balancing-wheel arranged at one side of the machine and connected thereto by a suitable frame detachably connected to the machine-frame, a guiding-wheel located in advance of the steering-wheel of the machine and connected to the steering-fork by suitably-spaced bars, and a spring interposed between the frame and the steering-fork, whereby a pressure is exerted to maintain the guiding-wheel in engagement with the rail upon which the machine is traveling, substantially as described.

12. The combination with a bicycle, of a balancing-wheel arranged at one side thereof and connected to the machine-frame by one or more brace-rods, a guiding-wheel arranged in advance of the steering-wheel of the machine and connected to the machine-frame by spaced bars, and a spring interposed between the bars of the guiding-wheel and the machine-frame, substantially as and for the purpose described.

13. The combination with a bicycle, of a balancing-wheel, a frame connecting said wheel with the machine-frame, a guiding-wheel located in advance of the steering-wheel, an arm connecting said wheel with the steering-fork, a laterally-projecting spring on the steering-fork, and a flexible connection interposed between said spring and the machine-frame, substantially as described.

14. The combination with a bicycle, of a side balancing-wheel, one or more braces connecting said wheel with the machine-frame independent of the steering-wheel whereby to leave the steering-wheel free, a flanged guiding-wheel connected to the steering-wheel, and means for automatically controlling the guiding-wheel.

606,074. LIQUID-COOLER. FRANCIS OAKLEY, Newport, R. I. Filed July 27, 1896. Serial No. 600,643. (No model.)



Claim.—In a cooler, the combination with the box A, mounted on suitable legs within an ice-box, the pipes *b* and *g* communicating with the interior of said box, the internally-threaded neck portion of the box and shoulder *f*, the cap B with integral nut extension *c* which is centrally apertured, the pipe *c* having screw-threaded connection with the said cap in said aperture, of the alternately-disposed screens and filters *h* and *d* respectively, held within the said neck portions and between the shoulder *f* and cap B, and the pump and connection with the supply-tank and box A, all substantially as shown and described.

606,075. RAILWAY-SIGNAL. MATHEW C. CRUM, Wahpeton, N. D. Filed Mar. 16, 1896. Serial No. 674,090. (No model.)

Claim.—1. In an automatic railway-signal, the combination of a signal-operating mechanism adjacent to a track and having a normally-concealed trip-lever, a switch-operated setting mechanism connected with said signal-operating mechanism, and a wheel-operated setting mechanism also connected with said signal-operating mechanism, substantially as described.

2. In an automatic railway-signal, the combination of a switch-operated setting mechanism, a wheel-operated setting mechanism adjacent to a track and a single signal-operating mechanism having a trip-lever adapted to be thrown into the path of a signal mechanism and provided with a controlling arm or lever which is operatively connected with said setting mechanism, substantially as described.

3. In an automatic railway-signal, the combination of a trip-lever, a controlling-lever arranged to normally hold the trip lever in its depressed position and to engage therewith and lock the same in its raised position, and means for operating said controlling-lever, substantially as described.

4. In an automatic railway-signal, the combination of a trip-lever, a controlling-lever normally engaging with said trip-lever to hold the latter in its depressed position, a spring to elevate the trip-lever when free from the controlling-lever, and means for engaging with said trip-lever to lock the latter in its exposed raised position, substantially as described.

5. In an automatic railway-signal, the combination of a spring-controlled trip-lever, a controlling-lever mounted above the trip-lever and engaging with the latter under normal conditions to depress and lock the trip-lever when lowered out of the path of a locomotive signal mechanism, and devices carried by said controlling-lever to engage with the trip-lever when raised, substantially as described.

6. In an automatic railway-signal, the combination of a trip-lever provided at its free end with a heel, a cross-bar rigid with said lever, a controlling-lever fulcrumed above the trip-lever and arranged to ride upon the cross-bar thereof, locking devices carried by the controlling-lever, a projection on the trip-lever to engage with said devices, and a spring to lift the trip-lever, substantially as described.

7. In an automatic railway-signal, the combination of a trip-lever, a controlling-lever engaging therewith, a switch-operated lever connected at one end with a switch-rail, a wire or cable between the controlling-lever and said switch-operated lever, and a spring, substantially as described.

8. The combination with a trip-lever and a controlling device therefor, of a switch-operated lever having at one end an offset, a clip-formed rod attached to a switch-rail and to the other end of said switch-operated lever, a spring connected to the offset end of the switch-operated lever, and a rod, wire or cable between said spring and the controlling device for the trip-lever, substantially as described.

9. The combination with a trip-lever and a controlling device therefor, of a wheel-operated track mechanism comprising a vertically-movable bar, levers in the path of said bar to be actuated thereby, and connections between said bar and the controlling device for the trip-lever, substantially as described.

10. The combination with a trip-lever and a controlling device therefor, of a wheel-operated track mechanism comprising a vertically-movable bar lying adjacent to a track-rail and normally in the path of wheels adapted to travel thereon, a series of connected levers in the path of said vertically-movable bar, means for sustaining the said bar normally free from the series of levers, and connections between said levers and the controlling device for the trip-lever, substantially as described.

11. The combination with a trip-lever, and a controlling device therefor, of a series of casings fixed to a track and forming vertical guides at one side of the head of a rail, a vertically-movable bar confined in said guides provided by the casings, means for normally lifting said bar, a series of connected levers supported below said bar, in the path thereof, and provided with antifriction devices for contact and normally free from engagement with, said bar, and connections between said levers and the controlling device for the trip-lever, substantially as described.

12. The combination with a trip adjacent to a track and means for controlling the same, of a signal mechanism embodying a rock-shaft having tappets adapted to contact with said trip, a signal and connections between said signal and the rock-shaft, substantially as described.

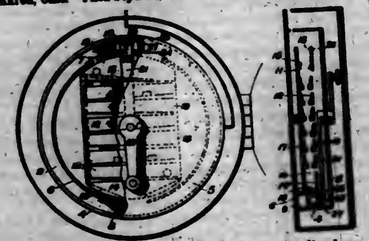
13. The combination with a trip and means for controlling the same, of a signal mechanism including a rock-shaft provided with tappet-arms, a lever carried by said shaft, a spring-controlled lever operatively connected with a signal device, and connections between the lever of the rock-shaft and the signal-device lever, substantially as described.

14. The combination with a trip, of a signal mechanism including suitable bearings, a rock-shaft mounted in said bearings for turning and sliding movement, a clutch on the shaft and one of the bearings, a spring acting against the shaft, tappet-arms carried by said shaft, a signal device, and connections between the shaft and said signal device, substantially as described.

15. The combination with a trip, of a signal mechanism including a rock shaft having suitable tappets, a signal device, a plate provided with a ratchet, a lever fulcrumed to said plate and having one arm thereof arranged to engage with said ratchet of the plate, connections between said signal device and said lever, a spring connected with said lever, and connections between the signal-lever and the rock-shaft, substantially as described.

16. In a signal-operating device for railway-signals, a housing or case struck up from a single piece of sheet metal and provided with a clip adapted for attachment to a track-rail, substantially as described.

17. In a signal-operating mechanism for railway-signals, a housing or case struck up from a single piece of sheet metal and provided with a clip, and a hood united to said case at one side of the clip thereof, substantially as described.



18. In an automatic railway-signal, the combination with switch-operated setting devices, of a signal-operating mechanism between said switch-operated devices, and spring-controlled wires or coils connected to the signal-operating mechanism and the switch-operated setting devices, substantially as described.

19. In an automatic railway-signal, the combination with switch-operated setting devices at a suitable interval from each other, a signal-operating mechanism, a wheel-operated track mechanism, connecting wires or cables between said devices, and coiled springs connected with said wires or cables to hold all the devices under tension and in operative positions, substantially as described.

20. The combination with a suitable signal mechanism on a locomotive including a crank-arm, of a yieldable clearer-plow arranged in advance of said crank-arm, substantially as described.

21. The combination with a signal mechanism on a locomotive, including a tappet or crank arm, of a clearer-plow arranged in advance of the tappet or crank arm, a spindle by which the clearer-plow is revolubly held in position, and a retracting-spring connected to said clearer-plow, substantially as described.

606,076. ELECTRIC ALARM SYSTEM. ALBERT OVENDEN, Akron, Ohio. Filed Sept. 24, 1897. Serial No. 652,866. (No model.)

Claim.—1. In an electric-circuit closer, an inclined way composed of a plurality of oppositely-extending superimposed separate members, one side of which is composed of conducting material throughout, while the other side is composed of non-conducting material having a portion of the engaging face formed of conducting material, and a roller circuit-closer.

2. In an electric-circuit closer, an inclined way consisting of a plurality of independent superimposed members each comprising a

conducting-rail and a non-conducting rail having a portion of its face composed of conducting material, and a roller circuit-closer.

3. In an electric-circuit closer, an inclined way consisting of a plurality of independent superimposed members, each comprising a conducting-rail and a non-conducting-rail, and having a plurality of conducting portions flush with the face thereof, and a roller circuit-closer.

4. In a circuit-closer for an electric alarm, a plurality of inclined ways independent of each other and extending in opposite directions, each of said inclined ways having one side composed of conducting material, and the other side composed of non-conducting material having conducting portions, a roller circuit-closer, and means for guiding said roller circuit-closer from the lower termination of one inclined way to the upper beginning end of the next.

5. In a circuit-closer for an electric alarm, a plurality of inclined ways independent of each other, and extending in opposite directions, and having conducting and non-conducting portions, a roller circuit-closer, an inclined guide extending from the lower end of one way to the upper end of the next.

6. A circuit-closer for an electric alarm, comprising a frame composed of inclined ways superimposed and independent of each other, said ways extending in opposite directions and having conducting and non-conducting portions, a roller circuit-closer, and a movable elevator adapted to receive said roller circuit-closer from the lower way and to deliver it to the upper way.

7. A circuit-closer for an electric alarm, comprising a plurality of inclined ways superimposed and independent of each other, the said ways extending in opposite directions and having conducting and non-conducting portions, a roller circuit-closer, hoppers at the upper and lower ends of said inclined ways, and a movable elevator to receive said roller circuit-closer from the lower hopper and to deliver it to the upper hopper.

8. A circuit-closer for an electric alarm, comprising a plurality of inclined ways having conducting and non-conducting portions, a roller circuit-closer, an elevator comprising a pivoted arm having a cup at one end thereof that normally stands below the lower inclined way to receive said roller circuit-closer, and adapted to swing above the upper inclined way to deliver said circuit-closer.

9. A circuit-closer for an electric alarm, comprising a plurality of inclined ways having conducting and non-conducting portions, a roller circuit-closer, an annular passage surrounding said inclined ways having openings above and below the same, a pivoted arm having a cup at one end that is situated within said annular passage, and which normally stands with the cup below the lower opening therein.

10. A circuit-closer for an electric alarm, comprising a plurality of inclined ways having conducting and non-conducting portions, a roller circuit-closer, an annular passage surrounding said inclined ways, having openings above and below the same, guide-faces at the upper side of said annular passage and opposite the upper opening therein and situated at opposite sides of the center thereof, a swinging arm having a swinging cup at one end that is situated within said annular passage, a projection upon said swinging cup, a projection in said annular passage situated at the upper side of the same and in the path of the projection upon said cup, and guide-fingers upon said cup situated to engage the stop-faces of said passage.

11. A circuit-closer for an electric alarm, comprising a swiveled frame carrying a plurality of inclined ways independent of each other and extending in reverse directions, and having conducting and non-conducting portions, a roller circuit-closer, and an elevator for delivering said circuit-closer from the lower to the upper end of said inclined ways.

12. In an electric-circuit closer, a frame provided with a plurality of inclined ways, superimposed and independent of each other, the said ways extending in reverse directions, each of which is composed of two rails, one of conducting material, and the other of non-conducting material having conducting portions, said conducting-rails and conducting portions of the non-conducting rails being connected in an electric circuit, and a roller circuit-closer.

13. In an electric-circuit closer, a frame having a plurality of inclined ways independent of each other and extending in opposite directions, the lowermost end of one being located adjacent to the highest end of the one next succeeding, and provided with conducting and non-conducting portions, said inclined ways being adjustably secured to said frame, and a roller circuit-closer.

14. In an electric-circuit closer, a frame having uprights, a plurality of inclined ways having conducting and non-conducting portions and slotted ends, fastening devices passing through the slotted end portion of the inclined ways for adjustably securing the same to said uprights, and a roller circuit-closer.

15. In an electric-circuit closer, an inclined way, consisting of a plurality of independent superimposed members, each comprising a conducting-rail and a non-conducting rail having a removable conducting-strip inlaid therein.

16. In an electric-circuit closer, an inclined way comprising a conducting-rail having a laterally-extending plate, a non-conducting rail secured to said plate, and having conducting portions.

17. In an electric alarm, a circuit in which are situated the alarm mechanism and a circuit closer, said circuit-closer comprising inclined ways superimposed and independent of each other, said ways extending in reverse directions, and having conducting and non-conducting portions, a valve above the upper inclined way adapted to retain the roller circuit closer which forms a part of the circuit, and an electromagnet for controlling said valve situated in the circuit formed by said roller circuit-closer.

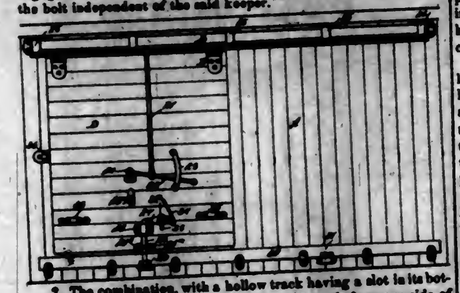
18. In an electric alarm, a circuit in which are situated the alarm mechanism and a circuit-closer, said circuit-closer comprising a plurality of inclined ways having conducting and non-conducting portions, circuit-terminals situated above the upper inclined way, a movable valve at the ends of the said terminals, a circuit-closer resting upon said terminals and held thereon by said valve, and an electromagnet controlling said valves and situated in the circuit formed by said roller circuit-closer.

19. In an electric alarm system, a circuit having a plurality of branch circuits, an alarm mechanism in said circuit, a plurality of circuit-closers in said circuit and from which the branch circuits lead, said circuit-closers comprising inclined ways and a roller circuit-closer controlled by the branch circuits, and a valve for each of said circuit-closers controlling the passage of the roller circuit-closer to the inclined ways, said valve being controlled by an electromagnet situated within the circuit in which said inclined ways are placed.

20. In an electric alarm system, a circuit having a plurality of branch circuits, an alarm mechanism in said circuit, a plurality of circuit-closers in said circuit and from which the branch circuits lead, said circuit closers comprising inclined ways and a roller circuit-closer controlled by the branch circuits, and a valve for each of the said circuit-closers controlling the passage of the roller circuit-closer to the inclined ways, said valve being controlled by an electromagnet situated within the circuit in which said inclined ways are placed, and devices to permit said valve to close quickly but which retard the opening of the same.

21. In an electric alarm system, a circuit having a plurality of branch circuits, an alarm mechanism in said circuit, a plurality of circuit-closers in said circuit and from which the branch circuits lead, said circuit-closers comprising inclined ways and a roller circuit-closer controlled by the branch circuits, and a valve for each of the said circuit-closers controlling the passage of the roller circuit-closer to the inclined ways, said valve being controlled by an electromagnet situated within the circuit in which said inclined ways are placed, and devices to permit said valve to close quickly but which retard the opening of the same, the connections between said valves and said device being arranged to cause the valves to open at different periods.

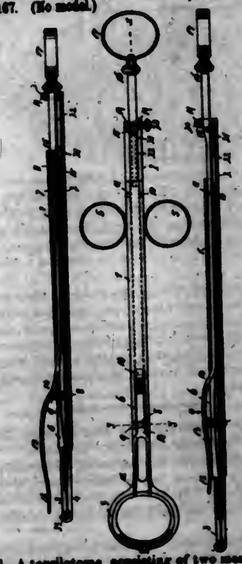
22. In an electric alarm system, a plurality of circuit-closers composed of inclined ways having conducting and non-conducting portions, a roller circuit-closer, a valve comprising a plate situated at the upper end of the upper inclined way of each of said circuit-closers, an armature connected with the valve, an electromagnet in the circuit controlled by said inclined ways and roller circuit-closers, and an arm upon the pivot of the valve and connected with the dash-pot.



23. In an electric alarm system, a plurality of circuit-closers composed of inclined ways having conducting and non-conducting portions, a roller circuit-closer, a valve comprising a plate situated at the upper end of the upper inclined way of each of said circuit-closers, an armature connected with the valve, an electromagnet in the circuit controlled by said inclined ways and roller circuit-closers, and an arm upon the pivot of the valve and connected with the dash-pot, said arms in the different circuit-closers varying in length.

24. In an electric alarm system, a plurality of circuit-closers, composed of inclined ways having conducting and non-conducting portions, a roller circuit-closer, a valve comprising a plate situated at the upper end of the upper inclined way of each of said circuit-closers, an armature connected with the valve, an electromagnet in the circuit controlled by said inclined ways and roller circuit-closers, an arm upon the pivot of the valve and connected with the dash-pot, and a counterbalance-weight.

25. In an electric alarm system, a plurality of circuit-closers composed of inclined ways having conducting and non-conducting portions, a roller circuit-closer, a valve comprising a plate situated at the upper end of the upper inclined way of each of said circuit-closers, an armature connected with the valve, an electric magnet in the circuit controlled by said inclined ways and roller circuit-closers, an arm upon the pivot of the valve and connected with the dash-pot, and an adjustable counterbalance-weight.



606,077. DOOR-HANGER. JAMES E. OWEN, JOHN C. GABEL, JR., and GEORGE F. MCKINNEY, Ottawa, Ill. Filed Mar. 26, 1897. Serial No. 630,373. (No model.)

Claim.—1. The combination, with the body of a car, a trolley and track, a door connected with the said track and a lift-lever for the door, of a keeper located near the door-opening, a bolt held to slide and rock upon the said door, the bolt being adapted to enter the said keeper, a lateral cam projection upon the bolt, adapted to engage the door when the bolt is rotated, and a locking device for the bolt independent of the said keeper.

2. The combination, with a hollow track having a slot in its bottom and brackets extending around the said track from one side of the slot to the other, and a carriage held to travel in the said track, consisting of a body-bar which extends within the slotted portion of the track, and wheels at each side of the carriage, traveling in the bottom portion of the track, of a drop-door, hinges connecting the said drop-door with the carriage, each hinge consisting of three members having a knuckle connection, the lower member of each hinge being secured to the upper portion of the door, and the upper member of each hinge being attached to the carriage, and a lift-lever fulcrumed upon the door, a rod connecting the lever with the carriage, a bolt held to slide and rock upon the door, said bolt being provided with a lateral cam projection adapted to engage the door when the bolt is rotated, a keeper for the bolt independent of the door, and a locking device for the said bolt, substantially as shown and described.

606,078. TONSILOTOME. CHRISTIAN PATTERSON, Brooklyn, N. Y., assignor to Friedrich A. Kosh, same place. Filed Nov. 19, 1897. Serial No. 659,167. (No model.)

Claim.—1. A tonsilotome, consisting of two members or shanks slidable longitudinally with respect to one another and having loop-shaped cutters, and a fork having a shank housed between the said two members or shanks and slidable longitudinally thereof, substantially as and for the purpose described.

2. A tonsilotome, consisting of two members or shanks slidable longitudinally with respect to one another and having loop-shaped cutters, one of the members or shanks having in its inner side a longitudinal grooved guideway, and a fork having a shank housed between said two members or shanks and slidable longitudinally in the said grooved guideway, substantially as and for the purpose described.

3. A tonsilotome, consisting of two members or shanks slidable longitudinally with respect to one another and one provided with a longitudinal slot, a stem secured to the other member or shank and provided with a cross-head to pass through the said slot for connecting and disconnecting the parts, and a fork having a shank portion housed between said two members or shanks and resting upon the cross-head of the stem, substantially as and for the purposes described.

4. A tonsilotome, consisting of two members or shanks slidable longitudinally with respect to one another and one provided with a longitudinal slot, a screw-stem secured to the other member or shank and provided with a cross-head to pass through the said slot for connecting and disconnecting the parts, and a fork having a shank portion housed between said two members or shanks and resting upon the cross head of the screw-stem, substantially as and for the purposes described.

5. A tonsilotome, consisting of two members or shanks slidable longitudinally with respect to one another, a lock for connecting the two members or shanks to prevent them sliding longitudinally with respect to one another, and a fork having a shank interposed between said two members or shanks and provided with means for opening said lock when said fork-shank is moved forward, substantially as and for the purposes described.

6. A tonsilotome, consisting of two members or shanks slidable longitudinally with respect to one another, one of said members or shanks having a recess and the other a tongue to engage the recess to lock the two members or shanks against longitudinal movement relatively to one another, and a fork having a shank interposed between said two members or shanks and having an inclined or wedge-shaped portion to disengage the tongue from the recess when the fork-shank is slid forward, substantially as and for the purposes described.

7. A tonsilotome, consisting of two members or shanks slidable longitudinally with respect to one another and one provided in its inner side with a longitudinal grooved guideway and a recess and the other with a tongue constructed to enter the recess to lock the two members or shanks together, and a fork having a shank located in the said longitudinal grooved guideway and having an inclined or wedge-shaped portion to disengage the tongue from the recess, substantially as and for the purposes described.

8. A tonsilotome, consisting of two members or shanks slidable longitudinally with respect to one another and having loop-shaped cutters, one of the shanks provided at the end opposite its loop-shaped cutter with a longitudinal groove 22, and a fork having a shank interposed between said two members or shanks and having a pin 21 fitted into said groove and designed to strike either end thereof when the fork-shank is moved longitudinally between said two members or shanks, substantially as and for the purposes described.

606,079. BUGGY-TOP-BOW SUPPORT. JOHN A. PAULIS, St. Louis, Mo. Filed Apr. 20, 1898. Serial No. 679,155. (No model.)

Claim.—The herein-described support for buggy-tops, consisting of the hub D provided with the angular opening E, the oppositely-extended arms F and G, the U-shaped cradles or seats H and I at their outer ends, and the soft lining J in said seats, said support being adapted to be secured to the ends of the seat-frame by means of square bolts passed through the openings E and into the seat-frame, substantially as described.

606,080. ROTARY ENGINE. WILLIAM J. PEARCE, Clinton, Ind., assignor of one-half to John A. Hurth, same place. Filed Aug. 19, 1897. Serial No. 648,797. (No model.)

Claim.—1. In a rotary engine the combination of a piston with an abutment, provided with steam and exhaust ports, being actuated directly by the piston and rotatable to reverse the engine, substantially as shown and described.

2. In a rotary engine the combination of the eccentric piston, the reciprocating rotatable abutment provided with steam and exhaust ports and operated directly by the piston, and means for rotating the abutment to reverse the engine, substantially as shown.

3. In a rotary engine the combination of an eccentric piston, an

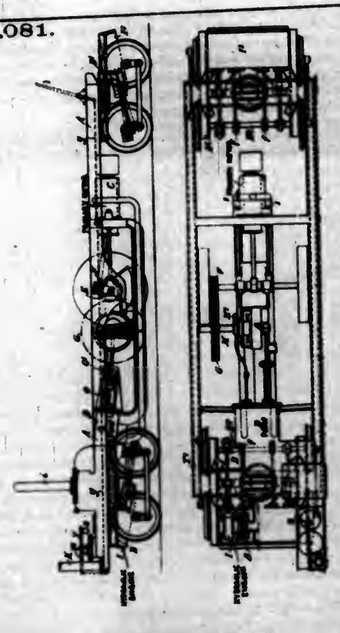
abutment provided with a steam-valve projecting therefrom and operated directly by the piston and an exhaust-passage in the abutment, substantially as shown and described.

4. In a rotary engine the combination of the piston with an abutment provided with steam and exhaust passages, a longitudinally-fixed reversing-rod upon which the abutment can reciprocate extending into the same, and means for rotating the rod to reverse the engine.

5. In a rotary engine the combination of a piston with an abutment provided with a valve in its steam-passage, a projection on the end of the same, upon which the piston acts to operate it.

6. In a rotary engine the combination of a piston with an abutment provided with grooves connecting with the steam and exhaust pipes, and with steam and exhaust passages, the steam-passage having a steam-valve projecting therefrom and operated directly by the piston.

7. In a rotary engine the combination of the eccentric piston, the ported abutment which is provided with a square recess in its outer end, a square-ended rod entering the recess and provided with a collar which seats against the abutment-cylinder head and means for turning the rod.



8. In a rotary engine the combination of the ported abutment, the rod entering the same, and projecting beyond the abutment-cylinder head, a segmental gear on the end of the rod, a reversing-lever connected to a shaft, and a segmental gear on the shaft meshing with the gear on the rod, whereby the engine is reversed.

606,081. ENGINE FOR DRIVING TRAMWAY-CARS. BUTLER F. PEEL, London, England. Filed Mar. 17, 1896. Serial No. 583,612. (No model.)

Claim.—1. In motive-power engines for driving tram-cars and other vehicles, the combination of a primary motor and a pump driven thereby, with a bogie carrying a hydraulic engine and provided with communicating passages between the pump and the hydraulic engine, and through the center of the bogie and a valve in the said passages under the control of the driver for controlling the flow of liquid to the hydraulic engine, all substantially as hereinbefore described.

2. In apparatus for starting, driving, regulating the speed, and reversing the motion of tramway-cars and other vehicles, the combination of a gas or oil engine, a pump operated thereby, a hydraulic engine supplied with water by the pump, a supply-tank, and connecting-passages, with a self-acting valve connecting the passage leading from the reservoir to the pump to the passage connecting the pump to the engine, and in the event of the hydraulic engine racing and thereby requiring more water than that supplied by the pump or pumps adapted to open and admit water from the supply-tank to make up the deficiency, substantially as hereinbefore described.

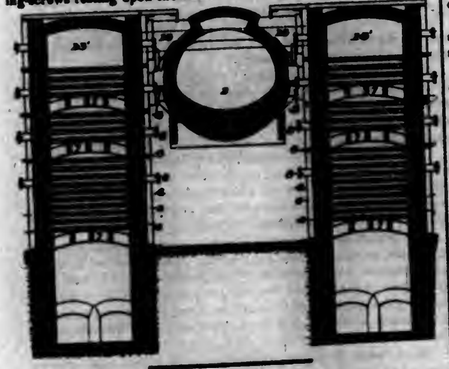
606,081.

606,082. CLASP. JOSEPH H. PILKINGTON, Waterbury, Conn. Filed Sept. 7, 1897. Serial No. 650,720. (No model.)

Claim.—1. A clasp consisting of a front plate and a back plate, a projection on the back plate having a vertical slot, and a spring locking-lever pivoted to the back plate and lying within said vertical slot when in locked position, said spring-lever having locking-prongs which extend upward parallel with the locking-lever and then inward so that the action of the prongs in engaging a garment is in an arc of a circle.

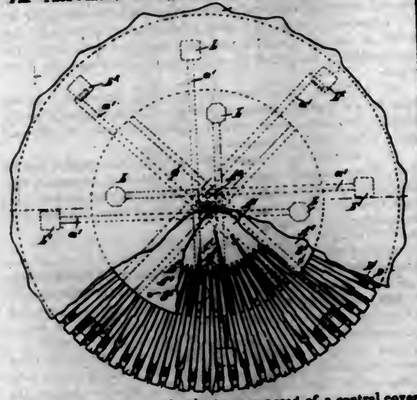
2. A clasp provided with a front and back plate between which the material to be engaged by said clasp is held, a locking-lever pivoted to said back plate and lying parallel therewith when in locked position, said locking-lever having prongs which span said plate and engage the material, spring-arms carried by said lever, and a projection on said back plate having a slot into which said spring-arms fall and are locked.

606,083. REGENERATOR. JOHN A. POTTER, Cleveland, Ohio. Filed Apr. 6, 1897. Serial No. 630,940. (No model.)



Claim.—1. In a single surface-regenerator, a portable open-ended section provided in its lower portion with inwardly-projecting supports, said section being filled with a series of separate bricks stacked to form checker-work, said bricks being entirely carried by the said inner supports.

2. A vertically-extending regenerator composed of horizontally-divided separate sections, each having in its lower portion an arch supporting the checker-work therein.



3. The combination with two flues having registering ends, one of said flues being movable relatively to the other, of a block between the ends of the flues, and having projecting lugs supported upon said flues.

4. The combination with two flues having registering ends, of a wedge-shaped block held between the same and having lugs supported upon the flues.

5. The combination with two flues having registering ends, of a block held between the same and having lugs provided with adjusting-screws resting upon the flues.

606,084. EXTENSION-TABLE. CHARLES POUPOS, Eagle Lake, Fla. Filed June 7, 1897. Serial No. 639,753. (No model.)

Claim.—1. A table having its top composed of a central cover-plate and a series of sectors retractible beneath the cover-plate said sectors all lying and moving in the same plane, means for uniformly moving them outward on radial lines, and fixed radial ribs forming guides controlling the position of said sectors and supporting the cover-plate.

2. A table having a central fixed structure, extension members comprising sectors flexibly connected to each other, and means for synchronously moving them in a radial direction.

3. A table having a top comprising sectors flexibly connected to each other, means for synchronously moving them outward in a radial direction, and a central cover-plate adapted to cover said sectors when in their retracted position.

4. A table having a central fixed structure, extension members comprising sectors movable on radial lines and flexible connections between their outer ends limiting their separation.

5. A table having a central fixed structure, extension members comprising sectors movable on radial lines and springs between the sectors pressing the same apart.

6. A table having a central fixed structure, extension members comprising sectors hinged to each other at their inner ends, and all occupying the same plane.

7. A table having its top formed of a central cover-plate and sectors movable on radial lines, and springs between the sectors pressing the same apart, substantially as described.

8. A table having its top composed of a central cover-plate and sectors hinged to each other at their inner ends, substantially as described.

9. A table having its top composed of a central cover-plate and sectors hinged to each other at their inner ends, and means for synchronously moving the sectors outward or inward, substantially as described.

10. A table having its top composed of a central cover-plate and sectors hinged to each other at their inner ends, fixed guides for the sectors, and means for synchronously moving the sectors outward or inward, substantially as described.

11. A table having its top composed of a central cover-plate and sectors, and spring-hinges connecting the inner ends of the sectors, substantially as described.

12. A table having its top composed of a central cover-plate and sectors, spring-hinges connecting the inner ends of the sectors, and means for synchronously moving the sectors in a radial direction, substantially as described.

13. A table having its top composed of a central cover-plate and sectors having shallow recesses on their sides, and flat springs within said recesses and forcing the sectors apart, substantially as described.

14. A table having its top composed of a central cover-plate and sectors movable on radial lines, and connections between the outer ends of the sectors and defining their maximum spread, substantially as described.

15. A table having its top formed of a central cover-plate and sectors movable on radial lines, and a chain attached to the outer ends of the sectors and defining their maximum spread, substantially as described.

16. A table having a central fixed structure, extension members comprising sectors hinged to each other at their inner ends, and a chain attached to the outer ends of the sectors and defining their maximum spread, substantially as described.

17. A table having a central fixed structure, extension members comprising sectors hinged to each other at their inner ends, means for synchronously moving the sectors outward and inward, and a chain attached to the outer ends of the sectors, and defining their maximum spread, substantially as described.

18. A table having a central fixed structure, extension members comprising sectors hinged to each other at their inner ends, fixed guides for the sectors, means for synchronously moving the sectors inward and outward, and a chain attached to the outer ends of the sectors and defining their maximum spread, substantially as described.

19. A table having a central fixed structure, extension members comprising sectors movable on radial lines, springs between the sectors and pressing the same apart, and a chain attached to the outer ends of the sectors and defining their maximum spread, substantially as described.

20. A table having a central fixed structure, extension members comprising sectors movable on radial lines, springs between the sectors and pressing the same apart, and means for synchronously moving the sectors outward or inward, substantially as described.

21. A table having a central fixed structure, extension members comprising sectors movable on radial lines, springs between the sectors and pressing the same apart, fixed guides for the sectors, and means for synchronously moving the sectors outward or inward, substantially as described.

22. A table having a central fixed structure, extension members comprising sectors movable on radial lines, springs between the sectors and pressing the same apart, means for synchronously moving the sectors outward or inward, and a chain attached to the outer ends of the sectors and defining the maximum spread, substantially as described.

23. A table having a top comprising sectors, means for synchronously moving the sectors outward or inward, guiding-ribs lying between sectors, and a thin plate above the sectors and upon the guiding-ribs, and secured to the table at its center, substantially as described.

24. A table having a top comprising sectors, guiding-ribs between the sectors, means for simultaneously moving the sectors outward or inward, a central hub having its upper surface level with the tops of the ribs, and a thin plate covering the sectors and ribs and fixed to the central hub, substantially as described.

25. A table having a top comprising sectors, guiding-ribs between the sectors, means for simultaneously moving the sectors outward or inward, a central hub having its upper surface level with the tops of the ribs, and a thin plate covering the sectors and ribs, and fixed to the central hub and at its outer edge to the table by pins passing through between the sectors, substantially as described.

26. A table having a central fixed structure, extension members comprising sectors, an expansible ring connected to said sectors, and means for expanding and contracting said ring, substantially as described.

27. A table having a central fixed structure, extension members comprising sectors, an expansible ring connected to said sectors, radial rods engaging said ring at intervals, and means for moving the rods inward or outward at will, substantially as described.

28. A table having a central fixed structure, extension members comprising sectors, an expansible ring connected to said sectors, toothed rods extending from the center outward and engaging said

ring at intervals, a central pinion engaging said rods, and means for turning the pinion, substantially as described.

29. A table having a central fixed structure, extension members comprising sectors, an expansible ring, staples upon the sectors embracing said ring, and means for expanding and contracting said ring, substantially as described.

30. A table having a central fixed structure, extension members comprising sectors, an expansible ring consisting of overlapping bars sliding upon each other, staples upon the sectors and embracing said ring, and means for expanding and contracting the ring, substantially as described.

31. A table having a central fixed structure, extension members comprising sectors, an expansible ring consisting of outer and inner parts which telescope, staples upon the sectors embracing said ring, and means for expanding and contracting the ring, substantially as described.

32. A table having a central fixed structure, extension members comprising sectors, two expansible rings, one within the other, each ring being composed of sections which telescope, the inner section of one ring being located adjacent to the tubular or outer section of the other ring, and staples attached to the sectors and embracing the outer or tubular sections of the rings, substantially as described.

33. A table having a central fixed structure, extension members comprising sectors, an expansible ring, staples upon the sectors embracing the said ring, arms extending from the center outward and engaging said ring, and means for operating said arms simultaneously, substantially as described.

34. A table having a central fixed structure, extension members comprising sectors, two expansible rings one within the other, each ring being composed of sections which telescope, the inner section of one ring being located adjacent to the tubular or outer section of the other ring, staples attached to the sectors and embracing the outer or tubular sections of the rings, arms extending from the center outward and engaging said rings, and means for extending or withdrawing said arms simultaneously, substantially as described.

35. A table having a central fixed structure, extension members comprising sectors, two expansible rings one within the other, each ring being composed of sections which telescope, the inner section of one ring being located adjacent to the tubular or outer section of the other ring, staples attached to the sectors and embracing the outer or tubular sections of the ring, toothed arms extending from the center outward and engaging said rings, a central pinion engaging said arms, and means for turning said pinion, substantially as described.

36. A table having a central fixed structure, extension members comprising sectors, two expansible rings one within the other, each ring being composed of sections which telescope, the inner section of one ring being located adjacent to the tubular or outer section of the other ring, staples attached to the sectors and embracing the outer or tubular sections of the rings, toothed arms extending from the center outward and engaging said rings, a central shaft carrying a spur-pinion engaging said arms, a bevel-pinion, a horizontal shaft having a bevel-pinion engaging the first-named bevel-pinion, and means for turning the shaft, substantially as described.

37. A table having a central fixed structure, extension members comprising sectors, an expansible ring connected to said sectors, toothed arms extending from the center outward and engaging said rings, a central shaft carrying a spur-pinion engaging said arms, a bevel-pinion, a horizontal shaft having a bevel-pinion engaging the first-named bevel pinion, and means for turning said shaft, substantially as described.

38. A table having a central fixed structure, extension members comprising sectors, an expansible ring connected to said sectors, arms extending from the center outward and connected to said ring, means for extending and withdrawing said arms, and legs connected to said arms, substantially as described.

39. A table having a central fixed structure, extension members comprising sectors, an expansible ring connected to said sectors, toothed arms extending from the center outward and connected to said ring, a central pinion engaging said arms, means for turning said pinion, and legs connected to the outer ends of said arms, substantially as described.

40. A table having a central fixed structure, extension members comprising sectors, two expansible rings one within the other, each ring being composed of sections which telescope, the inner section of one ring being located adjacent to the tubular or outer section of the other ring, loops attached to the sectors and embracing the outer or tubular sections of the rings, arms extending from the center outward and connected to said rings, means for extending and withdrawing said arms and legs connected to the outer ends of the arms, substantially as described.

41. A table having a central fixed structure, extension members comprising sectors, two expansible rings one within the other, each ring being composed of sections which telescope, the inner section of one ring being located adjacent to the tubular or outer section of the other ring, loops attached to the sectors and embracing the outer or tubular sections of the rings, toothed arms extending from the center outward and engaging said rings, a central shaft carrying a spur-pinion engaging said arms, a bevel-pinion, a horizontal shaft having a bevel-pinion engaging the first-named bevel-pinion, means for turning said horizontal shaft, and legs connected to the said arms and rings, substantially as described

42. A table having a central fixed structure, extension members comprising sectors, expansible rings connected to said sectors, arms extending from the center outwardly, means for extending and withdrawing said arms, and rollers connected to the outer ends of said arms and embracing the rings, substantially as described.

43. A table having an expansible top, legs supporting the expansible outer sections of the said top, toothed arms extending from the center outward and connected to said legs at top and bottom, central pinions engaging said toothed arms, and means for turning said pinions, substantially as described.

44. A table having an expansible top, legs supporting the expansible outer sections of said top, toothed arms extending from the center outward and connected to said legs at top and bottom, central pinions engaging said toothed arms, a common shaft for said pinions, a horizontal shaft provided at its outer end with means by which it may be turned, and bevel-gears connecting the two shafts, substantially as described.

45. A table having an expansible outer section, legs pivoted thereto, and means by which the pivoted legs may be locked in a horizontal or vertical position, substantially as described.

46. A table having an expansible outer section, arms extending from the center outward and connected to the expansible outer section to operate it, means for moving said arms synchronously, legs pivoted to the outer ends of said arms, and means for locking the arms in either a horizontal or vertical position, substantially as described.

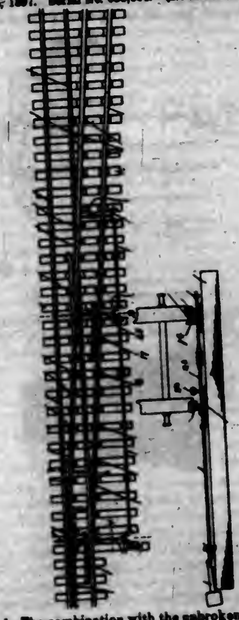
47. A table having an expansible top section composed of sectors, means for moving said sectors inward or outward, and peripherally-expansible supporting-rails extending about the table beneath said sectors, substantially as described.

48. A table having an expansible top section composed of sectors, means for moving said sectors inward or outward, expansible supporting-rails extending about the table beneath said sectors, and shoes attached to the under side of the sectors, and engaging said rails, substantially as described.

606,085. ANTIRATTLING NUT-LOCKING DEVICE FOR THILL-COUPLINGS. CHARLES T. REMFIELD, Glenhaven, N. Y. Filed Dec. 28, 1897. Serial No. 663,974. (No model.)

Claim.—1. A bearing and locking plate for thill-couplings, consisting of a spring-body provided with a tongue-section between its ends and with wings at the ends, one adapted as a means of support and the other for locking engagement with the nut of the pivot-bolt of the thill-coupling, as described.

2. In a bearing and locking plate for thill couplings, a body-section provided with a tongue and wings at its ends, the free end of the tongue extending beyond the plane of the upper surface of the body, one wing being longer than the other and provided with an opening and a flange, substantially as described.



3. The combination, with the barrel of a thill-coupling and the pivot-bolt and nut of the said barrel, of an attachment consisting of a plate provided with a body portion having a tongue arranged for engagement with the barrel, a wing at one end adapted to receive the bolt, and a wing at the opposite end, adapted for contact with the nut of the said pivot-bolt, for the purpose specified.

4. In an antirattling and nut-locking device for thill-couplings, a double spring, each spring extending parallel with and acting independently of the other, one spring locking the nut on the coupling-bolt and the other spring acting to prevent rattling of the coupling.

5. In an antirattling and nut-locking device for thill-couplings, a spring-body divided longitudinally to form a tongue adapted to engage with the barrel of the coupling and a section adapted to lock the nut on the bolt of the said coupling, as and for the purpose specified.

6. An antirattling nut-locking device having a body or connecting portion and end wings and having such body provided between its sides with a tongue whose free end is deflected for engagement with the barrel of the coupling substantially as described.

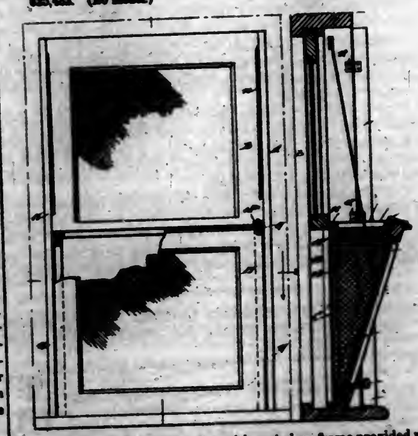
606,086. FROGLESS SWITCH. MICHAEL RILEY, London, Ohio. Filed Oct. 13, 1897. Serial No. 655,081. (No model.)

Claim.—1. The combination with the unbroken main-track rails, and the movable switch-rail sections elevated as described, one being adapted to be moved over the main-track rail and the others to contact with the side of the main-track rails, of a guard-rail between the main-track rails independent of but connected to and movable with one of the last-mentioned sections, as and for the purpose specified.

2. In a frogless switch, the combination with the unbroken main-track rails, of the movable switch-rail sections having their ends beveled to engage the sides of the main-track rails, the movable switch-rail section elevated to move over the main-track rail, means for moving all of said sections simultaneously, and a guard-rail between the main-track rails, independent of but connected to and movable with one of said sections, substantially as shown and described.

3. The combination with the unbroken main-track rails, of the movable sections of the switch-rails, a rod secured to the under side of the said sections and passed loosely through openings in the main-track rails, means for actuating said rod and sections, and an adjusting-nut on the outer end of said rod to contact with the main-track rail, substantially as and for the purpose specified.

606,087. GARBAGE-CLOSET. CORNELIA S. ROBINSON, New York, N. Y. Filed July 2, 1897. Serial No. 643,215. (No model.)



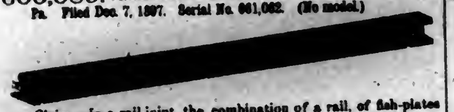
Claim.—1. A garbage-closet formed in a wall of a building and having a portion of its outer wall inclined downwardly and outwardly forming a hood projecting out beyond the outer face of the wall of the building and having its bottom closed by a screen, the said closet being provided with a flue leading from its top, substantially as described.

2. A garbage-closet formed in a wall of a building and having the upper portion of its outer wall inclined downwardly and outwardly forming a hood projecting out beyond the outer face of the wall of the building, terminating short of the bottom of the closet and having its bottom closed by a screen, the said closet being provided with a flue leading from its top, substantially as described.

3. A garbage-closet formed in the wall of a building and being of a depth about equal to the thickness of the said wall, the outer wall of the closet inclining from the top downwardly and outwardly forming a hood projecting beyond the outer face of the wall of the building, said hood terminating short of the bottom of the closet and having its bottom closed by a screen, the said closet being provided with a flue leading from the top out through the wall of the building, substantially as described.

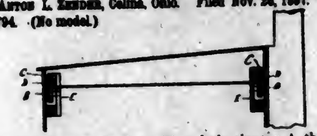
4. A garbage-closet formed in the wall of a building and comprising a casing fitting in an opening in the wall and having its outer wall inclined downwardly and outwardly from the top forming a hood projecting beyond the outer face of the wall of the building and terminating short of the bottom of the said casing, a screen extending from the lower outer portion of the hood to the vertical portion of the outer wall of the casing, a flue leading from the top of the casing, and a door in the inner wall of the said casing, substantially as herein shown and described.

606,088. VENTILATING ATTACHMENT FOR WINDOWS. KARIE C. SAMSON, Brooklyn, N. Y. Filed Mar. 1, 1897. Serial No. 625,622. (No model.)



Claim.—1. The combination with a window-frame provided with stop-beads hinged to the inner edge of the frame and adapted to be carried parallel with the inner vertical faces of the sides of the window-frame, and a lower sash held to slide in said frame and adapted to rest with its lower edge on the lower part of the said window-frame, the said sash being arranged to be given an inward inclination when the stop-beads are swung inward on their hinges, of a removable ventilating attachment comprising a framework covered with a reticulated or perforated material and shaped to fit between the inclined lower sash and the window-frame, and locking devices whereby the ventilating attachment may be secured to the sashes, substantially as described.

2. The combination with a window-frame provided with inner stop-beads having a hinged connection with the window frame at the inner edge thereof, whereby said stop-beads may be carried parallel with the inner vertical faces of the sides of the window-frame, and a lower sliding sash for said window-frame having its lower edge adapted to rest in a groove in the lower part of the window-frame, the said lower sash being arranged when in its lowermost position to be given an inward inclination when the inner stop-beads are swung inward out of the way, of a ventilating attachment for the said lower sash consisting of ventilating side frames covered with a reticulated or perforated material and shaped to approximate a right-angled triangle, the straight sides of the frames being arranged for engagement with the face of the window-frame and the inclined sides with the outer face of the lower sash when the latter is inclined from the window-frame, a cover ventilating-frame arranged to rest upon the side ventilating-frames and also provided with a reticulated or perforated

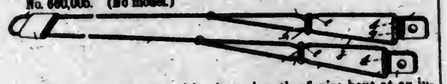


covering, the inclined sides of the ventilating-frame being each provided with an extension at its upper part, and latches attached to the extensions and adapted to engage with the lower sash, substantially as set forth.

606,089. RAIL-JOINT. ERNST J. SCHINDERÜTTE, McKee's Rocks, Pa. Filed Dec. 7, 1897. Serial No. 661,062. (No model.)

Claim.—In a rail-joint, the combination of a rail, of fish-plates engaging the web of the rail, said fish-plates being provided with a flange conforming to the base of the rail, said fish-plate being also provided on one end with an aperture, the opposite end with a transversely-extending lug, said lug passing through an aperture formed in the web of the rail at or near the center thereof and through the aperture of the fish-plate on the opposite side of the rail, and a wedge or key for securing the fish-plates in position, substantially as shown and described.

606,090. MOVABLE-TOP WRITING-DESK. JACOB M. SCHUPCK and ANTOS L. ZENDER, Celina, Ohio. Filed Nov. 26, 1897. Serial No. 659,794. (No model.)

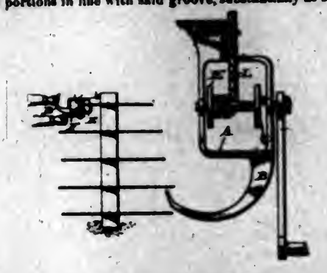


Claim.—1. In combination with a desk, the top A, the supporting-rollers B and means for holding the top upon said rollers, said top being movable endwise in either direction to uncover the desk, substantially as described.

2. In combination with a desk the top A, the supporting-rollers B and means for holding the top upon said rollers, comprising rollers C supported on the desk and bearing upon a part connected to the top, said top being movable endwise in either direction to uncover the desk substantially as described.

3. In combination with a desk, the top A, the supporting-rollers B and means for holding the top upon said rollers, comprising rollers C supported on the desk and bearing upon a part connected to the top, said part consisting of rails D and said top being movable endwise in either direction to uncover the desk substantially as described.

606,091. MUD-GUARD FOR BICYCLES. CHARLES I. SEAQUIST and ALFRED L. SEAQUIST, Portland, Oreg. Filed Nov. 27, 1897. Serial No. 660,005. (No model.)



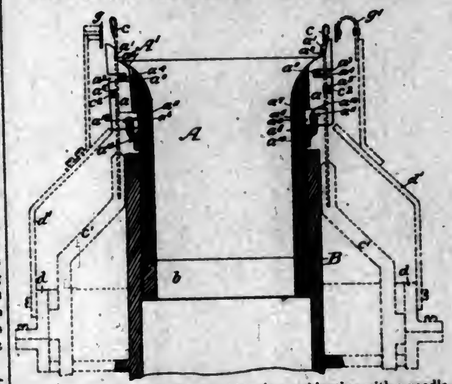
Claim.—1. A mud-guard having a length of wire bent at an intermediate point, a web attached to the wire adjacent to said bend and forming the mud-guard proper, two additional wires respectively connected with the arms of the first-named wire, a link embracing each of said additional wires and each arm of the first-named wire, and two clips each having a tubular portion, and each end of the first-named wire and the free ends of the second-named wires being bent transversely to fit into said tubular portions.

2. A mud-guard for wheels having a member capable of running around each side of the wheel and provided at its outer end with a guard proper, an additional member mounted to swing on each side of the first-named member at the inner end thereof, a link embracing each of said additional members and also embracing the adjacent side of the first-named member to hold said parts together, and a clip engaging the free and inner end of each of said additional members and also engaging each side of the first-named member to support the mud-guard.

3. In a mud-guard for wheels, the combination of two clips adapted to be supported adjacent to the axle of the wheel, a member capable of extending around each side of the wheel and having each of its inner ends held by one of the clips, a guard proper carried at the outer end of said member, and two additional members carried respectively by the sides of the first-named member and extending downwardly and inwardly to engage the respective clips.

606,092. MACHINE FOR STRETCHING WIRE OR OTHER PURPOSES. CHARLES W. SELVIDGE, Mexia, Tex. Filed Oct. 20, 1897. Serial No. 656,236. (No model.)

Claim.—The herein-described device for use as a wire-stretcher, and for other purposes, consisting of the centrally-open frame, having a claw extension at one corner portion, and a lug extension at the opposite corner portion, said extension having a broadened square end adapted to take a bearing against a fence-post, and having its lateral edge longitudinally grooved, said frame having a hole through its end portions in line with said groove, substantially as specified.



606,093. BOILER-FLUE CLEANER. WILLIAM SEEKER, Harrison, Kans. Filed Dec. 28, 1897. Serial No. 663,966. (No model.)

Claim.—In a boiler-tube cleaner, a head consisting of an outer section flaring toward and approximately to its front edge, which is beveled inwardly, and formed in the rear of its flaring portion with an internally-threaded nipple, and an inner section screwing into the said nipple, and closed at its outer end, said latter section flaring forwardly in a less degree than the outer section to a point near its front edge, at which point it is given a decided outward flare and closely approaches the beveled edge of the outer section, forming therewith a forwardly and outwardly extending steam-passage, and provided with annular series of openings through which the steam is adapted to flow into the space between the said shells, as and for the purpose set forth.

606,094. SINKER-TOP FOR HOSIERY-KNITTING MACHINES. HENRY H. SERVISS TON and WILLIAM L. WHITEHEAD, Philadelphia, Pa. Filed July 19, 1897. Serial No. 645,198. (No model.)

Claim.—1. In a knitting-machine the combination with a needle-cylinder and sinker-top of sinkers, an annular flange on the said top, a wedge-shaped notch in the bottom of each sinker fitting over the said flange, and allowing the top end of the sinker to move a certain distance outwardly, and means for holding the upper ends of the sinkers toward the center of the needle-cylinder, substantially as and for the purposes set forth.

2. In a knitting-machine the combination with a needle-cylinder and sinker-top, of sinkers, an annular flange on the said top, a groove in the lower end of each sinker to fit over the said flange and allowing the top end of the sinker to move a certain distance outwardly,

a shoulder on said sinker-top, a projection on each sinker abutting said shoulder to prevent the sinker from moving upwardly and means for holding the upper ends of the sinkers toward the center of the needle-cylinder, substantially as and for the purposes set forth.

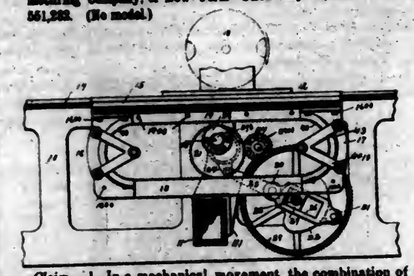
3. In a knitting-machine, the combination with a needle-cylinder and sinker-top, of sinkers, an annular flange on the said top, a groove in the lower end of each sinker to fit over the said flange and allowing the top end of the sinker to move a certain distance outwardly, a shoulder on said sinker-top, a projection on each sinker abutting said shoulder to prevent the sinkers from moving upwardly an annular groove in the sinker-top, a groove or notch in each of the sinkers corresponding with the said groove of the top and a coiled annular spring located in said groove substantially as and for the purposes set forth.

4. In a knitting-machine, the combination with a needle cylinder and sinker-top, of a diametrically-extended portion at the top of the sinker-top, slots in said extended portion, sinkers located in said slots, an annular flange removably held against a shoulder of the sinker-top, a groove in the lower end of each sinker, to fit over the said flange, and allowing the top end of the sinker to move a certain distance outwardly, a shoulder on said sinker-top, a projection on each sinker abutting said shoulder to prevent the sinkers from moving upwardly, an annular groove in the sinker-top, a notch in each of the sinkers corresponding with the said groove of the top, and a coiled annular spring located in said groove, substantially as and for the purposes set forth.

5. In a knitting-machine, the combination with needles, a needle-cylinder and means for operating the said needles, of a sinker-top mounted inside the needle-cylinder and having an extended portion at the top, slots in said portion, sinkers located in said slots, an annular flange on said top for supporting the said sinkers and allowing the top ends of the sinkers to move a certain distance outwardly and means for normally maintaining the top ends of the sinkers toward the center of the machine, substantially as and for the purposes set forth.

6. In a knitting-machine, the combination with a needle-cylinder and sinker-top of an extension on said top, slots therein, sinkers located in said slots, an annular flange on said top for supporting the said sinkers and allowing the top ends thereof to move a certain distance outwardly, means to prevent the sinkers from moving upwardly and means for normally maintaining the top ends of the sinkers toward the center of the machine, substantially as and for the purposes set forth.

606,095. PENCIL-HOLDER. WASHINGTON B. B. SMITH, Liberty, N. Y. Filed Jan. 7, 1897. Serial No. 618,268. (No model.)



Claim.—1. The herein-described holding device for pens, pencils, &c., comprising an approximately cylindrical receptacle having an opening in one side, attaching means, and an elastic band passing transversely around and lying partially within the side opening in said receptacle, substantially as and for the purpose described.

2. In a holding device of the class described, the main body portion having attaching means connected thereto, and provided with lateral flaps which are rolled upon one side to form receptacles for pencils, &c., the said receptacles being provided with openings, and a resilient band extending around the holder and lying partially within said receptacles, substantially as described.

3. A pencil-holding device, comprising a body portion, oppositely-projecting flaps having central openings and rolled upon one side of the holder to form receptacles, a tab at one end of the body portion folded back to form a bearing-eye, a pin having its journal portion mounted in said eye, and a guard for the point of the pin formed by incising the body of the holder and deflecting the metal included by the incision, said holder being adapted to receive a resilient band around it, the arrangement being such that said band will lie partially within the receptacles for the pencil, &c., substantially as described.

4. The pencil-holder described consisting of the body portion of sheet metal and provided with means for attachment to the clothing, the edges of said body portion having integral flaps which are looped inwardly toward the body and toward each other forming two receptacles nearly cylindrical in form in front of said body and side by side, said receptacles having front openings and a retaining-piece extending across the openings, substantially as and for the purpose stated.

606,096. MECHANICAL MOVEMENT. LOUIS W. SOUTHGATE, Worcester, Mass., assignor to the Campbell Printing Press and Manufacturing Company, of New York. Filed May 31, 1895. Serial No. 551,282. (No model.)

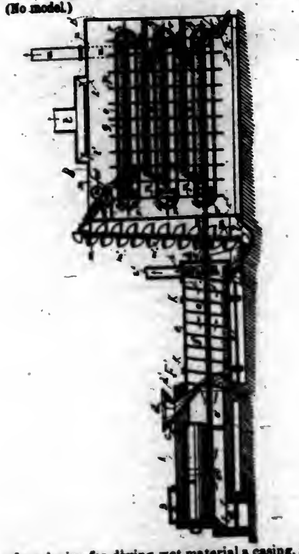
Claim.—1. In a mechanical movement, the combination of the reciprocating bed or member, with means for giving the same its major reciprocation and a reversing mechanism consisting of a curved rack carried by said bed, a pinion fixed upon a revolving crank, adapted to engage said curved rack, a working shoulder fixed upon said crank, concentrically with said reversing-pinion, and a curved working shoulder mounted on the bed, concentrically with said curved rack, substantially as described.

2. In a mechanical movement, the combination of the reciprocating bed or member, a main driving mechanism adapted to give the same its major reciprocation, curved racks mounted at each end of said bed, a reversing-pinion fixed upon a revolving crank, and adapted to alternately engage said curved racks to reverse the movement of the bed in either direction, a working shoulder fixed concentrically with said reversing-pinion, and curved working shoulders arranged concentrically with said curved racks, substantially as described.

3. In a mechanical movement, the combination of the reciprocating bed or member, the main driving mechanism for giving the same its major reciprocation, a curved rack carried by said bed, a reversing-pinion fixed upon a revolving crank, and adapted to engage said curved rack, a working shoulder fixed concentrically with said reversing-pinion, a working shoulder arranged concentrically with said curved rack, a stud arranged concentrically with said reversing-pinion, and a roller arranged concentrically with said curved rack, substantially as described.

4. In a mechanical movement, the combination of the reciprocating bed or member having the main racks, a driving-gear arranged between said main racks, means for raising and lowering the driving-gear to alternately engage said racks, curved racks secured to each end of said bed, a reversing-pinion fixed upon the main driving-gear, a circular working shoulder fixed upon said main driving-gear concentric with the reversing-pinion, and curved working shoulders arranged on said bed concentrically with said reversing-pinion, substantially as described.

5. In a mechanical movement, the combination of the reciprocating bed or member having two racks, a raising and lowering driving-gear engaging said racks, said gear carrying a reversing-pinion 38, a working shoulder 36 and a stud as 37, depending curved racks arranged at each end of the bed, working shoulders arranged concentrically with said curved racks, and rollers with which the stud mounted on the driving-gear is adapted to coact to keep the reversing-pinion in mesh with the curved racks and the working shoulders together, substantially as described.



6. The combination of the reciprocating bed or member, a main driving mechanism for giving the same its major reciprocation, and a reversing mechanism consisting of a reversing-pinion mounted on a revolving crank, a curved working shoulder also fixed upon said crank concentrically with said reversing-pinion, and of a diameter substantially equal to the pitch diameter of said pinion, a curved rack depending from said bed, and a curved working shoulder carried by said bed concentrically with said curved rack of a diameter substantially equal to the pitch diameter of said curved rack, substantially as described.

7. In a mechanical movement, the combination of the reciprocating bed or member, a main driving-gear 21, a stud 35 fitting therein, said stud having a working shoulder 36 and a projecting stud 37, a reversing-pinion 38 mounted on said stud 37, and curved racks, working shoulders and rollers secured to each end of said bed, substantially as described.

8. The combination in a mechanical movement of the reciprocating bed or member, the main driving mechanism for giving the same its major reciprocation, and a reversing mechanism consisting of a reversing-pinion mounted upon a revolving crank, a curved working shoulder arranged concentrically therewith substantially the pitch diameter of the reversing-pinion, brackets depending from each

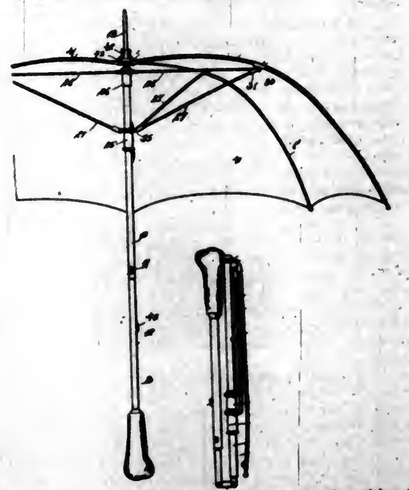
end of the bed having curved racks, and working shoulders formed integrally therewith, substantially as described.

606,097. DRYING APPARATUS. EMANUEL STAUBER, Berlin, Germany. Filed Aug. 15, 1896. Renewed Mar. 28, 1898. Serial No. 675,513. (No model.)

Claim.—In a device for drying wet material a casing, a fire-rack therein, a boiler above said rack and within said casing, a shoulder in said casing and opposite said fire-rack a rotatable cylinder engaging said shoulder, a cap, an annular inwardly-directed flange secured thereto having an opening in the lower part thereof and being adapted to receive the other end of said cylinder, a steam-pipe in connection with said boiler and passing lengthwise through said cylinder, a spiral flange within said cylinder and surrounding said pipe, an exhaust-pipe in connection with said cylinder, encircling bands having teeth on the outer end thereof, gear-wheels adapted to engage the same and a funnel in said casing and entering said cylinder, all of the said parts being combined substantially as described.

606,098. BOUQUET-HOLDER. ADOLPH STIEFEL, Hammelburg, Germany. Filed Jan. 4, 1896. Serial No. 665,525. (No model.)

Claim.—1. A bouquet-holder, comprising a plurality of adjustable sections, a ring adjustable longitudinally thereon, and means for retaining said ring in adjusted position.



2. In a bouquet-holder, the combination with a receptacle composed of a plurality of independently-movable sections, flaring at one end, of a longitudinally-adjustable ring designed to encompass said sections, and accomplish their adjustment, and a spring for retaining said ring in adjusted position.

3. In a bouquet-holder, the combination with a receptacle composed of a base, a pin for attaching the holder to a garment, and a plurality of independently-movable sections integral with the base and flaring at their upper ends, of an adjustably-mounted ring designed to encompass said sections and to accomplish their adjustment, and a spring attached at one end to said ring and provided with an eye at its opposite end, through which the pin is adapted to be passed for retaining said ring in adjusted position.

4. The combination with a bouquet holder having an opening in the body thereof, of a flexible pin pivoted to said body and adapted to be bent so that the pointed end thereof may be passed through said opening

5. The combination with a bouquet-holder composed of a plurality of sections, of an adjusting-ring encompassing the sections designed to clamp them upon the stems of a bouquet, a pin secured at the lower end of the holder and designed to enter a minute aperture adjacent to its upper end, and a spring secured at its opposite ends to the free end of the pin, and to the ring.

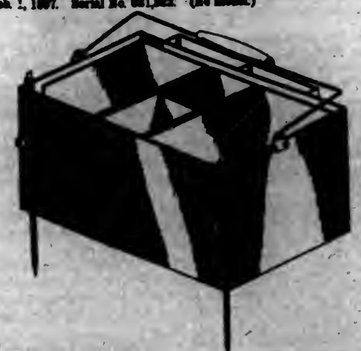
606,099. FOLDING UMBRELLA. FRANK H. STOVER and FRANK G. GROVE, Luray, Va. Filed June 21, 1897. Serial No. 641,664. (No model.)

Claim.—1. In a folding umbrella, the combination with a telescoping stick, the sections of which are provided with longitudinal slots, the slot of the inner section being the longer, of a double-headed latch pivoted at about the center of its length in the slots of the sections and provided at its upper end with an extension for limiting the downward movement of the inner section, substantially as described.

2. In an umbrella, the combination, with a telescopic stick, the inner stick-section being provided with a slot and a transverse recess at its slotted portion and the outer section being provided with a slot corresponding to that of the inner section, and likewise with a transverse recess, of a latch having a double head, the space between the heads being adapted for the reception of a runner, and a pivot-pin for the latch, passed through the same and normally entering the transverse recess or slot in the inner section of the stick.

3. In an umbrella, the combination, with a stick constructed in telescopic sections, the sections being provided with longitudinally-registering slots and the slot in the inner section being longer than that in the outer section, of a latch provided with a head near each end, and an extension beyond the upper head, the latch being adapted to enter the longitudinal slots in the two sections, and a pivot for the latch, capable of entering the transverse slots and recesses in both of the sections, or in one of them only, as and for the purpose specified.

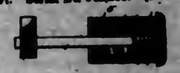
4. In a folding umbrella, a stick comprising a tubular outer section having its lower end notched, and an inner section sliding in the tube and consisting of two sections hinged together by a link, the outer member of the inner section being formed with a shoulder and lugs to enter the notches of the tubular outer section, substantially as described.



5. In a folding umbrella, the combination of a stick formed of telescoping sections provided with longitudinal slots, the slot of the inner section being the longer, the inner section of the stick being formed of two sections connected by a link, ribs carried by the stick, and formed of sections sliding one upon the other, runners on the stick, two sets of stretchers, one set for each runner, the stretchers being pivoted to the runners and to the ribs, and a double-headed latch pivoted in the slots of the stick-sections and provided with an extension for limiting the downward movement of the inner stick-section, substantially as described.

6. A folding umbrella, comprising a stick formed of an inner and outer section, each formed with a longitudinal slot, the slot of the inner section being the longer, the said inner section sliding in the outer section and formed of two members connected together by a link, ribs carried by the outer stick-section and formed of sections sliding one upon the other, runners on the outer stick-section, two sets of stretchers pivoted to the runners and to the lower rib-sections, a latch pivoted in the slots of the stick-sections and serving to lock the lower runner in position and the sections of the stick together when the umbrella is opened, and a cover secured to the lower rib-sections and provided with a central opening in which the upper end of the inner stick-section is free to slide, substantially as described.

7. A folding umbrella, consisting of a stick formed of an inner and outer section, each formed with a longitudinal slot, the slot of the inner section being the longer, the said inner section sliding in the outer section and formed of two members connected together by a link, ribs secured to the outer stick-section and formed of two sections sliding one upon the other, two runners on the outer stick-section, two sets of stretchers pivoted to the runners and to the lower rib-sections by a common pivot, a double-headed latch pivoted in the slots of the stick-sections and serving to lock the lower runner in position and the sections of the stick together when the umbrella is opened, and a cover secured to the lower rib-sections and provided with a ferrule in which the upper end of the inner stick-section is free to slide, substantially as described.



8. A folding umbrella, consisting of a stick formed of an inner and outer section, each formed with a longitudinal slot, the slot of the inner section being the longer, the said inner section sliding in the outer section and formed of two members connected together by a link, ribs carried by the outer stick-section and formed of sections sliding one upon the other, runners on the outer stick-section, two sets of stretchers pivoted to the runners and to the lower rib-sections, a double-headed latch pivoted in the slots of the stick-sections and serving to lock the lower runner in position and the stick-sections together when the umbrella is opened, the said latch being provided at one end with an extension for limiting the downward movement of the inner stick-section, and a cover secured to the lower sections of the ribs and to a ferrule in which the upper end of the inner stick-section is free to slide, substantially as herein shown and described.

606,100. COMBINATION PAINT-BUCKET. HENRY G. THOMPSON, Hollister, Cal., assignor of one-half to John Dettinger, same place. Filed Feb. 1, 1897. Serial No. 621,922. (No model.)

Claim.—The herein-described paint-bucket, comprising a receptacle having exterior pockets, a series of removable buckets located in said receptacle, sleeves located inside of said bucket in opposite corners of the latter, and pointed rods held in said sleeves and capable of independent adjustment, said rods being designed to extend at their lower ends below said receptacle, substantially as set forth.

606,101. SASH-FASTENER. JOHN T. THOMPSON, Baltimore, Md. Filed June 18, 1897. Serial No. 641,263. (No model.)

Claim.—In a sash-fastener, the combination with a window-sash, of a rack countersunk in the edge thereof, and having downwardly-disposed teeth, a window-frame, a squared spindle extending into the frame, an oscillatory dog secured to the spindle and designed to engage the rack, a rectangular locking-plate b provided with an enlarged opening for the spindle, an annular toothed projection extending from one face of the locking-plate, a cylindrical locking member, provided with a comparatively large shallow recess in one end and a deep circular recess in its opposite end defining an intermediate diaphragm, having a squared aperture for the reception of the spindle, teeth upon the locking member engaging the teeth upon the locking-plate projection, a knob extending into the deep recess in the locking member, and screwed upon the end of the spindle and having an enlarged head abutting against the outer end of the locking member, and extending beyond its periphery, said knob being designed to control the movement of the locking member upon the spindle and to oscillate the latter to operate the dog, and a leaf-spring secured to the face of the frame and having its lower end bent inwardly into engagement with the dog, substantially as specified.

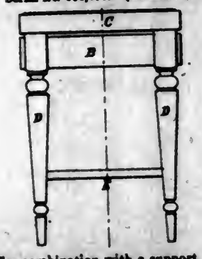
606,102. COUPLING ATTACHMENT FOR RAILWAY-CARS. WILLIAM THORBURN, Shelby, Ohio, assignor to the Thorburgh Coupler Attachments Company, Limited, Detroit, Mich. Filed Nov. 19, 1897. Serial No. 659,094. (No model.)

Claim.—1. A combined draft apparatus and draft-spring housing for railway-cars consisting of two metal walls forming draft-plates to take the place of the customary draft-timbers of a car, said walls constructed with integral inwardly-projecting contacting flanges to form draft-spring housing between said walls open at the bottom of said housing, an additional device to close the bottom of said housing, and means to unite said walls, substantially as set forth.

2. In a coupler attachment for railway-cars, the combination of two metal walls forming draft-plates to take the place of the customary draft-timbers and constructed to form the side walls, top and rear of a draft-spring housing between them integral with said walls, and means to unite said walls, said walls formed with integral inwardly-projecting top and rear flanges meeting one another intermediate the sides of said walls, and forming the top and rear of said draft-spring housing, substantially as set forth.

3. In a coupler attachment for railway-cars, integrally-combined draft-plates and a draft-spring housing consisting of two metal walls forming the draft-plates to take the place of the customary draft-timbers, said walls constructed to form a draft-spring housing between them integral with said walls open at the bottom of the housing and having integral stops to limit the movement of follower-plates in said housing, a draft-spring in said housing, an additional device to close the bottom of said housing, and bolts passed horizontally through said walls to unite said walls together, said walls formed with contacting flanges intermediate the sides of the walls preventing lateral compression of said spring, substantially as set forth.

4. A combined draft apparatus and draft-spring housing for railway-cars consisting of two metal walls forming draft-plates to take the place of the customary draft-timbers constructed to form a draft-spring housing between them integral with said walls, horizontal bolts uniting said walls, and a movable gate or spider to close the bottom of said housing, said walls formed with inwardly-projecting flanges forming the top and the rear of the housing, substantially as described.



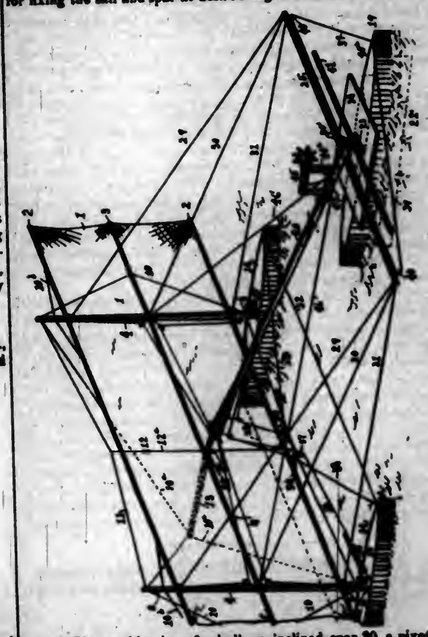
5. A combined draft apparatus and draft-spring housing for railway-cars consisting of two metal side walls independently secured to the car-sills, and constructed to form the side walls and top of a draft-

spring housing between them integral with said walls, a draft-spring in said housing, follower-plates in said housing, an additional device to close the bottom of said housing, and means to hold said side walls together, said side walls constructed with integral contacting flanges to form said housing, and with integral stops to limit the movement of said follower-plates, substantially as described.

6. In a coupler attachment for railway-cars, a housing provided with separable metal walls forming draft-plates to take the place of the customary draft-timbers, said walls formed with contacting top flanges a', a^3, and with inwardly-projecting contacting rear walls a^6, a^5, and bolts passed horizontally through said walls to unite said plates, substantially as set forth.

7. A coupler attachment for railway-cars consisting of two metal walls forming draft-plates and constructed to form a draft-spring housing between them integral with said walls, a draft-spring in said housing, follower-plates in said housing, and means to unite said walls, said walls formed with integral stops to limit the movement of the follower-plates, with inwardly-projecting flanges a', a^2 forming the top of the housing, with inwardly-projecting flanges a^3, a^4 forming the rear of the housing, and with inwardly-projecting flanges a^5, a^6 between the housing and the rear ends of said walls, substantially as set forth.

606,108. FOLDING CHAIR. CHARLES C. TOMPS, Johnstown, Pa., assignor to Thomas J. Pearl and Robert Ferguson, same place. Filed Sept. 23, 1896. Serial No. 606,758. (No model.)



Claim.—1. The combination with a support, of a strip secured thereto and having an upper straight edge, a seat having a strip along the rear edge thereof formed with a straight surface and adapted to rest, when in folded position, directly on the top of the horizontal strip and be held in a perpendicular position, an automatically-folding leg hinged to the under portion of the said seat, and spring-hinges connecting the strip at the rear edge of the seat with the said horizontal strip, the said seat with its leg being automatically raised by the action of the spring-hinges and prevented from moving backward beyond a predetermined point by the straight surface of the rear edge thereof engaging the upper straight surface of the horizontal strip, the hinges connecting said strips being respectively applied to the under rear portion of the seat-strip and the upper outer portion of the horizontal strip, substantially as specified.

2. The combination with a support, of a horizontal strip secured thereto and provided with an upper straight edge, a seat having legs hinged to the outer front portion thereof and provided with a strip along the rear edge, also formed with a straight surface of less width than the said horizontal strip and adapted to rest on the latter when in folded position and spring-hinges connecting the strip at the rear of the seat, and the said horizontal strip and serving to automatically raise the said seat, the said seat when elevated being perpendicularly positioned and the preponderance of its weight applied to the rear of the hinges and acting as an auxiliary to the springs of said hinges to maintain the seat in elevated position.

3. The combination with a support, of a horizontal strip secured thereto and provided with an upper straight edge, a seat having a strip along the rear edge thereof formed with a straight engaging surface adapted to rest on the upper straight surface of said horizontal strip, the seat-strip being of less width than the said horizontal strip, spring-hinges connecting said horizontal strip and seat-strip and automatically operating to raise the seat, the said seat, when in elevated rested position, being perpendicular and limited in backward movement by the straight edge of the rear strip thereof engaging the upper surface of the horizontal strip to avoid the strain on the connecting hinges and also facilitate the maintenance of an upright position thereof, and legs hinged to the outer under portion of the said seat and automatically folded when the seat is raised, substantially as described.

606,104. VESSEL AND SAIL AND RIGGING THEREFOR. CHARLES TWINING, Halifax, Canada. Filed Sept. 30, 1897. Serial No. 653,464. (No model.) Patented in England Sept. 30, 1896, No. 21,635.

Claim.—1. The combination, in a sailing apparatus, of a hull, an inclined spar, a pivotal connection between said spar and the hull, a sail at the outer end of said spar and transverse thereto, and means for fixing the sail and spar at desired angles with the hub.

2. The combination of a hull, an inclined spar 20, a pivot connecting the hull and spar, a sail at the outer end of the spar, and means distinct from said hull and spar for supporting said sail.

3. The combination of a hull, an inclined spar, a pivotal connection between the hull and spar, near the center of the hull, and a sail at the outer end of the spar and transverse thereto.

4. The combination of a hull, an inclined spar, a pivotal connection between the hull and spar, a sail at the outer end of the spar and transverse thereto, and means for spreading and furling said sail from said hull.

5. The combination of a hull, an inclined spar, a sail transverse to the spar, secured to the spar at its outer end, and ropes and pulleys for spreading and furling the sail from the hull.

6. The combination of a hull, an inclined spar, a sail, at the outer end of the spar, middle and side yards for the sail, ropes extending to the hull for pulling the side yards from the middle yard to spread the sail, and ropes also extending to the hull for pulling the side yards to the middle yard to furl the sail.

7. The combination of a hull, an inclined spar, a sail at the outer end of the spar, middle and side yards for the sail, ropes extending to the hull for pulling the side yards from the middle yard to spread the sail, and ropes also extending to the hull for pulling the side yards to the middle, and ropes from one side yard over suitable pulleys to the other side yard, whereby one side yard is caused to counterbalance the other side yard.

8. The combination of a hull, an inclined spar, a sail at the outer end of the spar, middle and side yards for the sail, the former being fixed and the latter movable from and toward it, ropes extending to the hull for spreading and furling the sail, and ropes passing over pulleys and between the side yards, whereby the moving of one side yard will move the other also but in opposite direction.

9. The combination of a hull, an inclined spar, a sail at the outer end of the spar, a pivotal connection between the sail and spar, and means operated at the hull for shifting the angle between the sail and spar.

10. The combination of a hull, an inclined spar having a pivotal connection with the hull, a sail adapted to be stretched in or nearly in a vertical plane, and connected to the outer end of the spar.

11. The combination of a hull, a sail, a spar connected at one end to said hull and at the other end pivotally connected at the center of the sail, whereby when the sail is spread in the wind the spar assumes a position in a vertical plane at right angles to the length of the sail, means for changing the angle between the sail and spar, and means for securing the spar and its hull in the new position, whereby the course of the apparatus is changed.

12. The combination of a hull, an inclined spar having a pivotal connection with the hull, a sail adapted to be stretched in or nearly in a vertical plane, a pivot at the outer end of the spar connecting the spar and sail, and means operated from the hull for shifting the angle between the sail and the spar and holding the sail and spar at the angle to which they are set.

13. The combination of a main hull, an inclined spar, a vertical or nearly vertical sail connected to the outer end of the spar, and hulls, distinct from the main hull, below and supporting said sail.

14. The combination of a single rectangular sail continually supported when spread in or nearly in a vertical plane, hulls below the sail, masts at the centers of said hulls supporting the sail, a main hull at a distance to one side of the plane of the sail, a spar one end of which is pivoted to the sail at its center and the other end of which is pivotally connected to the main hull, and means for turning any of the hulls to, and securing them at, any desired angle to the plane of the sail.

15. The combination of a rectangular sail having secured thereto horizontal yards along the middle, top, and bottom of the sail, and a plurality of hulls below the sail for supporting it.

16. The combination of a rectangular sail having secured thereto horizontal yards along the middle, top, and bottom of the sail, a plurality of hulls below the sail, a vertical mast from each hull below the sail, said masts being secured to the middle yard where they cross, and the side yards having eyes adapted to slide on the masts.

17. The combination of a main hull, a spar 20 secured thereto, a sail connected to the outer end of said spar, horizontal sail-yards secured along the top, bottom and middle of the sail, a hull below the sail on each side of its center, a mast on each hull below the sail, the middle yard being connected to the masts where they cross, and the side yards having eyes adapted to slide on the masts, and ropes and pulleys for moving the side yards at will and securing them.

18. The combination of a main hull, a spar 20, a sail at the outer end of the spar, horizontal yards along the edges and middle of the sail, hulls below the sail, masts rising from said hulls the middle yard being connected to the masts where they cross, the side yards having eyes adapted to slide on the masts, ropes extending from the side yards over pulleys to the main hull for pulling the side yards away from the middle yard, and similar ropes for returning said yards whereby the sail is spread and furled.

19. The combination of a main hull, a spar 20, a sail at the outer end of said spar, hulls 14 below the sail, masts 4, I-irons secured in bearings across the decks at right angles to their length, the vertical arms of said irons entering suitable eyes on the masts 4.

20. The combination of a main hull, a I-iron secured in bearings across the deck at or near the middle thereof, a spar 20 pivoted on the vertical member of said I-iron, a sail at the outer end of the spar, and hulls below the sail for supporting it.

21. The combination of a hull, a spar 20, a sail at the outer end of the spar, hulls below the sail, I-irons secured in bearings across the decks of the hulls below the sail, masts supported by said I-irons and supporting the sail, and on which the sail can be spread.

22. The combination, of a sail, a plurality of hulls below and supporting said sail, a mast rising from the centers of each of said hulls on which said sail can be spread, said sail always extending across both said hulls at their centers, said hulls below the sail being movable to vary the horizontal angle which they make with the plane of the sail, stays holding said masts parallel, and stays holding said hulls parallel.

23. The combination of a rectangular sail, horizontal side and middle sail-yards to which the sail is connected, a plurality of hulls below the sail, masts rising from said hulls and supporting the sail and yards, stays between said masts, and stays between said masts and the middle yard holding the masts parallel, said sail always extending over all said hulls.

24. The combination of a main hull, a spar 20, a pivot therefor on the main hull, a sail at the outer end of the spar, horizontal sail-yards, an end yard over the deck of the main hull parallel with the sail and sail-yards and secured to the pivot, hulls below the sail, masts rising therefrom, and stays between the sail-yards or the masts and the end yard holding the sail and end yard parallel.

25. The combination of a main hull, a spar 20, a pivot on said hull for said spar, a sail at the outer end of the spar, sail-yards, hulls below the sail, vertical masts rising therefrom and supporting the sail, an end yard above the deck of the main hull, stays holding the sail and yard continually parallel, ropes extending from a point of leverage on the main hull to pulleys at the end of the end yard for moving the hull to any angle with the end yard and there securing it.

26. The combination of a hull, a spar 20, a pivot on the hull for said spar, a sail at the outer end of the spar, an end yard above the deck of the hull, one or more bars projecting sidewise from the deck and firmly fixed thereto so as to stand horizontal pull, and ropes from said bar through pulleys at the ends of the end yard for shifting the hull to a different angle with the end yard.

27. The combination of a hull, a mast, a sail, a vertical pivot at the bottom of the mast and near the middle of the hull, a sidewise-extending bar fixed to said hull and forming a point of attachment for turning the hull horizontally on said pivot.

28. The combination of a hull, a mast, a sail, a vertical pivot near the middle of the hull and at the bottom of the mast, a sidewise-extending bar fixed to said hull and forming a point of attachment for turning the hull horizontally on said pivot, said bar being adjustable horizontally to different angles with the hull.

29. The combination of a hull, a vertical pivot near the middle thereof, a sidewise-extending bar fixed to said hull and forming a point of attachment for turning the hull horizontally on said pivot, a rope attached to said bar for partially turning the hull, and a rope attached to an end of said hull also for further turning it.

30. The combination of a hull having a central pivot, notched boards or bodies arranged beside the pivot, a bar for turning the hull on said pivot one end of which has a bearing against the pivot the other end of which projects beyond the hull the bar being adapted to enter one or another of the notches thereby securing the bar to the hull at a desired angle.

31. The combination of a hull having a deck, hinged notched boards near the edges of the deck, and a bar 43 held in either of said notches.

32. The combination of a hull closed air-tight, a vertical pivot rising at the middle of the hull, a spar 20 secured to the pivot and a sail secured to the spar at its outer end.

33. The combination of a hull, a vertical pivot rising from the hull, a spar 20 secured to the pivot, a sail secured to the spar at its outer end, hulls closed air-tight below the sail, and masts rising from the hulls below the sail and supporting the sail.

34. The combination of a main hull closed air-tight, a spar 20, a sail at the outer end of the spar, and hulls closed air-tight below the sail and supporting it.

35. The combination with a sail, of a plurality of hulls closed air-tight below the sail and supporting it said sail always extending over all said hulls.

36. The combination with a sail, of a plurality of hulls closed air-tight below the sail and supporting it, said sail always extending over all said hulls, and means for holding the hulls at any desired horizontal angle with the sail.

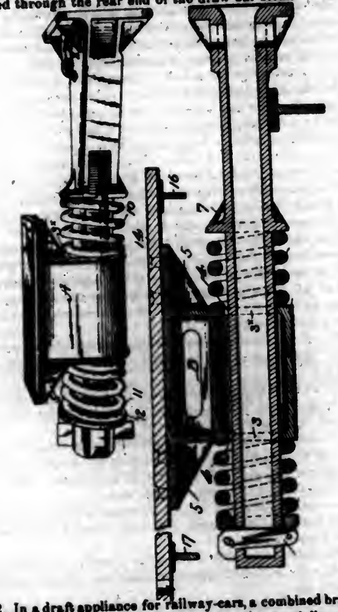
37. The combination of a hull rectangular in cross-section, the sides being vertical and inclining similarly from the center to each end, a spar pivotally connected to said hull, and a sail, as set forth.

38. The combination of a main hull closed air-tight, rectangular in cross-section, a vertical pivot rising at the middle of the deck of the hull, a spar 20, a vertical sail pivotally connected to the spar at its outer end, hulls below the sail closed air-tight and rectangular in cross-section, and masts rising from the hulls below the sail and supporting it.

39. The combination of a main hull, a spar 20, a vertical pin fixed to the outer end of the spar, a sail having side yards and a middle yard, a vertical eye or socket fixed to the middle of the middle yard and receiving said vertical pin.

40. The combinations of hulls 14 and 19, spar 20 and masts 4, a sail adapted to be spread on masts 4, horizontal middle and side yards for the sail, an end yard 25 above hull 19, stays 29, 30, 31 between the ends of the end yard and the sail at or near where the sail-yards cross masts 4, and ropes from the sail where the middle yard crosses masts 4 to hull 19.

41. The combination of a hull, an inclined spar pivotally connected at one end to the hull, a sail at the other end of the spar, means for securing the hull at a desired angle with the sail, means for changing the angle between the spar and sail, and means for maintaining the same angle between the sail and hull.



42. The combination of a vertical or nearly vertical sail, hulls inclining similarly from the middle to each end below and supporting the sail, a main hull, and a spar 20 between the main hull and the sail.

43. The combination of a vertical or nearly vertical sail, hulls inclining similarly from the middle to each end below and supporting the sail, a main hull also inclining similarly from the middle to each end and a spar 20 from the main hull to the sail.

606,105. DRAW-BAR FOR RAILWAY-CARS. WILLIAM T. VAN DORN, Chicago, Ill. Filed Jan. 14, 1898. Serial No. 666,705. (No model.)

Claim.—1. In a draft appliance for railway-cars, a combined bracket and buffer-sleeve integral with each other, a suitable supporting-bar secured to the bracket and pivotally connected to the car at one end to move on a horizontal plane, a draw-bar having its stem projected through the buffer-sleeve, and formed with an annular collar, a buffer-spring on the draw-bar between the collar and the front end of the buffer-sleeve, a relief-spring on the stem between the rear

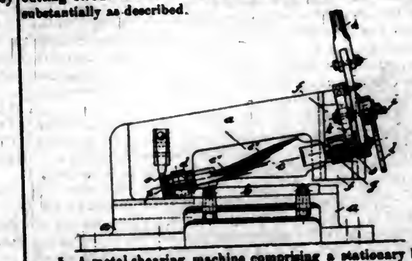
face of the buffer-sleeve and the end of the draw-bar stem, and a key projected through the rear end of the draw-bar stem.

2. In a draft appliance for railway-cars, a combined bracket and buffer-sleeve, the buffer-sleeve part being substantially cylindrical and formed with internal annular flanges having angular openings, a suitable pivotally-secured support to which the bracket is secured and movable therewith, a hollow draw-bar projected through the buffer-sleeve and having a limited vertical play in the openings therein, and formed with an annular collar, a spring on the draw-bar between the buffer-collar and the front interior flange of the buffer-sleeve, a spring on the rear portion of the draw-bar stem between the rear internal flange of the buffer-sleeve and the end of the stem, and a key through the rear end of the draw-bar.

3. In combination with a cylindrical buffer-sleeve secured and supported to move on a pivotal support on a horizontal plane, of a draw-bar projected through the buffer-sleeve and formed with an annular buffing-collar, a buffer-spring on the stem of the draw-bar between said annular collar and the buffer-sleeve, a spring on the stem of the draw-bar between the rear of the buffer-sleeve and the rear end of the draw-bar, and a retaining means at the end of the draw-bar stem.

4. In a draft appliance for railway-cars, the combination of a supporting-bracket and a buffer-sleeve pivotally connected together, a draw-bar slidingly projected through the buffer-sleeve, springs on the draw-bar at opposite ends of the said sleeve, and a key to hold the springs and draw-bar in relative position.

5. In a draft appliance for railway-cars, the combination of a suitably-supported buffer-sleeve turning on a vertical axis, a draw-bar projected through the sleeve and having a limited vertical play therein, springs on the draw-bar on opposite ends of the buffer-sleeve with their ends bearing against the ends thereof, and means on the draw-bar stem to hold the other ends of the springs in operative position.



606,106. METAL-SHEARING MACHINE. BRUNO WERNEBURG, Göttingen, Germany. Filed Oct. 7, 1897. Serial No. 654,443. (No model.) Patented in Germany May 19, 1897, No. 96,141; in France Sept. 27, 1897, No. 270,785; in England Sept. 28, 1897, No. 23,163, and in Austria Oct. 22, 1897, No. 47/4,214.

Claim.—1. A metal-shearing machine comprising a stationary blade and a swiveled rotary blade substantially as described.

2. A metal-shearing machine comprising a stationary blade and a swiveled rotary spiral blade substantially as described.

3. A metal-shearing machine comprising a stationary blade, a spiral blade, and a swiveled rotary shaft for the spiral blade substantially as described.

4. A metal-shearing machine comprising a stationary blade, a spiral blade, a swiveled rotary shaft for the spiral blade, and means substantially as described for causing the shaft to rotate during the cutting stroke and to remain stationary during the return stroke substantially as described.

5. A metal-shearing machine comprising a stationary blade, a spiral blade, a rotary shaft for the spiral blade, a ratchet and pawl carrying lever for rotating the shaft in one direction and a ratchet and pawl for holding the shaft against rotation in the opposite direction substantially as described.

6. A metal-shearing machine comprising a stationary blade, a spiral blade, a rotary shaft for the spiral blade, an actuating-lever for rotating the spiral blade, and an eccentric for moving the spiral blade toward and from the other blade substantially as described.

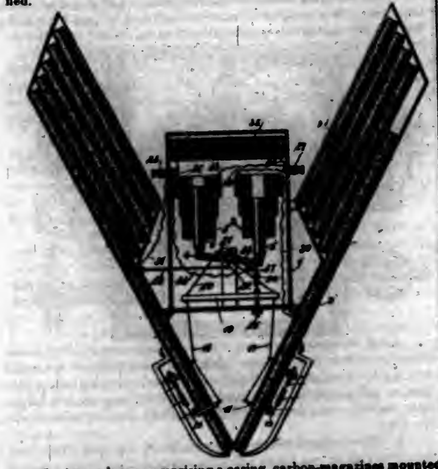
7. A metal-shearing machine comprising a stationary blade, a spiral blade, a rotary shaft for the spiral blade, and an actuating-lever for the spiral blade, said lever having an eccentric guide-arm substantially as described.

8. A metal-shearing machine comprising a stationary blade for supporting the material operated on in the plane of the cut, a swiveled rotary blade, and actuating means substantially as described for the rotary blade.

606,107. BELT-BUCKLE. EMMA B. WINTER, New York, N. Y. Filed Sept. 8, 1897. Serial No. 650,899. (No model.)

Claim.—1. A belt-buckle provided with a buckle-frame, a hook on the back of the frame, a toothed bar on the back of the said frame and spaced therefrom, and a plate extending from the said bar and spaced from the frame for the passage of the belt between the frame and the plate, and for doubling up the end of the belt over the outer edge of the plate, to finally engage the return end of the belt with the teeth of the said bar, substantially as shown and described.

2. A belt-buckle provided with a buckle-frame, two bars on the back of the said frame and spaced therefrom, one of the bars carrying a hook for engagement with a loop or slot plate, and the other being provided with teeth for engagement with the belt material, and a relief-plate extending from the toothed bar between the hook-bar and the back of the frame, to permit of passing the belt between the back of the frame and the said plate, then doubling the belt over the outer edge of the plate, to return the end of the belt between the relief-plate and the hook-bar, and then engage the belt with the teeth and the toothed bar, substantially as shown and described.

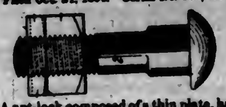


606,108. ELECTRIC-ARC LAMP. FREDERIC WRIGHT, Newburg, N. Y. Filed Oct. 7, 1897. Serial No. 654,574. (No model.)

Claim.—1. An arc-lamp, comprising a casing, carbon-magazines mounted on said casing, carbon-holder tubes extended from the magazines and converging, carbon-locking plates on the tubes, and means for automatically operating said plates, substantially as specified.

2. An arc-lamp, comprising two magazines for containing carbons, tubes extended from the lower ends of said magazines and converging, carbon-locking devices on said tubes, means for automatically operating said locking devices, and stop-fingers on the tubes, substantially as specified.

3. An arc-lamp, comprising a casing, a magazine rigidly attached to one side thereof, a magazine pivotally connected to the other side thereof, carbon-holding tubes extended from said magazines, a rocking lever, a connection between said rocking lever and the pivoted magazine, and electric means for rocking said lever, substantially as specified.

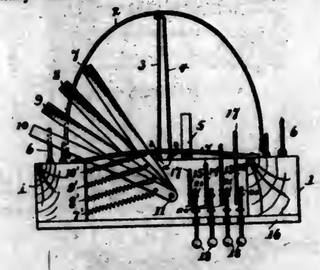


4. An arc-lamp, comprising a casing, a magazine rigidly attached to one side thereof, the said magazine having converging tubes, a rocking lever in the casing, a rod connecting said lever with the swinging magazine, a solenoid in the main circuit, and a core for said solenoid, having connection with the rocking lever, substantially as specified.

5. An arc-lamp, comprising a casing, carbon-magazines mounted on said casing, one of said magazines being mounted to swing relatively to the casing, locking-plates for the carbons, a rocking lever in the casing, connections between said lever and the locking-plates, a connection between said lever and the swinging magazine, a solenoid in the main circuit, having its core connected to one end of the rocking lever, and a solenoid in a shunt-circuit, having its core connected to the opposite end of said lever, substantially as specified.

6. An arc-lamp, comprising a casing, carbon-magazines mounted on said casing, carbon-holding tubes extending from the lower ends of said magazines, locking-plates pivoted to the lower ends of said tubes, adjustable springs for holding said plates in a locking position, a lever mounted to swing in the casing, flexible connections between said locking-plates and said lever at one side of its pivotal point, a solenoid in the main circuit, having its core connected to one end of said lever, a solenoid in a shunt-circuit, having its core connected to the opposite end of said lever, a rod extended from a metallic part carried by said lever to a connection with one of the magazines, the said rod forming a conductor, a contact point or arm operated by said lever, to engage with a fixed contact, a wire leading from said fixed contact through a resistance to the leading-in wire, and a wire leading from a magazine to the leading-out wire, substantially as specified.

606,109. NUT-LOCK. JACOB WURTHNER, Pittsburg, Pa., assignor of three-fourths to Dan Stahlo, Julius Schirra, and Mathias Schaedle, same place. Filed Oct. 21, 1896. Serial No. 609,622. (No model.)



Claim.—1. A nut-lock composed of a thin plate, having a threaded center, and downwardly-turned ends, with the diagonally opposite lower edges of such ends rounded upwardly and adapted to bear upon the face of the nut, substantially as set forth.

2. In combination with a bolt and a nut thereon: a nut-lock having a threaded hole in the center, composed of a thin metallic plate of the same width as the nut and having downwardly-turned ends flush with the sides of the nut, curved on their lower edges, adapted to bear on the face of the nut and to spring the plate upon the threads, substantially as set forth.

606,110. MUSIC-LEAF TURNER. LEONARD WITHERSPOON, Letterburg, Md., assignor of one-half to Daniel C. Gilbert, Washington County, Md. Filed May 17, 1897. Serial No. 636,987. (No model.)

Claim.—The improved music-leaf turner comprising the base 1, the arched spring-brace 2 fixed to said base, the vertical parallel spring-clips 3 and 4, encompassing the arch of said brace 2 and fixed at their lower ends a a to said base by means of the staples b b, the lyre-shaped spring-clips 6 6 fixed to the outer ends of said base, parallel with each other and at right angles to said arched brace, in combination with the pivot-bolt 11, horizontally fixed in the vertical front face of said base centrally beneath said arched brace, the series of plane sheet-metal fingers 7, 8, 9, fulcrumed at their lower ends on said pivot-bolt, the springs 7', 8' and 9' operatively connected to said fingers, and the independent finger-levers 12, 13, 14, each one of which is formed with an eye 20 to receive the staple 21, by means of which it is fulcrumed to said base at a right angle to the path of said fingers 7, 8, 9 and with an angular detent or toe 17 which projects into the path of said fingers and having its outer end provided with a button 18 and the leaf-spring 5, the whole constructed and arranged, substantially as shown and described.

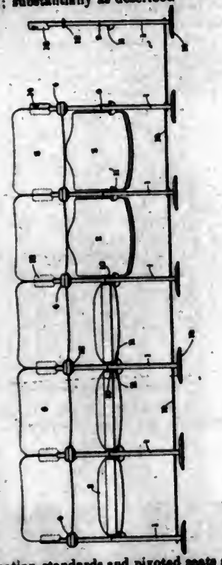
606,111. MUCILAGE-HOLDER. ARTHUR H. ALLEN, Chanute, Kans. Filed Mar. 2, 1898. Serial No. 672,257. (No model.)

Claim.—1. A cover portion for mucilage-holders, having a tapering opening merging into a narrow slot and under surfaces on each side of said slot inclined downwardly and oppositely to each other as they extend away from the latter, substantially as and for the purpose described.

2. A cover portion for mucilage-holders, having a tapering opening merging into a narrow slot, upper surfaces on opposite sides of the said slot sloping downwardly toward the same, and under surfaces sloping oppositely to each other and downwardly away from the slot.

3. A cover portion for mucilage-holders, of double flaring form having a tapering opening merging into a narrow slot with comparatively sharp edges, the upper surfaces around said opening and slot sloping downwardly toward the same and the under surfaces sloping downwardly away from the opening and slot on all sides thereof, substantially as described.

4. A cover portion for mucilage-holders, comprising a cylindrical internally-shouldered upper portion, a horizontal flange thereabout, a lower extension, and a web within the same having a tapering opening merging into a narrow slot and upper surfaces sloping down to said slot and under surfaces sloping oppositely to said upper surfaces.



606,112. CHAIR. JAMES G. ARMOUR and CHARLES SOUTHORN, Liverpool, England. Filed Oct. 12, 1897. Serial No. 654,918. (No model.)

Claim.—1. In combination, a row of standards, each of which with the exception of those at the extreme ends of the row serves for two seats; seats provided with pivots and supported by the said standards; open-mouthed sockets on the standards to receive the seat-pivots; and brackets on the standards against which the seats abut when turned down or turned up; substantially as described.

2. In combination, a pair of standards, seats provided with pivots and supported by the said standards, open-mouthed sockets on the standards to receive the seat-pivots, and brackets on the standards against which the seats abut when turned down or turned up; substantially as described.

3. In combination the standards and seat, arm-brackets on the standards and arms with means for fixing the same to the brackets by sliding the arms forwardly into position and means for preventing the retraction of the arms on the brackets, substantially as described.

4. In combination, standards and pivoted seats supported thereby, arm-brackets on the standards with holes of keyhole form, and arms provided with studs 15 to engage said holes and affix the arms to the arm-brackets; substantially as described

5. In combination, standards and pivoted seats supported thereby, palms on the said standards for the attachment of the backs, and backs adapted to be affixed to the said palms and means to tie the backs to the palms by being slid downward into position; substantially as described.

6. In combination, standards and pivoted seats supported thereby, palms on the standards provided with holes of keyhole form, and backs provided with studs such as 15 to engage said holes and affix the backs and tie the standards together; substantially as described.

7. In combination, standards and pivoted seats supported thereby, detachable backs adapted to be slid into position and to tie the standards together at the top, and tie-bars 19 to tie the standards together at the bottom; substantially as described.

8. In combination, standards and pivoted seats supported thereby, arms affixed to arm-brackets on the standards by being slid forward thereon, and backs affixed to the standards by being slid downward thereon and abutting against the rear ends of the arms so as to prevent displacement of the latter; substantially as described.

9. In combination, standards, seats provided with pivots and supported by the standards, open-mouthed sockets on the standards to receive the seat-pivots, brackets on the standards for the seats to abut against, arms affixed to the standards by being slid forward into position, and backs affixed to the standards by being slid downward into position and adapted to tie the standards together and prevent displacement of the arms; substantially as described.

10. A standard for seats of the kind herein set forth, comprising open-mouthed sockets to receive the seat-pivots, brackets for the seats to abut against, arms and arm-brackets and backs and back-palms and means for attaching the arms and backs thereto by sliding motion; substantially as described.

11. A seat 2 provided with a pair of coaxial pivots 10 combined with open-mouthed notches 9 in the standards 1; substantially as described.

12. In combination with the standards and seats, the arm-brackets and the arms having a pair of studs adapted to fit openings in the arm-brackets to be held by engagement therewith, substantially as described.

606,113. AUTOMATIC STEAM-BEER GOVERNOR AND PRESSURE-REGULATOR. SAMUEL H. ATCHISON, San Francisco, Cal. Filed May 4, 1896. Serial No. 590,296. (No model.)

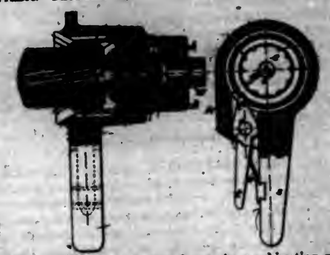
Claim.—1. An automatic regulator through which the fluid must pass, a fount to receive the liquid under pressure, and a float carrying a valve placed in the fount, combined with an outlet-pipe, a perforated inclosing case for the float, and a faucet for drawing off the fluid, substantially as described.

2. In an apparatus of the character described, the combination of a fount receiving steam-beer under pressure and provided with a vent-hole, valves adapted to control both sides of said hole, and a float actuating said valves, substantially as set forth.

3. An automatic regulator, a fount for receiving the fluid, under pressure, a float carrying two valves, and an outlet-pipe controlled by the two valves, combined with a perforated inclosing case for the float, a bell above the pipe, a valve for controlling the flow of gas from the bell, and a faucet for drawing off the fluid, substantially as specified.

4. The combination of a fount capable of receiving steam-beer, provided with an automatic valve for releasing part of the gas from the fount when the beer therein is below a certain level, means controlled by the beer for preventing the operation of the valve to release the gas after the beer has reached a certain level, a high-pressure faucet, and a regulator connected with the source of supply allowing the beer to flow into the fount while the faucet is opened, substantially as described.

606,114. SHOE-LAST. GEORGE H. RAMEY, Springvale, Me. Filed June 1, 1896. Serial No. 593,797. (No model.)



Claim.—1. A shoe-last having a recess therein, and wire loops or staples tightly packed in said recess, with the looped or bent ends thereof adjacent to the outer edge of the recess, as and for the purpose set forth.

2. A shoe-last having a recess therein, a cup fitting said recess, and wire loops or staples packed tightly in said cup, with the looped or bent ends thereof lying adjacent to the outer edge of the cup, as and for the purpose set forth.

3. A shoe-last having a series of recesses therein, cups fitting said recesses, wire loops or staples packed tightly therein and lying with the looped or bent ends thereof adjacent to the outer edge of the cups, and a protecting-plate secured to the bottom of said last having openings therein registering with said recesses, but of smaller diameter than said cups, as and for the purpose set forth.

606,115. GAS-OPERATED GUN. LAURENCE V. BENÉT, Paris, France. Filed Jan. 11, 1898. Serial No. 666,864. (No model.)

Claim.—1. In a gas-operated gun, the combination, with the barrel, of a muzzle-plug having an axial channel of smaller caliber than the bore of the gun, substantially as described and shown, and for the purpose set forth, whereby the pressure of the powder-gases may be utilized to operate the gun.

2. In a gas-operated gun, the combination, with the barrel, of a muzzle-plug having an axial channel of smaller caliber than the bore of the gun, and held in elastic contact with the muzzle, substantially as described and shown and for the purpose set forth.

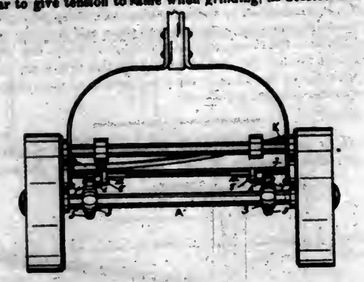
3. In a gas-operated gun, the combination, with the barrel, of a muzzle-plug, substantially as described, means for holding it in elastic contact with the muzzle of the barrel, and means for allowing any surplus gas to escape in the open air, substantially as described and shown.

4. In a gas-operated gun, the combination, with the barrel, of a muzzle-plug, substantially as described, a casing for the muzzle-plug, means for holding the latter in the casing, means for holding the muzzle-plug in elastic contact with the muzzle of the barrel, and means for allowing any surplus gas to escape in the open air, substantially as described and shown.

5. In a gas-operated gun, the combination, with the barrel, of a muzzle-plug, substantially as described, a casing for the muzzle-plug, means for holding the latter in the casing, means for holding the casing to the muzzle, means for holding the muzzle-plug in elastic contact with the muzzle of the barrel, substantially as described and shown, and for the purpose set forth.

6. In a gas-operated gun, the combination, with the barrel, of a muzzle-plug, substantially as described, a casing for the muzzle-plug, means for holding the latter in the casing, means for holding the casing to the muzzle, means for holding the muzzle-plug in elastic contact with the muzzle of the gun, and means for preventing unlocking during firing, substantially as described and shown, and for the purpose set forth.

606,116. BINDING FOR BLANK BOOKS. WILLIAM B. BOGERT, New York, N. Y. Filed Jan. 8, 1898. Serial No. 666,098. (No model.)



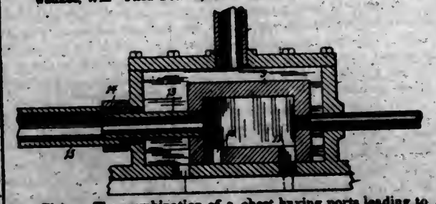
Claim.—1. A removable binding for books, comprising boards forming the sides of the cover, one of said boards being of the full width of the book and the other being narrower, flexible connections between said boards, and means for securing an intermediate portion of said flexible connection to one side of the book-body, near its back whereby either board may be folded about the back and lie smoothly against the other, substantially as described.

2. A removable binding for books, comprising boards included in the side covers, one of said boards being of the full width of its side and the other being narrower, a series of narrow sections having a flexible or hinged connection to each other and to said boards, the one of said narrow sections next the wider of said boards forming the back of the cover, and means for securing the section next said first-named section to one side of the book-body, near its back whereby either cover may be folded over the back and against the other cover and lie flat against the same, all of said strips being of a width substantially equal to the thickness of the book, substantially as described.

3. A removable binding for books, comprising two boards included in the side covers, one of said boards being of the full width of its side and the other being narrower, a series of four narrow sections having a flexible or hinged connection to each other and to said boards, the one of said narrow sections next the wider of said boards forming the back of the cover, and the next having holes therein adapted to receive staples or similar fasteners which pass through the back edge of the book-body, whereby either cover may be folded over the back and against the other cover and lie flat against the same, said strips being of a width substantially equal to the thickness of the book, substantially as described.

606,117. LAWN-MOWER GRINDER. WILLIAM W. ROGERSON, Hamilton, Canada. Filed July 19, 1897. Serial No. 645,073. (No model.)

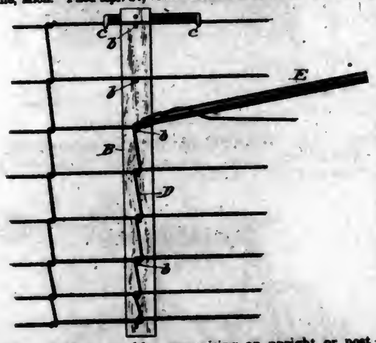
Claim.—A lawn-mower-knife grinder of the character described consisting of a horizontal emery-bar having rear lugs, clips capable of adjustment and fastening to the binding-bar, or axle of a lawn-mower and pivoted to the said rear lugs of the emery-bar and springs on said pivotal connections to engage with the rear part of said emery-bar to give tension to same when grinding, as described.



606,118. COMBINED BICYCLE LOCK AND HOLDER. DAVID BOWMAN, Berlin, Canada. Filed Aug. 4, 1896. Renewed Feb. 26, 1898. Serial No. 672,121. (No model.)

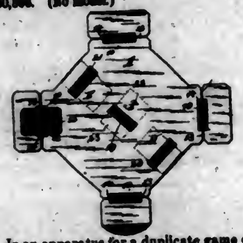
Claim.—1. In a combined bicycle lock and support, the combination with a backing, of a pivot-pin connected thereto, a piece of spring metal which is coiled around the pivot-pin and formed with free spring portions terminating in curved clamping members and normally open, and a keeper encircling the arms and adapted for manipulation to close them.

2. In a combined bicycle lock and support, the combination with pivoted arms having outwardly-bent portions and provided with curved fingers adapted to grasp a portion of the bicycle-frame, of a keeper slidable on the arms and a locking device for holding said keeper on the outwardly-extending portions of the arms, whereby the arms are prevented from spreading.



606,119. BALANCED SLIDE VALVE. JAMES CAMPBELL, Milwaukee, Wis. Filed Dec. 10, 1897. Serial No. 661,378. (No model.)

Claim.—The combination of a chest having ports leading to a cylinder, and also provided with an exhaust-passage, a pipe fitted to one end of the chest, a hollow valve located within the chest and provided with ports, one of said ports adapted, when the valve is reciprocated in one direction, to be brought into register with one of the ports of the valve-chest leading to the cylinder, the other port of the valve being closed by the bottom of the chest, and at the same time the other port of the chest leading to the cylinder being opened to the chest, and, when the valve is reciprocated in the opposite direction, said other port of the valve adapted to be brought into register with the other port of the chest leading to the cylinder, and the other port of the valve being closed by the bottom of the chest, and at the same time the other port of the chest leading to the cylinder being opened to said chest, the uncovered port of the chest in communication with the cylinder, in each instance, adapted for the passage therethrough of the exhaust-actuating agent from the cylinder, which exhaust-actuating agent is free to fill the chest and pass out



of the final exhaust-pipe, a pipe leading from one end of the valve, and extending freely through the end of the chest, and telescoping freely into the pipe connected to the end of said chest, through which latter pipe the inlet-actuating agent is free to enter and pass into the pipe extending from the valve, and thence through said pipe into the valve for passage through the port of the valve which is brought into register with one of the ports of the chest leading to the cylinder, and means for reciprocating the valve.

606,120. WIRE-FENCE MACHINE. ROBERT CARTER, Jonesville, Mich. Filed Apr. 27, 1896. Serial No. 589,236. (No model.)

Claim.—A fence-machine comprising an upright or post provided with lateral projections designed to engage the horizontal wires of a fence, a cross-piece located at the upper end of the upright or post and having downward projections on its ends, and a tube adapted to receive a wire for connecting to horizontal wires, substantially as described.

606,121. APPARATUS FOR PLAYING DUPLICATE GAMES OF CARDS. SIDNEY L. CASTNER, Brownsville, Tenn. Filed July 29, 1896. Serial No. 600,896. (No model.)

Claim.—1. In an apparatus for a duplicate game of cards, a tray having holders for the reception of the cards, an extension from the body of the tray, and a guide-board provided with index projections, arranged to receive between them the said projection from the tray, for the purpose of determining throughout the game a certain preferred position of the tray, as and for the purpose specified.

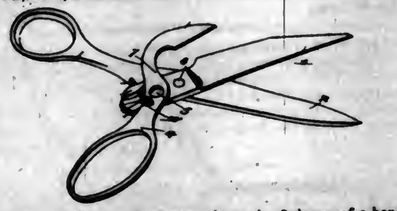
2. In an apparatus for a duplicate game of cards, a tray having holders for the reception of the cards and an extension from the body of the tray, and a guide-board provided with index projections to receive between them the said extension from the tray, for the purpose of determining throughout the game a certain preferred position of the tray, the said projection from the tray having indicators applied thereto, whereby it may be readily determined whether the reverse or the obverse side of the tray is uppermost, as and for the purpose specified.

3. A game apparatus having a guide-board provided with two index projections, and a tray capable of carrying cards and provided with a projection capable of extending between the index projections, substantially as described.

4. A game apparatus having a guide-board, and a tray, the tray being capable of being held on the guide-board in a series of certain positions, substantially as described.

5. A game apparatus, the game apparatus having a guide-board provided with two index projections, and a tray having a plurality of projections each capable of extending between the index projections on the guide-board, substantially as described.

6. The combination of a board, and a guide carried thereby, with a plurality of whist-trays, each adapted to rest upon said guide and to engage with said board in one position of the tray relative thereto.



606,122. NECKTIE-FASTENER. WILLIAM H. CATLIN, Glen Ellyn, Ill. Filed Mar. 22, 1897. Serial No. 628,568. (No model.)

Claim.—1. A necktie having a band, a supplemental piece of fabric adapted to be detachably attached thereto on the inside thereof, means whereby said supplemental piece of fabric may be adjusted lengthwise of said band, said supplemental piece provided with a buttonhole arranged to extend in the direction of length of the neck-band, into which the head of the collar-button may be received, whereby the necktie may fit any size of collar and may be held against lateral and vertical displacement and the head of the collar-button be concealed without injury to the neckband of the tie, as and for the purpose set forth.

2. A necktie having a band, a series of loops formed transversely across the inside thereof, and a supplemental piece having a buttonhole worked therein and having the ends thereof adapted to engage said loops, as and for the purpose set forth.

606,123. COMBINATION SHEARS AND BUTTONHOLE-CUTTER. CLARENCE COATES, Cliftondale, Mass. Filed July 19, 1897. Serial No. 645,053. (No model.)

Claim.—1. The combination with a pair of shears, of a handle formed separately from one of the shear-blades and pivotally connected thereto, a buttonhole-cutter carried by said handle, and means for retaining said handle in fixed relation to its respective blade, substantially as described.

2. The combination with a pair of shears having means for locking the blades against relative movement, of an auxiliary buttonhole-cutter connected to one of the shear-handles and adapted to cooperate with one of the shear-blades, and means for holding the buttonhole-cutter fixed relatively to the blade with which it cooperates, substantially as described.

606,124. BICYCLE-SADDLE. WARREN H. CRAIG, Lawrence, Mass. Filed Oct. 25, 1897. Serial No. 656,255. (No model.)

Claim.—1. In a bicycle-saddle, the combination with the seat portion, of a support for said seat portion comprising an integral spring extending transversely across the saddle at the rear and having the ends of the transverse portion curved in a substantially horizontal plane toward the middle of the saddle and crossing said transverse portion to afford supporting-loops and then forward, the seat portion being mainly supported on said transverse portion and secured at its forward end to the ends of said spring, substantially as described.

2. In a bicycle-saddle, the combination with the cushioned seat portion, of a support for said seat portion comprising an integral spring extending transversely across the saddle at the rear and having the ends of the transverse portion curved in a horizontal plane toward the middle of the saddle and crossing said transverse portion to afford horizontal supporting-loops and thence downward and forward substantially parallel with the longitudinal median line of the saddle and upward, the ends of said spring being secured to the said seat portion at the front end thereof, the said seat portion being

mainly supported upon the supporting-loops aforesaid, substantially as described.

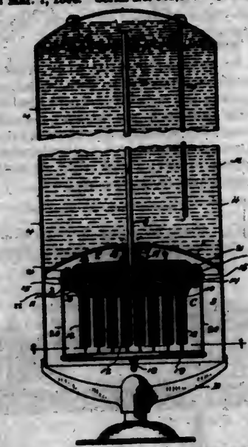
3. In a bicycle-saddle, the combination with a seat portion comprising two separate cushion-holders each having a cushion, a spring-support having two horizontal supporting-loops substantially conforming in shape to the said cushion-holders, and of sufficient size to afford an adequate support therefor, the ends of the spring extending, after said loops are formed, substantially parallel with the longitudinal median line of the saddle; and a clamping-piece to receive and connect the said ends, the said clamping-piece being also adapted to receive and secure the forward ends of said cushion-holders and connect them together and to the said support, substantially as described.

4. In a bicycle-saddle, the combination with a seat portion comprising two separate cushion-holders each provided with a cushion, of a fastening device at the forward end of each cushion-holder, a single clamp cooperating with said fastening devices to thereby connect the said cushion-holders together, an integral spring-support for said cushion-holders having a transverse portion at the end of the saddle and being curved around and across said transverse portion to afford a horizontal supporting-loop for each cushion-holder, the ends of said spring-support extending longitudinally toward the front of the saddle after the loops are formed, and means for securing the said ends to the said clamp, substantially as described.

5. In a bicycle-saddle, the combination with the seat portion comprising two separate cushioned portions, of a spring having horizontal supporting-loops of sufficient size to afford an adequate support for said cushioned portions, said spring extending transversely across the saddle and curved to form said loops, the ends of said spring extending, after said loops are formed, in a direction substantially parallel with the longitudinal median line of the saddle, a clamping-piece to receive and connect the said ends and to receive and secure the forward ends of said cushioned portions and connect them to said support, and clamping devices for securing the said portions to the transverse portion of the spring, the said clamping devices comprising bolts extending through the cushioned seat portions at the bottom thereof, clamping members having engaging projections to engage the transverse portion of the support, and nuts cooperating with said bolts and clamping members to secure the said transverse portion between the under side of the cushioned seat portions and the said clamping members, substantially as described.

6. In a bicycle-saddle, the combination with a seat portion comprising two separate cushion-holders each provided with a cushion, of a fastening device at the forward end of each cushion-holder, a single clamp cooperating with said fastening devices, said fastening devices and said clamp being arranged to afford a pivotal connection for said cushion-holders, an integral spring-support for said cushion-holders having a transverse portion curved coaxially with the aforesaid pivotal connections, means for securing the ends of said spring-support to the clamp aforesaid, and clamping devices for adjustably securing the said cushion-holders to the curved transverse portion of the spring-support, substantially as described.

7. In a bicycle-saddle, the combination with a support, of a pair of cushion-holders mounted on said support one at each side of the longitudinal median line of the saddle, a cushion-casing on each cushion-holder, a pneumatic cushion-chamber in each casing having an open passage extending from the upper to the lower surface thereof, and a fastening device to connect each cushion-casing to its cushion-holder consisting of a pin extending through said casing, said open passage, and said cushion-holder; and retaining projections at each end of said pin to engage respectively with the outer surface of the cushion-casing and the outer surface of the cushion-holder, substantially as described.



8. In a bicycle-saddle, the combination with a suitable support, of a pair of cushion-holders mounted on said support, each cushion-holder being dished or apert along its edges to receive a cushion-casing containing cushioning material, and a fastening device for securing said cushion-casing to said cushion-holder, consisting of a pin extending through said casing and having a head at the outer surface thereof, an opening for said pin through the cushion-holder, and a retaining projection or shoulder at the outside of said cushion-holder for said pin, the pins thus being adapted to form indentations one in the upper surface of each cushion, substantially as described.

606,125. THRESHING-MACHINE. THOMAS S. COLDSMITH, Abilene, Kans. Filed Sept. 12, 1897. Serial No. 651,480. (No model.)

Claim.—In a threshing-machine, the combination, with a threshing-cylinder and its driving-shaft journaled crosswise of the machine at one end of it, and driving-shafts arranged crosswise of the machine toward its other end; of a main driving-shaft provided with cranks for operating the shaker and arranged crosswise of the machine at its middle part and running at a slower speed than the said cylinder-shaft, belt-pulleys and belts extending in opposite directions and operatively connecting all the said shafts, a motor-shaft, and a universal coupling connecting the said motor-shaft to one end of the said main driving-shaft, substantially as set forth.

606,126. GAS WATER-HEATER. MICHAEL G. CUNNINGHAM, Bridgeport, Conn., assignor of one-half to Charles D. Woodruff, same place. Filed Mar. 7, 1898. Serial No. 673,628. (No model.)

Claim.—1. A water-heater comprising an upper chamber, a lower chamber, depending tubes closed at their lower ends and opening into the lower chamber, open-ended tubes opening into the upper chamber and passing downward through the lower chamber and nearly to the bottom of the tubes having closed ends, a cold-water pipe communicating with the upper chamber and a hot-water pipe leading from the lower chamber, substantially as described and shown.

2. In a water-heater the combination with plates 13 and 14 having between them an intermediate plate whereby upper and lower water-chambers are formed, of a cold-water pipe leading into the upper chamber, depending tubes 12 closed at their lower ends and opening into the lower chamber, open-ended tubes 10 which open into the upper chamber and extend downward through the lower chamber and nearly to the bottom of tubes 12 and a hot-water pipe leading from the lower chamber and passing through the upper chamber and through the cold-water pipe, substantially as described and shown.

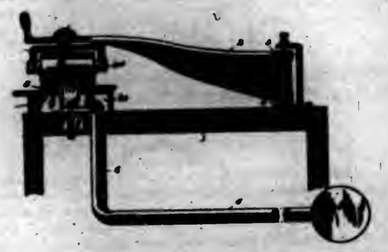
606,127. ELECTRODE FOR ARC-LIGHTS. CHARLES S. DOLLEY, Philadelphia, Pa., assignor of one-half to Howard T. Goodwin, same place. Filed Nov. 21, 1896. Serial No. 612,908. (No specimens.)

Claim.—1. An electric-arc electrode manufactured of calcium carbid (CaC_2) substantially as described.

2. An electric-arc electrode manufactured of calcium carbid (CaC_2), of size, shape and resistance proportional to the amount of current used, substantially as described and for the purpose specified.

3. An electric-arc electrode for use in connection with electric-arc lamps, the same consisting of calcium carbid, (Ca_2C_2) of size, shape and resistance proportionate to the amount of current used, substantially as described and for the purpose specified.

606,128. BICYCLE-SUPPORT. HARVEY H. DRAPER, Arkansas City, Kans. Filed Nov. 10, 1897. Serial No. 658,068. (No model.)



Claim.—1. A bicycle-support comprising a sleeve having lateral projections, a support detachably pivotally mounted thereon and having a central spring portion in proximity to its pivot and an extended portion forming a handle, and a spring on the sleeve for engaging the support to hold it in its inoperative position, substantially as specified.

2. A bicycle attachment comprising a sleeve with attaching means, projections extending laterally from the sleeve, a support of spring-wire having a central spring portion in proximity to its pivot and loops detachably and pivotally engaged with said projections, and a spring-plate attached to the sleeve at right angles to the projections and having a shoulder to engage the support when the latter is in its horizontal position, substantially as specified.

3. The combination with a sleeve having lateral projections on opposite sides thereof, and a spring-plate on its rear side and having an inclined portion and a shoulder, of a support formed of a single piece of resilient material formed near each end with a coil to engage detachably over said projections and one end extended to form a handle, the support being formed with a central spring portion having a bend to engage over the said shoulder of the spring on the sleeve, substantially as and for the purpose specified.

606,129. CIGAR-WRAPPER-CUTTING MACHINE. NAPOLEON DU BEUL, Cincinnati, Ohio. Filed Feb. 1, 1897. Serial No. 621,513. (No model.)

Claim.—1. The combination of a cutting-die, a closely-fitting wrapper-supporting block constructed with deep "kerf-like" channels extending through the surrounding wall of the block and providing downwardly and laterally extending air-passages having outlets below the cutting-die, an air-chest surrounding the cutting-die, and means for exhausting the air laterally from beneath the cutting-die and from the air-chest; substantially as described.

2. The combination of a cutting-die, a closely-fitting wrapper-supporting block constructed with deep intersecting "kerf-like" channels extending through the surrounding wall of the block and providing downwardly and laterally extending air-passages having outlets below the cutting-die, an air-chest surrounding the cutting-die, and means for exhausting the air laterally from beneath the cutting-die and from the air-chest; substantially as described.

3. The combination of a cutting-die, a closely-fitting wrapper-supporting block constructed with deep transverse "kerf-like" channels extending through the surrounding wall of the block and providing downwardly and laterally extending air-passages having outlets below the cutting-die, an air-chest surrounding the cutting-die, and means for exhausting the air laterally from beneath the cutting-die and from the air-chest; substantially as described.

4. The combination of a cutting-die, a closely-fitting wrapper-supporting block constructed with deep longitudinal "kerf-like" channels extending through the surrounding wall of the block and providing downwardly and laterally extending air-passages having outlets below the cutting-die, an air-chest surrounding the cutting-die, and means for exhausting the air laterally from beneath the cutting-die and from the air-chest; substantially as described.

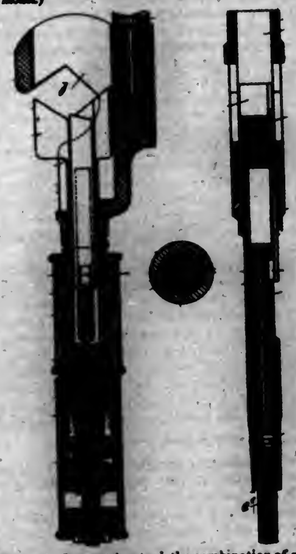
5. The combination of a cutting-die, a closely-fitting wrapper-supporting block constructed with deep longitudinal, and with still deeper transverse "kerf-like" channels extending through the surrounding wall of the block and providing downwardly and laterally extending air-passages having outlets below the cutting-die, an air-chest surrounding the cutting-die, and means for exhausting the air laterally from beneath the cutting-die and from the air-chest; substantially as described.

6. A cigar-wrapper-cutting machine comprising a cutting-die, an air-chest surrounding the cutting-die, a wrapper-supporting block within the cutting-die, and means for exhausting the air laterally from beneath the cutting-die and from the air-chest; substantially as described.

7. A cigar-wrapper-cutting machine comprising a cutting-die, an air-chest surrounding the cutting-die, a wrapper-supporting block with the cutting-die constructed with deep "kerf-like" channels extending through the surrounding wall of the block and providing downwardly and laterally extending air-passages, and means for exhausting the air through the wall of the block beneath the cutting-die and from the air-chest; substantially as described.

8. A cigar-wrapper-cutting machine comprising an air-chest, a cutting-die supported in pendent position within the air-chest and surrounded by the latter, a wrapper-supporting spring-block adapted to slide within the cutting-die, and means for exhausting the air laterally from beneath the cutting-die and from the air-chest; substantially as described.

9. A cigar-wrapper-cutting machine comprising an air-chest, a cutting-die supported in pendent position within the air-chest and surrounded by the latter, a wrapper supporting spring-block adapted to slide within the cutting-die, means for adjusting the spring-block exposed beneath the air-chest, and means for exhausting the air laterally from beneath the cutting-die and from the air-chest located at one side of the cutting-die; substantially as described.



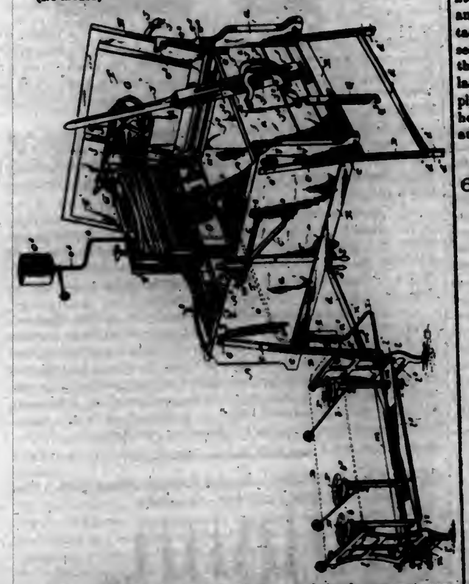
10. A cigar-wrapper-cutting machine comprising a suitable frame, a cutting-die, a swinging arm, a self-adjusting frame loosely suspended from the swinging arm, and a roller mounted in the frame; substantially as described.

11. A cigar-wrapper-cutting machine comprising a suitable frame, a cutting-die, a swinging arm, a self-adjusting frame having a rocking bearing by which it is suspended from the swinging arm, and a roller mounted in the frame; substantially as described.

12. A cigar-wrapper-cutting machine comprising a cutting-die, a swinging arm, and a roller suitably mounted on the said arm and having its sides tapered toward the center of oscillation of the said arm; substantially as described.

13. A cigar-wrapper-cutting machine comprising a cutting-die, a swinging arm, the frame having a rocking bearing on the said arm, and a tapered roller mounted in the frame and adapted to bear horizontally on the cutting-die; substantially as described.

606,180. CUTTING-TOOL FOR PIPES AND BARS. HENRY FORTANER, Munich, Germany. Filed Apr. 4, 1896. Serial No. 585,988. (No model.)



Claim.—1. In a cutting-tool, the combination of a stationary jaw having an opening therethrough and a movable jaw adapted to enter said opening, an exteriorly-threaded tubular stem to said stationary jaw and a tubular stem for the movable jaw arranged within the same, an interiorly-threaded sleeve to screw on said stationary-jaw stem and having the movable-jaw stem attached thereto, a bar within the movable-jaw stem, a screw-spindle rotatably coupled to said bar, a lower sleeve fixed to said screw-spindle and rotatable on said interiorly-threaded sleeve, a cutter and means for attaching the same to the carrier-bar substantially as described.

2. The combination of a stationary cheek *a* having orifice *j* therethrough and guide-cheeks a^2, a movable cheek *c* to move between said guide-cheeks and into said orifice, a tubular stem to said stationary cheek and a tubular stem guided therein to said movable cheek, a cutter and cutter carrier-bar within said movable-jaw stem, and means for adjustably attaching the two parts, an outer sleeve *d* to adjust the jaws against each other, and a lower sleeve *g* mounted on said outer sleeve and means in connection therewith for adjusting the position of the cutter and carrier-bar relatively to the movable jaw but independently of both jaws substantially as described.

3. In a cutting-tool having a stationary cheek and a movable cheek the combination of an opening in the stationary cheek and guide-cheeks on the same for the reception of the movable cheek, a tubular stem to the said stationary cheek and a hollow stem therein for the movable cheek, a cutter and a cutter carrier-bar mounted within the stem of the movable cheek and means in connection with said stems and bar to adjust the position of the jaws or cheeks, and means for adjusting the position of the cutter relative to the movable jaw and for adjusting the position of the cutter on its carrier-bar, and a socket in the upper part of the stationary jaw substantially as described.

606,181. WASHING-MACHINE. JOHN J. FRANCIS and LOUIS C. FRANCIS, Cincinnati, Ohio. Filed Sept. 10, 1896. Serial No. 562,107. (No model.)

Claim.—1. The combination of a receptacle having separate compartments, and a wringer-carrier arranged exteriorly to the receptacle and movable bodily in a horizontal direction thereon to a position opposite an end wall of either compartment of said receptacle, as and for the purposes described.

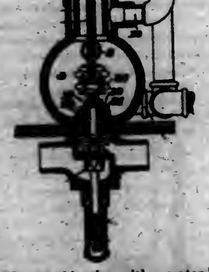
2. The combination with a receptacle divided by a partition into two compartments, of a wringer-carrying bar, and means substantially such as described for supporting said bar whereby the bar may be held over the partition or over an end wall of the receptacle, substantially as and for the purposes described.

3. The combination with a receptacle, of a pivoted wringer-carrying bar adapted to be turned vertically, and an adjustable support for said wringer-bar to hold the same over the partition or one end of the tub, substantially as and for the purposes described.

4. The combination with a divided receptacle, of a crane, a swiveled bracket carried thereby, and a wringer-bar attached to said bracket, substantially as and for the purposes described.

5. The combination with a divided receptacle, of a swinging crane pivoted to the receptacle, means for locking said crane in either of its adjusted positions, and a wringer-bar carried by the crane, substantially as described.

6. The combination with a divided receptacle, of a pivoted reversible crane, a bracket swiveled to the crane, and a wringer-bar carried by the bracket, substantially as and for the purposes described.



7. The combination with a divided receptacle, of a notched or recessed lid for said receptacle, a pivoted wringer-bar adapted to fit in the notch or recess of said lid and having fasteners for engaging with the receptacle to detachably connect said bar to said receptacle, and a movable support for the wringer-bar, substantially as described.

8. The combination with a receptacle having a transverse partition, of a reversible crane pivotally supported in the receptacle between one end thereof and the partition, a vertical bracket swiveled by a vertical bolt on the free end of the crane and supported thereon to turn in a horizontal plane, and a wringer-bar pivoted to the bracket by a horizontal bolt to adapt said bar to turn in a vertical plane, whereby the wringer-bar may be turned on its pivotal bolt to clear the receptacle and the bracket can be adjusted to fold with the wringer-bar alongside of the receptacle, substantially as and for the purposes described.

9. The combination of a receptacle, provided with a notched cleat f^9 near its upper end, a perforated false bottom fitted on the bottom of said receptacle and having a notch f^4, a vertical locking-bar having its lower end fitted in the notched false bottom and its upper end seated in the notched cleat, and a catch to drop over the upper end of the locking-bar and hold the same within the notched cleat, substantially as and for the purposes described.

10. The combination with a receptacle, of the pendent hanger *q* attached to said receptacle, a supply-pipe attached to the receptacle and having its lower end fitted in the hanger *q*, another hanger attached to the opposite end of the receptacle and provided with a seat at its lower end, a heater having a horizontal pipe which, when the heater is adjusted below the receptacle, fits in the seat of the last-mentioned hanger, and a swiveled coupling which unites the supply-pipe and the heater-pipe and furnishes a hinge on which the heater may be swung out bodily from the receptacle, substantially as and for the purposes described.

606,182. WATER-HEATER VALVE. HENRY F. GAHM, Pittsburg, Pa. Filed Nov. 3, 1897. Serial No. 657,353. (No model.)

Claim.—1. The combination with a water-heater having a supply-pipe leading thereto, of a burner arranged to heat the water in the heater, a valved supply-pipe leading thereto, a water-regulating valve in the supply-pipe leading to the heater, said valve being connected to and arranged to actuate the gas-valve, and a valved by-pass leading from between the regulating-valve and the heater to the water-supply pipe and arranged to allow liquid under pressure to flow back from the heater into the supply-pipe.

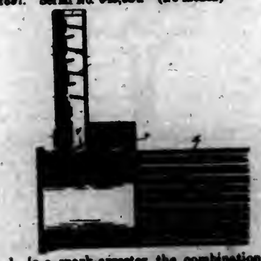
2. A regulator for water-heaters arranged to be placed in the water-supply pipe to the heater, said regular coming a regulating-valve, and having a valved by-pass arranged to connect the pipe leading to the regulator with that leading from the regulator to the heater, so as to give a direct connection between the heater and the supply-pipe, in combination with a gas-valve connected to the regulating-valve and arranged to be placed in the gas-supply leading to the burner.

3. The combination with a water-heater having a heating-burner, of a water-supply pipe leading to the heater, a water-regulator in said supply-pipe, a gas-supply pipe leading to the burner, a valve in said

gas-supply connected to and actuated by the water-regulator, a valved by-pass connecting the water-supply pipe to the regulator with the feed-pipe leading from the regulator to the heater, and a valved pipe leading from the by-pass to the regulator.

4. An automatic regulator for water-heaters comprising a cylinder having slots in its upper end portion, a piston movable therein, a supply-pipe leading into the cylinder below the piston, an outer casing surrounding the cylinder, and an outlet-pipe leading from this casing below the level of the slots in combination with a gas-regulating valve connected to and operated by the piston.

5. An automatic regulator for water-heaters comprising a cylinder having an opening in its upper end, a piston movable therein, a supply-pipe leading into the cylinder below the piston, means for adjusting the piston longitudinally upon its rod, said rod having a stop arranged to limit its movement, an outer casing surrounding the cylinder, and an outlet-pipe leading from this casing at a point below the level of the upper opening in the cylinder in combination with a gas-valve connected to and operated by the piston.

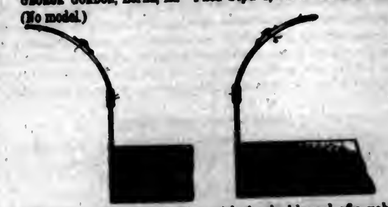


6. The combination with a fixed element forming the wall of a chamber and having a hole, of a rod movable through the hole, and a flexible diaphragm arranged to pack the rod or stem, said diaphragm surrounding the rod and having at one end a flange clamped to the fixed element and at the other a flange clamped to the rod, said diaphragm having an inwardly-curved annular portion arranged to double upon itself during movement of the rod, thereby preventing contact of the curved portion with the rod.

606,183. CONVERTIBLE COUCH. JABE GIDDINS, Rutland, Vt. Filed May 24, 1897. Serial No. 638,623. (No model.)

Claim.—In a convertible couch and bed, the combination with a main body portion provided with supporting-legs and with an inclined and hinged end section forming the head of the couch, of a folding section hinged to one side of said main body portion and adapted to be turned to either a vertical or a horizontal position to form a back for the couch or a part of the bed, elongated sliding bolts or rods carried by the section hinged to one side of the main body portion, eyes on said body portion adapted to engage said bolts for holding said section upright said bolts being adapted to be withdrawn from said eyes and extended below the rear edge of the body portion for supporting said hinged end section, in horizontal position, and a hinged lateral extension of the hinged end section upholstered on its outer side to form a pillow when folded over upon said end section, substantially as described.

606,184. SPARK-ARRESTER. MAX GOTTER, Sturgis, S. D., assignor to William G. Smith and Charles C. Polk, same place. Filed Aug. 26, 1897. Serial No. 649,634. (No model.)



Claim.—1. In a spark-arrester, the combination, with a boiler, of a smoke-stack, a smoke-box secured to the base of the stack on the outer side of the boiler and in communication with both the boiler and stack, said stack and box being provided with doors, an inclined deflector located in the base of the stack and projecting upwardly therefrom into the smoke-box, and a series of perforated screen-plates secured in said stack, said screen-plates being alternately arranged at opposite sides of the stack and each having its inner edge projecting beyond the vertical center of the stack, whereby said screen-plates are caused to overlap each other and thereby effectually prevent the escape of live sparks and the like from the stack, substantially as described.

2. In a spark-arrester, the combination with a stack, of a smoke-box projecting therefrom and opening thereinto, a deflector disposed at the base of the stack and projecting into the smoke-box, and a series of perforated screen-plates secured in said stack, said screen-plates being alternately arranged at opposite sides of the stack and each having its inner edge projecting beyond the vertical center of the stack, whereby said screen-plates are caused to overlap each other and thereby effectually prevent the escape of live sparks and the like from the stack, substantially as described.

3. In a spark-arrester, the combination, with a stack, of a smoke-box projecting therefrom and opening therein, an inclined deflector secured within said stack and projecting into the smoke-box, and a series of inclined perforated screen-plates also arranged within the stack, the perforations of the said screen-plates being formed by punching the plates and bending the punched portion downwardly to permit of the free passage of the smoke but effectually preventing the egress of live sparks and the like, substantially as set forth.

606,185. REVERSIBLE MUD-GUARD AND STORM-FENDER. GEORGE GORDON, Lorne, Ill. Filed Sept. 1, 1897. Serial No. 650,200. (No model.)

Claim.—1. The combination with the dashboard of a vehicle, of a reversible mud-guard and storm-fender, consisting of a rectangular frame comprising two portions hinged to each other and curved as shown, and means for retaining them in an unfolded position and in attachment to the dashboard of the vehicle, all substantially as herein shown and set forth.

2. The combination with the dashboard of a vehicle, of a detachable and reversible mud-guard and storm-fender, consisting of a frame portion comprising two parts hinged to each other laterally, and a flexible portion covering said frame, substantially as herein shown and set forth.

3. The combination with the dashboard of a vehicle, of a reversible and detachable folding mud-guard and storm-protector, consisting of a metal frame divided and hinged laterally, means for retaining said portions in an unfolded position, and means for securing the lower of said hinged portions upon the dashboard of the vehicle, all substantially as herein shown and set forth.

4. The combination with the dashboard of a vehicle, of a mud-guard and storm-protector, consisting of two curved frame portions laterally hinged to each other and provided with a continuous cover of impervious flexible material, means whereby the said portions of the frame may be maintained in a folded position, and means in connection with the lower portion of said frame whereby the device may be secured to the dashboard either as a mud-guard or as a storm-fender, all substantially as herein shown and set forth.

606,186. BURNER. CHARLES HAFFNER, Baltimore, Md. Filed May 15, 1897. Serial No. 636,663. (No model.)

Claim.—1. In a gas-burner, the following elements in combination, viz., a base-plate having a series of holes and raised sides and a covering-plate with nozzles which register with the said holes in the base-plate, a duct to convey gas and air to the said receptacle, and tubes which pass through the nozzles and the holes in the base-plate and are fastened therein, the said tubes having apertures in their walls for the admission of the mixture of gas and air to the interior of the said tubes, substantially as specified.

2. In a gas-burner, a base-plate having a series of holes therein and raised sides, and a covering-plate with nozzles, which rests on the said raised sides to form with the base-plate a receptacle for air and gas, the said nozzles registering with the holes in the base-plate, combined with perforated tubes which pass through the said holes and nozzles and are secured therein, and a deflecting-plate in the said receptacle with annular spaces around the tubes to distribute the mixture of air and gas equally to the various tubes, substantially as specified.

606,187. TANGLED-GRAIN SEPARATOR FOR HARVESTING-MACHINES. ALFRED A. HANLEIN, Philadelphia, Pa. Filed July 17, 1896. Serial No. 599,530. (No model.)

Claim.—1. The combination in a harvesting or reaping machine, of a tangled-grain separator having an upturned nose extending a considerable distance beyond the cutter-bar and having arms projecting rearwardly and extending to a point higher than the intersection of the tangled grain when upright so as to completely separate the tangled grain to be cut from the grain at the side of the machine, substantially as and for the purpose set forth.

2. An attachment for application to a harvester or reaper for separating entangled grain, of a head having a rearward extension, means for securing said extension to the machine and arms extending upwardly and rearwardly from the head and to a point higher than the intersection of the tangled grain when upright so that they will completely separate the grain before it is cut by the cutter-bar of the machine, substantially as described.

3. The combination in an attachment for harvesting or reaping machines for separating entangled grain, of a head adapted to be secured to the machine and having a socket on its under side to receive the nose of the machine, the under side of the head being beveled from the said socket to the nose so that the machine can be adjusted to make a low cut, and arms projecting upwardly and rearwardly from the head to a point higher than the intersection of the tangled grain when upright so that they will completely separate the tangled grain before it is cut, substantially as described.

4. The combination in an attachment for harvesting and reaping machines for separating entangled grain, of a head having a socket on its under side adapted to receive the nose of the permanent separator, a vertically-arranged board extending rearwardly from the head and adapted to be secured on edge to the separator-board of the machine, the under side of the head being beveled from the socket up to the nose, and arms projecting rearwardly and upwardly from the head to a point higher than the intersection of the tangled grain when upright so that the tangled grain will be completely separated thereby before it is cut, substantially as described.

5. The combination in an attachment for harvesting and reaping machines for separating entangled grain, of a head adapted to be secured to the separator-board of the machine having a socket on its under side in which the nose of the separator-board rests, the under side of the head being beveled, a fixed arm projecting rearwardly and upwardly from the head and an adjustable bracket pivoted to the head at the outer side, means for securing the bracket after adjustment, and an arm attached to said bracket and extending rearwardly, said arms extending to a point higher than the intersection of the tangled grain when upright, so that the tangled grain will be completely separated thereby before it is cut, substantially as described.

6. The combination in an attachment for harvesting and reaping machines for separating entangled grain, of a head adapted to be secured to the separator-board of the machine, and means for securing said board to the separator-board of the machine, a socket on the under side of the head to secure the nose of the separator-board of the machine, said head being inclined upward to the nose to allow the machine to be adjusted for a low cut, a plate secured to the upper edge of the head forming the nose of the attachment and a socket, a rearwardly-extending arm secured in the said socket, a bracket pivoted at its forward end to the head and slotted, a bolt adapted to the slot in the bracket and a rearwardly-extending arm secured to the bracket, said arms extending to a point higher than the intersection of the tangled grain when upright so that they will completely separate the tangled grain before it is cut, substantially as described.

606,188. CONCENTRATOR AND SLIMER. FRANKLIN W. HARLOW, Eureka, Colo. Filed Mar. 11, 1897. Serial No. 627,008. (No model.)

Claim.—1. A device of the class described, provided with a bed or pan, the said bed or pan having a depression or pocket formed in its bottom and outlet-funnels having spouts the outer ends of which extend through the bottom of the bed at the said pocket, the funnel-bodies being held above the bottom of the bed and extending upward to allow the concentrates to settle in the bottom of the bed and to permit the water and tailings to flow down through the funnels and a caisson arranged over each funnel and open at the top and bottom, the lower end of each caisson being located a short distance above the top of the corresponding funnel-body, as and for the purpose set forth.

2. A device of the class described, provided with a bed or pan having its bottom formed of inclined portions extending in opposite directions and forming a pocket at the angle or junction of said inclined portion, and outlet-funnels located at the junction of said inclined portions of the bed and having spouts extending through the bottom of the bed, the funnel-bodies being held above the bottom of the bed and extending upward therein, a caisson located over each funnel-body, the lower end of each caisson being larger than the funnel-body and terminating a short distance above the same, a hopper located below the bed and arranged to receive the material passing through the said funnels, and an endless apron arranged to travel beneath the said hopper and upon which the material is discharged, substantially as described.

3. A device of the class described, comprising a bed or pan provided in its lower portion with outlet-funnels each having a spout extending through the bottom of the bed and a funnel-body extending upward in the bed, a caisson arranged over each funnel and open at the top and bottom, the lower end of each caisson being located a short distance above the top of the funnel-body, and an endless apron arranged to travel and adapted to receive the discharge from the said funnels, substantially as shown and described.

4. In a device of the class described, the combination with a swinging bed or pan, and a hopper carried by the said pan, of a water-box discharging into the said pan, and a frame carrying the said water-box and resting on rollers journaled in the support for the said bed or pan, the said frame being provided with guides engaging fixed guideways, substantially as shown and described.

5. A device of the class described, comprising a fixed frame provided with standards, a frame mounted to swing in said fixed frame and adapted to receive successive concussions, a bed or pan carried by said swinging frame, a feed-hopper secured to said swinging frame near the front end thereof, a water-supply box, and a frame carrying the said water-supply box and provided with guides engaging guideways on the standards of the fixed frame, the said frame carrying the water-supply box resting loosely on friction-rollers journaled in the sides of the said swinging frame, substantially as shown and described.

6. A device of the class described, comprising a bed or pan mounted to swing and adapted to receive successive concussions, a fixed water-supply at the upper end of said bed, a hopper moving with the bed and adapted to discharge the material upon the bed always at the same place a series of funnels arranged in the lower portion or pocket formed in the bottom of the said bed, each funnel having a spout extending through the bottom of the bed, a funnel-body held above the bottom of the bed and extending upward in the bed, and a caisson arranged over each funnel and open at the top and bottom, the lower end of the caisson being located a short distance above

the top of the corresponding funnel-body, substantially as shown and described.

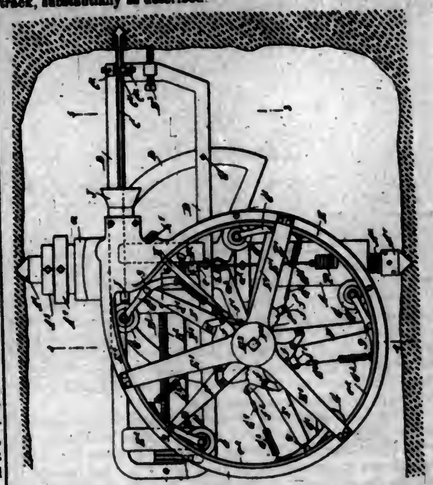
7. A device of the class described, provided with a bed or pan mounted to swing and adapted to receive successive concussions, the said bed being formed in its bottom with a pocket, a series of transversely-arranged funnels held in the said pocket, each provided with a spout extending through the bottom of the bed and a funnel-body held above the bottom and extending up into the pan or bed, and a caisson for each funnel located above the same and fixed to the bed, each caisson being funnel-shaped and open at the top and bottom, the lower end of the caisson being larger than the top of the funnel-body and terminating a short distance above the same, substantially as shown and described.

8. A device of the class described, provided with a bed or pan mounted to swing and adapted to receive successive concussions, the bottom of said bed or pan having inclined portions extending upward in opposite directions forming a pocket at the angle or junction of the inclined portions, a series of transversely-arranged funnels held in the said pocket, each provided with a spout extending through the bottom of the bed, the inner ends of the spouts extending above the bottom of the bed, and a funnel-body held above bottom of the bed and extending up into the bed, and a caisson for each funnel located above the same and fixed to the bed, each caisson being funnel-shaped with beveled sharp-edged ends, the lower end of the caisson being larger than the top of the funnel-body, and terminating a short distance above the said top of the funnel body, substantially as described.

9. In a device of the class described, the combination with a bed or pan, a swinging support for said bed or pan, and a hopper adapted to discharge the pulp into the said bed or pan, the said hopper being secured to said swinging support and movable therewith, whereby the material is discharged upon the bed or pan always at the same place, of a fixed water-box discharging into the said bed in front of the said hopper, and a frame supporting the said water-box and resting loosely on rollers journaled in the swinging support for the said bed or pan, substantially as shown and described.

10. In a device of the class described, the combination with a fixed frame, of a swinging frame, a bed or pan carried by said swinging frame, a feed-hopper fixed to said swinging frame and movable therewith, whereby the pulp is deposited upon the bed or pan always at the same place, a water-supply box, a frame carrying the said water-supply box and resting loosely on friction-rollers journaled in the sides of the swinging frame, and guide-plates located at the rear ends of the frame carrying said water-supply box, the said guide-plates engaging vertical guideways on the fixed frame, substantially as shown and described.

11. In a device of the class described, the combination with a frame mounted to swing and adapted to receive successive concussions, a bed or pan carried by said frame, a hopper carried by the frame and adapted to discharge the material into said pan, and an endless traveling apron adapted to receive the discharge from said pan, of a water-supply box discharging into the said bed or pan, a frame carrying the said water-supply box and resting loosely on friction-rollers journaled in the said swinging frame, and means for preventing longitudinal movement of the said frame carrying the water-supply box during the forward and backward travel of the swinging frame, substantially as shown and described.



12. A device of the class described, provided with a bed or pan formed in its lower portion with outlet-funnels each having a spout extending through the bottom of the bed and a funnel-body extending upward in the bed, an endless apron adapted to receive the discharge from the said funnels, an adjustable table under the upper run of the said apron, a shaft journaled in the frame of the device and on which the rear end of said table is mounted, a drum formed with flanges at its ends and secured on said shaft, and a similar drum journaled in adjustable bearings held on the forward or free end of the table, the said apron being arranged to travel over the said drums, and the sides of the apron extending up on the said flanges, substantially as shown and described.

606,189. PERCUSSION-DRILL. JOSEPH P. HARTMAN, Pueblo, Colo. Filed Aug. 10, 1897. Serial No. 648,437. (No model.)

Claim.—1. A percussion-drill, comprising a hammer-track which is mainly circular in outline and has a segment of increasing radius, hammer-supports pivoted to revolve within said track, hammers having arms pivoted to said supports, and rollers engaging the track, substantially as described.

2. A percussion-drill, comprising a hammer-track which is mainly circular in outline and has a segment of increasing radius, hammer-supports pivoted to revolve within said track, hammers connected thereto having cylindrical heads rolling on the track, and positive means for holding the hammers against the upper portion of the track, substantially as described.

3. A percussion-drill, comprising an orbital hammer-track, hammer-supports revolving within said track, hammers mounted on handles which are pivoted to said supports, and springs attached thereto and adapted to at all times hold the hammers against the hammer-track, substantially as described.

4. A percussion-drill, comprising an orbital hammer-track, hammer-supports revolving within said track, hammers mounted on handles which are pivoted to said supports, springs connected to the hammer-handles, levers connected to the opposite ends of the springs, and a cam engaging said levers to tension the springs while the hammers are passing through the upper part of their orbit, substantially as described.

5. A percussion-drill, comprising a hammer-track which is mainly circular and has a segment of increasing radius, hammer-supports pivoted to revolve within said track, hammers having arms pivoted to said supports, and heads engaging said track, and a drill-socket in line with the hammers when in their outermost position, substantially as described.

6. A percussion-drill, comprising a hammer-track which is mainly circular and has a segment of increasing radius, hammer-supports pivoted to revolve within said track, hammers having arms pivoted to said supports and heads engaging said track, a drill-socket in line with the hammers when in their outermost position, and connections between the drill-socket and the revolving hammer-supports, whereby the drill-socket is revolved, substantially as described.

7. A percussion-drill, comprising a hammer-track which is mainly circular and has a segment of increasing radius, hammer-supports pivoted to revolve within said track, hammers having arms pivoted to said supports and heads engaging said track, a drill-socket in line with the hammers when in their outermost position, and gear connections between the same and the shaft of the hammer-supports, substantially as described.

8. A percussion-drill having a revolvable frame, a series of hammers mounted upon arms which are pivoted to the frame, a central fixed cam having a notched or toothed outer surface, levers pivoted to the frame having notched surfaces engageable with the cam at one point in their revolution, and connections between said levers and the hammer-arms, substantially as described.

9. A percussion-drill having a revolvable frame, a series of hammers mounted upon arms which are pivoted to the frame, a central fixed cam having a notched or toothed outer surface, levers pivoted to the frame having notched surfaces engageable with the cam at one point in their revolution, and a spring connecting said levers and the hammer-arms, substantially as described.

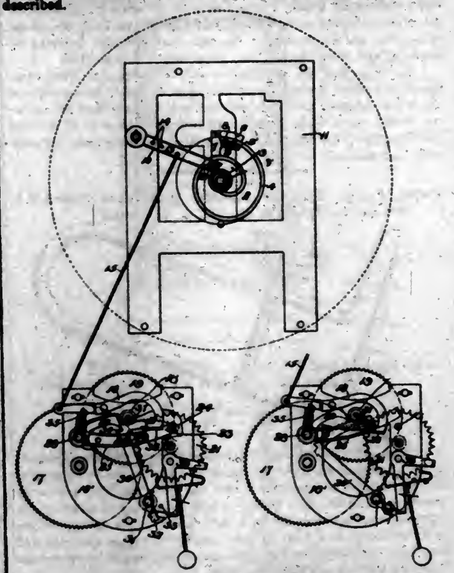
606,140. FOLDING EGG-CRATE. JAMES A. HASKETT, Parsons, Kans. Filed May 3, 1897. Serial No. 634,940. (No model.)

Claim.—A folding crate, comprising the sides 1 2, ends 3 4, bottom and top, 5 and 19 respectively, and partition 17, each side provided with a square end 8 and a bevel end 9, while each end piece is provided with a beveled end 10, opposing the bevel end of the side piece and with a square end 11, opposing the square end of the side piece, hinges secured to the outside of the beveled ends of the end and side pieces, hinges secured to the inside of the square ends of the end and side pieces, cleats 14 secured to the inner faces of the side pieces near their lower edges and provided with recesses 15, cross-pieces secured to the under side of the bottom piece and seated in said recesses, and fasteners for securing the top piece in place, substantially as set forth.

606,141. INFLATABLE TIRE. LAWRENCE W. KEELAR, Dallas, Tex., assignor of one-half to Walter S. Stone, same place. Filed Feb. 8, 1897. Serial No. 622,944. (No model.)

Claim.—The inflatable, non-puncturable tire, comprising the seamless innermost tube, the intermediary fabric layers, the threads of one layer crossing the threads of the other layer, the layer of rawhide interposed between said intermediary fabric layers, and the outermost seamless tube or jacket inclosing the aforesaid tubes, substantially as set forth.

606,142. TABLE. BENJAMIN M. KIRBY, North Adams, Mass. Filed Nov. 6, 1896. Serial No. 611,308. (No model.)



Claim.—1. A table, comprising a base and standard, a stationary annular rim supported thereon, and a circular table rotatably mounted within the annular rim, the inner edge of the rim and the outer edge of the rotatable table being provided with pockets or recesses, in combination with retaining-strips conforming to the curvature of the adjacent edges of the stationary rim and rotatable table, said strips being provided with projecting tongues adapted to enter the pockets or recesses and to bind the cloth upon both sections of the table, substantially as described.

2. A table comprising a base, a supporting standard, cross-arms thereon, a stationary annular rim on said cross-arms, and a rotatable table mounted within the annular rim, both the rim and rotatable table being provided in their meeting or adjacent edges with pockets or recesses, and retaining-strips conforming to the curvature of said meeting edges and having laterally-projecting tongues adapted to enter said pockets or recesses for the purpose specified, the said strips lying opposite each other and serving to mutually support and retain each other in place, substantially as described.

606,143. ALARM-CLOCK. FREDERICK D. HOOPS, Pittsburg, Pa. Filed July 19, 1892. Serial No. 440,892. (No model.)

Claim.—1. In a clock, the combination with the clock-movement, of an alarm-movement, an alarm-controlling cam rotated by the clock-movement more than once in a certain period of time and arranged to actuate the alarm-movement once in the same period, an alarm-setting plate having divisions, and an indicator operated by the alarm-setting plate and arranged to indicate continuously the position of the alarm-controlling cam; substantially as described.

2. In a clock, the combination of the clock-movement arranged to complete one cycle of motion in twelve hours, an alarm-movement, an alarm-controlling cam rotated by the clock-movement twice in twenty-four hours and arranged to actuate the alarm but once in the same time, an alarm-setting dial having twelve divisions, and a movable sign operated by the alarm-setting dial arranged to indicate continuously the position of the alarm-controlling cam; substantially as described.

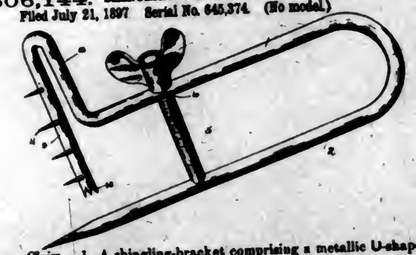
3. In a clock, the combination with the clock-movement, of an alarm-movement, an alarm-controlling mechanism arranged to be rotated by the clock-movement more than once in a certain period of time and to actuate the alarm but once in the same time, said mechanism consisting of a flat spiral cam of more than one convolution, the path of the convolutions receding from the center of the spiral, an element cooperating with the cam, one of said parts being arranged to actuate the other, and an alarm-setting dial having divisions; substantially as described.

4. In a clock, the combination with the clock-movement, of an alarm-movement, mechanism operated by the clock-movement for controlling the alarm-movement, stop mechanism for the alarm, means connected with the alarm-controlling mechanism for operating the stop mechanism, a pivoted lever which may be adjusted to alter the duration of the alarm, and mechanism for retaining said lever in its adjusted position; substantially as described.

5. In a clock, the combination with the clock-movement, of an alarm-movement, means for controlling the same, stop mechanism for the alarm, mechanism which may be adjusted to alter the duration of the alarm, means for retaining said adjusting mechanism in its adjusted position, means operated by the clock-movement to disengage the stop mechanism, and mechanism for automatically returning the stop mechanism to its locking position; substantially as described.

6. In a clock, the combination with the clock-movement, of an alarm-movement, a flat spiral cam of more than one convolution the path of the convolutions receding from the center of the spiral, mechanism in engagement with said cam for operating the alarm-movement, and mechanism near the outer terminus of the cam by which the mechanism in engagement with the cam is brought to a position to be returned to its starting-point at the center of the cam; substantially as described.

7. In a clock, the combination with the clock-movement, of an alarm-movement, a pivoted lever for starting and stopping the alarm, means operated by the clock-movement to disengage said lever for the purpose of sounding the alarm, and a toothed lever by which said pivoted lever is returned to its alarm-stopping position; substantially as described.



8. In a clock, the combination of an alarm-movement, means for controlling the same, stop mechanism for the alarm, a pivoted adjusting-lever for altering the duration of the alarm, and an indicator for indicating the different durations of the alarm; substantially as described.

9. In a clock, the combination with the clock-movement, of an alarm-movement, a cam, a lever adapted to engage with said cam for operating the alarm-movement, and a bridge-piece for returning the lever to its starting position after it has reached the outer terminus of the cam; substantially as described.

10. In a clock, the combination with the clock-movement, of an alarm-movement, a cam, a lever having in its end a spring-actuated pin or stud adapted to engage with said cam for operating the alarm-movement, and mechanism on the cam near its outer terminus for engaging and retracting the pin; substantially as described.

11. In a clock, the combination with the clock-movement, of an alarm-movement, a cam, a lever having in its end a spring-actuated pin or stud adapted to engage with said cam for operating the alarm-movement, and a bridge-piece for returning the lever to its starting position after it has reached the outer terminus of the cam; substantially as described.

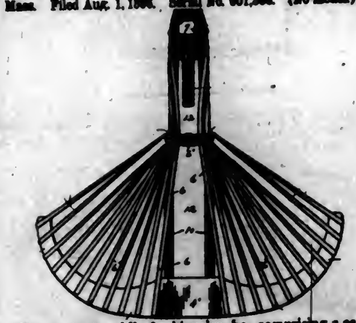
606,144. SHINGLING-BRACKET. ISAAC HOMER, Philmont, N. Y. Filed July 21, 1897. Serial No. 645,574. (No model.)

Claim.—1. A shingling-bracket comprising a metallic U-shaped body having parallel arms, the end of one of said arms being pointed to adapt it to enter beneath a shingle, the end of the other arm being bent to form an auxiliary U-shaped arm extending at substantially right angles to said parallel arms, said auxiliary arm being provided at its extremity with teeth or spurs adapted to engage a shingle, and means for regulating the distance between said parallel arms and for clamping them in any desired position.

2. A shingling-bracket comprising a U-shaped body having substantially parallel arms, the end of one arm being adapted for insertion beneath a shingle, and the end of the other arm being bent away from the first arm and then recurved or bent upon itself, and extended toward the first arm and at substantially right angles thereto, the said right-angular arm being provided at its extremity with teeth or spurs and along its length with laterally-projecting spurs or prongs, and means for regulating the distance between said parallel arms and for clamping them in any desired position.

606,145. NUT-LOCK. ISAAC HOMER, Philmont, N. Y. Filed Aug. 11, 1897. Serial No. 647,892. (No model.)

Claim.—1. In a nut-lock, the combination of a spring-plate having a bolt-hole therein, a plate hinged at one end to said spring-plate and provided at its opposite end with a hinged section, and adapted to engage a nut, and means for locking said hinged section to said curved plate.



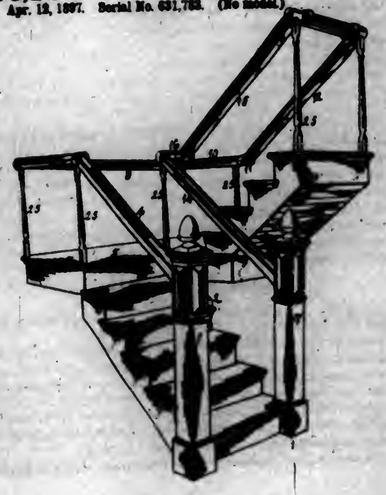
2. In a nut-lock, the combination of a spring-plate having a bolt-hole therein, and provided with a flange, a plate hinged at one end to said spring-plate and adapted to engage a nut, said plate being provided at its opposite end with a hinged section adapted to engage the flange of said spring-plate and lock them together.

3. In a nut-lock, the combination of a spring-plate having a bolt-hole therein, a locking-plate hinged at one end to said spring-plate, and having a nut-engaging hole therein registering with the bolt-hole in the spring-plate, said locking-plate being also provided with a hinged section adapted to engage said spring-plate and lock them together.

4. In a nut lock, the combination of a spring-plate curved longitudinally and provided with a bolt-hole and with a flange at one end, and a locking-plate composed of a pair of jointed sections hinged to said spring-plate at one end and engaging the flange at the other end adapted to engage the nut.

5. In a nut-lock, the combination of a spring-plate provided with a bolt-hole and with an inturned flange extending across one end thereof, a locking-plate provided with a nut-hole coincident with the bolt-hole in the spring-plate, said locking-plate being composed of a pair of jointed sections, one of said sections being hinged to the end of the spring-plate opposite the flange and the free end of the other section of the locking plate being designed to engage said flange.

606,146. BICYCLE-SADDLE. JONATHAN A. HUNT, Westborough, Mass. Filed Aug. 1, 1896. Serial No. 601,266. (No model.)

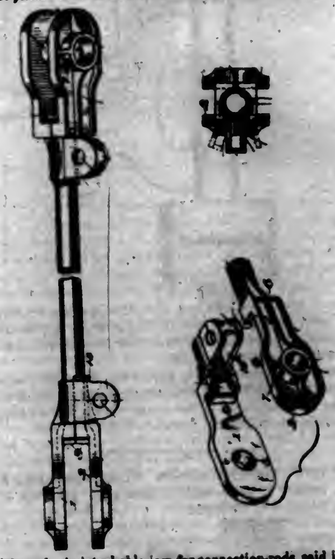


Claim.—1. A saddle for bicycles, &c., comprising a cantle-plate, a pommel-plate, a spring or support intermediate the cantle and pommel, and strips or lacing, and a retaining band or device therefor, some of said strips extending from the cantle-plate through openings in said retaining-band to the pommel-plate, and others of said strips extending from the cantle-plate only as far as the retaining-band, substantially as shown and described.

2. A saddle for bicycles, &c., comprising a cantle-plate, a pommel-plate, a spring or support intermediate the cantle and pommel, and strips or lacing, and a retaining band or device therefor, some of said strips extending from the cantle-plate through openings in said retaining-band to the pommel-plate, and others of said strips extending from the cantle-plate only as far as the retaining band, and through openings therein back to the cantle-plate, substantially as shown and described.

3. A saddle for bicycles, &c., comprising a cantle-plate, a pommel-plate, a spring or support intermediate the cantle and pommel, and strips or lacing, and a transverse retaining band or device therefor, said band grooved or recessed in its upper surface, and some of said strips extending from the cantle-plate through openings in said retaining-band to the pommel-plate, and others of said strips extending from the cantle-plate only as far as the retaining-band, and over the ends of the retaining-band, and in through the openings therein, and back of the central part of the band to hold it in place, substantially as shown and described.

606,147. STAIR-RAIL. SAMUEL HUNTER, Lockburg, Pa. Filed Apr. 12, 1897. Serial No. 631,783. (No model.)



Claim.—1. The combination of two baluster-rails and a cylindrical cross-head, the ends of the rails shaped to fit the same and being secured thereto on opposite sides of a medial transverse plane of the cross-head.

2. The combination of a support consisting of two cylindrical surfaces located at an angle to each other and a rail secured to each surface having their ends cut to conform thereto.

3. The combination of two baluster-rails and a cylindrical cross-head in two sections adjustably joined together, the ends of the rails being shaped to fit the same and secured thereto, one to each section and both located on the same side of the cross-head.

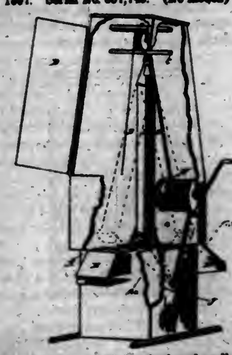
606,148. BRAKE CONNECTION-ROD. CHARLES F. HUNTOON, Chicago, Ill., assignor to the Chicago Railway Equipment Company, same place. Filed Dec. 30, 1897. Serial No. 664,668. (No model.)

Claim.—1. A detachable jaw for connection-rods, said jaw composed of lateral sections, each having an axial rod-groove, and one of said sections having transverse clamp-ears; substantially as and for the purposes specified.

2. A detachable jaw for connection-rods, composed of lateral sections each having an axial rod-groove and one or more of said sections having a stop-lug adjacent to the rod-groove, and means for confining the jaw-sections; substantially as and for the purposes specified.

3. A detachable jaw for connection-rods, composed of lateral sections each having an axial tapered rod-groove, one of said sections having a stop-lug adjacent to the rod-groove, and one of said sections having laterally-projecting clamp-ears adapted to inclose the other section; substantially as and for the purposes specified.

4. A detachable jaw for connection-rods, composed of lateral sections each having a rod-groove, one of said sections having laterally-projecting perforated clamp-ears, and the other having a tapered rib on the portion included between the clamp-ears of the first-named section; substantially as and for the purposes specified.



606,149. PORTABLE ASSAY-FURNACE. JOHN G. ILG, San Francisco, Cal. Filed Dec. 4, 1897. Serial No. 660,812. (No model.)

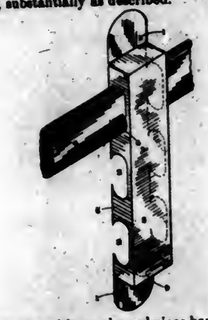
Claim.—1. A portable assay-furnace comprising substantially a four-sided sheet-metal body each side of which is convex in cross-section, lining-tiles having flat inner faces and convex outer faces inclosing a rectangular furnace-space, the angular cast-metal plates secured to the sheet-metal body and adapted to support the tiles, the cast-metal top within the sheet-metal body, and to which the same is riveted, said top having a rectangular opening, slidable covers on said top and fixed guide-rails carrying said covers, an opening in the front of the furnace-body for inserting a muffle, a grate-surface in the lower part of the furnace-body, a fuel-opening in the front provided with doors and an ash-pit below the grate-surface closed at the bottom and having an opening covered by a door.

2. An assay-furnace having a four-sided sheet-metal body, each side of which is convex in horizontal cross-section, in combination with lining-tiles having convex outer faces and flat inner faces, said tiles when in place producing a fire-space substantially rectangular in horizontal cross-section and the cast-metal angle-plates riveted to the sheet-metal body and adapted to support the lining-tiles.

606,150. WELL-CURB. ALBERT A. JAMES, Tecumseh, Okla. Filed May 22, 1897. Serial No. 637,749. (No model.)

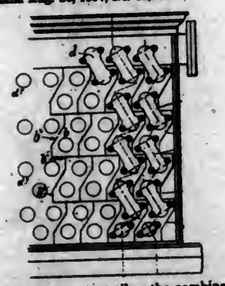
Claim.—The combination with an inclosed well-curb having a door in one of its sides in its upper portion and covered discharge-spouts provided with screen-wire bottoms located at opposite sides of said curb above the base of the same, of a windlass journaled in said inclosed well-curb, a rope or chain connected with the windlass, a pulley, over which said rope or chain runs, suspended from the upper part of said casing, a bucket connected with the lower end of said rope or chain, and provided in its lower end with a filling and discharging valve, a bucket-guide fulcrumed in the sides of the well-curb, provided with a ring at the upper end of its shorter arm encircling the valve-bucket, a lever for shifting the bucket to either of the discharge-spouts, and a notched lever-guard for holding the lever to either of its three adjustments, substantially as specified.

606,151. BORDER FOR FLOWER-BEDS. EVERITTE F. JOHNSON, Nicholson, Pa. Filed Oct. 2, 1897. Serial No. 653,884. (No model.)



Claim.—1. A border of the character set forth comprising inner and outer flanges, a flat or horizontal plate, and an inner swell or enlargement, substantially as described.

2. A border of the character set forth comprising inner and outer flanges having lower penetrating edges and a flat or horizontal plate, and an inner swell or enlargement, substantially as described.



606,152. BRACKET FOR SUPPORTING CURTAIN-RODS. JOHN JOHNS, Liverpool, England. Filed May 19, 1897. Serial No. 637,136. (No model.) Patented in England Mar. 26, 1896, No. 6,969.

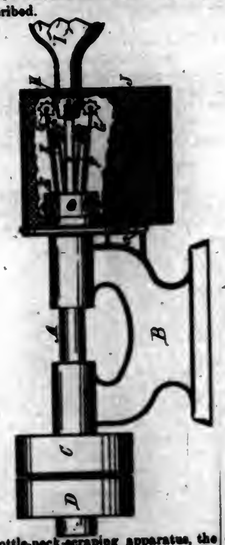
Claim.—1. A curtain-bracket comprising the channel-piece having the sides 2 connected at one edge by the plate forming the bottom of the channel leaving the other edges of the sides free, and the right-angular attaching-clip at the end of channel and extending from the bottom plate, substantially as described.

2. A bracket comprising a channel-piece having perforations extending through its sides laterally, and the right-angular attaching-clip at the end, said clip having the hole 9 therein, substantially as described.

606,158. **WATER-TUBE BOILER.** CONRAD C. S. KNAP, London, England. Filed Dec 15, 1897. Serial No. 662,041. (No model.) Patented in England Aug. 30, 1897, No. 19,251.

Claim.—1. In a water-tube boiler, the combination with a number of vertically-disposed headers having their middle parts directed obliquely or at an angle relative to their ends and arranged in vertical series of connecting-caps connecting up each header with the next adjacent header of its particular series and inclined in opposite directions to the said header middles, substantially as described.

2. In a water-tube boiler, the combination with a number of vertically-disposed headers having their middle parts directed obliquely or at an angle relative to their ends and arranged in vertical series, each header connecting together the ends of two tubes disposed one at a relatively higher plane than the other, of connecting-caps connecting up each header with the next adjacent header of its particular series and inclined in opposite directions to the header middles, substantially as described.

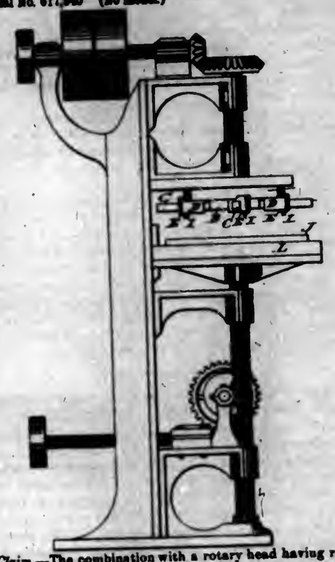


3. In a water-tube boiler, the combination with a number of vertically-disposed headers having their middle parts directed obliquely or at an angle relative to their ends and arranged in vertical series, each header connecting together the ends of two tubes disposed one at a relatively higher plane than the other and having its ends breaking joint with the ends of the headers of the next adjacent series, of connecting-caps connecting up each header with the next adjacent header of its particular series and inclined in opposite directions to the said header middles, substantially as described.

606,154. **FOIL-REMOVING APPARATUS.** GEORGE A. MUELLER, Cincinnati, Ohio, assignor, by mesne assignments, to YAWMAN & ERBE, Rochester, N. Y. Filed Feb. 19, 1898. Serial No. 670,941. (No model.)

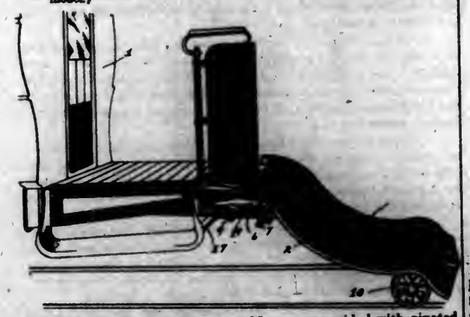
Claim.—1. In a bottle-neck-scraping apparatus, the combination with a revolving head, of a pivoted and yielding series of toothed scraping-wheels carried thereby, substantially as described.

2. In a bottle-neck-scraping apparatus, the combination of a revolving head, of a series of yielding metal bars, and toothed scraping-wheels pivoted at the ends of the bars, substantially as described.



3. In a bottle-neck-scraping apparatus, the combination of a frame, a revolving head therein, yielding scrapers carried thereby, and a hood secured to the frame and surrounding the scrapers, substantially as described.

4. In a bottle-neck-scraping apparatus, the combination of a frame, a revolving head therein, yielding scrapers carried thereby, and a combined hood and receptacle, the former surrounding the scrapers, substantially as described.



5. In a bottle-neck-scraping apparatus, the combination of a frame, a revolving head therein, yielding scrapers carried thereby, a transparent hood surrounding the scrapers and a foil-receptacle beneath the scrapers, substantially as described.

606,155. **ROUTING-MACHINE.** WILLIAM S. RICHARDS, Albany, Oreg., assignor to Angie Richards, same place. Filed Jan. 4, 1897. Serial No. 617,945. (No model.)

Claim.—The combination with a rotary head having radial supports, cutter-heads sliding on such supports and having tool-holders rotatably mounted in said cutter-heads and routing-chisels secured in said tool-holders, of a continuous-pattern form engaging directly surfaces on tool-holders and governing the angular relation of said tool-holders to the cutter-heads as well as the position of the cutter-heads on the radial supports so that the face of the routing-chisel is always normal to the direction of travel of the chisel.

606,156. **DEVICE FOR ATTACHING FENDERS TO CARS.** CHRISTIAN SAUERBREY, Owego, N. Y., assignor of one-half to Theodore D. Gere, same place. Filed Oct. 4, 1897. Serial No. 654,022. (No model.)

Claim.—1. The combination with a car provided with pivoted fender-supporting bars which extend, approximately, to the end of the car, and a wheeled fender, of a detachable rigid connection between the free ends of the fender-supporting bars and the fender, whereby lateral movement of the fender, independent of the supporting-bars, is prevented.

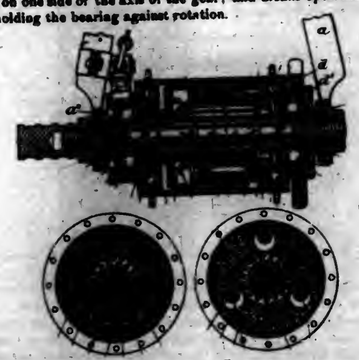
2. The combination with a car provided with pivoted fender-supporting bars extending approximately, to the end of the car, and a wheeled fender provided with coupling-bars, of a detachable rigid connection between the free ends of the fender-supporting bars and the coupling-bars attached to said fender, whereby the fender may be detached at will.

3. The combination with a car provided with pivoted fender-supporting bars carrying coupling-hooks, and a wheeled fender provided with coupling-bars carrying segmental coupling-arms, of means for securing the coupling parts together, whereby accidental uncoupling is prevented, and a rigid connection obtained.

4. The combination with a car provided with pivoted fender-supporting bars carrying coupling-hooks, and a wheeled fender provided with coupling-bars carrying segmental coupling-arms, of a pin or bolt securing said segmental arms against accidental uncoupling.

5. The combination with a car body or truck, of pivoted supporting-bars, each one carrying a set of coupling-hooks separated by a space, and a wheeled fender provided with rigid coupling-bars, carrying segmental coupling-arms which are received in the spaces between said coupling-hooks, with the transverse pins resting in the bottom of the hooks, thereby forming a rigid detachable connection between the fender and the fender-supporting bars.

6. The combination with a car body or truck, of pivoted fender-supporting bars, each bar carrying a set of spaced coupling-hooks, a wheeled fender provided with the bars 3 and 5, a segmental coupling-arm pivoted to each set of bars, and means for securing the coupling-hooks and coupling-arms against accidental uncoupling.



7. The combination with a car provided with fender-supporting bars, pivoted to move laterally in the arc of a circle and supported horizontally at the outer ends, and a wheeled fender, of a rigid detachable connection between the fender and pivoted attachment to the car body or truck.

8. The combination with a car provided with pivoted fender-supporting bars formed with curves 21, a transverse bar supporting the outer ends of said bars horizontally, and a wheeled fender, of a rigid detachable connection between the fender and pivoted attachment to the car body or truck.

9. The combination with a car provided with fender-supporting bars, pivoted to move laterally in the arc of a circle, and a wheeled fender, of detachable means for rigidly connecting the bars to the fender, between the pivotal point of the supporting-bars and the fender, whereby lateral motion of the fender, independent of the supporting-bars, is prevented.

606,157. **MECHANICAL MOVEMENT.** VICTOR BELANGER, Boston, Mass., assignor to Mrs. R. F. Wood, same place. Filed Feb. 8, 1897. Serial No. 622,463. (No model.)

Claim.—1. A mechanical movement, comprising a toothed gear; a revoluble toothed ring arranged eccentrically of the said gear and in engagement therewith; an outer wheel concentric with the said gear; a bearing concentric with the said gear; antifriction devices interposed between the said ring and the bearing of greater thickness on one side of the axis of the gear; and means operable at will for holding the bearing against rotation.

2. A mechanical movement comprising a power-transmitting pinion, an outer hub or wheel concentric with the pinion, an intermediate eccentrically-arranged internally-toothed ring meshing with the pinion, and connected to said hub or wheel, antifriction rollers or balls having different diameters for maintaining said ring in its eccentric arrangement, and means controllable at will for causing said pinion to revolve said ring about the axis of said ring or else about the axis of the pinion.

3. A mechanical movement comprising a power-transmitting pinion, an outer hub or wheel concentric with the pinion, an intermediate eccentrically-arranged internally-toothed ring meshing with the pinion, and connected to said hub or wheel, a bearing concentric with the hub and arranged between the hub and the internally-toothed ring, means for holding said bearing stationary and releasing it, and antifriction devices having varying diameters interposed between the toothed ring and the bearing.

4. A mechanical movement comprising a power-transmitting pinion, an outer hub or wheel concentric with the pinion, an intermediate eccentrically-arranged toothed ring meshing with the pinion, and connected to said hub or wheel, a bearing concentric with the hub and arranged between the hub and the internally-toothed ring, a revoluble cup in which said bearing is mounted, antifriction-bearings for said cup, antifriction devices between the bearing and the ring of greater thickness on one side of the axis of said bearing, and a brake-strap operable at will for locking said cup and said bearing against rotation.

5. A mechanical movement comprising a toothed gear, an outer hub or wheel concentric with the gear, an eccentrically-arranged toothed ring meshing with the gear, a bearing concentric with the hub, means for holding said bearing stationary and releasing it, and antifriction devices of greater thickness on one side of the axis of the bearing interposed between the said toothed ring and said bearing and revoluble about the axis of said gear.

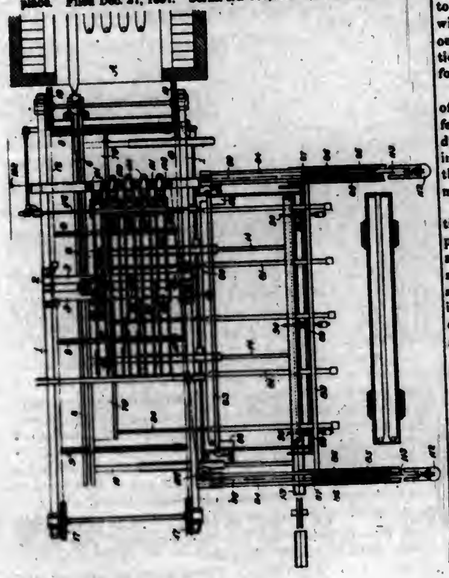
6. In combination, a spindle having a bearing-cone at each end, a sleeve formed with external gear-teeth intermediate of its ends, antifriction-balls interposed between said sleeve and said cones, a sprocket-wheel mounted on the end of said sleeve, a wheel-hub concentric with the pinion, an internally-toothed ring arranged eccentrically about the external teeth of the sleeve and in engagement therewith, means connecting said toothed ring to said hub, a revoluble bearing concentric with the pinion and the wheel-hub, said bearing being mounted on antifriction-bearings, antifriction devices having different diameters interposed between said bearing and said toothed ring, and means operable at will for holding said revoluble bearing against rotation.

7. A mechanical movement comprising a spindle, a hub concentric with the spindle, a toothed gear concentric with said spindle, a toothed ring eccentric of the spindle and intermeshing with the toothed gear, a bearing concentric with said spindle, antifriction devices having varying diameters and placed between said toothed ring and said bearing, and controllable means for locking or releasing the said bearing whereby the said ring may revolve on its own axis or on the axis of the spindle.

606,158. **MECHANICAL MOVEMENT.** VICTOR BELANGER, Boston, Mass., assignor to Mrs. R. F. Wood, same place. Filed Dec. 28, 1898. Serial No. 617,208. (No model.)

Claim.—1. In combination, a driving-pinion, an internally and

externally toothed eccentric sleeve meshing with said pinion, a driven internally-toothed ring concentric with the pinion and meshing with the said sleeve, and graded balls for maintaining said sleeve in its eccentric relation to the said pinion and ring.



2. In combination a driving-pinion, a concentric driven internally-toothed ring, an intermediate internally and externally toothed eccentric sleeve, graded balls for maintaining the eccentric relation of the said sleeve, and a drum for supporting the graded balls.

3. Gearing comprising in its construction a pinion; driving means for said pinion; a sleeve encircling said pinion formed with an internal gear, and having gear-teeth formed upon the exterior thereof arranged to engage with the teeth of an internal gear; graded balls interposed between the sleeve and a ring; means for maintaining the balls in their proper relative positions, and a ring concentric with the pinion and encircling the sleeve formed with internal gear-teeth, substantially as described.

4. Gearing comprising in its construction a pinion; a driven internally-toothed ring; driving means for said pinion; a sleeve encircling said pinion formed with an internal gear, and having gear-teeth formed upon the exterior thereof arranged to engage with the teeth of an internally-toothed ring; graded balls interposed between the sleeve and a ring; a separator formed with notches for the reception of the balls, each notch of a size to accommodate its respective ball; and a ring concentric with the pinion and encircling the sleeve formed with internal gear-teeth, substantially as described.

5. Gearing comprising, a driving-pinion, a driven internally-toothed ring, an eccentric internally and externally toothed sleeve meshing with said pinion and said ring, a rotary drum, graded balls, between said drum and said sleeve, and a separator formed with notches to receive the balls.

606,159. APPARATUS FOR MANUFACTURING PIPE. PETER BOYD, Wheeling, W. Va., assignor to the Riverside Iron Works, same place. Filed Dec. 27, 1897. Serial No. 663,666. (No model.)

Claim.—1. In an apparatus for bending or welding pipe, the combination of a support or table for pipe blanks or skelps arranged in front of the heating-furnace, reciprocating draft mechanism, and a pusher operated by the draft mechanism for shifting the blank or skelp from said support or table into the furnace, substantially as set forth.

2. In an apparatus for bending or welding pipe, the combination of a support or table for pipe blanks or skelps, a reciprocating draft mechanism, means for adjusting the table and draft mechanism across the charging-opening of the furnace and a pusher connected to the draft mechanism for shifting the blanks or skelps from the table into the furnace, substantially as set forth.

3. In an apparatus for bending or welding pipe, the combination of a table or support, mechanism for feeding blanks or skelps onto said table, and a reciprocating pusher for shifting the blanks or skelps from the table into the furnace, and connections from the pusher to the blank-feeding mechanism whereby the latter is operated by the pusher, substantially as set forth.

4. In an apparatus for bending or welding pipe, the combination of a table or support, mechanism for feeding blanks or skelps onto said table, a reciprocating draft mechanism, and a pusher operated by the draft mechanism for shifting the blanks or skelps from the table into the furnace, substantially as set forth.

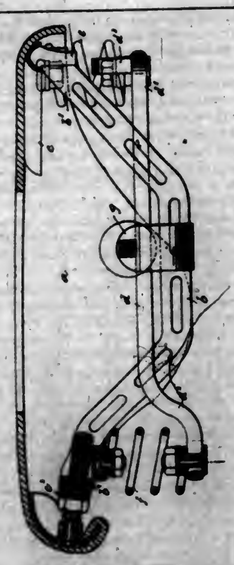
5. In an apparatus for the manufacture of pipe, the combination of mechanism for shifting blanks or skelps into feeding position in front of a furnace, a pusher for shifting the blanks or skelps into the furnace, and a draft mechanism for pulling the blanks from the furnace and for operating the pusher, substantially as set forth.

6. In an apparatus for the manufacture of pipe, the combination of a laterally-movable bench, a laterally-movable draft mechanism, a table or support for blanks or skelps movable with the bench and a pusher for shifting the blanks or skelps into the furnace, operative by the draft mechanism, substantially as set forth.

7. In an apparatus for the manufacture of pipe, the combination of a table or support, a pusher for shifting the blank or skelp into the furnace, a draft mechanism for pulling the blanks or skelps from the furnace, and mechanism controlled by the draft mechanism for shifting the table-pusher and draft mechanism laterally, substantially as set forth.

8. In an apparatus for manufacturing pipe, the combination of mechanism for shifting blanks or skelps into feeding position, a pusher for shifting the blanks or skelps into the furnace, a draft mechanism for pulling blanks from the furnace, the pusher and shifting mechanism being operative by the draft mechanism, substantially as set forth.

9. In an apparatus for the manufacture of pipe, the combination of a frame for shifting blanks or skelps laterally to feed position, a draft mechanism and pulling mechanism operative by the draft mechanism for shifting the frame laterally, substantially as set forth.



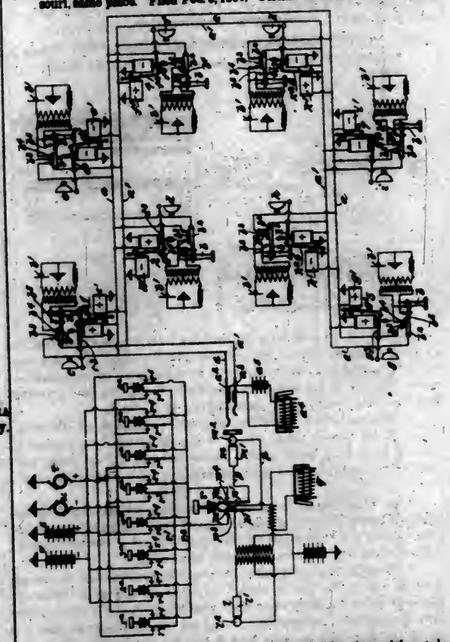
10. In an apparatus for the manufacture of pipe, the combination of a draft mechanism, a frame for laterally shifting blanks or skelps to feed position, pulling mechanism having a detachable connection with the draft mechanism for shifting said frame, and means operative on a predetermined movement of the frame for releasing the connection between the draft and pulling mechanism, substantially as set forth.

11. In an apparatus for the manufacture of pipe, the combination of draft mechanism, a frame for laterally shifting blanks or skelps to feed position, a series of pulling mechanisms for shifting the frame to different positions, means for detachably connecting one of said pulling mechanisms to the draft mechanism during the back stroke of the latter and means for releasing such connection on a predetermined movement of the draft mechanism, substantially as set forth.

12. In an apparatus for the manufacture of pipe, the combination of a laterally-adjustable draft mechanism, a laterally-adjustable pusher for feeding blanks or skelps into a furnace, a frame for laterally shifting blanks or skelps to feed position, a series of pulling mechanisms for shifting the frame to different positions, means for detachably connecting one of said pulling mechanisms to the draft mechanism during the back stroke of the latter and means for releasing such connection on a predetermined movement of the latter, substantially as set forth.

606,160. CYCLE-SADDLE. JOHN B. BROOKS, Birmingham, England. Filed Jan. 3, 1898. Serial No. 665,454. (No model.)

Claim.—In a bicycle-saddle, the combination with a base-framing the front ends of the members of which are close together and bent downward to provide a spring-space, and the rear ends of which are separated, and an attaching boss or clip carried by said framing intermediate its ends, of seat-stretcher members the front ends of which are outside and the rear ends inside the corresponding ends of the base-framing, and the middle portions of which are carried beneath the corresponding portion of the base-framing and the attaching boss or clip, and seat-supporting springs carried by the base-framing, substantially as described.



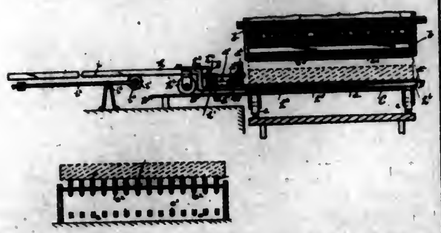
606,161. CISTERN-CLEANER. WILLIAM R. CONWAY and SHERA A. MURRAY, Menominee, Wis.; said Murray assignor to said Conway. Filed Sept. 1, 1897. Serial No. 650,202. (No model.)

Claim.—1. A well or cistern cleaner comprising a bucket hermetically sealed at its top and bottom, means for lowering the same to the bottom of the cistern and raising it therefrom, a hinged bottom for said receptacle, an opening in the said bottom, a valve adapted to close the said opening, a catch adapted to engage the said valve to close the same and provided with a depending lug extending below the bucket, a valve provided in the top of said bucket carried by a sliding stem adapted to extend below the bottom of the bucket, substantially as described.

2. A well or cistern cleaner comprising a hermetically-sealed receptacle, a pipe connected with the top of said receptacle extending to the top of the cistern, a valve provided in the said pipe, an opening provided in the bottom of said receptacle, a valve for closing said opening, a catch for holding the said valve in a closed position carrying a depending projection for releasing said valve when coming in contact with the bottom of the cistern, an opening provided in the top of said receptacle, and a valve adapted to keep said opening normally closed, having a stem mounted on the receptacle and projecting below the bottom thereof for opening the said valve when coming in contact with the bottom of the well, substantially as described.

606,162. TELEPHONE-EXCHANGE SYSTEM. WILLIAM W. DEAN, St. Louis, Mo., assignor to the Bell Telephone Company of Missouri, same place. Filed Feb. 6, 1897. Serial No. 622,948. (No model.)

Claim.—1. In a telephone system, the combination with a telephone-line extending from an exchange to a plurality of substations, of a plurality of positively and negatively polarized bells and electromagnets connected therewith located at the substations, mechanical means controlled by said electromagnets for preventing the actuation of said bells, and means at the central office for including said electromagnets in circuit with direct current of positive or negative sign, and including said bells in circuit with ringing-current of positive or negative sign, substantially as described.



2. In a telephone system, the combination with a telephone-line extending in two limbs from an exchange to a plurality of substations, of a plurality of positively and negatively polarized bells and a plurality of positively and negatively polarized electromagnets connected with each limb of the telephone-line, each substation having a bell connected with one limb and an electromagnet connected with the other limb, mechanical means controlled by said electromagnets for preventing the operation of said bells, and means at the exchange for including said electromagnets in circuit with direct current of positive or negative sign and for including said bells in circuit with ringing-current of positive or negative sign, substantially as described.

3. In a telephone system, the combination with a telephone-line extending in two limbs from an exchange to a plurality of substations, of a plurality of positively and negatively polarized bells, and a plurality of positively and negatively polarized electromagnets, two grounded branches at each substation, each limb of the telephone-line being connected thereat with one of said branches, a bell being included in one of the branches, while an electromagnet is included in the other branch, mechanical means controlled by said electromagnets for preventing the operation of said bells, a source of direct current, a source of ringing-current and switching apparatus for directing positive or negative direct current to operate the electromagnet at the selected station and for directing ringing-current of positive or negative sign over the line, whereby the bell at the selected station may alone be operated, substantially as described.

4. In a telephone system, the combination with a telephone-line

extending in two limbs from an exchange to three substations, a bell at each station connected in circuit with the telephone-line thereat, two positively and negatively polarized electromagnets connected with the same limb of the telephone-line, each electromagnet being included at a substation in a grounded branch, a third electromagnet connected in circuit with the telephone-line at a third substation, mechanical means controlled by said electromagnets for preventing the operation of said bells, and means at the exchange for including said electromagnets in circuit with direct current of positive or negative sign and for including said bells in circuit with ringing-current, substantially as described.

606,163. APPARATUS FOR FORMING HAIR FELT. HIRAM W. FRENCH, Bellevue, Pa. Filed Aug. 6, 1892. Serial No. 442,365. (No model.)

Claim.—1. In apparatus for forming hair felt, the combination of a lower felting-platen and an upper platen, a traveling-chain carrier adapted to carry the material to be felted between said platens, means for moving the same, and mechanism for raising and lowering said traveling-chain carrier, substantially as set forth.

2. In apparatus for forming hair felt, the combination of a lower felting-platen and an upper platen, a carrier normally in operative position with said lower platen, means for moving the same, and mechanism for raising and lowering said carrier, substantially as set forth.

3. In apparatus for forming hair felt, the combination of a lower felting-platen and an upper platen, a carrier normally flush with said lower platen and mechanism for raising and lowering said carrier and means for moving same, substantially as set forth.

4. In apparatus for forming hair felt, the combination of towers through which the hair is caused to fall, a reciprocating table or platform below the same whereby a mass or bat of hair is distributed over the platform, substantially as and for the purposes set forth.

5. In apparatus for forming hair felt, the combination of one or more towers through which the hair is caused to fall, a reciprocating table or platform below the same, and aprons extending from the ends and center of the platform to the towers so as to protect the hair distributed upon the table, substantially as and for the purposes set forth.

6. In apparatus for forming hair felt, the combination of one or more towers through which the hair is caused to fall, a reciprocating table or platform below the same, aprons extending from the ends of the platform to the towers so as to protect the hair distributed upon the table, and means for taking up the aprons as the table reciprocates, substantially as and for the purposes set forth.

7. In apparatus for forming hair felt, the combination of one or more towers through which the hair is caused to fall, a reciprocating table or platform below the same, aprons extending from the ends and center of the platform to the towers so as to protect the hair distributed upon the table, and spring-rollers for taking up the aprons as the table reciprocates, substantially as and for the purposes set forth.

8. In apparatus for forming hair felt, the combination of a reciprocating table, one or more towers through which the hair is caused to drop, and air-blast pipes in said towers for controlling the dropping of the hair, substantially as and for the purposes set forth.

9. In apparatus for forming hair felt, the combination of a reciprocating table having a tine carrier supported thereon, one or more towers above the same through which the hair is caused to drop, and mechanism for engaging said tine carrier to lift the bat from the platform, substantially as and for the purposes set forth.

10. In apparatus for forming hair felt, the combination of a reciprocating table having a tine carrier supported thereon, one or more towers above the same through which the hair is caused to drop, mechanism for engaging said tine carrier to lift the bat from the platform, and mechanism for withdrawing said tine carrier from the traveling carrier after depositing the bat, substantially as and for the purposes set forth.

11. In apparatus for forming hair felt, the combination of a reciprocating table, a tine carrier on the same, a traveling carrier to which the bat is transferred by the tine carrier and felting-platens to which the bat is carried by the traveling carrier, substantially as and for the purposes set forth.

12. In apparatus for forming hair felt, the combination of a lower and upper platen, and edge-felters at the sides thereof, substantially as and for the purposes set forth.

13. In apparatus for forming hair felt, the combination of a lower felting-platen having grooves therein and traveling-chain carriers fitting in said grooves, an upper platen above the same, and edge-felters at the sides of the upper and lower platens, substantially as and for the purposes set forth.

14. In apparatus for forming hair felt, the combination of a lower felting-platen having grooves therein and traveling-chain carriers fitting into said grooves, and an upper platen above the same, substantially as and for the purposes set forth.

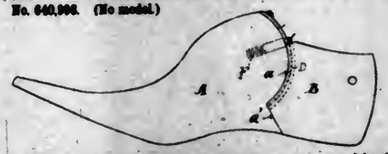
15. In apparatus for forming hair felt, the combination of a lower platen having grooves therein and traveling-chain carriers fitting in said grooves and forming therewith the lower platen of the felting mechanism, substantially as and for the purposes set forth.

16. In apparatus for forming hair felt, the combination of a lower platen having grooves therein and traveling-chain carriers fitting in said grooves and forming therewith the lower platen of the felting mechanism, said traveling-chain carriers being vertically movable, substantially as and for the purposes set forth.

17. In apparatus for forming hair felt, the combination of a lower felting-platen having grooves therein and traveling chains fitting in said grooves, said chains having corrugations or indentures on their upper faces, substantially as and for the purposes set forth.

18. In apparatus for forming hair felt, the combination of a lower felting-platen having grooves therein and traveling chains fitting in said grooves, said chains having grooves on their lower faces, substantially as and for the purposes set forth.

19. In apparatus for forming hair felt, the combination of a lower felting-platen having grooves therein and traveling chains fitting in said grooves, said chains being connected by a tongue-and-groove joint having a pivot therein, substantially as and for the purposes set forth.



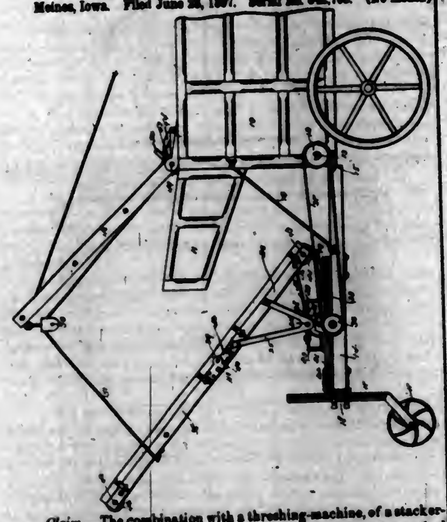
20. In a felting-machine, a driving-shaft having eccentrics provided with eccentric-collars in combination with counterbalances fitting around said eccentric-collars and reciprocated by said eccentrics, substantially as and for the purposes set forth.

21. In a felting machine, a driving-shaft having eccentrics provided with eccentric-collars in combination with counterbalances fitting around said eccentric-collars, and having weights thereon, substantially as and for the purposes set forth.

22. In a felting-machine, a driving-shaft having eccentrics provided with eccentric-collars in combination with counterbalances fitting around said eccentric-collars and having weights thereon, said weights being adjustable, substantially as and for the purposes set forth.

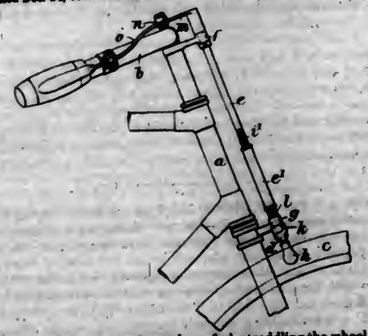
23. In a felting-machine, a driving-shaft having eccentrics provided with eccentric-collars and annular grooves in combination with counterbalances fitting around said eccentric-collars and attached by set-screws entering said grooves, substantially as and for the purposes set forth.

606,164. LAST. JOHN F. CRAFT, Lynn, Mass., assignor of one-half to Charles L. Holland, Boston, Mass. Filed June 16, 1897. Serial No. 640,998. (No model.)



Claim.—1. A last divided transversely into a fore and heel portion by being cut between the heel and shank portion on an angle for a short distance and then on an arc of a circle, so that the two parts will fit together, the angular portion being toward the rear from the curved portion and forming a stop, a circular flaring tenon secured to the circular portion of the fore part and a circular mortise with receding sides secured to the circular part of the heel portion and adapted to fit onto said tenon on the fore part, whereby the fore and heel portions are held in close contact but so that the fore portion is free to be depressed substantially as set forth.

2. A last consisting of a fore part the rear of which is cut on an angle at the rear of the shank for a short distance and then on an arc of a circle and a heel portion cut to correspond and fit thereon the angular portion being toward the rear from the curved portion and the two parts being held together by a dovetail joint whereby the forward portion can be bent down to place a shoe upon or remove a shoe from the last and when raised the angular parts will come together and form a stop substantially as set forth.

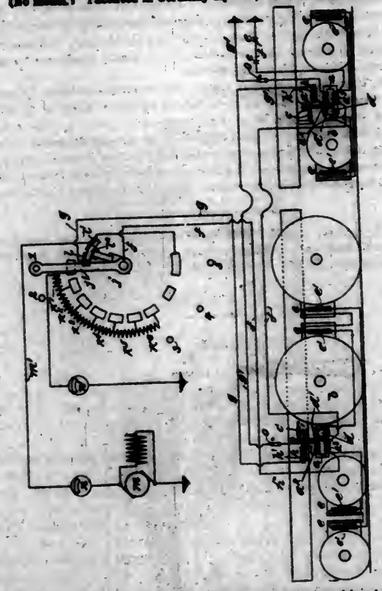


3. In combination with a last divided transversely into a fore and heel portion connected together by means of a dovetail joint, a spring locking-bolt attached to the rear of the fore portion and projecting below the edge of the heel portion to hold the two portions in the closed position but capable of being depressed so as to pass within the heel portion so that the fore part of the last can be pressed down substantially as set forth.

606,165. STRAW-STACKER. HENRY R. GREGORY and RICHARD H. RATTOS, Prescott, Iowa, assignors of one-half to C. H. Dicks, Des Moines, Iowa. Filed June 28, 1897. Serial No. 642,769. (No model.)

Claim.—The combination with a threshing-machine, of a stacker-frame hinged thereto in such a manner as to be capable of a vertical movement and all lateral movement be prevented, and so that the stacker-frame is held in alinement with the threshing-machine frame at all times, a caster-wheel having an upright connected therewith, bearings on the rear central portion of the stacker-frame designed to receive said upright and permit it to be adjusted vertically therein, clamping devices for fixing the upright in any desirable position relative to the said bearing, and straw-stacking mechanism on said frame, substantially as and for the purposes stated.

606,166. BICYCLE-BRAKE. JOHN HARRISON, Peterborough, England, assignor to the Elliptic Cycle Company, Limited, same place. Filed Dec. 24, 1897. Serial No. 663,333. (No model.)



Claim.—1. In a brake for cycles, a fork straddling the wheel, and means for rotating it so as to cause the arms of said fork to make contact with the sides of the wheel-tire, substantially as described.

2. In a brake for cycles, the combination of a fork straddling the wheel-tire, a shaft made in two parts telescoping one into the other, the lower end of which shaft carries the said fork, and means for forcing down such fork and also for imparting rotary motion to it, substantially as set forth.

3. In a brake wherein a fork which straddles a wheel-tire is adapted to be rotated upon its axis, the combination of a bracket having a groove *j*, a fork having an inclined lug for causing the depression of the said fork, and a spring for returning the fork to its normal position when released, substantially as described.

606,167. ELECTRIC BRAKE. ERNST W. G. G. HOFFMANN, Charlottenburg, Germany, assignor to the Siemens & Halske Electric Company of America, Chicago, Ill. Filed Dec. 29, 1897. Serial No. 664,388. (No model.) Patented in Germany Apr. 14, 1896, No. 92,760.

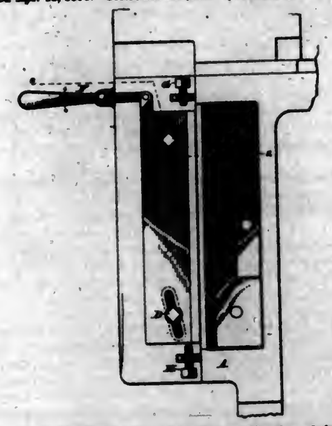
Claim.—1. In an electric braking system, the combination with a dynamo suitably mounted to be driven by the movement of the controlled wheel or wheels, of an electromagnetic brake appliance connected with said dynamo, a controlling-circuit, and an electromagnetic controlling device connected in said circuit adapted to secure the transmission of current from said dynamo to the brake appliance when the said device is actuated, substantially as described.

2. In a braking system for cars or vehicles, the combination with a dynamo connected with and driven by the wheels of the car or vehicle, of an electromagnetic brake appliance connected with the said dynamo and adapted to be actuated thereby, a controlling-circuit, and an electromagnetic controlling device connected in said controlling-circuit adapted normally to prevent the actuation of the brake appliance by the said dynamo-electric machine, substantially as described.

3. The combination with a dynamo-electric machine *a* adapted to be driven by the controlled wheel or part, of an electromagnetic brake appliance *c* electrically connected with said dynamo, a controlling-circuit *g g'*, a circuit-controlling device *j*, and an electromagnetic device *k''* associated with said dynamo and adapted normally to prevent the actuation of the dynamo by the controlled wheel or part, substantially as described.

4. The combination in an electric-brake system with a dynamo *a* adapted to be moved into and out of operative engagement with the controlled wheel *b* by which the same is adapted to be driven, of an electromagnetic brake appliance acting upon said wheel, a controlling-circuit *g g'*, a controller *j*, and an electromagnetic controlling device *k''* connected in said circuit adapted to secure the operative connection and disconnection of the dynamo with the actuating-wheel *b*, substantially as described.

5. The combination with a dynamo-electric machine *a* adapted to be driven by the controlled wheel or part, of an electromagnetic brake appliance *c* electrically connected with said dynamo, a controlling-circuit *g g'*, a circuit-controlling device *j*, and an electromagnetic controlling device *k''* associated with the dynamo and adapted



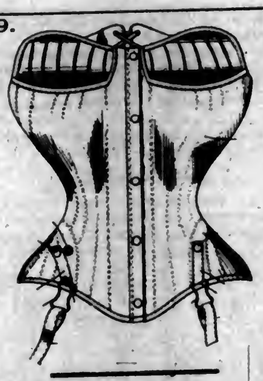
normally to prevent the actuation of the brake appliance by said dynamo, substantially as described.

6. The combination with a dynamo-electric machine *a* adapted to be driven by the controlled wheel or part, the said dynamo having a normally-excited field-winding a^3, of an electromagnetic brake appliance *e* electrically connected with said dynamo, a controlling-circuit *g g'*, a circuit-controlling device *j*, and an electromagnetic device h'' associated with said dynamo and adapted normally to prevent the actuation of the dynamo by the controlled wheel or part, substantially as described.

7. The combination with a dynamo-electric machine *a* adapted to be driven by the controlled wheel or part, the said dynamo being provided with means for augmenting its normal field of force, of an electromagnetic brake appliance *e* electrically connected with said dynamo, a controlling-circuit *g g'*, a circuit-controlling device *j*, and an electromagnetic device h'' associated with the dynamo and adapted normally to prevent the actuation of the brake appliance by said dynamo, substantially as described.

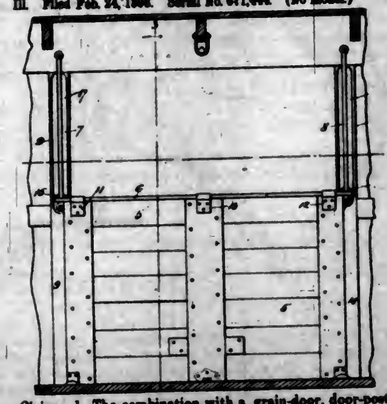
8. In an electric braking system the combination with a dynamo-electric machine *a* adapted to be driven by the rotation of the controlled wheel or part, of an electromagnetic brake appliance connected with said dynamo and adapted to be actuated thereby, a controlling device h'' associated with said dynamo and adapted normally to prevent the actuation of the brake appliance by said dynamo, and means for governing the controlling device, substantially as described.

606,168. LINOTYPE-MACHINE. THOMAS H. KELLER, New York, N. Y., assignor to the Mergenthaler Linotype Company, of New York. Filed Apr. 12, 1886. Serial No. 582,167. (No model.)



Claim.—1. In a linotype-machine the combination of the stationary knife, a movable opposing knife having its edge parallel therewith, obliquely-arranged guiding devices for the movable knife, independent adjustable stops to limit the motion in opposite directions, and a mechanical means for effecting the movement at will.

2. In a linotype-machine the combination of a stationary knife, an obliquely-guided knife, a lever whereby the latter may be moved endwise and stop devices adjusted to permit the movement of the knife, but limiting its motion in both directions whereby the knife may be instantly adjusted to trim slugs of either of two predetermined thicknesses.



606,169. CORSET. MURRAY C. MAYER, Chicago, Ill., assignor to the Sage-Downs Company, same place. Filed July 28, 1897. Serial No. 646,276. (No model.)

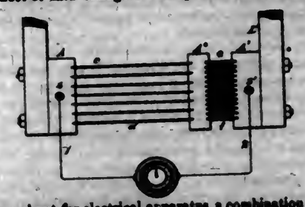
Claim.—In a corset, the combination with a corset-body having a binding applied to its lower edge, of a vertically-arranged strap applied to the outer face of the corset, and having its lower end extended under and permanently secured in place within the said binding, and a fastening device comprising two members, one of which is attached to the upper end of the strap, and the other of which is attached to the body of the corset in position to hold the strap flat against the outer face of the corset-body and taut when the two members of the fastening device are engaged with each other, whereby a suspension-loop passed over the strap is crowded by the lower end thereof against the body of the corset at a point substantially in line with the upper edge of the said binding, so that a portion of the draft or strain imposed upon the loop is borne by the corset-body in a line coincident with the same.

606,169.

606,170. GRAIN-CAR DOOR. WILLIAM A. MCGUIRE, Chicago, Ill. Filed Feb. 24, 1896. Serial No. 671,444. (No model.)

Claim.—1. The combination with a grain-door, door-posts provided with grooves, and guide-rods arranged in said grooves, of a pivot-rod secured upon the upper edge of said door, said rod extending from end to end of said door and having eyes at its ends adapted to embrace the guide-rods and move vertically thereon in said grooves, substantially as described.

2. The combination with a grain-door, door-posts provided with grooves, and guide-rods secured in said grooves, of a pivot-rod secured upon the upper edge of said door, said pivot-rod extending from end to end of said door and having eyes at its ends adapted to embrace the guide-rods and move vertically thereon in said grooves, and means preventing endwise movement of the door upon said pivot-rod, substantially as described.



3. The combination with a grain-door, door-posts and guide-rods secured to said door-posts, of a pivot-rod secured upon the upper edge of said door, said pivot-rod extending from end to end of said door, and having eyes at its ends adapted to embrace the guide-rods and move vertically thereon, bearing-plates secured to said door and supporting said pivot-rod, said pivot-rod having shoulders at each side of one of said bearing-plates whereby endwise movement of the door upon said pivot-rod is prevented, substantially as described.

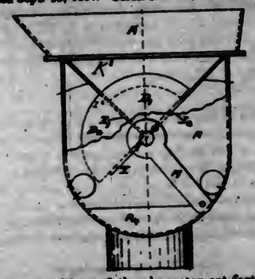
606,171. SHUNT FOR ELECTRIC CIRCUITS. OLIVER B. SHALLENBERGER, Rochester, Pa.; Mary W. Shallenberger executrix of said Oliver B. Shallenberger, deceased. Filed Apr. 22, 1897. Serial No. 633,261. (No model.)

Claim.—1. An electric shunt comprising two groups of conductors which have different temperature coefficients, substantially as described.

2. A shunt having a resistance varying with changes of temperature, and a second resistance connected therewith for the purpose of modifying such variations in resistance, each of said resistances comprising a group of conductors arranged in multiple, substantially as described.

3. A composite shunt having a plurality of multiple resistances differently affected by changes in the temperature of the surrounding air, said resistances being connected to act conjointly in modifying the effect of said changes in temperature, substantially as described.

4. In a shunt for electrical apparatus, a combination of multiple resistances in which a plurality of conducting materials is employed, said material having different degrees of variation in resistance for a given change in the temperature of the surrounding air, substantially as and for the purpose described.

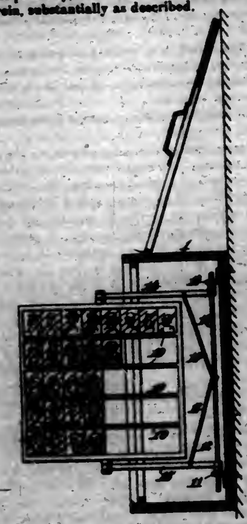


5. In a shunt for electrical apparatus designed to have a certain definite variation in resistance for a given change in the temperature of the surrounding air, the combination of a group of conductors having a greater variation, and a second group of conductors having a less variation than the said definite variation required.

6. In a shunt for electrical apparatus, the combination of a multiple resistance which varies with changes in the temperature of the surrounding air, and a second multiple resistance having a comparatively small variation for like changes in temperature, substantially as described.

7. The combination with an electrical device comprising a circuit having a resistance varying with changes in the temperature of the surrounding air, of a shunt thereto comprising conductors composed of materials having different temperature coefficients, said conductors being so proportioned that their joint resistance shall vary with changes in the temperature of the air so as to maintain a practically fixed ratio between the resistances of said shunt and said circuit.

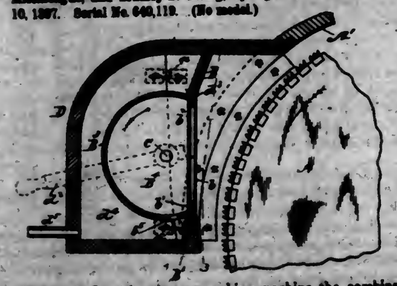
8. The combination with an electrical measuring instrument in which the indications for a given difference of potential are rendered inaccurate by changes in the temperature of the surrounding air, of a shunt thereto comprising two conductors having temperature coefficients differing from each other and adjusted to jointly vary the resistance of said shunt with changes in the temperature of the air so as to compensate for the variations of said measuring instrument.



606,172. SAND-BOX FOR RAILROAD-CARS. HENRY M. SPELLER, Newark, N. J., assignor of one-half to Halsey M. Barrett, Bloomfield, N. J. Filed Sept. 15, 1897. Serial No. 651,718. (No model.)

Claim.—In a sand-box of the character set forth, a top part or funnel having four sides, suitably attached to the main body or shell, a sand receiving and distributing compartment having two chambers, whose sides lie in alinement with the four sides of the top part, a main body or shell inclosing and supporting the receiving and distributing compartment, and having the funnel secured to its top, having two hubs, a screw-cut pivot having its screw-cut part fitting in the similarly screw-cut aperture in one of the hubs aforesaid, a second pivot secured loose in the hub of the main body and attached to a hub on the receiving and distributing compartment, a lever-arm firmly secured to the pin, loosely pivoted in the hub of the main body, all for the purposes as set forth, substantially as illustrated and described.

606,173. DEVICE FOR DISPLAYING PICTURES, ADVERTISEMENTS, &c. RICHARD SYLVESTER, Washington, D. C. Filed May 14, 1896. Serial No. 592,722. (No model.)



Claim.—1. A device for displaying photographs, and the like, comprising a casing, two parallel, horizontally-disposed angle-irons secured on the inner side of the back thereof, a series of frame-supports pivotally mounted in said angle-irons, and a series of picture-carrying frames pivotally mounted in said frame-supports and axially revolvable therein, substantially as described.

2. A device for displaying photographs, and the like, comprising a casing, two parallel, horizontally-disposed angle-irons secured on the inner side of the back thereof, and provided with a series of apertures, a series of frame-supports pivotally mounted in said casing, each of which comprises a rod, the opposite ends of which pass through corresponding apertures in said angle-irons, and arms extending at right angles to said rod at points near its upper and lower ends, respectively, and a picture-carrying frame pivotally mounted in the outer ends of said arms and free to revolve axially on its supports, substantially as described.

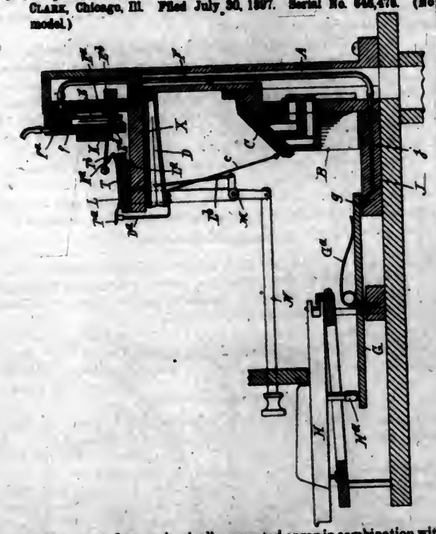
3. In a device for displaying photographs, and the like, the combination with an oblong casing, of two parallel, horizontally-disposed angle-irons secured on the inner side of the back thereof and provided with a series of apertures, a series of frame-supports pivotally mounted in said casing, each of which comprises a vertical rod, the opposite ends of which pass through corresponding apertures in said angle-irons, arms extending at right angles to said rod and secured thereto at points near its upper and lower ends, respectively, and brace rods connecting said arms and said vertical rod, and a picture-carrying frame pivotally mounted in the outer ends of said arms and free to revolve axially on its supports, substantially as described.

606,174. BEATING OR WASHING ENGINE. ALLEN A. WHEAT, West Springfield, Mass., assignor of two-thirds to Charles McKernon, Mittineague, and Bradley D. Rising, Springfield, Mass. Filed June 10, 1897. Serial No. 640,119. (No model.)

Claim.—1. In a beating or washing machine the combination with a rotary beating-cylinder, of an inclosing casing for said cylinder, an auxiliary drum-chamber opening into said first-named chamber, and a rotary drum to close said opening, said drum being provided with a screen on one side and a water-outlet.

2. In a beating or washing engine, the combination with a rotary beating-cylinder, of an inclosing casing for said cylinder, an

auxiliary chamber in proximity to said casing, a partition separating the interiors of the said casing and chamber and having an opening therethrough, a rotary drum having a flattened screened side and a cylindrical imperforate portion which are adapted to be alternately interchanged to close the opening in said partition and provided with a water-outlet.

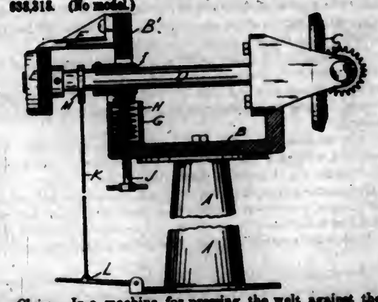


3. The combination in a beating or washing engine with the beating-cylinder A, of the drum-chamber d^4 having an opening between it and the cylinder-casing, a drum B^4 contained within said chamber d^4, means for turning said drum B^4, the screen-partition B^2 carried by said drum B^4, and the curved drum-section B^3 having a water-outlet.

4. The combination in a beating or washing engine of the beating-cylinder A, the case D having a chamber d^4, an opening between the said chamber and the cylinder-casing, the partial partitions B, B' and the rotary drum B^4 having the screen B^2, an outlet, the curved section B^3, the said curved section B^3 maintaining a close joint with the lower edge or bottom of the partition B as the drum is being turned to move the screen from an operative to an inoperative position and the section B^3 to a position to close the opening.

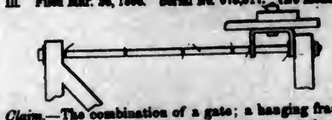
5. In a beating or washing engine, the combination with a beating-cylinder, of an inclosing casing for said cylinder, an auxiliary chamber, a partition having an opening separating the interiors of said cylinder-casing and auxiliary chamber, a screen to span the opening in said partition, a cover to close the opening, and mechanism by means of which the cover is thrown into operative position when the screen is moved out of operative relation to the beating-cylinder and the screen is brought into operative position when the cover is moved away from said opening.

6. In a beating or washing engine, the combination with a beating-cylinder, of an inclosing casing for said cylinder, an auxiliary chamber removably secured in proximity to said cylinder-casing, a partition having an opening separating the interiors of said cylinder-casing and auxiliary chamber, a screen to span the opening in said partition pivoted in said auxiliary chamber, a cover, also pivoted in said auxiliary chamber, to close the opening, and mechanism by means of which the cover is thrown into operative position when the screen is moved out of operative relation to the beating-cylinder and the screen is brought into operative position when the cover is moved away from said opening.



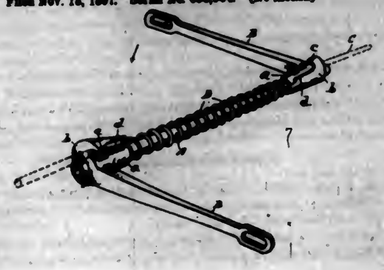
606,175. COUPLER FOR PNEUMATIC ORGANS. MELVILLE CLARK, Chicago, Ill. Filed July 30, 1897. Serial No. 646,478. (No model.)

Claim.—1. In a mechanically-operated organ in combination with the reed-valves, motor-pneumatics which operate them, primary pneumatics which cause the motor-pneumatics to act; vent-valves for the primary pneumatics, and lever-arms extending from the motor-pneumatics and from the vent-valves respectively; a pivoted coupler-board; rock-shafts mounted obliquely thereon having lever-arms at their opposite ends adapted to cooperate respectively with the lever-arms of the motor-pneumatics and with those of the vent-valves of the octave-distant primary pneumatics, the coupler-board pivot being so located that at one position of the board the rock-shaft lever-arms at one end will be encountered and actuated by the motor-pneumatic lever-arms, and those at the other end will encounter and actuate the vent-valve lever-arms, and at another position said rock-shaft lever-arms at one end shall be out of operative relation to the lever-arms of the cooperating part.



2. In a pneumatic organ in combination with the horizontally-located motor-pneumatics and the board X upon the under side of which they are mounted; the primary pneumatics having vent-valves K; a coupler-board mounted upon the upper side of the board X; and the rock-shafts mounted obliquely thereon having lever-arms at their opposite ends respectively, one octave distance apart; the motor-pneumatics having the lever-arms D^5 and the vent-valves having the lever-arms K^5 in position to cooperate with the front and rear rock-shaft arms respectively; the coupler-board being pivoted at one edge and provided with stop connections for tilting it on its pivot, to carry the lever-arms at one end of the rock-shafts into and out of operative relation with the lever-arms of their respective cooperating parts.

606,176. SOLE-LAYING MACHINE. GEORGE A. MOORE and HARRY J. ROSENKAUF, Philadelphia, Pa. Filed May 26, 1897. Serial No. 638,318. (No model.)



Claim.—In a machine for pressing the welt against the outer edge of the sole, a rigid lip that is secured to the frame, combined with a vertically-adjustable roller placed upon a driven shaft and which roller projects beyond the outer end of the lip, and forms a support for the sole of the shoe; the outer end of the lip being formed so as to enter the crease between the upper and the welt, and flat on its under side so as to straighten out the wrinkles in the welt, substantially as shown.

606,177. FARM-GATE. ROBERT B. MCCLELLAND, Williamsville, Ill. Filed Mar. 26, 1898. Serial No. 675,317. (No model.)

Claim.—The combination of a gate; a hanging frame to which the gate is secured; a bar pivoted at the ends of the arms of the hanging frame, which bar has several grooves formed in it, perpendicular to its central line; a stirrup which is bolted to the gate and which slides on the bar through slots in the arms of the stirrup; a collar fitting about the bar between the arms of the stirrup and which fits into the grooves in the bar and thus controls the movement of the stirrup on the bar, all substantially as and for the purposes set forth.

606,178. DEVICE FOR TIGHTENING WIRE. JAMES B. VAIL, Weston, Mich., assignor of one-half to Wellington C. Smith, same place. Filed Nov. 13, 1897. Serial No. 658,504. (No model.)

Claim.—1. In a device for crimping and tightening wire, the combination of the supporting-shaft, a shoulder at one end of said shaft adapted to engage a lateral wire, a pivoted lever at the opposite end of said shaft having a reversed shoulder also adapted to engage said wire whereby a spiral twist may be placed in said wire by a rotation of said lever.

2. In a wire-tightening device, the combination of a supporting-shaft, opposed engaging shoulders on the opposite ends of said shaft adapted to receive a lateral wire, and means for rotating one of said shoulders to crimp the lateral wire spirally around said shaft.

3. In a wire-tightening device, the combination of a supporting-shaft, the opposed levers pivoted on opposite ends of said shaft, the opposed engaging hooks carried by said levers adapted to engage a lateral wire whereby said wire may be wound spirally around said shaft by a reverse movement of said levers.

4. In a wire-tightening device, the combination of a supporting-shaft, the opposed levers pivoted on the opposite ends of said shaft, the engaging hooks upon the hubs of said levers standing in opposite directions, and the coiled spring surrounding said shaft between the hubs of said levers.

606,179. STRINGING PIANOS. CHARLES S. WEBER, San José, Cal. Filed July 26, 1897. Serial No. 646,012. (No model.)

Claim.—1. In stringed instruments, a sound-bridge provided on its upper face with two longitudinal series of staple-like bearing-wires 5 spaced apart and arranged in transverse pairs, the bearing-wires of each pair being located at opposite sides of the central line of the bridge, a string or strings extending across the bearing-wires of each pair, a rail provided at its lower face with a central longitudinal series of similar-spaced staple-like bearing-wires 4 adapted to bear upon the said strings on a line between each pair of bearing-wires on the bridge, and adjustable connections uniting the bridge and rail, substantially as described.

2. In stringed instruments, the combination of a sound-board 1, a bridge 2 mounted thereon, two series of spaced staple-like bearing-wires 5 having their prongs entered into the upper face of the bridge, said series being arranged in transverse pairs located at opposite sides of the central line of the bridge, strings 7 extending across the bearing-wires of each pair, a rail 3 adapted to clamp the strings against said bearing-wires, a longitudinal series of spaced staple-like bearing-wires 4 having their prongs entered into the lower face of the rail and adapted to bear upon said strings on a line between each pair of bearing-wires 5 on the bridge, bolts 6 extending up through the sound-board, bridge and rail, a nut 14 engaging the threaded end of each bolt, and washers 10 13 encompassing each bolt between the head of the bolt and sound-board, and nut and rail, substantially as described.

REISSUES.

11,670. INDICATOR. WILL H. WIRRE, Carthage, Ohio. Filed Mar. 12, 1898. Serial No. 673,670. Original No. 563,640, dated June 4, 1897.

Claim.—1. In an indicating apparatus, the combination of a display-plate, means for advancing said plate pivotally connected thereto, and swinging means for engaging the plate as it advances and thereby causing it to turn into its display position, substantially as described.

2. In an indicating apparatus, the combination of a display-plate, means for advancing said plate pivotally connected thereto, swinging means for engaging the plate as it advances and thereby causing it to turn into its display position, and means for locking said plate in its display position, substantially as described.

3. In an indicating apparatus, the combination of a display-plate having an advancing means hinged or pivotally connected thereto, a stop whereby the plate is held in display position when advanced, and swinging restraining means for causing the plate as advanced to assume its display position, substantially as described.

4. In an indicating apparatus, the combination of a display-plate, a sliding rod pivotally connected thereto, means for engaging one side of the plate as it advances and thereby causing it to turn into its display position, and means for engaging the other side of said plate when in its display position and thereby locking it therein, substantially as described.

5. In an indicating apparatus, the combination of a display-plate, a rod pivotally connected thereto, a swinging arm adapted to engage and turn said plate as it advances into its display position, and means for locking said plate in its display position, substantially as described.

6. In an indicating apparatus, the combination of a casing provided with an aperture, a display-plate in said casing, a rod pivotally connected thereto, a swinging arm provided with a projection at its free end adapted to engage and turn said plate and means for locking said plate in its display position, substantially as described.

7. In an indicating apparatus, the combination of a casing, provided with an aperture, a display-plate in said casing, a sliding rod pivotally connected thereto, a swinging arm provided with a projection at its free end adapted to engage and turn said plate, means for automatically retracting said arm when the rod is drawn back, and means for locking said plate in its display position, substantially as described.

8. In an indicating apparatus, the combination of a casing provided with an aperture, a display-plate in said casing, a sliding rod pivotally connected thereto, two swinging arms provided with projections at their free ends, one of said arms being adapted to turn said plate as it advances and the other to lock it in its display position, substantially as described.

9. In an indicating apparatus, the combination of a casing provided with an aperture, a display-plate in said casing, a sliding rod pivotally connected to said plate, two swinging arms, each provided with a projection at its free end adapted to engage and turn said plate pivoted to said casing and arranged opposite to each other and springs for retracting said arms when the rod is drawn back, substantially as described.

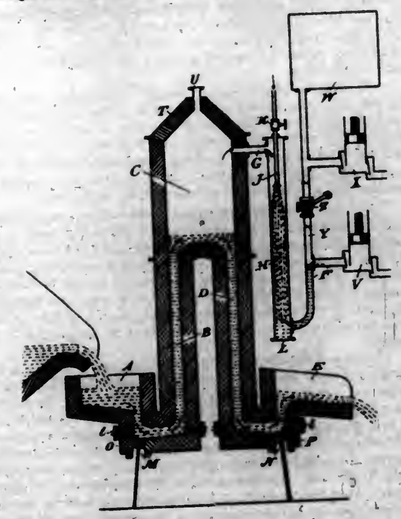
10. In an indicating apparatus, the combination of a frame, an index-plate adapted to stand edgewise when not in use, and flatwise when in use as a display-sign, a reciprocating rod for advancing the plate, front abutments for the index-plate, and a reciprocating device for operating on the plate, this device consisting of a pivoted arm, and an arm angulated thereto, and a spring for elastically returning this reciprocating device to its first position when free to so do, substantially as described.

11. In an indicating apparatus, the combination of the index-plate, making its preliminary advance edgewise, and the arm M^3 hinged at one end to the frame, and provided at its free end with a projection and with an angulated arm connected to the arm M^3, and spring P^7 connected to the angulated arm and to the frame, and swinging restraining means for engagement with the display-plate, substantially as described.

12. In an indicating apparatus, a front apertured frame having detents K^2, and an index-plate adapted to make its preliminary advance toward the said aperture, and an arm M^3 hinged at one end and carrying swinging restraining means at the other, and having the angulated arm M^3, and a spring connected substantially as described and adapted to elastically draw back the arm into the first position whenever free to do so, substantially as described.

13. In an indicating apparatus, a frame having a front aperture and having detents K^2, and an index-plate adapted to make its preliminary advance toward the said aperture, and a rod for advancing the plate, and hinged thereto, and a spring for elastically keeping the plate edgewise when allowed to so do, and an arm M^3 hinged at one end and carrying the swinging restraining means and having the angulated arm M^3, and a spring adapted to elastically draw back the arm into its first position whenever free to so do, substantially as described.

14. In an indicating apparatus, a compartment or division, a front aperture thereof, and an index-plate, and means for advancing the latter, and a spring for locating the plate edgewise to the aperture when free so to do, and two sets of independent devices each having an arm M^3 hinged at its outer end, and provided at its free end with a detent projection M^5 and an angulated arm M^3, and a spring strained between the said device and a portion of the frame for drawing the arms M^3, M^3 back to a given position, the projections M^5 of the respective arms being nearest as the arms are moved, these two independent opposite devices cooperating to properly turn the plate as the latter is advanced and locate it at the aperture, and properly assist in returning the plate to its first position, substantially as and for the purposes specified.



15. In an indicating apparatus, the combination of the plate in its rear position standing edgewise to the front of the machine and front abutments to receive the index-plate when advanced and in a display position, the device M consisting of the two arms M^3, M^3 each carrying the arm M^2 angulated thereto, and each having end projections M^3 and the connecting-rod M^4, and spring P operating between the rod M^4 and a fixed portion of the stationary frame of the machine, substantially as described.

16. In an indicating apparatus, the combination of the plate in its rear position standing edgewise to the front of the machine, and front abutments to receive the index-plate when advanced and in a display position, the devices M each consisting of the two arms M^3, M^3, each carrying the arm M^2 angulated thereto, and each having end projections M^3, and the connecting-rod M^4, and spring P operating between the rod M^4 and a fixed portion of the stationary frame of the machine, the devices M being present and oppositely disposed in the compartment, and coöperating to turn the plate edgewise as it is retracted, substantially as described.

17. In an indicating apparatus, the combination of the plate, in its rear position standing edgewise to the front of the machine, and front abutments to receive the index-plate when advanced and in a display position, the devices M each consisting of the two arms M^3, M^3, each carrying the arm M^2 angulated thereto, and each having swinging restraining means for causing the plate to assume its display position, and the connecting-rod M^4, and spring P operating between the rod M^4 and a fixed portion of the stationary frame of the machine, the devices M being present and oppositely disposed in the compartment, and coöperating to turn the plate edgewise as it is retracted, a rod hinged to the plate, and a spring adapted to elastically move the plate so as to bring the plate flatwise to the side of the rod, substantially as described.

18. In an indicating apparatus, the combination of the plate, in its rear position standing edgewise to the front of the machine, and front abutments to receive the index-plate when advanced and in a display position, the devices M each consisting of the two arms M^3, M^3, each carrying the arm M^2 angulated thereto, and each having end projections M^3 and the connecting-rod M^4, and spring P operating between the rod M^4 and a fixed portion of the stationary frame of the machine, the devices M being present and oppositely disposed in the compartment, and coöperating to turn the plate edgewise as it is retracted, a rod hinged to the plate, and a spring adapted to elastically move the plate so as to bring the plate flatwise to the side of the rod, and a platform for supporting the rods and guides for compelling the rod to run longitudinally in a given line, substantially as described.

11,671. MACHINE FOR EXHAUSTING MOLTEN METAL. JACOB T. WAINWRIGHT, Chicago, Ill. Filed Apr. 22, 1898. Serial No. 678,480. Original No. 596,037, dated Jan. 25, 1898.

Claim.—In combination with an exhauster; a connected vacuum-chamber with an elevated bottom, a trap inlet, and a trap outlet; substantially.

DESIGNS.

28,883. BADGE. JOHN BRATHING, Philadelphia, Pa. Filed May 12, 1898. Serial No. 680,527. Term of patent 7 years.

Claim.—The design for a badge or similar article, as herein shown and described.

28,884. BADGE. JOHN J. CLOIN, Lowell, Mass. Filed May 2, 1898. Serial No. 679,544. Term of patent 7 years.

Claim.—The design for a badge, substantially as herein shown and described.

28,885. HANDLE FOR SPOONS, &c. BENJAMIN W. GOODING and GEORGE GOODING, Plymouth, Mass. Filed Aug. 19, 1897. Serial No. 648,833. Term of patent 7 years.

Claim.—The design for a handle for spoons, forks and similar articles, substantially as herein shown and described.

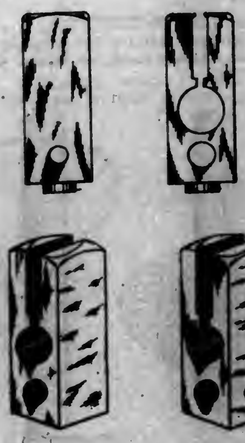
28,886. TEA OR COFFEE POT STRAINER. JOHN P. BOOTH, Newton, Mass. Filed May 26, 1898. Serial No. 681,503. Term of patent 7 years.

Claim.—The design for a tea or coffee pot strainer, substantially as described.

28,887. FRAME FOR REFLECTING-SPECTACLES. JOHN STORER CORNELLY, Titusville, Pa. Filed Sept. 30, 1897. Serial No. 653,655. Term of patent 14 years.

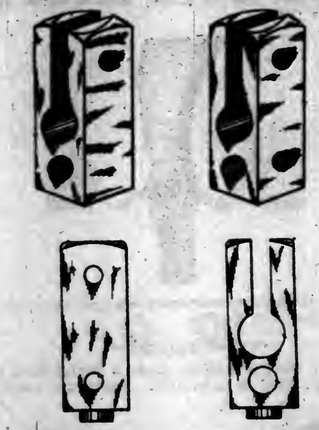
Claim.—The design for a frame for reflecting-spectacles substantially as shown and described.

28,888. THREAD OR TWINE CUTTER. WALTER R. ROBBINS, Blenburst, Cal. Filed Mar. 16, 1898. Serial No. 673,470. Term of patent 14 years.



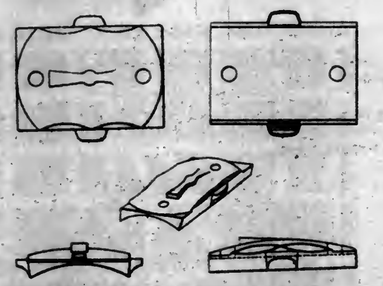
Claim.—The design for a thread and twine cutter substantially as shown and described.

28,889. FASTENER FOR FENCE-STAYS. WILLIAM ALONZO FORNER, Butler, Ohio. Filed Dec. 20, 1897. Serial No. 662,767. Term of patent 14 years.



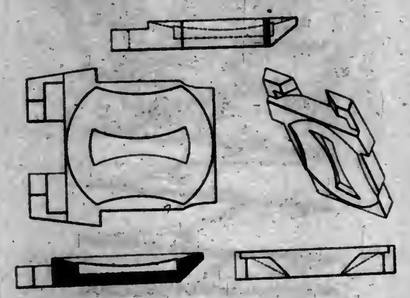
Claim.—The design for a fastener for the stays of wire fences, substantially as shown and described.

28,890. CLIP-POST. JOHN J. ZIMMER, Merchantville, N. J. Filed May 13, 1898. Serial No. 680,642. Term of patent 3½ years.



Claim.—The design for a clip-post, substantially as shown and described.

28,891. HINGE-POST. JOHN J. ZIMMER, Merchantville, N. J. Filed May 13, 1898. Serial No. 680,644. Term of patent 3½ years.

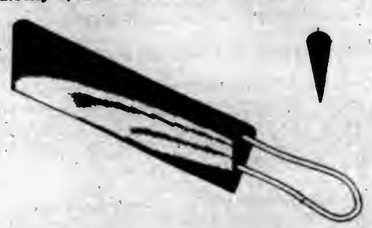


Claim.—The design for a hinge-post, substantially as shown and described.

28,892. CROWN-BACK FOR CAR AXLE BEARINGS. WILLIAM B. SMITH, New York, N. Y., assignor to the Smith Adjustable Car-Axle Bearing Company, same place. Filed May 25, 1898. Serial No. 681,751. Term of patent 14 years.

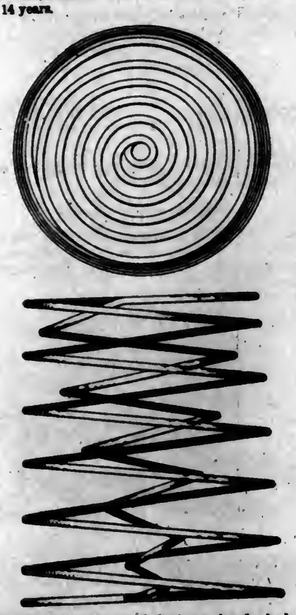
Claim.—The design for a crown-back for car-axle bearings, substantially as shown and described.

28,893. WEDGE FOR CAR-AXLE BEARINGS. WILLIAM B. SMITH, New York, N. Y., assignor to the Smith Adjustable Car-Axle Bearing Company, same place. Filed May 25, 1898. Serial No. 681,752. Term of patent 14 years.



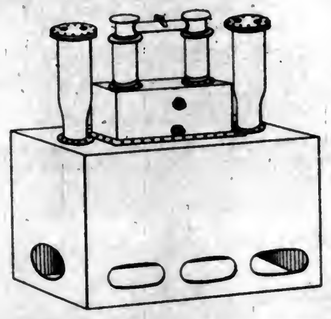
Claim.—The design for a wedge for car-axle bearings, substantially as shown and described.

28,894. SEPARATOR OR CLOVER-HULLER TOOTH. MARSHAL T. REEVES and JOHN H. KAILOR, Columbus, Ind., assignors to Reeves & Co., same place. Filed Feb. 24, 1898. Serial No. 672,106. Term of patent 14 years.



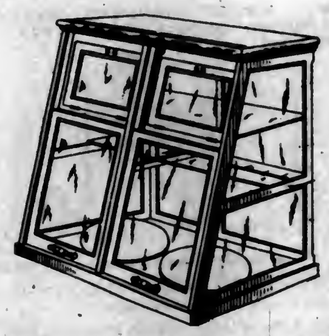
Claim.—The design for a separator or clover-huller tooth, substantially as shown and described.

28,895. SHARPENING-TOOL. ARTHUR G. HUNTLEY, Toston, Mont. Filed May 13, 1898. Serial No. 681,071. Term of patent 7 years.



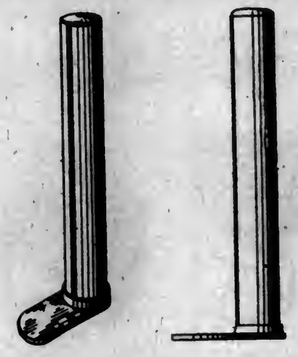
Claim.—The design for a sharpening-tool as herein shown and described.

28,896. COILED-WIRE SPRING FOR BEDS, &c. WILLIAM A. CONSTOCK, Cleveland, Ohio. Filed Dec. 21, 1897. Serial No. 662,941. Term of patent 14 years.



Claim.—The design for a coiled-wire spring for beds and other household furniture, substantially as herein shown and described.

28,897. FRAME FOR ICE AND REFRIGERATING MACHINES. RUSSELL D. HOLMES, Oakland, Cal. Filed May 26, 1897. Serial No. 638,175. Term of patent 7 years.

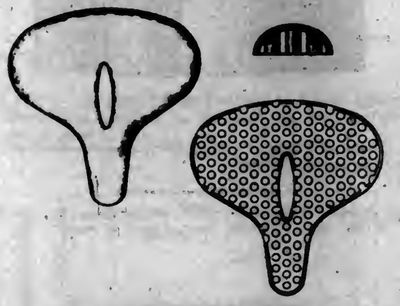


Claim.—The design for a frame for an ice and refrigerating machine, substantially as herein shown and described.

28,898. CHEESE-CABINET. FREDERICK M. KEITH, Somerville, Mass. Filed Apr. 28, 1898. Serial No. 679,142. Term of patent 7 years.

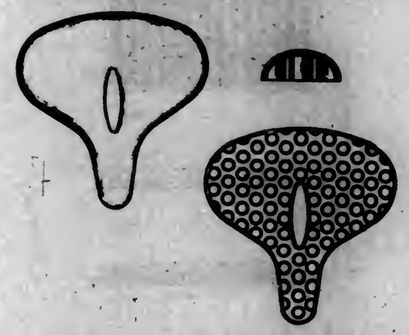
Claim.—The design for a cheese-cabinet, substantially as herein shown and described.

28,899. BODY AND BASE FOR BICYCLE-PUMPS. DEWARE B. SMITH, Deerfield, N. Y. Filed May 28, 1898. Serial No. 682,071. Term of patent 3½ years.



Claim.—The design for the body and base of a bicycle-pump as herein shown and described.

28,900. SEAT-POST FOR BICYCLES. BENJAMIN F. FIELD and WILLIAM J. SEEBO, Chicago, Ill. Filed Oct. 11, 1897. Serial No. 654,966. Term of patent 7 years.

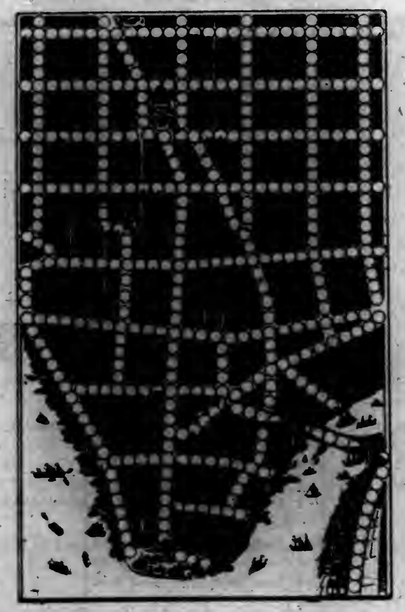


Claim.—The design for a seat-post for a bicycle-saddle substantially as herein shown and described.

28,901. SADDLE-SEAT. WILLIAM I. BUSKIRK, La Grange, Ill. Filed May 6, 1898. Serial No. 679,967. Term of patent 14 years.

Claim.—The design for a saddle-seat substantially as herein shown and described.

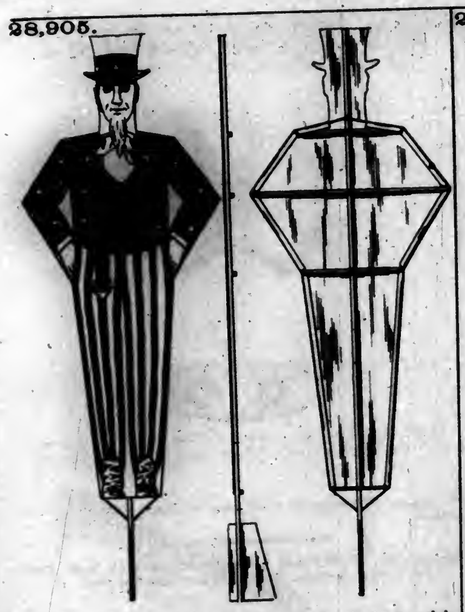
28,902. SADDLE-SEAT. WILLIAM I. BUSKIRK, La Grange, Ill. Filed May 7, 1898. Serial No. 680,057. Term of patent 14 years.



Claim.—The design for a saddle-seat substantially as herein shown and described.

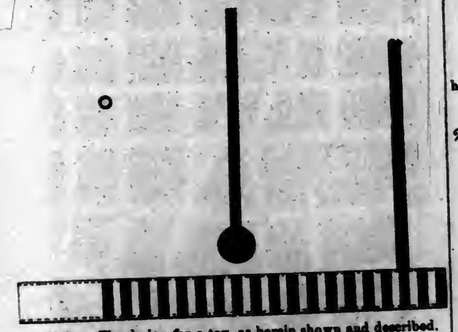
28,903. CUSHION. WILLIAM H. AHORY, New York, N. Y. Filed Mar. 1, 1898. Serial No. 672,102. Term of patent 14 years.

Claim.—The design for a cushion substantially as shown and described.



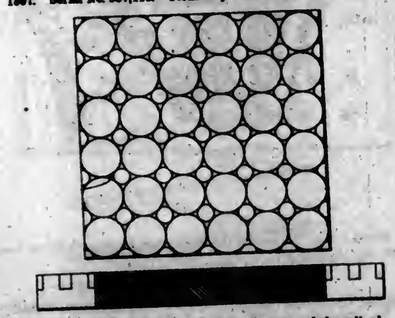
28,904. GAME-BOARD. GEORGE S. PARKER, Salem, Mass. Filed May 9, 1898. Serial No. 680,222. Term of patent 14 years.

Claim.—The design for a game-board substantially as herein shown and described.



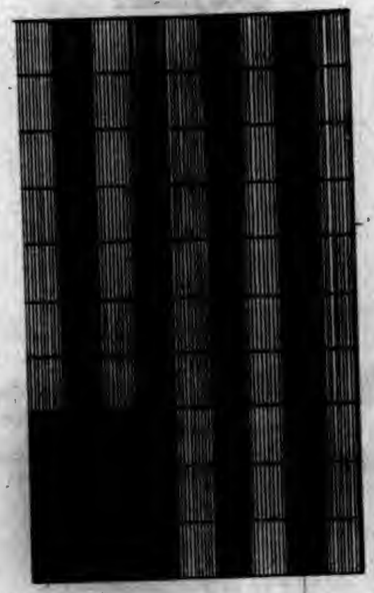
28,905. KITE-FRAME. HOWE R. DANTENBOCHER, Philadelphia, Pa. Filed Mar. 23, 1898. Serial No. 674,840. Term of patent 7 years.

28,905.



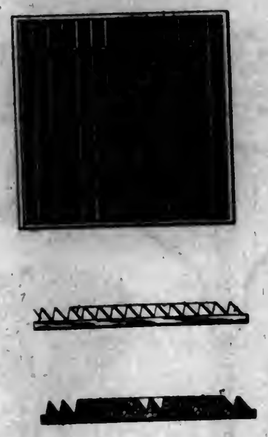
Claim.—The design for a kite-frame as herein shown and described.

28,906. TOY. ROBERT SOMMERLEY, Philadelphia, Pa. Filed Mar. 22, 1898. Serial No. 674,834. Term of patent 3½ years.



Claim.—The design for a toy, as herein shown and described.

28,907. TILE. BENJAMIN O. HAGER, Anderson, Ind. Filed Nov. 1, 1897. Serial No. 657,113. Term of patent 14 years.

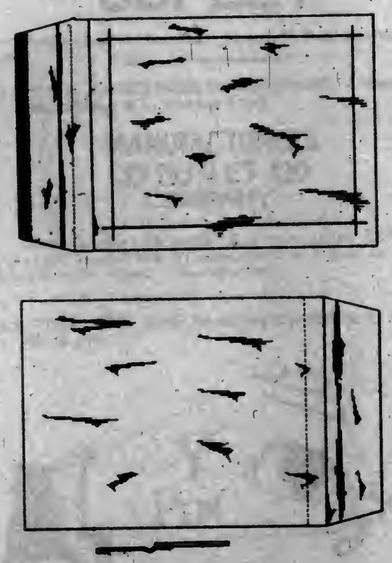


Claim.—The design for a tile herein shown and described.

28,908. ILLUMINATED PANEL. HARRY L. JENKINS, Minneapolis, Minn. Filed Nov. 19, 1897. Serial No. 659,268. Term of patent 7 years.

Claim.—The design for an illuminating-panel, substantially as herein shown and described.

28,909. PRISM-LIGHT. LOUIS J. MILLER, Chicago, Ill. Filed May 6, 1898. Serial No. 679,962. Term of patent 3½ years.



Claim.—The design for a prism-light as herein shown and described.

28,910. ORNAMENTATION FOR BOXES. NICHOLAS WITMER, Jersey City, N. J., assignor to the American Lithographic Company, New York, N. Y. Filed May 4, 1898. Serial No. 679,727. Term of patent 7 years.

Claim.—The design for the ornamentation of boxes substantially as shown and described.

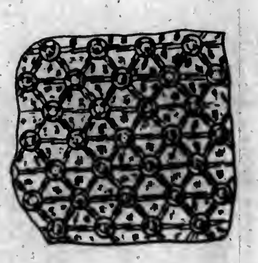
28,911. BLOTTER FOR CHECK OR SIMILAR BOOKS. BENJAMIN MOTT WITMER, Philadelphia, Pa. Filed Mar. 7, 1898. Serial No. 673,012. Term of patent 14 years.

Claim.—The design for a blotter for check and similar books, substantially as shown and described.

28,912. RUBBER HEEL. HENRY C. PERKINS, Boston, Mass., assignor to Frank W. Whitcher, same place, Sanford Cranston, Melrose, and Herbert L. Turner, Malden, Mass. Filed May 23, 1898. Serial No. 681,511. Term of patent 14 years.

Claim.—The design for a rubber heel, substantially as herein shown and described.

28,913. NECKSCARF. MAX BARNER, New York, N. Y. Filed May 20, 1898. Serial No. 681,260. Term of patent 7 years.



Claim.—The design for a neckscarf-section substantially as herein shown and described.

28,914. COLLAR. HARLAN P. WILSON, Gardner, Mass. Filed May 7, 1897. Serial No. 635,895. Term of patent 14 years.

Claim.—The design for a collar herein shown and described.

98,915. FABRIC. Seaman I. Fleischman, New York, N. Y. Filed May 23, 1898. Serial No. 681,510. Term of patent 3½ years.

FABRIC.

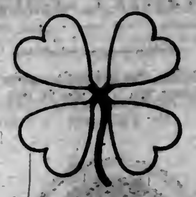
Claim.—The design for a fabric, substantially as herein shown and described.

98,916. CASKET. Leo Stern and Clayton F. Wheeler, Hoboken, N. J., assignors to the National Casket Company, same place. Filed Feb. 26, 1898. Serial No. 672,093. Term of patent 14 years.

98,916.

Claim.—The design for a casket, substantially as herein described and shown.

TRADE-MARKS



REGISTERED JUNE 21, 1898.

81,704. WRITING-PAPER. Wilmore Paper Company, Holyoke, Mass. Filed Mar. 5, 1898.

LEGION

Essential feature.—The word "Legion." Used since November, 1894.

81,705. PHOTOGRAPHIC PAPER. Rochester Aristo Company, Rochester, N. Y. Filed Mar. 2, 1898.

Essential feature.—The representation of a four-leaved clover. Used since May 15, 1897.

81,706. ART PHOTOGRAPHS. Curtis & Cameron, Boston, Mass. Filed Mar. 14, 1898.

COPLEY

Essential feature.—The word "Copley." Used since March, 1896.

81,707. CERTAIN NAMED WEARING-APPAREL. J. Sanders & Son, Providence, R. I. Filed Aug. 6, 1897.

MANUFACTURERS
OUTLET
COMPANY

Essential feature.—The words "Manufacturers' Outlet Company," together with the representation of a crown on each side of the word "Outlet." Used since 1896.

81,708. PINS. Handy Pin Company, New York, N. Y. Filed Mar. 22, 1898.

Essential feature.—The representation of a hand, a hyphen, the letter "Y," and the word "Pin," which together form a rebus indicating the words "Handy Pin." Used since January 15, 1896.

81,709. JEWELRY. Jacob Schwarzhoff and Jacob Solinger, Providence, R. I. Filed Mar. 17, 1898.

Essential feature.—The representation of a Maltese cross having on its face a monogram of the letters "S S." Used since February 14, 1898.

81,710. GLASSWARE. Edward A. Fowler & Co., Pittsburg, Pa. Filed Apr. 12, 1898.

A F

Essential feature.—The letters "A F." Used since September 15, 1897.

81,711. PILLOW-INHALERS. Pillow Inhaler Company, Washington, D. C. Filed Mar. 19, 1898.

Essential feature.—The representation of a pillow with the head of a person resting thereon. Used since July 1, 1861.

81,712. WITHDRAWN.

81,713. CERTAIN NAMED MEDICAL PREPARATION. John Linden, Cleveland, Ohio. Filed Apr. 5, 1898.

Essential feature.—The figure of a hand holding a surgical instrument, known as "John Linden's Improved Reconcentrator," and the representation of a vial bearing the words "J. Linden's Improved Oleum Bauscreidtii." Used since July, 1877.

81,714. REMEDY FOR RHEUMATISM. Giambattista Arbib, Hoboken, N. J. Filed Feb. 21, 1898.

Essential feature.—A representation of two crossed battle-axes superposed on two crossed palm-branches. Used since August 1, 1897.

81,715. TONIC ALTERATIVE COMPOUND. SHARP & DOHME, Baltimore, Md., New York, N. Y., and Chicago, Ill. Filed May 6, 1898.

MEL-MAROBA.

Essential feature.—The compound word "MEL-MAROBA." Used since April 2, 1898.

81,716. CERTAIN NAMED MEDICINAL REMEDIES. CHARLES C. COOK, Baltimore, Md. Filed Apr. 13, 1898.

THIEF

Essential feature.—The word "THIEF." Used since March 1, 1898.

81,717. WHISKY. MARSHALL, McEWEN & Co., Glasgow, Scotland. Filed May 5, 1898.

SURPRISE

Essential feature.—The word "SURPRISE." Used since April 27, 1892.

81,718. MEDICATED WHISKY. WILLIAMS & NEWBAS, Chicago, Ill. Filed Jan. 24, 1898.

Essential feature.—The pictorial representation of a bunch of celery of a green color with the words and character "ROCK & RYE" arranged in red letters horizontally across the same and the word "CELERY" in white letters upon a green scroll arranged above the same. Used since December 21, 1897.

81,719. MINERAL WATER. GEROLSTEINER SPRUDEL, W. CASTENDYK, Cologne, Germany. Filed Mar. 7, 1898.

Gerolsteiner Sprudel

Essential feature.—The words "GEROLSTEINER SPRUDEL" and the representation of a star bearing a lion arranged centrally below the said words. Used since 1883.

81,720. CERTAIN NAMED BEVERAGES AND MINERAL WATER. L. BOTH'S SONS, New York, N. Y. Filed Oct. 27, 1897.

Essential feature.—The words "MYLES STANDISH SPRING WATER" in a circle surrounding the upper portion of a figure of a man in pilgrim costume. Used since October, 1896.

81,721. COFFEE. THE ENTERPRISE COFFEE COMPANY OF BALTIMORE CITY, Baltimore, Md. Filed Mar. 26, 1898.

Essential feature.—The figure of a star surrounded by circular lines in assorted colors. Used since July 6, 1877.

81,722. ICED CONFECTIONS. DAVIS BROS., St. Louis, Mo. Filed Mar. 26, 1898.

"LUNARET"

Essential feature.—The word "LUNARET." Used since March 1, 1898.

81,723. CANDY. SEABAGOUTS TAYLOR HOPKINS, New Orleans, La. Filed Jan. 20, 1898.

JOHNNY-CROOK

Essential feature.—The words "JOHNNY-CROOK." Used since January 1, 1897.

81,724. CERTAIN CANNED AND BOXED GOODS. J. W. MATTHEWS & Co., Newburg, N. Y. Filed Feb. 4, 1898.

81,724. HIGHLAND BRAND

Essential feature.—The words "HIGHLAND BRAND" and the representation of a Highlander. Used since February 1, 1898.

81,725. CERTAIN NAMED GROCERIES. FRANCIS H. LEGGETT & Co., New York, N. Y. Filed Dec. 17, 1897.

GABRIEL TRIAT & CO.

Essential feature.—The words, character, and abbreviation "GABRIEL TRIAT & Co." Used since May, 1890.

81,726. CERTAIN NAMED GROCERIES. BROWNELL, CHITTENDEN & Co., Rochester, N. Y. Filed July 8, 1897.

Gladiator

Essential feature.—The word "GLADIATOR" with the figure of a gladiator. Used since July 6, 1892.

81,727. WHEAT-FLOUR. CHARLES B. WELLENKAMP, New York, N. Y. Filed Feb. 16, 1898.

Essential feature.—The picture of a spherical figure having an equatorial belt extending diagonally across it and stars above and below said belt. Used since January 1, 1898.

81,728. ROLLED OATS AND OATMEAL. HUMANITIES OAT MEAL COMPANY, Muscatine, Iowa. Filed Mar. 22, 1898.

Essential feature.—The representation of a hawk's eye and head. Used since February 1, 1898.

81,729. YEAST. THE AMERICAN YEAST COMPANY, Boston, Ohio. Filed Mar. 30, 1898.

Essential feature.—The picture of a loaf of bread extending across a sheaf of wheat. Used since February 18, 1898.

81,730. CATSUPS, MUSTARD, AND SOUPS. THE H. C. FLAGG COMPANY, Wheeling, W. Va. Filed May 4, 1898.

CHILIMATO

Essential feature.—The word "CHILIMATO." Used since March 1, 1898.

81,731. SEA-SALT. TIDMAN & SON, LIMITED, London, England. Filed Feb. 4, 1898.

Essential feature.—The representation of a bag placed in a vertical position, closed at the top by being tied at the two corners, with the words "TIDMAN'S SEA SALT" printed thereon. Used since January, 1861.

81,732. LEAF-TOBACCO, MANUFACTURED TOBACCO, AND CIGARS. S. HERSHFIELD, BECK & COMPANY, LIMITED, New Orleans, La. Filed June 16, 1898.

BLACK HORSE

Essential feature.—The words "BLACK HORSE" or the representation of a black horse. Used since 1865.

81,733. OILS. VACUUM OIL COMPANY, Rochester, N. Y. Filed Mar. 17, 1898.

VACUUM

Essential feature.—The word "VACUUM" represented in party-colored characters. Used since December, 1866.

81,784. OILS. VACUUM OIL COMPANY, Rochester, N. Y. Filed Mar. 17, 1898.

600 W

Essential feature.—The party-colored characters "600 W." Used since December, 1886.

81,785. OILS. VACUUM OIL COMPANY, Rochester, N. Y. Filed Apr. 21, 1898.

Vacuum

Essential feature.—The word "VACUUM." Used since April, 1867.

81,786. SHELLAC. NEW YORK SHELLAC CO., New York, N. Y. Filed Mar. 21, 1898.

A & M

Essential feature.—The letters and character "A & M." Used since February 10, 1896.

81,787. SHELLAC. NEW YORK SHELLAC CO., New York, N. Y. Filed Mar. 21, 1898.

H A T

Essential feature.—The letters "HAT" and a representation of a hat. Used since January 10, 1898.

81,788. CERTAIN NAMED TYPE-WRITERS' SUPPLIES, NOTE-BOOKS, COPYING-BOOKS, AND COPYING-CLOTHS. F. S. WHEELER COMPANY, Boston, Mass., New York, N. Y., Chicago, Ill., and London, England. Filed Apr. 13, 1898.

STAR

Essential feature.—The word "STAR" or the representation of a star. Used since April, 1894.

THE NORRIS PETERS CO.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

WOLFENDEN *v.* PRICE.

Decided June 6, 1898.

1. INTERFERENCE—DISSOLUTION—PATENTABILITY OF CLAIMS OVER THE ISSUE—SUGGESTION BY THE EXAMINER AS TO REJECTION OF CLAIMS INVOLVED IN THE ISSUE.

Where the issue of the interference was Wolfenden's third claim and involved his first, second, and fourth claims, *Held* that as the issue is not the first, second, and fourth claims they should be dropped from the interference, and if the Examiner is of the opinion that there is no patentable invention in these claims over the subject-matter of the issue it would be better practice for him to notify Wolfenden that in the event of the interference being determined adversely to him such claims would stand rejected as involving no patentable invention.

2. SAME—SAME—CLAIMS INCLUDING IMMATERIAL LIMITATIONS—INTERFERENCE IN FACT.

Where Price's claim involved in the issue, which is Wolfenden's third claim, includes certain limitations which are not stated in Wolfenden's claim and Wolfenden's claim contains a limitation not found in Price's claim, *Held* that notwithstanding it is urged that these differences are immaterial and may be disregarded there is no interference in fact.

3. SAME—SAME—DISREGARDING LIMITATIONS IN CLAIM.

The Patent Office is no more competent than the courts to say in declaring an interference that an element which an applicant or a patentee has placed in his claim is an immaterial one.

4. SAME—SAME—SAME.

An interference is not sufficiently clear and definite which requires that certain limitations in the claims of one party should be held to be immaterial and that other limitations should be read into the claims of either one or the other party to the proposed interference in order to make them the issue of the interference.

5. SAME—SAME—SAME—SUGGESTION OF CLAIM BY EXAMINER.

A claim may be patentable in the opinion of the Examiner which does not contain certain limitations, and it is within his province, when he believes it is necessary for him to declare an interference, to indicate to the parties a patentable claim as the issue of the interference which shall omit immaterial elements and thereby make it unnecessary for the Office to hold that the issue and the claims are different from what they read.

6. SAME—SAME—SAME.

It is not necessary that identical language should be employed in the claims of every party to the interference; but when different words are used they must mean and refer to the same thing.

7. SAME—SAME—INTENT OF HAMMOND *v.* HART.

The case of *Hammond* v. *Hart* (83 O. G., 743) was intended to bring about a practice in the Office that should result in making the issue of an interference both definite and clear, and to that end to cause the parties to the proposed interference to claim substantially the same patentable invention, so as to obviate the many motions and appeals that have unnecessarily arisen in the Office.

APPEAL on motion.

HYDRAULIC VALVE.

Application of Frank Wolfenden filed June 26, 1897, No. 642,474. Application of William W. Price filed April 8, 1897, No. 631,253.

Mr. James L. Norris for Wolfenden.

Messrs. Wright, Brown & Quinby and *Mr. F. P. Davis* for Price.

DUELL, *Commissioner:*

This is an appeal from the decision of the Primary Examiner denying Wolfenden's motion for dissolution of the interference. The interference was declared with the following issues:

1. In a hydraulic valve for presses, the combination of a casing having passages communicating with high and low pressure engines, a low-pressure passage being provided with an automatic valve whereby the valve of the low-pressure passage will be closed by the high pressure, said casing also having a chamber provided with passages leading to and from the press-cylinder, and a single valve arranged in said casing between the high and low pressure passages and the passage to the press-cylinder and serving to control the passage to the press-cylinder and also to permit and cut off the supply of high and low pressure to the press-cylinder.

2. In a hydraulic valve for presses, the combination of a casing having passages communicating with high and low pressure engines, an automatic valve in the low-pressure passage and a throttled valve in the high-pressure passage, the valve of the low-pressure passage adapted to be closed by the high pressure, said casing also having a chamber provided with passages leading to and from the press-cylinder, and a single valve arranged in said casing between the high and low pressure passages and the passage to the press-cylinder and serving to control the passage to the press-cylinder and also to permit and cut off the supply of high and low pressure to the press-cylinder.

The first issue is said to be in substance Wolfenden's third claim and Price's first claim and also to involve Wolfenden's first, second, and fourth claims. That it is Wolfenden's third claim is undisputed and indisputable. That the issue is not his first, second, and fourth claims is equally certain, and, in fact, is directly admitted by counsel for Price and tacitly admitted by the Examiner, if I read his decision rightly.

Under the present practice, as laid down in *Hammond* v. *Hart*, (83 O. G., 743,) these claims should not remain directly in the interference. If the Examiner is of the opinion that there is no patentable invention in these claims over the subject-matter of the issue, it would be better practice for him to notify Wolfenden's attorney that in the event of the interference being determined adversely to him such claims would stand rejected as involving no patentable invention. At all events they should be dropped from the interference.

Upon an examination of Price's claim 1, which is the one placed in interference under the first issue, it is found to read as follows:

1. In a pressure-controlling mechanism for hydraulic presses,

the combination of check-valved passages leading from high and low pressure producers respectively and interrupted only by the check-valves, a passage leading to the press from said check-valved passages, the low-pressure passage communicating with the said press-passage at a point in advance of that where the high-pressure passage communicates with said press-passage, and the check-valve of the low-pressure passage being removed from the path of communication between the high-pressure passage and the press, and a single manually-operated valve whose manipulation establishes communication for both pressures simultaneously to the press, substantially as described.

Upon a comparison between this claim and Wolfenden's third claim, which is the first issue, it will be found that it includes certain limitations which are not stated in Wolfenden's claim, and, on the other hand, Wolfenden's claim 3 contains a limitation not found in Price's claim 1. It is argued that notwithstanding these differences there is an interference in fact and that the differences are immaterial and may be disregarded.

In deciding the case of *Hammond* v. *Hart* it was my intention to bring about a practice in the Office that would result in making the issue of an interference both definite and clear, and to that end to cause the parties to the proposed interference to claim substantially the same patentable invention, so as to obviate the many motions and appeals that have unnecessarily arisen in the Office.

There is no principle of law better settled than that whatever element is incorporated into a claim will be considered a material one, and the patentee in the courts is invariably judged by that rule. This rule has been stated in various ways:

> Our law requires the patentee to specify particularly what he claims to be new, and if he claims a combination of certain elements or parts, we cannot declare that any one of those elements is immaterial. The patentee makes them all material by the restricted form of his claim. (*Water Meter Company* v. *Desper*, 101 U. S., 332, 337.)
>
> If the claim had been intended to be a claim broadly to square shoulders, without reference to their vertical form, it would have been easy to make such a claim. But the claim industriously introduces the element of the vertical curving. The inventor must have regarded that as a material element. (*Le Fever* v. *Remington*, 22 O. G., 1537; 13 Fed. Rep., 86, 87.)
>
> * * * If the language of the specification and claim shows clearly what he (the patentee) desired to secure as a monopoly, nothing can be held to be an infringement which does not fall within the terms the patentee has himself chosen to express his invention. (*McClain* v. *Ortmayer*, 57 O. G., 1129; 141 U. S., 419, 425.)

I do not think that the Patent Office, any more than the courts, is competent, in declaring an interference, to say that an element which an applicant or a patentee has placed in his claim is an immaterial one. A claim may be patentable in the opinion of the Examiner which does not contain certain limitations, and I think it is within the province of the Examiner when he believes it is necessary for him to declare an interference to indicate to the parties a patentable claim as the issue of the interference which shall omit immaterial elements, and thereby make it unnecessary for the Office to hold that the issue and the claims are different from what they read.

Too often the question of "priority" is lost sight of and argument of counsel is directed to the question "what does the issue mean?" This should be avoided.

In *White* v. *Dunbar* (37 O. G., 1002; 119 U. S., 47, 51) the Court in referring to the construction of the claims in patents said:

> Some persons seem to suppose that a claim in a patent is like a nose of wax which may be turned and twisted in any direction, by merely referring to the specification, so as to make it include something more than, or something different from, what its words express. The context may, undoubtedly, be resorted to, and often is resorted to, for the purpose of better understanding the meaning of the claim; but not for the purpose of changing it, and making it different from what it is. The claim is a statutory requirement, prescribed for the very purpose of making the patentee define precisely what his invention is; and it is unjust to the public, as well as an evasion of the law, to construe it in a manner different from the plain import of its terms.

This statement applies equally to the issues in an interference proceeding. I do not mean to be understood as expressing the opinion that identical language must be employed in the claims of every party to the interference; but when different words are employed they must mean and refer to the same things.

In claim 3 of Wolfenden we find recited—

> a chamber provided with passages leading to and from the press-cylinder.

It is admitted that this limitation is not found in Price's claim 1. The contention is that the limitation is immaterial. In claim 1 of Price are found the limitations that—

> the low-pressure passage communicating with the said press-passage at a point in advance of that where the high-pressure passage communicates with said press-passage, and the check-valve of the low-pressure passage being removed from the path of communication between the high-pressure passage and the press.

These limitations are not found in Wolfenden's claim 3—the issue of the interference. It is contended by Price that such limitations must be implied in Wolfenden's claim, as they are essential to an operative construction embodying the invention. On the part of Wolfenden it is insisted that he cannot make a claim with such limitations. At all events he has not done so.

It is obvious that the issue must be made "a nose of wax" in order that the claim of Price fit it.

At the present time the claims are not, in my opinion, the same, nor do they show that the parties are claiming substantially the same patentable invention.

It is conceded that if an interference is not found to exist between the claims of the first issue an interference does not exist between the claims of the second issue, and therefore it is unnecessary to enter into any elaborate statement with reference to the second issue. An interference is not sufficiently clear and definite which requires that certain limitations in the claims of one party should be held to be immaterial and that other limitations should be read into the claims of either one or the other party to the proposed interference in order to make them the issue of the interference.

It is unnecessary at the present time to pass upon the question whether there is a common patentable invention in the applications of the parties to this interference; but if there is the parties should claim it and an interference be declared based upon the claims for such common patentable invention.

The decision of the Examiner is reversed.

EX PARTE WEIL.

Decided June 14, 1898.

1. TRADE-MARK—"YUCATAN"—GEOGRAPHICAL WORD.

The word "Yucatan" is geographical and cannot be registered as a trade-mark for leather and leather goods. Any one importing hides from Yucatan or purchasing hides exported from Yucatan would be entitled to call or mark skins and tanned leather having such origin by the name "Yucatan."

2. SAME—"YUCATAN" WITHIN A DESCRIBED SQUARE FIGURE.

As "Yucatan" taken by itself is not registrable, it is not made registrable by placing it within a square figure, as the essential feature of the mark is the word "Yucatan."

3. SAME—ESSENTIAL FEATURES OF A MARK.

The essential features of a trade-mark are those which serve in whole or in part to distinguish the goods of the party by whom such mark is adopted.

ON petition.

TRADE-MARK FOR LEATHER AND LEATHER GOODS.

Application of J. M. and V. Weil for registration filed November 13, 1897, No. 54,583.

Messrs. Barton & Brown for the applicants.

DUELL, *Commissioner:*

Applicants sought originally to register as a trade-mark for skins and tanned leathers the word "Yucatan." Registration of that word having been refused by the Examiner on the ground that the word was geographically descriptive and incapable of exclusive appropriation by any one, the applicants amended their application and asked for the registry of the word "'Yucatan' within the described square figure, as shown." The Examiner having rejected the application as amended, applicants by petition seek to review his action.

While admitting the recognized principle of law that geographical terms are incapable of registration, applicants seek to except the word "Yucatan" from the general rule. It is insisted that because they carry on their business at Chicago, Ill., the word has lost its geographical significance when applied to leathers and skins of their manufacture, although *hides* may constitute a principal export of Yucatan.

I do not think their position is tenable. Any one importing hides from Yucatan or purchasing hides exported from Yucatan would, in my opinion, be entitled to call or mark skins and tanned leathers having such origin by the name "Yucatan."

The question remaining to be considered is whether by placing the word "Yucatan" within the described square figure, as shown, applicants have disclosed a registrable trade-mark. The answer to the question seems to turn upon what is to be considered the essential feature of the trade-mark. At this time it is too well settled to admit of controversy that the essential features of the trade-mark are those which serve in whole or in part to distinguish the goods of the party by whom such mark is adopted. The specification as amended states:

> The essential or distinguishing feature of our trade-mark we consider to be the word "Yucatan" within the described square figure, as shown.

In other words, it is the word "Yucatan," and the arrangement of the word within the square figure is a non-essential. As "Yucatan" taken by itself is not registrable, I do not think it is made so by placing it within the square figure. (*Ex parte Farnum & Co.*, 18 O. G., 412.) In referring to that case it was said in *ex parte Adriance, Platt & Co.*, (20 O. G., 1820,) which was a case where it was held that the name of a person, firm, or corporation does not acquire an arbitrary significance by association with an otherwise valid trade-mark, that—

in the case of *ex parte Farnum & Co.* (18 O. G., 412) I had occasion to hold that a geographical term acquired no arbitrary significance from association with an arbitrary symbol; and in the present case I feel constrained to hold, by parity of reasoning, that the name of the person, firm, or corporation does not acquire an arbitrary signification by association with an otherwise valid trade-mark, and cannot therefore be included as an essential feature of such trade-mark. This conclusion, I think, will be found to be in harmony with the decisions of the courts so far as they are applicable to the subject.

From principle and authority I am constrained to hold that the trade-mark now sought to be registered is not properly registrable, and therefore the decision of the Examiner is affirmed.

PAINTER v. HALL.

Decided May 25, 1898.

1. INTERFERENCE—MOTION TO DISSOLVE—NATURE OF SUCH MOTION.

A motion to dissolve an interference on the ground of non-patentability is in the nature of a suggestion to the Office of certain facts which are believed to negative patentability or to show that one of the parties is not entitled to make the claim. It is not a contest in which testimony can be received or anything presented for consideration which is not actually or presumably within the knowledge of the Examiner in the *ex parte* treatment of the applications of the respective parties prior to the declaration of the interference.

2. SAME—SAME—SAME.

The motion is brought not on the ground that the interest of the party bringing it would be adversely affected by the issuance of a patent for the subject-matter to his opponent, but for the reason that it appears to the moving party that the Office was in error in finding the claim patentable.

3. SAME—SAME—SAME.

The fact that the interest of the moving party may be adversely affected by the issuance of the patent for the subject-matter to his opponent does not in itself entitle him or any other person to be heard, nor is it a fact to be considered in the determination of the question by the Examiner. The question is the same question that was considered before the declaration of the interference—a question of patentability.

4. SAME—SAME—EXAMINER'S ACTION AS TO PATENTABILITY CONCLUSIVE.

If the Examiner, upon hearing the motion to dissolve, adheres to his decision that the claims are patentable and patentable to the respective parties, the contest as to these questions is concluded in so far as it is preliminary to the question of priority.

5. SAME—SAME—NON-PATENTABILITY—EX PARTE APPEAL.

Should the Examiner, upon the motion to dissolve, decide that the claims are not patentable to one of the parties, a decision which is as to one or both of the parties equivalent to a final rejection, the full course of appeal is open to the party whose claim is affected by such decision, and such appeal is *ex parte*.

6. SAME—SAME—APPEALS—"MAY BE HEARD INTER PARTES" RULE 124 CONSTRUED.

The words "may be heard *inter partes*" in Rule 124 permit the adverse party to an interference proceeding, on a motion to dissolve on the ground of non-patentability or no right to make the claim, to be heard on appeal, if considered advisable by the Examiners-in-Chief. The adverse party, however, is not heard as a matter of right, but as a matter of courtesy only.

7. SAME—SAME—DISCRETION OF THE EXAMINERS-IN-CHIEF.

On an appeal from the decision of the Primary Examiner on a motion involving the right of an applicant to make a claim it is doubtful whether the adverse party should be heard, even as a matter of courtesy. This matter should, however, be left to the discretion of the Examiners-in-Chief.

8. SAME—SAME—RIGHT OF MOVING PARTY TO BE HEARD BEFORE APPELLATE TRIBUNAL.

The party bringing such motion, so far as an appeal is concerned, is no more entitled to be heard as of right, whatever may be decided by the Office as regards his appearing before

an appellate tribunal as a matter of policy, than any person not before the Office whose rights to freely manufacture the invention covered by the claim might be curtailed by the issuance of a patent.

9. SAME—SAME—RIGHT OF PARTIES TO BE HEARD—RIGHT OF APPEAL.

Such motion is heard *inter partes* by the Primary Examiner as a matter of Office policy, in order that the facts and reasons which in the opinion of the moving party negative the patentability of the claim or show that his opponent is not entitled to make the claim may be clearly presented; but the Office does not and cannot recognize the moving party as a party in interest entitled to contest the patentability of another's claims. He has no right of appeal from a decision denying his motion.

10. SAME—SAME—SAME.

The same reasons which justify the rule which refuses the right of appeal from the decision of the Primary Examiner affirming patentability or the right of the respective parties to make the claim justify the Office in refusing to permit the appeal taken by the party whose claims are affected to be made a contest *inter partes* before the appellate tribunal.

11. SAME—SAME—SAME.

Whether or not the adverse party is to be heard upon the appeal upon the question raised by the motion to dissolve, it is clear that he cannot be heard before the appellate tribunal as to the validity of the appeal of the party against whom the question of patentability or right to make the claim has been decided by the Primary Examiner. As to questions involving validity, the appeal is *ex parte* purely.

12. SAME—SAME—TIME OF TAKING APPEAL—ESTOPPEL—RIGHT OF ADVERSE PARTIES TO BE HEARD—EX PARTE QUESTION.

The question of the time of taking appeal and the question of estoppel of a party by his adoption of a course deemed to be inconsistent with an appeal are *ex parte* questions, and an adverse party has no right to be heard as a matter of course by the Examiners-in-Chief on appeal on these questions.

13. SAME—SAME—SETTING LIMIT OF APPEAL.

On a motion to dissolve on the ground of non-patentability or of no right to make a claim the Examiner should not set a limit of appeal, as the party who is affected adversely by such decision has the full statutory limit of two years within which to appeal.

14. SAME—SAME—RELIEF OF PARTY WHEN HIS OPPONENT FAILS TO TAKE AN APPEAL.

An applicant has his remedy in case his opponent fails to take an appeal from a decision of the Primary Examiner granting the motion to dissolve an interference upon the question of non-patentability or no right to make the claim. He may ask that his own application be passed to issue unless his opponent exercises his right of appeal within a reasonable time. Failure on the part of the opponent to take an appeal within such time may perhaps be held to work an estoppel, but consideration of such questions should be *ex parte*. (Citing *Abel and Dewar* v. *Maxim* v. *Nobel*, 56 O. G., 139, and *ex parte Lombard*, 43 O. G., 1347.)

APPEAL on motion.

BOTTLE-STOPPERS.

Reissue application of William Painter filed December 26, 1895, No. 573,419. Patent granted Robert A. Hall June 18, 1895, No. 541,203.

Mr. Ellis Spear for Painter.

Messrs. Dodge & Sons for Hall.

GREELEY, *Assistant Commissioner:*

This interference was declared November 17, 1896. On January 2, 1897, Hall moved for dissolution upon the grounds of irregularity, lack of patentability to Painter, and lack of right on Painter's part to make the claims in issue. This motion was duly transmitted by the Examiner of Interferences. Appeal was taken from his decision making such transmission, and his ruling was affirmed March 29, 1897. On May 17, 1897, the motion for dissolution was decided by the Primary Examiner, who granted the motion upon the second and third grounds, denying it as to the first. His decision concluded with the following:

Limit of appeal expires June 7, 1897.

On May 18, 1897, Painter brought before the Commissioner a motion to set aside the decision of the Primary Examiner upon the grounds (1) that said decision was in plain violation of the law; (2) that appeal to the Examiners-in-Chief was in effect precluded to Painter, since the Examiner had decided that the decisions of the Examiners-in-Chief were not binding upon him; (3) that the specific ground of the Examiner's decision was *res adjudicata*, and (4) that the action of the Examiner was an abuse of discretion. On June 7, 1897, Hall brought an appeal to the Commissioner from the Examiner's denial of the first ground of his motion for dissolution. June 8, 1897, the Commissioner, Mr. Butterworth, decided that the Examiner had not violated the law and that his action in dissolving the interference was not an abuse of discretion, since the question of patentability, decided *ex parte*, could not on account of such decision be said to be *res adjudicata* when raised *inter partes*. This was in effect a negative ruling as to the second ground of the motion there considered. On June 11, 1897, (four days after the limit set by the Primary Examiner,) Painter took an appeal from the Primary Examiner's decision granting Hall's motion for dissolution to the Examiners-in-Chief, alleging that the Examiner erred in holding that the issue involved in the interference was not patentable to Painter and that Painter had no right to make the claim. This appeal was a renewal of Painter's former appeal taken August 11, 1896, from the action of the Examiner rejecting claims of the application. Upon that appeal the decision of the Examiner was reversed, the claims involved being those involved in the present interference and brought up by the present appeal for the consideration of practically the same question—viz., their allowability in view of the prior state of the art. Substantially the same question was twice presented to the Examiners-in-Chief in the prosecution of the original application, so that the claims, or at least the subject-matter of the claims now involved, has been four times decided by that tribunal to be patentable.

Hall at the hearing on the appeal now under discussion moved for the dismissal of the appeal upon the ground that it was not brought in proper time. Concerning Hall's motion the Examiners-in-Chief held as follows:

By the decision of the Principal Examiner dissolving the interference of *Painter* v. *Hall*, Painter's application became released from all interference with the patent to Hall and by Hall or his attorney, and must be prosecuted *ex parte*. This is an *ex parte* appeal on the record and in fact.

They also held that Hall had a right to be heard on the grounds of the appeal which were *inter partes* below, but had no right to be heard on any other question. They found that—

The question whether Painter's appeal has been duly taken is one between Painter and the public represented by the Patent Office. Neither Hall nor any other outside person has any right to be heard in it.

For the reason that Hall has no right to raise or be heard on the question of the validity of Painter's appeal, his motion to dismiss that appeal is dismissed.

Assuming that Hall had the right to raise and be heard on this question, we at the hearing denied the motion.

We derive our authority for such action from Commissioner's decision in *Coburn* v. *Brodie*, August 10, 1896, (recorded Commissioner's MS. Decisions, vol. 59, p. 394.)

This decision also contains the following:

At the hearing we denied the motion. Our decision stands on the ground that substantial justice required the hearing to be then had and that no one would be injured thereby, all parties being present and ready for the hearing, even to the preparation of briefs.

Hall took exceptions to this decision and then took part in the hearing, on the questions appealed, and also argued against the patentability of all of these appealed claims.

The decision of the Primary Examiner was reversed.

July 31, 1897, Hall brought an appeal, the first paragraph of which is as follows:

I hereby appeal to the Commissioner in person from the decision of the Board of Examiners-in-Chief rendered July 28, 1897, in so far as the same dismisses my motion to vacate and set aside the appeal taken by Painter to the Board of Appeals.

On August 3, 1897, he presented the same matter substantially in the motion now before me. The grounds set up are substantially error in declaring the appeal to the Examiners-in-Chief *ex parte*; error in dismissing Hall's motion to dismiss Painter's appeal without hearing argument, because the decision says "Assuming that Hall had the right to * * * be heard," whereas it was declared without argument that Hall had no such right; because the dismissal is contrary to the statute, to the rules, and to precedent; because the decision of the Primary Examiner had become binding before the appeal was taken, and the Examiners-in-Chief were without jurisdiction; because Painter having elected to pursue a different and inconsistent remedy—to wit, a motion to the Commissioner—and having failed to take his appeal within the limit his right to appeal was lost; because no motion has been made to have the case reopened, and because the decision in *Coburn* v. *Brodie* (59 MS. Dec., 394,) gives no basis for the action of the Board.

Both parties have presented briefs fully covering the points in controversy. The brief for Hall concludes with the following summary:

Painter has waived his right of appeal by failure to appeal within the limit set. He has asked no stay or extension. He has made no motion to reopen. He has declared that he wants no stay nor any reopening. He has tried another remedy inconsistent with appeal and has failed in it; he cannot now try the appeal.

It is clear that if the question of patentability raised by Hall's motion to dissolve becomes, upon the decision of the motion by the Primary Examiner, an *ex parte* question on which Painter, and he alone, can appeal, and on which he alone can *of right* be heard by the appellate tribunal, the limit of appeal is the statutory limit and cannot be set by the Primary Examiner to expire before the expiration of the statutory period, and the limit set in this case by the Primary Examiner may be disregarded.

It therefore becomes necessary to consider to what extent questions raised by motions to dissolve are to be regarded as *inter partes*.

It is clear that it is the settled practice of the Office for the Primary Examiner to hear *inter partes* all questions raised by motions to dissolve under Rule 122. Motions on the ground of no interference in fact and on the ground of irregularity are appealable to the Commissioner and are necessarily *inter partes* on such appeal. There is no conflict of authorities upon this.

There is no question that from decisions of the Primary Examiner upon motions brought under Rule 122 on the ground that an applicant's claim is not patentable or that he has no right to make the claim, appeal lies to the Examiners-in-Chief when any appeal is permissible. Decisions of the Primary Examiner affirming the patentability of the claim or the applicant's right to make the claim are conclusive upon the Office up to that point, and no appeal is permitted.

As to the question whether appeal to the Examiners-in-Chief is *ex parte* or *inter partes* there is a marked conflict of authorities.

In the case of *Stone* v. *Greaves*, (17 O. G., 260,) decided November 6, 1879, by Commissioner Paine, substantially the same question which is here raised was before the Commissioner for determination, though at a different stage of the proceedings.

In deciding that case the Commissioner said:

On one side of the question stands the rule authorizing the dissolution of an interference for want of patentability of the claim. On the other stands the statute conferring upon the applicant the right of appeal, from an adverse decision of the Primary Examiner on the patentability of his claim, to the Examiners-in-Chief, to the Commissioner, and to the Supreme Court of the District of Columbia. It is necessary to avoid, if possible, both Scylla and Charybdis; but it is necessary, in any event, to avoid a violation of the statute. If possible, that course is to be chosen which will harmonize the statute and the rule and give effect to both. If that is impossible, the rule must be sacrificed to the law.

If the Commissioner has power to dissolve an interference at this stage on the ground that the claim is not patentable, his decision to that effect, being lawfully rendered, will be binding not only on the applicants—as to whom the question of patentability, although springing out of an interference case which involves the question of priority alone, is itself an *ex parte* question—but also on the Examiners-in-Chief, and even on the Commissioner himself, except under such circumstances as would warrant a rehearing or a new trial. The action of the Examiners-in-Chief will therefore necessarily, and that of the Commissioner will ordinarily, be altogether formal; and yet it must be had in order to secure to the applicant his right of appeal to the Supreme Court of the District of Columbia under the interpretation which that court is supposed to have given to the statute.

If the Primary Examiner had held the claim to be patentable, and the Commissioner, overruling him, had held it to be unpatentable, and thereupon dissolved the interference, such decision of the Commissioner would not have infringed any right of appeal of the applicant from the Primary Examiner to the Examiners-in-Chief; for, from a favorable decision of the Primary Examiner no right of appeal is conferred by the rules. For that case all the rights which even the spirit of the law confers would be secured to the applicant if, upon the dissolution of the interference, he should take his *ex parte* case to the Primary Examiner for action by him, subject to appeal to the Examiners-in-Chief and Commissioner according to law. This would secure all that remains, namely, the appeal to the Supreme Court of the District of Columbia.

If the interference in this case shall be dissolved, it will become necessary to encounter the difficult question presented as to the relation of testimony heretofore taken to any new interference which may be hereafter declared in the event of a reversal of this decision of the Primary Examiner. On the contrary, if the interference shall not be dissolved until the *ex parte* question of patentability shall run its full course of appeal, the patent of Greaves will stand in the meantime a menace to the applicant Stone and to the public.

It seems to me to be the better practice to give the *ex parte* question of priority (patentability) its legal course of adjudication by permitting the appellants, or either of them, to demand a reconsideration by the Primary Examiner, and from a second adverse decision to appeal to the several appellate tribunals in succession, if necessary, and in the meantime to suspend the interference a reasonable period for that purpose, and to provide for its dissolution at a future day, unless the claim shall be decided to be patentable.

In *Zeidler* v. *Leech et al.*, (54 O. G., 503,) decided January 19, 1891, a case in which the question of appeal in interference cases from the decision of the Primary Examiner upon motions to dissolve on

the ground that no interference in fact existed was under consideration, Commissioner Mitchell, speaking of Rule 124, said:

That rule provides that all appeals shall be taken directly to the Commissioner from the decision of the Primary Examiner on all motions excepting three classes specified, the first class being motions which deny patentability, the second class motions which deny the right to make the claim, and the third class being all other motions "involving the merits of the invention." Questions involving "the merits of an invention" are questions concerning the meritorious or unmeritorious attitude of an alleged invention to the antecedent rights of the public; or, in other words, questions other than questions of "form" arising between the applicant and the Office. The same words which are found in Rule 124, to wit, "involving the merits of the invention," are found in Rule 133 governing the jurisdiction of the Examiners-in-Chief on appeals from the Examiner. That rule (133) provides that—

"Every applicant for a patent, any of the claims of whose application have been twice rejected for the same reasons, upon grounds involving the merits of the invention, * * * may, upon payment of a fee of $10, appeal from the decision of the Primary Examiner to the Examiners-in-Chief."

I think that there can be no room whatever for doubt that the same words in both rules refer to the same subject-matter of inquiry and that their presence in Rule 124 means no more than that the questions which go to the Examiners-in-Chief when they arise directly under Rule 133 go to the same tribunal when they arise *collaterally* under Rule 124. It is because "questions involving the merits of the invention" are *ex parte* questions arising between the applicant and the public that upon appeals to the Examiners-in-Chief under Rule 124 the party only whose claim is affected has a right to appear and be heard. If they were not *ex parte*—that is to say, if the questions which go to the Examiners-in-Chief in the first instance under Rule 124 were not always and necessarily *ex parte* questions—the rule which denies to all but one of the parties the right to be heard would be formulated injustice and nothing else.

All appeals in which, under the rule, the party only "whose claim is affected" has a right to be heard lie to the Examiners-in-Chief, and if decided adversely by them, to the Commissioner, and if by him decided adversely, to the Supreme Court of the District of Columbia. All appeals from the Examiner's decision upon motions to dissolve upon which both parties have the right to be heard go directly to the Commissioner, and from his decision there is no further appeal.

In an earlier decision (*Gessner* v. *Miller*, 50 O. G., 433) Commissioner Mitchell said in reference to this question:

It is urged with great force that an interference proceeding is thoroughly *inter partes*, and that nothing done *ex parte* by the latter applicant can serve to prove anything material to the trial. It is indeed true that the proceedings are *inter partes*; but it should be remembered that nothing is material to the trial excepting the issue of priority. Both parties enter the controversy entitled to the presumption that they are original inventors, and the trial becomes thoroughly *inter partes* only so far as relates to the issue of priority. Either party may, if he can, prove that the other was not an original inventor; but the presumption stands until it is overborne by the proofs duly taken in the case.

From these decisions it is clear that from 1879 until as late as 1891 it was the settled practice of the Office that an appeal from the decision of the Primary Examiner denying the patentability of the issue upon a motion to dissolve brought by one of the parties to an interference should be *ex parte* and that only the party whose claim was affected had the right to appear and be heard.

March 23, 1892, Commissioner Simonds amended Rule 124 by adding the words "unless the question is *inter partes*." What questions were at that time considered as coming under the rule as thus amended is not clear from any decisions, either published or manuscript, made by Commissioner Simonds.

Later Assistant Commissioner Fisher, in *Duncan* v. *Westinghouse*, (66 O. G., 1005,) decided December 15, 1893, said:

Upon the declaration of the present interference Duncan moved to dissolve on the ground that Westinghouse had no right to make the claim; but the Primary Examiner held that the question presented by this motion was *res adjudicata*, inasmuch as that question had been passed upon by the Board of Examiners-in-Chief in their decision holding that there was a sufficiency of disclosure in Westinghouse's application to warrant the claim. Duncan contends that this action of the Examiner has practically cut off his privilege under Rule 122 to bring up on proper motion Westinghouse's right to make this claim, and asks that the supervisory powers of the Commissioner under section 481, Revised Statutes, giving him the authority to "perform all duties respecting the granting and issuing of patents directed by law," be exercised to give him relief under the peculiar circumstances of this case.

Rule 124 contains the following provision:

"Decisions on these motions, when appealable, go to the Examiners-in-Chief, and upon such appeals the party only whose claim is affected shall have the right to appear and be heard, unless the question is *inter partes*."

Motions to dissolve an interference are argued before the Primary Examiner, both parties having the right to appear and be heard. If, from the decision of the Primary Examiner, an appeal is duly taken to the Commissioner both parties have the right to appear and be heard.

When, however, a decision is made on a motion to dissolve which denies the patentability of an applicant's claim, or a motion to dissolve which denies the right of applicant to make the claim, or on a motion involving the merits of the invention, the appeal to the Examiners-in-Chief is usually an *ex parte* one. It follows that only one side of the question is presented to the Examiners-in-Chief, whereas it would seem to be proper, since the appeal grew out of a contested proceeding, that the appeal itself should be a contested proceeding. Otherwise various complications are liable to result. For instance, a motion to dissolve might be brought on the ground that the issue, couched in the language of the claims of one of the applicants, was not patentable. This motion would be argued before the Primary Examiner, who would hear both parties. If he should decide the issue to be unpatentable, he would dissolve the interference. The party whose claim was thus adjudged to be unpatentable might appeal to the Examiners-in-Chief, who would then listen merely to the applicant's presentation of his case without the additional light that might be afforded by the argument of the opposing party. If the decision were in favor of the applicant, the case would then be sent back to the Primary Examiner, who, considering himself bound by the decision of the Examiners-in-Chief, would redeclare the interference, refusing, as a matter of course, a renewed motion to dissolve on the part of the other applicant on the ground that such matter was *res adjudicata*. If, then, the interference should be heard and decided by the Examiner of Interferences, and on appeal to the Examiners-in-Chief the party who had brought the motions to dissolve should attempt to renew his motion before the Examiners-in-Chief, or to have them insert in their decision a statement directing the attention of the Commissioner to a matter not relating to priority, establishing, in their opinion, the fact that a statutory bar existed to the grant of a patent to either of the parties for the claim or claims in interference, (Rule 124,) the request might be refused on the ground that the patentability of the issue had been decided by the Primary Examiner in declaring the interference. One of the parties would, therefore, be prevented from arguing the question whether or not the issue was patentable, and his only remedy would be to petition to the Commissioner to exercise his supervisory authority under section 481 of the Revised Statutes—a proceeding which ought to be discouraged, and which should never be had except under extraordinary circumstances.

The case stated above is one that actually occurred.

There seems to be an inconsistency in a practice which allows both parties to be heard by the Primary Examiner and by the Commissioner and only one of such parties by the Examiners-in-Chief. It is thought, therefore, that Rule 124 ought to be so construed that both parties could be heard in such cases.

That this was not intended to establish a practice under which, on an appeal from a decision of the Primary Examiner adverse to patentability or to the applicant's right to make the claim, the party who brought the motion should be entitled to appear before the appellate tribunal on the same footing which he had before the Primary Examiner, appears from the decision of Assistant Commissioner Fisher in *Buckley* v. *Page*, (54 MS. Dec., 485:)

It would be impossible for the Commissioner to review all the favorable decisions of the Primary Examiners, and it is under peculiar circumstances only that it would be wise or politic for him to undertake the reëxamination of favorable decisions. The rule of office practice (124) has, therefore, for many years been against any such appeal to any tribunal of the Office. The weight of authorities in the past has been in favor of considering *ex parte* all appeals on motions to dissolve which involve the merits of an interference, thus emphasizing the position that the patentability of an application is a question between the public, as represented by the Office, and the applicant, and that no single person can have an especial interest in the question to the extent of entitling him to convert the ordinary examination of an application into a contested case.

And although the rules provide for reconsidering patentability, after the declaration of an interference, upon the suggestion of a motion to dissolve, this provision did not change the fundamental relation of the parties, but was a provision of abundant caution, so that the Examiner might avail himself of an independent, careful search, made by one familiar with the application through the interference proceedings, and having generally the experience of an expert in the art, quickened by a personal interest in anticipating or defeating the claims of an opponent.

Under the present practice, however, it is thought that the consideration of the several bars which may be presented under

a motion to dissolve, would be assisted by the oral explanations and elucidations of the party suggesting the bar, and that the interests of applicants and the public alike would be better conserved if all proceedings arising out of an interference should be of an *inter partes* character. And this is the provision of *Duncan* v. *Westinghouse*. (66 O. G., 1005.)

Now, although such an appeal is *inter partes*, the moving party is not allowed to appear as a matter of right. * * * His relation to his opponent is the same now as before. He is given the privilege of a hearing. * * *

Later Assistant Commissioner Fisher, in the case of *Pell* v. *Pierpont*, (76 O. G., 1573,) decided June 23, 1896, in an interference in which the question of priority had been decided, but the Examiner directed to again consider the question of patentability, refused to direct that such consideration be *inter partes*.

Rule 67 of the Rules of Practice in force February 9, 1897, provided that—

questions *inter partes* before the Primary Examiner will be *inter partes* on appeal.

This rule was in force until June 18, 1897. Under this rule the decision of June 8, 1897, above referred to, was rendered in this interference by Commissioner Butterworth upon Painter's motion to set aside the decision of the Primary Examiner dissolving the interference.

On June 18, 1897, present Rule 124 was adopted. This rule is in substance Rule 124 of the rules of 1892, with the difference that it provides that upon appeals from decisions dissolving interferences which are appealable to the Examiners-in-Chief the question may be heard *inter partes*.

The language of this rule was not employed unadvisedly. It was intended by the use of the words "may be heard *inter partes*" to permit the adverse party to be heard, if considered advisable, by the Examiners-in-Chief, in that respect differing from the old rule, which provided that such appeals should be *ex parte*, but not prescribing that the adverse party should be entitled to be heard *as of right*. On such appeals the adverse party is heard as a matter of courtesy and not as a matter of right. In appeals on the question of patentability of the claim which is made the issue it may be that the Examiners-in-Chief may deem it desirable that the adverse party be permitted to present his views either orally or by filing a brief. It may also happen that in an interference involving three or more parties it may be expedient to hear at one time all of the parties who may insist that the subject-matter of the issue is patentable, though patentability is denied by the Examiner upon motion to dissolve. In appeals on the question of right to make the claim it appears doubtful whether the adverse party should be heard even as a matter of courtesy. This matter should, however, be left to the discretion of the Examiners-in-Chief.

Under the decisions in *Abel and Dewar* v. *Maxim* v. *Nobel* (56 O. G., 139) and *ex parte Lombard* (43 O. G., 1347) an applicant has his remedy in case his opponent fails to take his appeal upon an adverse decision of the Primary Examiner upon the question of patentability or right to make the claim raised by motion to dissolve. He may ask that his own application shall be passed to issue unless his opponent exercises his right of appeal within a reasonable time. Failure on the part of the opponent to take his appeal within such time set may perhaps be held to work an estoppel; but consideration of this question should be *ex parte*.

Under the law the Primary Examiner determines in the first instance the question of priority between parties having interfering claims, one of whom is an applicant. The contest as to this question of priority is the only contest authorized by law to be conducted before the Patent Office. As has been clearly pointed out by the Commissioner in the recent decision of *Hammond* v. *Hart*, (83 O. G., 743,) the Office cannot under the statute relating to interferences entertain a contest as to the respective rights of parties, one of whom has claims which infringe but do not interfere with the claims of the other. Such a contest should be conducted before the courts. It is of course necessary to the institution of an interference that the claims in issue be held patentable and that it be held that the respective parties have the right to make the claims. Upon a motion to dissolve seasonably brought the Examiner will under the rule review his decision allowing the claims in issue.

This motion to dissolve is in the nature of a suggestion to the Office of certain facts which are believed to negative patentability or to show that one of the parties is not entitled to make the claim. It is not a contest in which testimony can be received or anything presented for consideration which was not actually or presumably within the knowledge of the Examiner in the *ex parte* treatment of the applications of the respective parties prior to the declaration of the interference. The motion is brought not on the ground that the interests of the party bringing it would be adversely affected by the issuance of a patent to his opponent for the subject-matter in issue, but for the reason that it appears to the moving party that the Office was in error in finding the claim patentable. The fact that the interests of the moving party may be adversely affected by the issuance of a patent to his opponent for the subject-matter of the issue does not in itself entitle him or any other person to be heard, nor is it a fact to be considered in the determination of the question by the Examiner. The question is the same question that was considered before the declaration of the interference—a question of patentability. As was said by Commissioner Hall in *Ely* v. *Vinton* v. *Schwab*, (35 MS. Dec., 17:)

Patentability is a question wholly between an applicant and the Office. When an application first comes up for consideration on the question of patentability, the applicant is entitled to receive what is supposed to be the best and highest opinion, that of the Office uninfluenced by the testimony, solicitations, or views of third parties or outside experts. If after interference and dissolution thereof, such questions again arise, the same condition follows. * * * It would be a complete departure from the system of the Office if third parties could interpose or thrust affidavits before Primary Examiners when they are determining questions involving the patentability of inventions in *ex parte* proceedings.

In a very recent case, that of *Hill* v. *Hodge*, decided April 12, 1898, by the Court of Appeals of the District of Columbia, (83 O. G., 1211,) in which the question of patentability of the subject-matter of the inventions was raised, it was held that:

The Commissioner was right in refusing to entertain the issue of patentability. That the question of patentability of the claim

in interference is not involved therein has been time and again decided (*Hiney* v. *Peters*, 71 O. G., 893; *Doyle* v. *McRoberts*, 70 O. G., 1029, and cases cited therein.)

After this controversy shall have been determined the question of patentability may be raised in the Patent Office against the successful party. As a matter of fact the Commissioner, though refusing to take cognizance of the issue of patentability, regarded the evidence of prior invention and public use by Leeds as sufficiently important to require him in rendering his decision to direct the Primary Examiner to inquire into and consider the question of patentability when the matter shall again come before him. When that question shall be raised, Hill will have no other interest in its decision than as one of the general public whose interests are under the protection of the Commissioner of Patents.

The decision in the case of *Doyle* v. *McRoberts*, referred to in the above decision, is instructive upon this point. In this decision the court says:

Since the case was submitted a supplemental brief has been filed in behalf of Doyle, in which we are asked to dismiss the case because there is no invention in the patent-right claimed.

The motion is strangely at variance with the original application and the preliminary statement of Doyle, each supported by his affidavit, in which he claims to be the inventor "of a new and useful improvement," which is the very matter claimed by McRoberts. The appositeness of the reference by McRobert's counsel to the judgment of Solomon is very apparent, for it is the fictitious mother of this invention who desires to see it repudiated altogether, rather than allow the true inventor to obtain his just rights. It is obvious enough that the next best thing to success in the interference case for Doyle and his fellow stockholders in the Shickle, Harrison & Howard Company would be to have the patent to McRoberts annulled, that they may be free to use that invention without payment of any royalty.

In our opinion it is not competent for this court, in an interference proceeding, to abandon the question of priority and pass upon the patentability of the alleged invention. This was decided as far back as 1875 by the Supreme Court in general term, (*U. S., ex rel. Bigelow*, v. *Thatcher*, McA., 24,) where the petitioner in interference asked for the vacation of the patent upon the ground that the inventor had abandoned his invention to public use. In *Hiney* v. *Peters* (71 O. G., 893; 6 App. D. C., 70) the identical motion interposed here was made and was overruled upon the ground that the applicant was effectually estopped to dispute the patentability of the invention by reason of his own affirmative assertions that his claim was patentable. (See also *U. S., ex rel. Brodie*, v. *Seymour, Comr.*, 79 O. G., 506; 25 Wash. Law Rep., 161.) But it is insisted that under the authority of *Hill* v. *Wooster* (50 O. G., 560; 132 U. S., 694) the Supreme Court has settled the competency of this court to sustain this claim.

But that decision has no relevancy to a case like the present. Section 52 of the Patent Office act of July, 1870, (R. S., sec. 4915) provides that—

"Whenever a patent or application is refused, either by the Commissioner of Patents or by the Supreme Court of the District of Columbia upon appeal from the Commissioner, the applicant may have a remedy by bill in equity, and the court having cognizance thereof, on notice to adverse parties and other due proceedings may adjudge that such applicant is entitled, according to law, to receive a patent for his invention as specified in his claim as the facts in the case may appear and such adjudication, if it be in favor of the right of the applicant shall authorize the Commissioner to issue such patent," etc.

It was in a proceeding under this special statute that the Supreme Court held an equity judge was obliged, under the language of the act, to consider the patentability of the invention covered by the claim, and if he should find it not patentable should deny the application. Such a provision is in entire sympathy with the general principles of equity, which refuses to decree in favor of the most specious of two applicants under a claim of an illicit character.

But the present is not a proceeding in a court of equity; nor is it an application for the issue of a patent under the circumstances recited in the statute.

It is a proceeding as at law and under altogether different conditions, and hence the decision can have no application to the matter before us.

If the Examiner upon hearing the motion adheres to his decision that the claims are patentable and patentable to the respective parties, the contest as to these questions is concluded in so far as it is preliminary to the determination of the question of priority. Should the Examiner upon motion for dissolution decide that the claims are not patentable or not patentable to one of the parties, a decision which is as to one or both of the parties equivalent to a final rejection, the full course of appeal is open to the party whose claim is affected by such decision, and such appeal is *ex parte*. The party bringing the motion is, so far as such appeal is concerned, no more entitled to be heard as of right, whatever may be decided by the Office as regards his appearing before the appellate tribunals as a matter of policy, than any person not before the Office whose rights to freely manufacture the invention covered by the claim might be curtailed by the issuance of a patent. (*Cf. Hill* v. *Hodge*, above cited.) The moving party has a right to ask that his opponent move promptly to determine his rights. He has a right to withdraw his own claim for the subject-matter held not patentable and to defeat the patent if granted to his opponent before the courts. His right to be heard in opposition to the grant of a patent to his opponent ceases with the decision by the Primary Examiner. The interference is by the adverse decision of the Primary Examiner upon those questions virtually—though not technically—dissolved. Proceedings may be resumed upon a decision of an appellate tribunal favorable to patentability. If resumed, the question of patentability may be raised before the Examiner of Interferences and each of the appellate tribunals of the Office for such actions under Rule 126 as the case may demand. The party who denies the patentability of the claim in issue or his opponent's right to make the claim has thus his remedy in the Office and in the courts.

The motion to dissolve on the ground of non-patentability or that one of the parties has no right to make the claim is heard *inter partes* by the Primary Examiner as a matter of Office policy in order that the facts and reasons which in the opinion of the moving party negative the patentability of the claim or show that his opponent is not entitled to make the claim may be clearly presented; but the Office does not and cannot recognize the moving party as a party in interest entitled to contest the patentability of another's claims. He has no right of appeal from a decision denying his motion. His position is not unlike that of *amicus curiæ*. The same reasons which justify the rule which refuses the right of appeal from the decision of the Primary Examiner affirming patentability or the right of the respective parties to make the claim justify the Office in refusing to permit the appeal taken by the party whose claims are affected to be made a contest *inter partes* before the appellate tribunal.

It follows that the Examiners-in-Chief, being governed by the rules in force at the time of hearing Painter's appeal, were right in holding that the appeal was *ex parte* and not *inter partes*.

But whether or not the adverse party is to be heard upon the appeal upon the question raised by the motion to dissolve, it is clear that he cannot be heard before the appellate tribunal as to the validity of the appeal of the party against whom the question of patentability or right to make the claim has been decided by the Primary Examiner. As to questions involving validity, the appeal is clearly *ex parte* purely. The question of the time of taking the appeal is such a question. So, also, is the question of estoppel of a party by his adoption of a course deemed to be inconsistent with an appeal. The Examiners-in-Chief were clearly right in dismissing the motion made before them by Hall to dismiss Painter's appeal because not taken until the limit of appeal set by the Examiner had expired. Such limit of appeal should not have been set by the Examiner, and it was not binding upon Painter.

The motion to set aside the decision of the Examiners-in-Chief is denied.

War Revenue—Stamp Tax.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., June 25, 1898.

The attention of persons having business before this Office is called to the provisions of the act entitled "An act to provide ways and means to meet war expenditures, and for other purposes," approved June 13, 1898. That part of this act which relates to matters arising in this Office takes effect July 1, 1898.

The first sentence of section 9 of this act provides:

That in any and all cases where an adhesive stamp shall be used for denoting any tax imposed by this act, except as hereinafter provided, the person using or affixing the same shall write or stamp thereupon the initials of his name and the date upon which the same shall be attached or used, so that the same may not again be used.

The first sentence of section 14 provides:

That hereafter no instrument, paper, or document required by law to be stamped, which has been signed or issued without being duly stamped, or with a deficient stamp, nor any copy thereof, shall be recorded or admitted, or used as evidence in any court until a legal stamp or stamps, denoting the amount of tax, shall have been affixed thereto, as prescribed by law.

Section 15 provides:

That it shall not be lawful to record or register any instrument, paper, or document required by law to be stamped unless a stamp or stamps of the proper amount shall have been affixed and canceled in the manner prescribed by law; and the record, registry, or transfer of any such instruments upon which the proper stamp or stamps aforesaid shall not have been affixed and canceled as aforesaid shall not be used in evidence.

Schedule A contains the following provisions:

Certificates of any description required by law not otherwise specified in this act, ten cents.

* * * * * * *

Mortgage or pledge, of lands, estate, or property, real or personal, heritable, or movable, whatsoever, where the same shall be made as a security for the payment of any definite and certain sum of money, lent at the time or previously due and owing or forborne to be paid, being payable; also any conveyance of any lands, estate, or property whatsoever, in trust to be sold or otherwise converted into money, which shall be intended only as security, either by express stipulation or otherwise; on any of the foregoing exceeding one thousand dollars and not exceeding one thousand five hundred dollars, twenty-five cents; and on each five hundred dollars or fractional part thereof in excess of fifteen hundred dollars, twenty-five cents.

* * * * * * *

Power of attorney * * * to perform any and all other acts not hereinbefore specified, twenty-five cents.

Notice is hereby given that to all certificates required by law to be issued by this Office there must be affixed the proper revenue-stamp, to the value of ten cents, which must be provided or paid for by the party ordering the certificate, and that mortgages of patent-rights, and conveyances of such rights "in trust to be sold or otherwise converted into money, which shall be intended only as security, either by express stipulation or otherwise," which are offered for registration in this Office, and all powers of attorney, must be provided with the stamps required by this act. Unless every such mortgage, conveyance, or power of attorney be stamped in accordance with this act it will not be registered or entered on the records of this Office, but will be returned to the party offering it for compliance with the provisions of this act.

C. H. DUELL,
Commissioner.

Schedule of stamp taxes required upon papers filed in or issued by the United States Patent Office.

Certificates. (This includes certificates of registration of Trade-Marks, Labels, and Prints issued by the Patent Office)	$0.10
Mortgages, and conveyances in trust—	
Exceeding one thousand dollars and not exceeding fifteen hundred dollars	.25
And on each five hundred dollars or fractional part thereof in excess of fifteen hundred dollars	.25
Power of attorney	.25

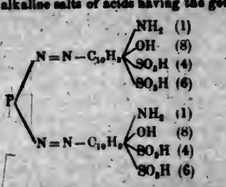
PATENTS

GRANTED JUNE 28, 1898.

606,180. WRITING-BOOK COVER. CLARENCE J. AINSWORTH, Gardner, Mass. Filed Sept. 30, 1897. Serial No. 653,832. (No model.)

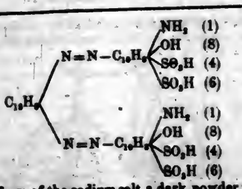
Claim.—1. The book-cover A, in combination with the writing-book and copy-holder device C, the latter consisting of the back strip *d* attached to the flexible back between the leaves of said book-cover, and having the curved and preferably eye-shaped ends *d'* *d²*, with the end *d²* terminating in a pointed or hook end *d³*, the swinging arm *f*, pivoted at *e* to one end of said back strip *d*, and adapted, at its opposite end, to be attached to the hooked end *d³*, the slide *g* fitted on arm *f* and the arm *g* pivoted at one end to said slide *g*, substantially as and for the purpose set forth.



2. In a writing-book cover, the combination of the book-cover with the back strip having the eye-shaped loops formed on the ends thereof, said loops being bent upward, inward and downward to form supports for the leaves of the book-cover when closed; means for fastening the back strip to said book-cover, and the swinging arm pivoted at one end to one end of the back strip and adapted to be detachably fastened at the other end, substantially as and for the purpose set forth.

606,181. BLUE TETRAZO DYE AND PROCESS OF MAKING SAME. JOHANN BADISARE, Elberfeld, Germany, assignor to the Farbenfabriken of Elberfeld Company, of New York. Filed Dec. 20, 1897. Serial No. 662,703. (Specimens.) Patented in France Oct. 30, 1896, No. 263,725; in England Oct. 31, 1896, No. 20,578, and in Italy Dec. 31, 1896, XXVIII, 36,235, LXXI, 298.

Claim.—1. The process for producing new tetrazo dyestuffs by combining one molecule of a tetrazotized paradiamin with two molecules of 1.8 amidonaphthol 4.6 disulfo-acid substantially as hereinbefore described.



2. The process for producing a new tetrazo dyestuff by combining one molecule of a tetrazodiphenyl salt with two molecules of 1.8 amidonaphthol 4.6 disulfo-acid substantially as hereinbefore described.

3. As new articles of manufacture the new dyestuffs from tetrazotized paradiamins with two molecules of 1.8 amidonaphthol 4.6 disulfo-acid, being alkaline salts of acids having the general formula:

in which formula P means a radical of the benzidin series such as diphenyl, and which are dark powders, soluble in water with from reddish-blue to blue color, yielding on unmordanted cotton from violet-blue to blue shades substantially as described.

4. As a new article of manufacture the specific dyestuff, being an alkaline salt of an acid having the formula:

which is in the form of the sodium salt a dark powder with a bronzy luster, easily soluble in water with a reddish-blue color, being dissolved by concentrated sulfuric acid (66° Baumé) with a greenish-blue color which turns into bluish violet on adding a small quantity of ice while a bluish-violet flaky precipitate is obtained on the addition of a larger quantity of ice to the sulfuric-acid solution, dyeing unmordanted cotton violet-blue shades fast to acids and alkalies substantially as described.

606,182. WIRE-FENCE SPACER. CHARLES BAXTER, Waukesha, Wis. Filed Aug. 9, 1897. Serial No. 647,543. (No model.)

Claim.—1. A wire-fence spacer comprising the parallel bars, adjustably secured together and provided with wire-engaging prongs, and a lever pivotally secured to one of the bars and operating in a recess in the other bar, whereby, when said lever is turned to a vertical position, the recessed bar will be lifted upon the other to adjust the prongs in a position for engaging the fence-wires, and the lever locked in such position by reason of the bearing of the recessed bar upon the end of the lever above its pivotal support, substantially as described.

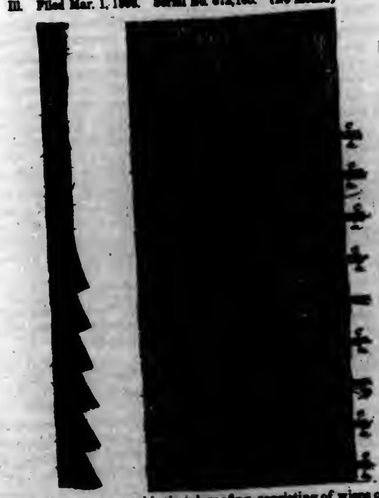
2. A wire-fence spacer comprising the parallel wooden bars adjustably secured together and provided with metallic wire-engaging prongs, together with a lever pivoted to one of the bars and operating in a recess in the other bar, whereby when said lever is adjusted in a vertical position, it is adapted to become locked by the bearing of the recessed bar upon its end above its pivotal support, substantially as described.

606,183. FLAT METAL TABLEWARE. GEORGE H. BRABOOK, Taunton, Mass., assignor to the Reed & Barton Corporation, same place. Filed Sept. 28, 1897. Serial No. 652,819. (No model.)

Claim.—That improvement in the art of manufacturing flat metal tableware, which consists in first striking the article to its ultimate form, next removing the base metal from portions thereof exposed to wear, then substituting precious metal of a shape and size corresponding to the base metal removed, by welding and finally finishing and plating the article, substantially as described.

606,184. BRUSH. JOHN T. BURRIS, Melbourne, Victoria. Filed Sept. 11, 1897. Serial No. 651,307. (No model.)

Claim.—A brush for cycle-chain cleaning, consisting in two parallel brush members formed from one length of twisted wire bent in the center to a U shape, and radiating bristles tapering in length toward the points of the members, said members being held apart by a flat plate forming a rest for the thumb, substantially as described.

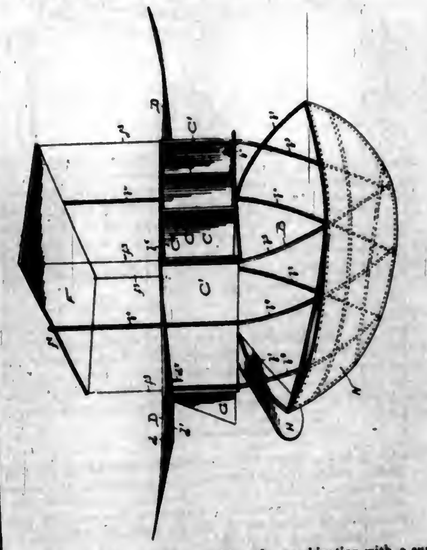


606,185. BICYCLE ATTACHMENT. MERRITT BURT, Jacksonville, Fla. Filed Mar. 10, 1897. Serial No. 626,863. (No model.)

Claim.—1. In a safety appliance for bicycles, the combination of a plate apertured to receive the terminal of the rear axle and having opposite extensions in vertical alinement and diverging parts formed with openings to receive fastenings by means of which the plate is secured to the converging ends of the machine-frame, a curved rod secured to the upper extension of the plate and having its outer terminal deflected and provided with a vertical sleeve, a horizontal brace connecting the lower extension with the lower portion of the curved rod, a rolling support having a stem mounted in the said sleeve and held from turning therein, and means for securing the rolling support at the required elevation, substantially as set forth.

2. In a safety appliance for bicycles, the combination of the plate to be secured to the converging bars of the machine-frame, a rod secured to the plate and having a sleeve at its outer end, a rolling support having its stem mounted in the sleeve so as to move vertically therein and held from turning, and a horizontally-disposed spring-actuated lever fulcrumed to the terminal portion of the aforesaid rod and adapted to operate through the sleeve and engage with the stem of the rolling support and hold the latter at the desired position, substantially as specified.

606,186. THATCH ROOFING. CHARLES H. BUSSELL, Oquawka, Ill. Filed Mar. 1, 1898. Serial No. 672,185. (No model.)



Claim.—1. A portable thatch roofing, consisting of wisps of straw or analogous material fastened together by warp wires or cords arranged in series of groups each group containing three or more of said wires or cords to form an imperforate rain-shedding fabric substantially as shown and described.

2. A portable thatch roofing, consisting of wisps of straw, or analogous material, fastened together in overlapping layers and bound together by wires or cords transversely to the length of the wisps substantially as shown and described.

3. A portable thatch roofing, consisting of wisps of straw or analogous material, fastened together by wires or cords transversely to the length of the wisps, the body part of said wisps being arranged two-ply, or with one wisp in one layer opposite the space between two wisps of the other layer, and the butt-ends of the wisps being arranged in overlapping shingle-like layers substantially as shown and described.

4. A portable thatch roofing, consisting of wisps of straw or analogous material, a series of warp wires or cords arranged in sets of three connecting the body of the wisps in two-ply relation, the butt-ends of the wisps being arranged in overlapping shingle-like layers substantially as described.

606,187. SOARING-MACHINE. WILLIAM P. BUTUROV, Chicago, Ill. Filed July 15, 1896. Serial No. 599,209. (No model.)

Claim.—1. In a soaring-machine, the combination with a support or platform for the rider to stand and move back and forth upon as required for balancing the machine and steering it up or down, of balancing tunnels or keels above the rider's support or platform, wings projecting at each side of the balancing tunnels or keels, a skeleton boat-shaped framework rigidly connecting the rider's support or platform, the balancing tunnels or keels and the wings, a kite or plane above the balancing tunnels or keels and hinged or mounted movably on the frame so that its inclination or angle of incidence may be varied or adjusted as required, a rudder hinged to the frame at the rear of the balancing tunnels or keels, a tail connected to the frame at the rear of the balancing tunnels or keels and projecting at a downward inclination to the rudder, a ballast box or vessel below the rider's platform and furnished with a valve for emptying the same at the will of the operator, substantially as specified.

2. In a soaring-machine, the combination with a support or platform for the rider to stand and move back and forth upon as required for balancing the machine and steering it up or down, of balancing tunnels or keels above the rider's support or platform, wings projecting at each side of the balancing tunnels or keels, a skeleton boat-shaped framework rigidly connecting the rider's support or platform, the balancing tunnels or keels and the wings, a kite or plane above the balancing tunnels or keels and hinged or mounted movably on the frame so that its inclination or angle of incidence may be varied or adjusted as required, and a rudder hinged to the frame at the rear of the balancing tunnels or keels, substantially as specified.

3. In a soaring-machine, the combination with a support or platform for the rider to stand and move back and forth upon as required

for balancing the machine and steering it up or down, of balancing tunnels or keels above the rider's support or platform, wings projecting at each side of the balancing tunnels or keels, a skeleton boat-shaped framework rigidly connecting the rider's support or platform, the balancing tunnels or keels and the wings, a kite or plane above the balancing tunnels or keels and hinged or mounted movably on the frame so that the inclination or angle of incidence may be varied or adjusted as required, a rudder hinged to the frame at the rear of the balancing tunnels or keels, and a ballast box or vessel below the rider's platform and furnished with a valve for emptying the same at the will of the operator, substantially as specified.

4. In a soaring-machine, the combination with a support or platform for the rider to stand and move back and forth upon as required for balancing the machine and steering it up or down, of balancing tunnels or keels above the rider's support or platform, wings projecting at each side of the balancing tunnels or keels, a skeleton boat-shaped framework rigidly connecting the rider's support or platform, the balancing tunnels or keels and the wings, a kite or plane above the balancing tunnels or keels and hinged or mounted movably on the frame so that its inclination or angle of incidence may be varied or adjusted as required, a rudder hinged to the frame at the rear of the balancing tunnels or keels, and a tail connected to the frame at the rear of the balancing tunnels or keels and projecting at a downward inclination to the rudder, substantially as specified.

5. In a soaring-machine, the combination with a support or platform for the rider to stand and move back and forth upon as required for balancing the machine and steering it up or down, of balancing tunnels or keels above the rider's support or platform, wings projecting at each side of the balancing tunnels or keels, a skeleton boat-shaped framework rigidly connecting the rider's support or platform, the balancing tunnels or keels and the wings, a kite or plane above the balancing tunnels or keels and hinged or mounted movably on the frame, so that its inclination or angle of incidence may be varied or adjusted as required, a rudder hinged to the frame at the rear of the balancing tunnels or keels, means for operating said rudder and means for adjusting said kite or plane, substantially as specified.

6. The combination with a support or platform for the rider to stand and move back and forth upon as required for balancing the machine in the air and steering it up or down, of balancing tunnels or keels above the rider's platform, wings projecting at each side of the balancing tunnels or keels, a kite or plane, a rudder, and a skeleton boat-shaped framework having upper and lower longitudinal bowed ribs b, b', substantially as specified.

7. The combination with a support or platform for the rider to stand and move back and forth upon as required for balancing the machine in the air and steering it up or down, of balancing tunnels or keels above the rider's platform, wings projecting at each side of the balancing tunnels or keels, a kite or plane, a rudder, and a skeleton boat-shaped framework having upper and lower longitudinal bowed ribs b, b', and longitudinal bowed side ribs b^2, upright bowed ribs b^3 b^3 b^4 on each side, substantially as specified.

8. The combination with a support or platform for the rider to stand and move back and forth upon as required for balancing the machine in the air and steering it up or down, of balancing tunnels or keels above the rider's platform, wings projecting at each side of the balancing tunnels or keels, a kite or plane, a rudder, a skeleton boat-shaped framework having upper and lower longitudinal bowed ribs b, b', longitudinal bowed side ribs b^2, upright bowed ribs b^3 b^3 b^4 on each side, and front and rear cross-bars b^5, substantially as specified.

9. The combination with a support or platform for the rider to stand and move back and forth upon as required for balancing the machine in the air and steering it up or down, of balancing tunnels or keels above the rider's platform, wings projecting at each side of the balancing tunnels or keels, a kite or plane, a rudder, a skeleton boat shaped framework having upper and lower longitudinal bowed ribs b, b', longitudinal bowed side ribs b^2, upright bowed ribs b^3 b^3 b^4 on each side, front and rear cross bars b^5, said upright ribs b^3 b^4 extending above the balancing tunnels or keels, and said kite or plane being pivoted thereto, substantially as specified.

10. In a soaring-machine, the combination with a support or platform for the rider to stand and move back and forth upon as required for balancing the machine and steering it up or down, of balancing tunnels or keels above the rider's support or platform, wings projecting each side of the balancing tunnels or keels, a skeleton boat-shaped framework rigidly connecting the rider's support or platform, the balancing tunnels or keels and the wings, a kite or plane above the balancing tunnels or keels and hinged or mounted movably on the frame so that its inclination or angle of incidence may be varied or adjusted as required, a rudder hinged to the frame at the rear of the balancing tunnels or keels, a tail connected to the frame at the rear of the balancing tunnels or keels and projecting at a downward inclination to the rudder, and a spring for holding the tail yieldingly in position, substantially as specified.

11. In a soaring-machine, the combination with a support or platform for the rider to stand and move back and forth upon as required for balancing the machine and steering it up or down, of balancing tunnels or keels above the rider's support or platform, wings projecting at each side of the balancing tunnels or keels, a skeleton boat-shaped framework rigidly connecting the rider's support or platform, the balancing tunnels or keels and the wings, a kite or plane above the balancing tunnels or keels and hinged or mounted movably on the frame so that its inclination or angle of incidence may be varied or adjusted as required, a rudder hinged to the frame at the rear of the balancing tunnels or keels, and springs for automatically holding the rudder in its normal position, substantially as specified.

12. In a soaring-machine, the combination with a support or platform for the rider to stand and move back and forth upon as required for balancing the machine and steering it up or down, of balancing tunnels or keels above the rider's support or platform, wings projecting at each side of the balancing tunnels or keels, a skeleton boat-shaped framework rigidly connecting the rider's support or platform, the balancing tunnels or keels and the wings, a kite or plane above the balancing tunnels or keels and hinged or mounted movably on the frame so that its inclination or angle of incidence may be varied or adjusted as required, a rudder hinged to the frame at the rear of the balancing tunnels or keels, and springs for holding the wings yieldingly in position or at the required angle of incidence to the wind, substantially as specified.

13. A soaring-machine having a balancing platform or support below the sustaining devices for the rider to stand upon and balance the machine and steer it up or down by moving back and forth on said platform or support as required, and sustaining devices comprising wings projecting to each side and a kite or plane above the wings, substantially as specified.

14. A soaring-machine having a support for the rider to stand upon, adapted to permit him to balance and control the machine by movements of his body backward and forward, and sustaining devices above said rider's support comprising wings projecting to each side, a tail projecting to the rear and a kite or plane above the wings and centrally above said rider's support, substantially as specified.

15. A soaring-machine having a support or platform for the rider to stand upon and balance the machine and steer it up or down by movements of his body on said platform or support, and a rigid framework connecting such support or platform with the sustaining devices above it, and sustaining devices comprising wings projecting to each side and a kite or plane above the wings, substantially as specified.

16. The combination with a support or platform for the rider to stand and move back and forth upon as required for balancing the machine and steering it up or down, of balancing tunnels or keels above the rider's support or platform, wings, a framework connecting the rider's support or platform and said keels and wings, a kite or plane and a rudder, substantially as specified.

17. The combination with a support or platform for the rider to stand and move back and forth upon as required for balancing the machine and steering it up or down, of balancing tunnels or keels above the rider's support or platform, wings, a framework connecting the rider's support or platform and said keels and wings, a kite or plane, a rudder, and a tail, substantially as specified.

18. The combination with a support or platform for the rider, of balancing tunnels or keels above the rider's support or platform, wings, and a rigid frame connecting the rider's support or platform with the keels and wings, substantially as specified.

19. The combination with a support or platform for the rider, of balancing tunnels or keels above the rider's support or platform, and wings, substantially as specified.

20. The combination with a balancing support or platform for the rider, of balancing tunnels or keels, a frame connecting the same, and a kite or plane, substantially as specified.

21. The combination with a balancing support or platform for the rider, of balancing tunnels or keels, a frame connecting the same, a kite or plane and a rudder, substantially as specified.

22. In a soaring-machine a double boat-shaped skeleton frame, provided with lower and upper longitudinal bowed ribs b b', in combination with sustaining devices comprising wings projecting to each side and a kite or plane above the wings, substantially as specified.

23. In a soaring-machine a double boat-shaped skeleton frame provided with lower and upper longitudinal bowed ribs b b', the longitudinal bowed side ribs, upright bowed ribs on each side, and cross-bars connecting the upright bowed ribs, in combination with sustaining devices comprising wings projecting to each side and a kite or plane above the wings, substantially as specified.

24. In a soaring-machine a double boat-shaped skeleton frame provided with lower and upper longitudinal bowed ribs b b', the longitudinal bowed side ribs, upright bowed ribs on each side and cross-bars connecting the upright bowed ribs, the middle upright bowed ribs being extended to form supports for a kite or plane, in combination with sustaining devices comprising wings projecting to each side and a kite or plane above the wings, substantially as specified.

25. In a soaring-machine, the combination with a frame of balancing tunnels or keels having horizontal and vertical surfaces, wings projecting laterally from the balancing tunnels or keels, and a rudder, substantially as specified.

26. In a soaring-machine, the combination with a frame of balancing tunnels or keels having horizontal and vertical surfaces, wings projecting laterally from the balancing tunnels or keels, a rudder, and a kite or plane above the balancing tunnels or keels, substantially as specified.

27. In a soaring-machine, the combination with a frame of balancing tunnels or keels having horizontal and vertical surfaces, wings projecting laterally from the balancing tunnels or keels, a rudder, a kite or plane above the balancing tunnels or keels, and a tail, substantially as specified.

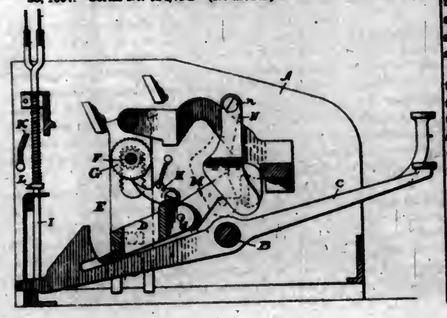
28. In a soaring-machine, the combination with a frame of balancing tunnels or keels having horizontal and vertical surfaces, wings projecting laterally from the balancing tunnels or keels, a rudder, a kite or plane above the balancing tunnels or keels, and a rider's support or platform below the balancing tunnels or keels, substantially as specified.

29. In a soaring-machine, the combination with a frame of balancing tunnels or keels having horizontal and vertical surfaces, wings projecting laterally from the balancing tunnels or keels, a rudder, a kite or plane above the balancing tunnels or keels, a rider's support or platform below the balancing tunnels or keels, means for turning the rudder, and springs for holding the rudder in its straight or normal position, substantially as specified.

30. In a soaring-machine, the combination with the wings of a hinged kite or plane above the wings and a tail projecting rearwardly below the kite or plane and centrally from the back edge of the wings, substantially as specified.

31. In a soaring-machine, the combination with the wings of a hinged kite or plane above the wings, a frame, and a balancing-support for the rider below the wings and a tail projecting rearwardly below the kite or plane and centrally from the back edge of the wings, substantially as specified.

32. In a soaring-machine, the combination with a frame, a support for the rider below, balancing tunnels or keels, and wings having a longitudinal front rib extending in one piece across the balancing tunnels or keels, substantially as specified.



33. In a soaring-machine, the combination with a frame, a support for the rider below, balancing tunnels or keels, and wings having a longitudinal front rib extending in one piece across the balancing tunnels or keels, said wings being adapted to turn or rotate on said front rib as a pivot, substantially as specified.

34. In a soaring-machine, the combination with a frame, a support for the rider below, balancing tunnels or keels, and wings having a longitudinal front rib extending in one piece across the balancing tunnels or keels, said wings being adapted to turn or rotate on said front rib as a pivot, and springs attached to said wings and to the frame for holding the wings yieldingly in position as to their rear edges, substantially as specified.

35. In a soaring-machine, the combination with a frame, of wings having a longitudinal curved front rib extending across the frame in one piece, and means for pivotally connecting said front rib to the frame, substantially as specified.

36. In a soaring-machine, the combination with a frame having two upright standards or supports, of a kite or plane hinged near its longitudinal middle to said upright standards or supports and held adjustably in position by cords or lines at its four corners and wings projecting to each side below said kite or plane, substantially as specified.

606,188. CASH-REGISTER. THOMAS CARNEY, Dayton, Ohio, assignor to the National Cash Register Company, same place. Filed Feb. 23, 1897. Serial No. 624,734. (No model.)

Claim.—1. In a device of the class described, the combination with a key controlling a movable part, of means cooperating with the movable part to lock the key as each stroke thereof ceases and then, afterward, to automatically unlock said key.

2. In a device employing a series of keys controlling a movable part, the combination with said part, of cooperating means arranged to lock the keys as each stroke thereof ceases and then, afterward, to automatically unlock said keys while they remain at rest in normal position.

3. In a cash-register, the combination with a registering device comprising movable parts and a key arranged to actuate the register, of means cooperating with the movable parts to lock the key as each stroke thereof ceases, and then, afterward, to automatically unlock said key.

4. In a device of the class described, the combination with an operating-key, of means arranged to lock said key at a certain period and then, afterward to automatically unlock the same again.

5. In a device of the class described, the combination with a plurality of operating-keys and a movable member arranged to be operated by said keys and adapted to lock all of said keys at a certain period and then, afterward, to automatically unlock them again.

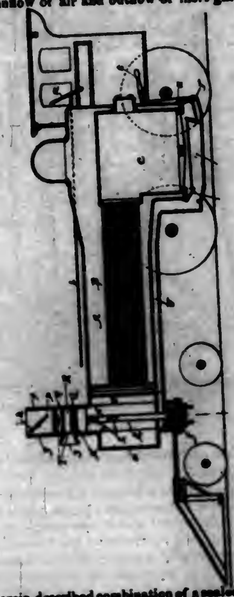
6. In a cash-register, the combination with a key controlling a movable part, of a vibrating bar moved by the actuated key to temporarily lock all of the keys after the actuated key returns to normal position and to then automatically release said keys.

7. In a device of the class described the combination with a key controlling a moving part, of a slotted plate secured to the moving part and a locking-bar cooperating with said plate arranged to temporarily lock all the keys after one of them has been actuated and to afterward automatically release said keys.

8. In a device of the class described the combination with a key controlling a moving part, of a slotted plate carried by the moving part and a locking-bar having a stud arranged to cooperate with the slot in the plate for the purpose of temporarily locking said keys after one of them has been actuated and to afterward automatically unlock said keys.

9. In a device of the class described, the combination with a key controlling a moving part, of a plate provided with a shoulder and a locking-bar arranged to cooperate with the said plate to temporarily lock said key after each actuation thereof.

10. In a device of the class described, the combination with a key controlling a moving part, of a plate provided with a shoulder and carried by the moving part, and a locking-bar bearing a stud arranged to cooperate with the shoulder on the plate to lock the key, as described.



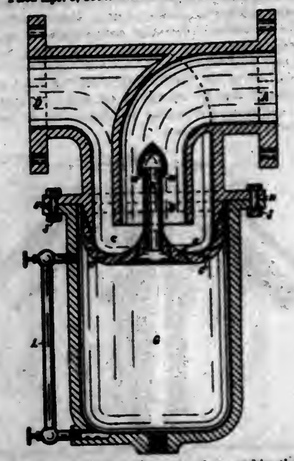
11. In a cash-register the combination with a series of keys cooperating with moving parts, of a locking-bar and a plate carried by the moving parts and arranged to throw the locking-bar into position to lock the keys for an instant after the actuation of any of the keys and to then automatically unlock said keys; substantially as described.

606,189. APPARATUS FOR FORMING GAS. DAVID CLOSE, Philadelphia, Pa. Filed Aug. 10, 1897. Serial No. 647,670. (No model.)

Claim.—1. In combination, a boiler, a fire-box connected therewith, an extension formed with the boiler having three compartments therein, adjustable slats formed in the fronts of the two side compartments, a baffle-plate above the compartments, a semicircular partition above the baffle-plate, whereby a passage is formed therebetween, said passage leading downwardly in two directions to the side compartments, a stand-pipe arranged in the central compartments having nozzles directing the steam upwardly against the baffle-plate, arms projecting from the top of the stand-pipe having nozzles directing the steam downwardly through the side compartments, a conduit leading from the side compartments to the fire-box, a passage-way for the escape of non-combustible material and a deflector-plate in said passage-way, and means for operating the deflector-plate and slats in conjunction with each other, substantially as shown and described.

2. In combination with a boiler having tubes or flues in connection therewith and a fire-box, compartments arranged in the front of the boiler, a baffle-plate arranged over said compartments to direct the products of combustion downwardly, pipes conveying exhaust-steam to said compartments, passages conveying atmospheric air and discharging it simultaneously with the steam, and means for admitting and regulating the flow of air to the compartments after the mixing of the steam, air and products of combustion, and a passage leading from the compartments to the fire-box, substantially as described.

3. In an apparatus for forming a gas from the combination of the products of combustion, exhaust-steam and a certain amount of atmospheric air and returning the same to the fire-box for the further support and increase of combustion therein, a fire-box, a boiler, tubes or flues in connection therewith, a sealed ash-pit, compartments formed in front of the boiler and connected with the tubes, a stand-pipe leading from the exhaust, nozzles connected therewith, for combining steam with the products of combustion and forcing the combination upward, baffle-plates for deflecting the gases, injectors consisting of steam-nozzles for driving the combined gases downward, means for feeding air to the combination at this point, means for admitting more or less air to the combination thereafter, a conduit for conveying the combined gases to the ash-pit, and suitable dampers and levers for regulating the inflow of air and outflow of inert gases, as specified.

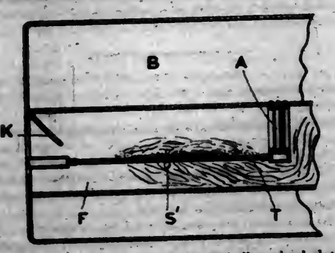


4. The herein-described combination of a sealed fire-box, a sealed ash-pit, a boiler, tubes or flues for conveying the products of combustion from the fire-box, an extension secured to the opposite end of the boiler, compartments formed in said extension, a stand-pipe leading from the exhaust and located within one of the compartments, nozzles leading from said stand-pipe for driving the products of combustion upward and commingling steam therewith, baffle-plates for deflecting said gases downward, passages for admitting atmospheric air at this point, steam-nozzles also connected with the stand-pipe for admitting more steam to the combination and injecting the combined gases downward, slats admitting a further quantity of atmospheric air, a conduit for conveying the combined gases to the ash-pit, a passage-way for permitting the non-combustible elements to escape, a deflector-plate for bringing about an indowing of air while permitting the outflow of the non-combustible elements, and means for regulating the action of the apparatus, substantially as shown and described.

5. In combination, a boiler, a sealed fire-box connected therewith, a sealed ash-pit beneath the fire-box, suitable tubes or flues for leading the products of combustion from the fire-box, an extension formed with the boiler having therein three compartments, means for admitting steam to the central compartment, baffle-plates for deflecting the steam and products of combustion downward, means for admitting air at this point, means for admitting more steam to the combination and injecting the same within the remaining compartments of the extension, means for forcing atmospheric air within the apparatus at various points, and means for permitting the escape of non-combustible elements, substantially as and for the purpose set forth.

6. An apparatus for forming gas and returning it to the fire-box consisting of a boiler, tubes or flues, a fire-box, compartments formed at the front of the boiler, baffle-plates for directing the products of combustion downwardly, pipes conveying exhaust-steam and discharging it downwardly above the compartments, air-passages for admitting air simultaneously with the steam, a series of slats arranged in the front of the compartments under the control of the engineer for admitting and regulating the flow of air to the compartments after the mixing of the steam, air and products of combustion, and a passage leading from the compartments to the fire-box, substantially as described.

606,190. STEAM-SEPARATOR. FRED B. COREY, Springfield, Mass. Filed Apr. 3, 1897. Serial No. 630,634. (No model.)



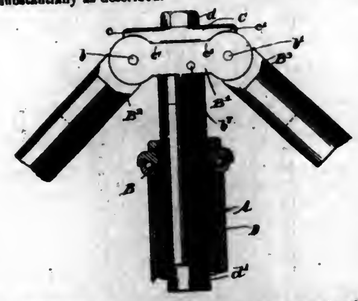
Claim.—1. In a steam-separator, the combination of a main steam-passage, a water-receiver, a perforated wall between the said main steam-passage and the said receiver and an auxiliary steam-passage extending from the upper part of the said receiver to the said main steam-passage, substantially as described.

2. In a steam-separator, the combination of a main steam-passage, a water-receiver, a perforated wall between the said main steam-passage and the said receiver, an auxiliary steam passage or pipe extending from the upper part of the said receiver to the said main steam-passage and a hollow cone overlapping the end of the said auxiliary steam passage or pipe but not in contact therewith, as set forth.

3. In a steam-separator, an inlet-pipe, a deflecting-plate in close proximity to the end of the said inlet-pipe and perforations in the said deflecting-plate, the said perforations being tangent to the inner surface of the said deflecting-plate, substantially as set forth.

4. In a steam-separator, a steam-circulating device consisting of a steam pipe or passage and a hollow cone overlapping the outlet of the said pipe or passage but not in contact therewith, the said pipe or passage being in communication with the water-receiver of the separator, substantially as described.

606,191. GRATE FOR STEAM-BOILERS. ALFRED DAVY and JOHN RENT, London, England. Filed July 21, 1897. Serial No. 645,455. (No model.) Patented in England June 4, 1897, No. 13,774.



Claim.—In combination, the sliding hollow dead-plate D, the water-bridge A engaging the inner wall of the boiler, the hollow grate-bars connecting the dead-plate and the water-bridge, the outside tubes s^1 s^2 connected with the water-space of the boiler and with the dead-plate and an outlet-tube W, said tubes having valves whereby when the tube W is closed and the tubes s^1 s^2 are open the water under pressure of the boiler will pass through the grate-tubes and the water-bridge, substantially as described.

606,192. ADJUSTABLE HANDLE-BAR FOR BICYCLES. WILLIAM C. DAYHOFF, Kankakee, Ill., assignor of one-half to Daniel H. Paddock, same place. Filed Feb. 23, 1897. Serial No. 624,236. (No model.)

Claim.—1. The combination with the steering-head of a bicycle, of a handle-bar having a shank telescoping therein and slit at the

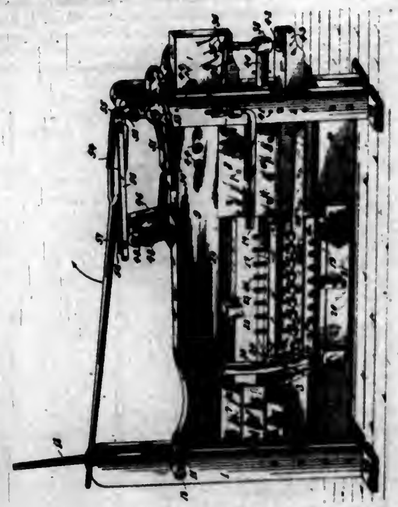
bottom, a pair of handles pivoted upon said shank in their own plane and in lines substantially at right angles to themselves and provided upon their inner ends with ratchet-teeth, a long washer extending from one of said handles to the other and provided at its ends with teeth adapted to engage with said ratchet-teeth and a bolt extending through said washer and shank, said bolt being provided at the top with a nut and at the bottom with a tapered head adapted to expand the shank whereby the tightening of the nut upon the bolt secures the handles upon the shank and the shank in the steering-head; substantially as described.

2. The combination with the steering-head, A, of a handle-bar consisting of the shank, B, having a T-shaped head, B', and the pin, b^3, the handles, B^2, B^2, pivoted in the head and having ratchet-teeth upon their inner ends, the washer, C, engaging the ratchet-teeth, and the bolt, D, having the nut, *d*, above the washer and the tapered end, *d'*, adapted to expand the bottom of the shank, said bolt being held against rotation and being limited as to vertical movement by the pin, b^3; substantially as described.

606,193. YELLOW-BROWN COTTON-DYE. ROBERT DEMUTH, Elberfeld, Germany, assignor to the Farbenfabriken of Elberfeld Company, of New York. Filed Nov. 20, 1897. Serial No. 659,329. (Specimens.) Patented in England Sept. 23, 1895, No. 17,738; in France Jan. 15, 1896, No. 253,213, and in Italy Mar. 31, 1896, XXXI, 40,694, LXXIX, 407.

Claim.—1. The process for the production of a new yellowish-brown cotton-dye by subjecting dinitrotoluenesulfo-acid ($CH_3NO_2NO_2SO_3H$ 1:2:4:6) or salts thereof to the action of an alkaline-sulfid-carrying compound at elevated temperatures.

2. As a new article of manufacture the yellowish-brown cotton-dye producible from dinitrotoluenesulfo-acid or salts thereof, forming a dark-brown mass or powder, readily soluble in water with a reddish-brown color unalterable by the addition of sodium sulfid, being separated from its watery solution by the addition of dilute hydrochloric or sulfuric acid as a brown precipitate, while sulfureted hydrogen is set free, yielding on unmordanted cotton in cold and hot baths with or without the addition of alkaline sulfid bright yellowish-brown shades fast against the action of alkalies and light.



606,194. SHEARING AND PUNCHING MACHINE. JOHN E. DENHAM, Stanberry, Mo. Filed June 11, 1897. Serial No. 640,360. (No model.)

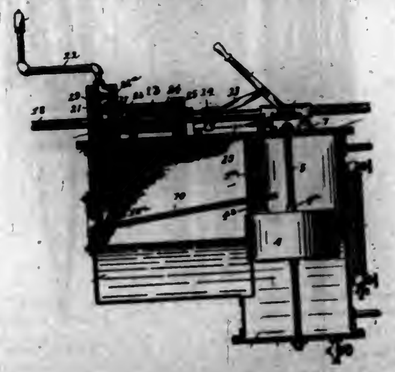
Claim.—1. In a machine of the class described, the combination with a plurality of punches arranged in series, of an operating-lever having a fixed pivot and arranged parallel with the series of punches, and a punch-driving head adjustably mounted upon the lever for movement independently of the same to arrange it in the plane of either of the punches, substantially as specified.

2. In a machine of the class described, the combination of a plurality of punches arranged in series, an operating-lever arranged parallel with the series of punches and capable of swinging movement, and a punch-driving head mounted to slide upon the operating-lever for arrangement in the plane of either of the punches, said head having inturned guide fingers or ears to engage grooves in the opposite side surfaces of the operating-lever, substantially as specified.

3. In a machine of the class described, the combination with a series of punches, of an operating-lever provided with means for successively driving the punches, a lifting arm arranged in operative relation with the punches and adapted when elevated at its free end to draw the latter, and a trip carried by the operating-lever for engaging and communicating upward movement to the free end of the lifting-arm, substantially as specified.

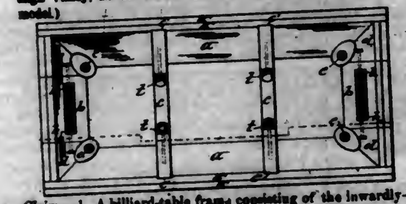
4. In a machine of the class described, the combination with a series of punches, of an operating-lever provided with means for successively driving the punches, a lifting-arm arranged in operative relation with the punches and adapted when elevated at its free end to draw the latter, a trip carried by the operating-lever for engaging and communicating upward movement to the free end of the lifting-arm, and means for disengaging the trip from the lifting-arm when it reaches a predetermined point, substantially as specified.

5. In a machine of the class described, the combination with a series of punches, of an operating-lever provided with means for successively driving the punches, a lifting-arm arranged in operative relation with the punches and adapted when elevated at its free end to draw the latter, a trip carried by the operating-lever for engaging and communicating upward movement to the free end of the lifting-arm, and means, consisting of a cam, on the trip, and a fixed stop for cooperation therewith, to disengage the trip from the lifting-arm, substantially as specified.



6. In a machine of the class described, the combination of terminal standards connected by stationary upper and lower bars 3 and 4, a movable bar mounted to swing in the plane of the fixed bars, means for actuating said movable bar, shear-blades carried by the movable and upper fixed bars respectively contiguous to the standards, a series of punches mounted in guides located between the shear-blades on the upper fixed bar, a die-plate carried by the lower fixed bar, adjustable means carried by the swinging bar for successively driving the punches, a lifting-arm mounted for swinging movement upon the upper fixed bar for cooperation with projections on the punches, and trip devices actuated by the swinging bar for operating the lifting-arm, substantially as specified.

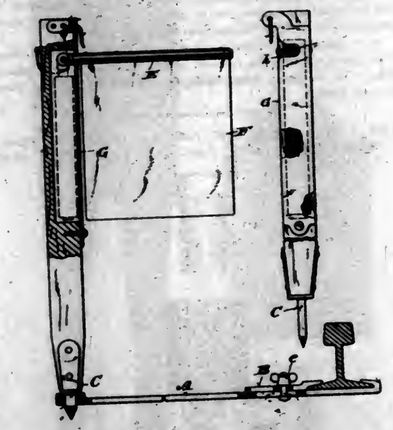
7. In a machine of the class described, the combination with a fixed die, of an operating-lever provided with a socket, a punch having a head removably fitted in said socket, an adjustable latch for locking the punch-head in its socket, and a pivotally-movable guide for the punch, the same consisting of a guide-tube having a stem, and a tubular bearing adapted to receive the stem, substantially as specified.



606,195. FEED-WATER REGULATOR. LOUIS DERY, Montpelier, N. D., assignor of one-fourth to Prosper Hase, same place. Filed July 30, 1897. Serial No. 646,544. (No model.)

Claim.—1. In a boiler-feed-pump regulator, the combination of a barrel or float casing having water and steam pipe connections with a boiler, a chamber in open communication at one end with the barrel and provided at its opposite end with a hand-hole, a detachable plate closing said hand-hole, a vertical guide-rod in the barrel, a float fitted to slide thereon, an operating-rod projecting across the chamber and having one end detachably connected with the float and its opposite end pivoted to said hand-hole plate, a steam-supply pipe for a feed-water pump having a valve controlling the passage of steam therethrough, a cylinder having a steam-chest supplied with steam from the chamber, a piston therein operatively connected with said valve in the feed-pump pipe, a valve-rod detachably connected at its lower end to the operating-rod and having its upper end projecting through the top of the chamber into the steam-chest of the cylinder, and valves carried thereby controlling the supply of steam to said cylinder, substantially as described.

2. In a boiler-feed-pump regulator, the combination of a barrel or float casing having water and steam supply pipe connections with a boiler; a water and steam chamber in open communication therewith; a float in the barrel; an operating-rod projecting across said chamber and pivoted at one end therein and detachably connected at its opposite end to the float; a steam-supply pipe for a feed-pump having a valve controlling the passage of steam therethrough; a lever connected with said valve; a cylinder supported on the chamber and having the following instrumentalities, viz: a piston-chamber, a steam-chest in communication with the water and steam chamber and supplied with steam therefrom and provided with a port for the escape of steam when the water in the float-casing falls to the danger-point, a pipe in communication with said port and carrying an alarm device, such as a whistle, a main port in the cylinder to admit steam from the chest to the adjacent end of said cylinder, and a passage in the cylinder to admit steam to the opposite end thereof; a piston in said cylinder operatively connected with the valve in the steam-pipe of the feed-pump; a valve-rod connected at its lower end to the pivoted operating-rod, and having its upper end projecting into the steam-chest; and a pair of slide-valves carried thereby, one controlling the alarm-port in the steam-chest and the other the said main port and passage in the cylinder, substantially as described.



606,196. BILLIARD-TABLE FRAME. JAMES DOUNHADER, Syracuse, N. Y., assignor of one-half to Thomas W. Meacham, Onondaga Valley, N. Y. Filed Sept. 2, 1896. Serial No. 604,616. (No model.)

Claim.—1. A billiard-table frame consisting of the inwardly-inclined side broad rails each composed of a plurality of planks extending in one continuous piece from end to end of the frame and glued together throughout their length; slotted end rails; head-blocks glued to the ends of said side rails, said head-blocks and end rails each being composed of a plurality of planks glued together throughout their length; nuts countersunk in said head-blocks; bolts having their threaded ends engaged with said countersunk nuts and their heads exposed in the slots in said end rails, the supporting-legs arranged directly under the ends of said side rails and bolted to said head-blocks; the intermediate cross-beams; and diagonal bolts, having nuts each countersunk at the junction of a pair of planks of the respective side rails, for securing the intermediate beams thereto, the ends of said intermediate beams being received within recesses formed only in the inner planks of the side rails.

2. The herein-described billiard-table frame; consisting of the side broad rails, each comprising a plurality of planks rigidly united side by side throughout their entire length and each of said planks extending in one continuous piece from end to end of the frame; head-blocks permanently secured to the ends of said side rails; the end cross-rails having slots; nuts countersunk in said head-blocks and bolts engaging said nuts and having heads exposed in said slots, for securing the end rails to the head-blocks; the intermediate cross-beams; diagonal bolts, having nuts each countersunk at the junction of a pair of planks of the respective side rails, for securing the intermediate beams thereto, the ends of said intermediate beams being received within recesses formed in the inner planks of the side rails; and the supporting-legs placed directly under the ends of said side rails and attached to said head-blocks, substantially as described.

606,197. RAILWAY-SIGNAL. JOHN S. DUBE, Portage, Wis. Filed Jan. 12, 1898. Serial No. 666,559. (No model.)

Claim.—1. A portable horizontal arm having one end thereof bent in the form of a hook engageable with the inner flange of a track-rail, a jaw adjustable on the arm longitudinally thereof to engage the outer flange of the track-rail, suitable means for securing the jaw in adjusted position, and a signal having detachable connection with said arm.

2. A portable horizontal arm having one end thereof bent in the form of a hook engageable with the inner flange of a track-rail and its other end provided with an oblong aperture, a jaw adjustable on the arm longitudinally thereof to engage the outer flange of the track-rail, suitable means for securing the jaw in adjusted position, and a signal provided with a shank having detachable match fit in the aforesaid aperture.

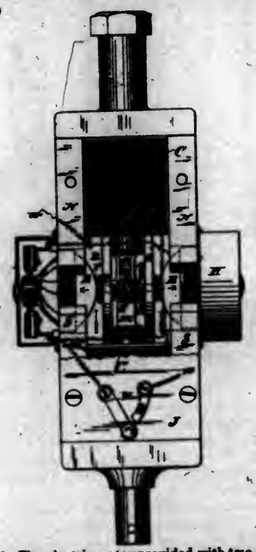
3. A horizontal arm having one end in the form of a hook engageable with the inner flange of a track-rail and its other end provided with a suitable aperture, a jaw adjustable on the arm longitudinally thereof to engage the outer flange of the track-rail, suitable means for securing the jaw in adjusted position, a signal provided with a shank having detachable match fit in the aforesaid aperture, and a set-screw arranged to maintain the engagement of the signal-shank with said arm.

4. A longitudinally-slotted arm having one end in the form of a hook engageable with the inner flange of a track-rail, a jaw loose on the arm for engagement with the outer flange of the track-rail, a bolt extending through the arm-slot and an aperture in the jaw, a set-nut run on the bolt, and a signal having detachable connection with said arm.

5. A railway-signal comprising a staff longitudinally recessed to form a housing, a rod pivoted at one end within the upper part of the housing, a flag made fast at one edge to the rod, a pivotal closure-plate for the housing provided with a transverse rod-supporting notch, and suitable means for fastening the closure-plate parallel to the staff.

6. A railway-signal comprising a staff longitudinally recessed to form a housing, a rod pivoted at one end within the upper part of the housing, a flag made fast at one edge to the rod, a pivotal closure-plate for the housing provided with a transverse rod-supporting notch, apertured matching ears on said staff and plate, and a hook in permanent flexible connection with the aforesaid staff for engagement with said ears.

7. A railway-signal comprising a staff longitudinally recessed to form a housing, a rod pivoted at one end within the upper part of the housing, a flag made fast at one edge to the rod, a pivotal closure-plate for the housing, suitable means for fastening the closure-plate parallel to said staff, and a shank on said rod, in combination with a holder organized for temporary connection with a track-rail and provided with an aperture for the engagement of the staff-shank.



606,198. DENTAL BASE-PLATE. WARREN R. EVANS, Portland, Me., assignor to The S. S. White Dental Manufacturing Company, Philadelphia, Pa. Filed Jan. 11, 1898. Serial No. 666,294. (No model.)

Claim.—1. A new product for making base or trial plates for use by dentists, consisting of a sheet of wax and a sheet of cloth, the two being united to form a composite sheet of wax and cloth, the cloth being on the side of the sheet which is to come in contact with a plaster model, and subsequently with the gums in a human mouth, substantially as and for the purpose set forth.

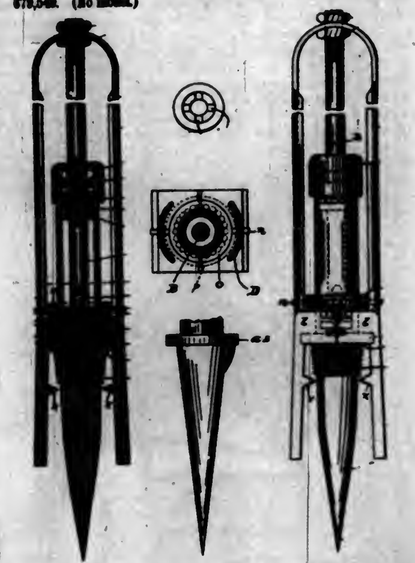
2. A dental base or trial plate consisting of wax and cloth firmly united, the cloth being on the side of the plate which is to come in contact with the gums, substantially as and for the purpose hereinbefore set forth.

606,199. INSTRUMENT FOR CALKING SHIPS. WARREN P. FREEMAN, New York, N. Y. Filed June 23, 1897. Serial No. 641,805. (No model.)

Claim.—1. The electric motor provided with two armatures, the reciprocating tool-holder mounted in operative relation to the armature-shaft of the said motor between the two armatures, and gearing operatively connecting the armature-shaft with the tool-holder for reciprocating the same, substantially as set forth.

2. The electric motor provided with two armatures, the reciprocating tool-holder mounted in operative relation to the armature-shaft of the said motor between the two armatures, operative connections between the armature-shaft and the reciprocating tool-holder for moving the holder in one direction, and a spring for moving the tool-holder in the opposite direction, substantially as set forth.

3. The electric motor provided with two armatures, the reciprocating tool-holder mounted in operative relation to the armature-shaft of the said motor between the two armatures, the Geneva gearing driven by the said armature-shaft and turning the cam R, a spring acting upon the tool-holder, and a projection upon the said tool-holder with which the said cam engages and forces the tool-holder backward against the action of the said spring, substantially as set forth.



4. In combination, the double field-magnet and pair of armatures, the field-magnet windings and core extending longitudinally between the said pole-pieces, the tool-holder extending axially through the said coils, and reduction-gearing, operatively connecting the shaft of the electric motor with the said tool-holder, substantially as set forth.

5. In combination, the double field-magnet, the two armatures mounted on a shaft which is supported between the armatures at the central and neutral point of the field-magnets, and a tool actuated by the said shaft and supported upon the field-magnets.

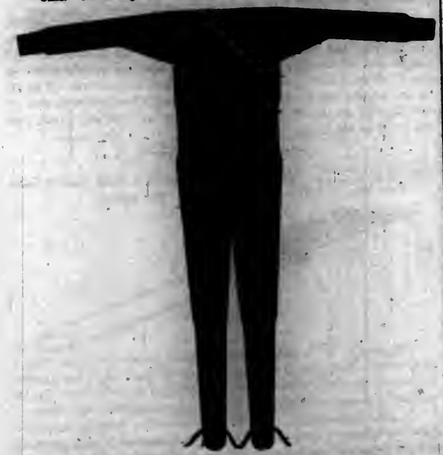
6. In combination, an electric motor, a reciprocating tool-holder, a spring acting on the tool-holder in one direction, and the Geneva gearing actuating the said tool-holder intermittingly in the opposite direction, substantially as set forth.

7. In combination, a rotary motor, a reciprocating tool-holder, and a Geneva gear, intermittently actuating the said tool-holder, substantially as set forth.

606,200. GLASS-WORKER'S TOOL. LEWIS FRIEDRICH, Pittsburg, Pa. Filed May 26, 1897. Renewed May 2, 1898. Serial No. 679,542. (No model.)

Claim.—1. In glass-workers' tools, the combination with a pair of spring-handles having jaws, of a chaser, the rear or upper portion of which is tubular, and the forward portion thereof conical in shape; a spindle adapted to project into the tubular portion of said chaser; a cap slipped over said spindle, and clutch mechanism arranged on said spindle and in said cap for the purpose of locking said spindle, cap and chaser, substantially as herein described.

2. In glass-workers' tools, the combination with a pair of spring-handles having jaws, of a chaser provided with a forming portion, and a collar or projection adjacent to said forming portion; a spindle adapted to project into the upward portion of said tubular portion of said chaser; said spindle carrying ball-bearings arranged at both ends of the tubular portion of said chaser; a cap adapted to slip over said spindle; means carried by said spindle and said cap to lock said spindle, cap and chaser, and a guide-ring having ball-bearings arranged in an interior annular groove or recess therein, substantially as herein described.



606,201. OVERSHOE ATTACHMENT. JAMES C. GILLAM, Colbyville, Kans. Filed Apr. 14, 1897. Serial No. 632,154. (No model.)

Claim.—1. The combination with a shoe, of a pin having a swiveled connection to the heel portion of the shoe and provided with an eye at its outer end, and a band or wire of spring material having one end loosely connected with the eye, said band being curved and adapted to be passed over the instep of the wearer, and being provided at its opposite end with a head or enlargement to be passed through the eye of the swiveled pin, substantially as and for the purpose set forth.

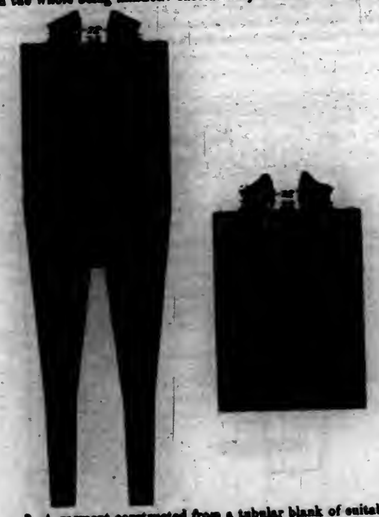
2. The combination with a shoe, of a pin inserted through the heel portion of the shoe and having its outer end bent to form an eye and provided with a plate or disk to engage the outer surface of the shoe, a perforated plate fitted over the inner end of the pin to engage the inner face of the shoe, the inner end of the pin being headed to hold said plate in place, a spring wire or band having at one end an eye loosely engaged with the eye on the outer end of the pin, said wire or band being curved to pass over the instep of the wearer and having at its free end a head or enlargement adapted to be passed through the eye at the outer end of the pin, substantially as and for the purpose set forth.

606,202. UNDERGARMENT. ISAIAH GOLDSMITH, Cleveland, Ohio. Filed July 13, 1896. Serial No. 598,991. (No model.)

Claim.—1. An undergarment constructed from a tubular blank of suitable material, one ply of the upper portion of which is cut on a dividing longitudinal line, and on a transverse line at the inner end of the longitudinal line, to produce shoulder-flaps which are folded inwardly, the said ply being also cut inwardly on diverging lines from the center of the transverse line to produce an upwardly-tapering chest flap and from the inner ends of the diverging lines outwardly of the blank to produce breast-openings which are closed by said shoulder-flaps; substantially as described.

2. An undergarment constructed from a tubular blank of suitable material with shoulder-flaps and gussets integral with the shoulder-flaps extending outward beyond the sides, and sleeves formed with openings which receive the said gussets; substantially as described.

3. An undergarment having a downwardly-projecting shoulder-flap extending beyond the body portion to provide a front arm-gusset portion, and a sleeve having a bias cut to provide a rear arm-gusset portion; the arm-gusset portions being secured together at their lower edges, the front arm-gusset portion being secured to the sleeve at its upper edge, and the rear arm-gusset portion being secured to the body portion; substantially as described.



4. An undergarment having a body portion and a chest-opening extending across the body portion, an upwardly-projecting central front chest-flap and downwardly-projecting shoulder flaps extending beyond the body portion to provide front arm-gusset portions, and sleeves having bias-cut portions formed from the front thickness to provide rear arm-gusset portions; the lower edges of the arm-gusset portions being secured together; the upper edges of the front arm-gusset portions being secured to the sleeves, and inner edges of the rear arm-gusset portions being secured to the body portion; substantially as described.

5. An undergarment having a seat-opening, and symmetrically-formed overlapping closing-flaps having extensions and secured to the respective sides of the seat-opening with the extensions extending from beneath the crotch and secured in front of the garment; substantially as described.

606,203. UNDERGARMENT. ISAIAH GOLDSMITH, Cleveland, Ohio. Filed Apr. 8, 1897. Serial No. 631,943. (No model.)

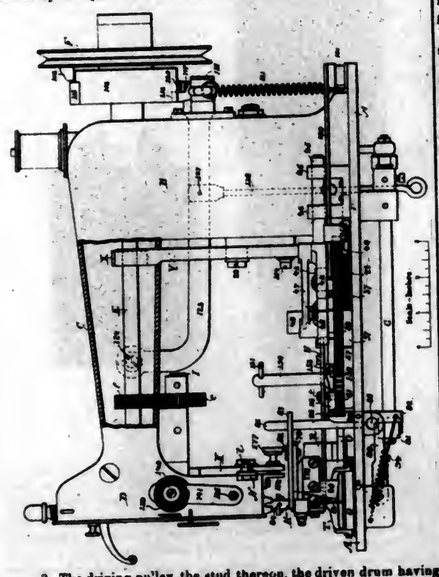
Claim.—1. A garment comprising a tubular body portion cut at its central upper portion on longitudinal and transverse lines, said cut portions being turned outwardly and finished to form shoulder portions; substantially as described.

2. A garment constructed from a tubular blank of suitable material, the plies of the upper portion of which are cut on a dividing longitudinal line, and on a transverse line at the inner end of the longitudinal line toward the sides, the cut portions being doubled and the free portions turned outwardly producing shoulder-straps and armholes between the shoulder-straps and the sides of the garment, and the whole being finished: substantially as described.

3. A garment constructed from a tubular blank of suitable material, the plies of the upper portion of which are cut away on lines converging inwardly from the sides to a transverse line and also on said transverse line; the plies being also cut on a dividing longitudinal line and on a transverse line at the inner end of the longitudinal line toward the sides, the upper portions being doubled and the free portions turned outwardly, producing shoulder-straps and armholes between the shoulder-straps and the sides of the garment, and the whole being finished; substantially as described.

4. An undergarment comprising a tubular body portion the central portion of the plies of the upper portion of which are severed on longitudinal and transverse lines and turned outwardly and finished to produce shoulder-straps and armholes between the shoulder-straps and the sides of the garment; substantially as described.

5. A garment comprising a flat tubular body portion formed with diagonal cuts providing side portions, with central horizontal cuts, and with a vertical cut providing central portions partly separated from the body portion, the side portions with about one-half the width of the separated pieces being turned over on a horizontal line inside of the body portion and the side portions stitched thereto to provide double thicknesses at the armpits, and the central pieces having their free ends stitched together, and turned outwardly to provide upwardly-projecting shoulder-straps, neck-opening and armholes, and the whole finished in suitable manner; substantially as described.



6. A garment comprising a seat-flap of ribbed fabric having the lower portion formed of a band in which the ribbing extends lengthwise of the garment, and the upper portion formed of a band folded over on a transverse line and in which the ribbing extends transversely of the garment so as to provide a yielding closure; substantially as described.

606,204. BUTTONHOLE-SEWING MACHINE. JULIUS G. GOODWIN, Philadelphia, Pa. Filed Dec. 20, 1893. Serial No. 495,946. (No model.)

Claim.—1. The work-carrier comprising a bottom laterally-moving plate and an upper slide movable lengthwise on the bottom plate, the step-by-step revolving cam-stud having a rounded triangular outline, and a slotted yoke operatively connected with said work-carrier slide, in the slot of which yoke said cam-stud enters, in combination with a rotating cam moving in unison with said cam-stud, said cam having two long dwells of different radii connected by abrupt rises, and a movable slotted plate in the slot of which said cam enters, said slotted plate being operatively connected with said carrier-plate, substantially as set forth.

2. The work-carrier comprising a laterally-movable bottom plate and an upper slide movable lengthwise on said bottom plate, the rotating toothed disk having a step-by-step rotation, the triangular cam-

stud eccentrically located on said disk, and the rectilinearly-reciprocating slotted yoke operatively connected with said slide in the slot of which said cam-stud enters, in combination with the idle-pinion engaging said toothed disk, the swinging slotted plate swinging on the same axis as that of said idle-pinion, said slotted plate being operatively connected with said work-carrier bottom plate, and a gear engaging said idle-pinion and having a cam entering the slot of said swinging slotted plate, said cam having two dwells of different radii united by abrupt rises, substantially as set forth.

3. The driving-pulley, the stud thereon, the driven drum having a recess and a notch therein, a pawl pivoted to said drum and occupying said recess, a spring holding said pawl outward in the path of said stud, said pawl having a cam-incline then exterior to the periphery of said drum out of the path of said stud, in combination with a movable nose and tappet always out of the path of said stud and normally out of the paths of said notch and cam-incline, and means for moving said nose into the path of said notch and said tappet into the path of said cam-incline, substantially as set forth.

4. The driving-pulley, the stud thereon, the driven drum having a recess and a notch therein and a projecting stop alongside of said notch, a pawl pivoted to said drum and occupying said recess, and a spring normally holding said pawl beyond the periphery of said drum and in the path of said stud, said pawl having a cam-incline then exterior to the periphery of said drum but out of the path of said stud, in combination with a movable nose and tappet normally held out of the paths of said notch, stop, and cam-incline, and means for releasing said nose and tappet, and a spring for bringing said nose into the path of said stud and notch and said tappet into the path of said cam-incline, substantially as set forth.

5. The drum, and the movable pawl, in combination with the slotted link, and pin, for limiting the movement of said pawl, substantially as set forth.

6. The main shaft E, drive-pulley F, drum 102 with notch 114, stud 103, and pawl 104, lever 117, with nose 119 and tappet 120, spring 121, lever 123, and connecting-rod 128 with catch 129, in combination with the rotating disk 41 with stop-tappet 98, trip-lever 100 with nose 99, catch-rod 131, and spring 133, substantially as set forth.

7. The main shaft E, drive-pulley F, drum 102 with notch 114, stud 103 and pawl 104, lever 117 with nose 119 and tappet 120, spring 121, lever 123, and connecting-rod 128 with catch 129 and enlargement 130, in combination with the rotating disk 41 with stop-tappet 98, trip-lever 100 with nose 99, catch-rod 131, and spring 133, substantially as set forth.

8. For adjusting the number of stitches to the inch, the operating-lever of the feeding mechanism having two slots 161, and 165, the block 162 adjustable in said slot 161, said block having a tailpiece 163 overlapping said slot 165, a set-screw passing through said slot 165 and tapping into said tailpiece, in combination with an adjustable pivot-pin upon which said block 162 turns, substantially as set forth.

9. For adjusting the number of stitches to the inch, the operating-lever of the feeding mechanism having two slots 161 and 165, the block 162 adjustable in said slot 161, said block having a tailpiece 163 overlapping said slot 165, a set-screw passing through said slot 165 and tapping into said tailpiece, in combination with the standard B, having slot 166, a nut 167 within the standard, and an adjustable pivot-pin screwing into said nut 167, upon which pin said block 162 is journaled, substantially as set forth.

10. The reciprocating work-carrier, the rotating operating-disk 41, having radial guide 155, with radial slot 156, with margins 157, in combination with movable stud 42 having legs 158 straddling said guide 155, the movable nut 159 below said margins, and the screw 160 passing through said stud and slot, and tapping into said nut, substantially as set forth.

11. The vertically-movable cutter-bar 75, spring 76, for elevating the same, carrier 79, at the lower end of the bar 75, cutter 80, on said carrier, and horizontally-swinging tappet 83, pivoted on said carrier and having slot 85, in combination with the bed-plate having slot 87, sliding bar 88, beneath said bed-plate, and vertical rod 86 attached to said bar 88 and extending upwardly through said slots 87 and 85, and means for moving said sliding bar back and forth, substantially as set forth.

606,205. CAKE-TURNER. Milton D. Good, Abilene, Kans. Filed Mar. 10, 1897. Serial No. 626,792. (No model.)

Claim.—1. In a cake-turner, a turning-plate provided with a transversely-extending U-shaped rib, in combination with a compressible handle provided with two pivots attached to the sides of the rib and being pivoted off center in the rib, substantially as described.

2. In a cake-turner, the combination with a turning-plate having a transverse hollow rib, of a handle composed of a single piece of wire forming a spring, and having longitudinal pivots at its forward ends, said pivots having bearings in the sides of the rib at points out of coincidence with the direction of pressure, substantially as described.

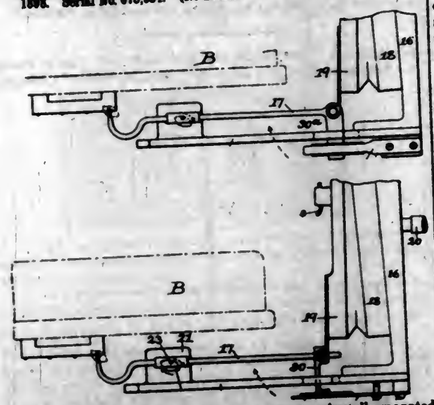
3. In a cake-turner, the combination with a handle composed of a single piece of wire bent to form a spring and having its forward ends turned inwardly and then longitudinally to form pivots, and a turning-plate having a transversely-extending hollow rib provided with holes for the reception of the pivots, whereby the handle is connected directly to the plate, substantially as described.

4. In a cake-turner, a reversible lifting-plate provided with a U-shaped rib, in combination with a compressible handle having forwardly-projecting pivots operating within the walls of the rib, substantially as described.

5. In a cake-turner, a reversible plate provided with a transversely-extending hollow rib, in combination with a compressible handle having inturned ends *d*, and *d'*, and forwardly-projecting ends *g*, and *g'*, constituting two pivots, one being prolonged and passed through both walls of the rib, and the other passed through one wall in the manner and for the purposes substantially as described.

6. In a cake-turner, the combination with a reversible plate of an upturned hollow rib forming a shoulder, and a compressible handle having inturned portions provided with forwardly-projecting pivots operating in the rib, substantially as described.

7. In a cake-turner, a reversible lifting-plate provided with a hollow transverse rib, in combination with a wire handle having its forward ends formed into pivots, one of which is prolonged to extend through both sides of the rib, and the other made shorter to pass through one side only of the rib, both being arranged off center in relation to each other, substantially as described.

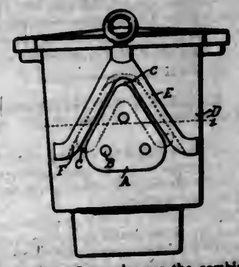


606,206. MANHOLE-COVER. Thomas P. Greene, Philadelphia, Pa. Filed Aug. 14, 1897. Serial No. 648,287. (No model.)

Claim.—The combination in a manhole-cover, of a frame or wall surmounting the manhole, two concentrically-arranged webs projecting upward from said frame, the outer web being higher than the inner web, a horizontally-arranged flange on the outer web, a dish-shaped upper member seated on the flange of the outer web, the rim or periphery of said upper member being traversed by a series of perforations or air-holes, an inner member, a series of legs secured to said inner member and fitted on the inner web to support the inner member above the inner web and a drain-pipe leading from the compartment between the webs to a sewer or other receptacle for moisture, substantially as and for the purposes described.

606,206.

606,207. PICKER DEVICE FOR STRINGED MUSICAL INSTRUMENTS. Walfrid Gunapson, New York, N. Y., assignor to the American Automatic Banjo Company, of New Jersey. Filed Mar. 31, 1898. Serial No. 675,951. (No model.)



Claim.—1. In a stringed musical instrument, a pivotally-mounted reciprocating picker and a controller for frictionally engaging with the picker at one side of the plane of movement of the pivot thereof, for oscillating the picker in one direction during its forward movement and in the opposite direction during its backward movement.

2. In a stringed musical instrument, a pivotally-mounted reciprocating picker, a guiding-cam therefor, and a controller frictionally engaging with the picker at one side of the plane of movement of its pivot, whereby the picker is caused to follow the contour of the guiding-cam during its reciprocations.

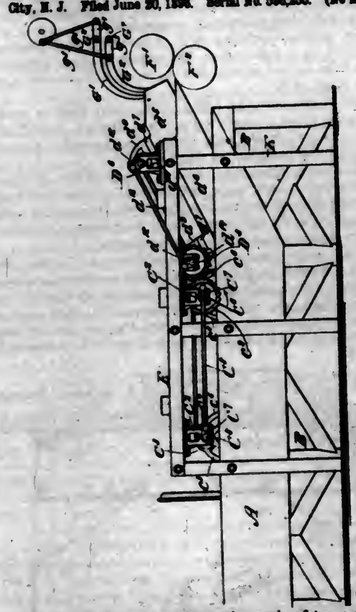
3. In a stringed musical instrument, a pivotally-mounted reciprocating picker, a guiding-cam therefor, a controller, and means for resiliently pressing the controller into frictional engagement with the picker, at one side of the plane of movement of its pivot to hold the picker laterally into contact with its guiding-cam during its reciprocations.

4. In a stringed musical instrument, a pivotally-mounted reciprocating picker, a guiding-cam therefor, and a controller resiliently pressed into frictional engagement with the picker, at one side of the plane of movement of its pivot, for holding the picker laterally in contact with its guiding-cam during its reciprocations, with means for varying the intensity of the resilient frictional engagement of the controller with the picker.

606,208. TRANSFORMER BOX AND HANGER. Ludwig Gutmann, Peoria, Ill. Filed Nov. 22, 1897. Serial No. 659,498. (No model.)

Claim.—1. In a transformer-hanger the combination of a main body tapering toward the upper end, a tapering rim forming part of said hanger, located in a parallel plane to the main body, and holes or recesses in said main body for retaining screws, bolts, or other devices for fastening, as and for the purpose described.

2. In a transformer-box the combination with a receptacle for inclosing a transformer, of a groove or recess provided on one of the sides of said receptacle, a removable plate adapted to be retained in said recess, and means, such as holes in said plate, as and for the purpose described.



3. In a transformer-box the combination of a receptacle, a projecting rib, or ribs, provided with a slot or recess, a removable plate provided with a rim, normally engaged with said recess, and means, provided in said plate, for its attachment to a suitable support, as and for the purpose described.

4. In a transformer-box the combination of one or more projecting channels extending from a side of a receptacle inclining toward each other, adapted to retain a supporting plate or bracket, and a removable plate or bracket normally retained in said channel, and means, such as holes in said plate or bracket, for suitably attaching it, as and for the purpose described.

5. In a transformer-box the combination of a bracket or plate, means, such as holes, or recesses for attaching said plate to its place, and a projecting rim, a metallic box provided with an extension containing a recess normally engaging with said projecting rim, but removable from the latter in an upward direction.

6. In a hanger-plate the combination of a triangular main body A, a projecting flange located in a plane parallel to said main body, and means such as holes or recesses in said main body, as and for the purpose described.

606,209. MACHINE FOR TREATING TOBACCO. Orville S. Harmon, Brooklyn, N. Y., assignor to the P. Lorillard Company, Jersey City, N. J. Filed June 20, 1896. Serial No. 596,356. (No model.)

Claim.—1. The combination with a tank, of two series of horizontal parallel bars having downwardly-projecting teeth and operating above and entirely clear of the bottom of the tank, the bars of one series alternating with those of the other series, means comprising two sets of reversely-set, eccentrics one set at each end of said bars, and connections between said bars and eccentrics for moving the two series of bars in reverse order, downwardly, forwardly, upwardly and rearwardly, substantially as specified.

2. The combination with a tank, of two series of horizontal parallel bars having downwardly-projecting teeth and operating above and entirely clear of the bottom of the tank, the bars of one series alternating with those of the other series, means comprising two sets of reversely-set eccentrics respectively arranged at opposite ends of said bars, for moving the two series in reverse order, downwardly, forwardly, upwardly and rearwardly, and cranks and a connecting-rod for causing the two sets of eccentrics to move in unison, substantially as specified.

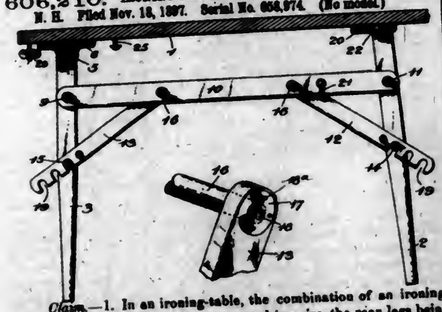
3. The combination with a tank having a horizontal bottom section, and an upwardly-inclined bottom section, of two sets of toothed bars, one set having teeth on the lower side and overlying and being parallel with said horizontal section and operating above and clear thereof, and the other set having teeth on the upper side and overlying and being parallel with said inclined section, and means for reciprocating said sets of bars, substantially as specified.

4. The combination with a tank having a bottom provided with a horizontal section, and an upwardly-inclined section, of two sets of toothed bars respectively above and lying parallel with said bottom sections, the teeth of the horizontal bars projecting downwardly and those of the inclined bars projecting upwardly, and means for simultaneously reciprocating said sets of bars, substantially as specified.

5. The combination with a tank having a bottom provided with a horizontal section, and an upwardly-inclined section at its delivery end, of two sets of bars, one set having teeth on the lower side and arranged above and parallel with said horizontal bottom section, and the other set having teeth on the upper side and arranged above and parallel with said inclined bottom section, and each set of bars comprising two series of alternately-arranged bars, reversely-set eccentrics at opposite ends of said bars, and connections between said eccentrics and series of bars for simultaneously moving the series of each set in opposite directions, substantially as specified.

6. The combination with a tank, of bars, roughened or toothed on their upper surfaces and extended upwardly out of the tank at the delivery end, means for reciprocating said bars, rollers adjacent to the upper end of said bars, and fingers oscillating opposite the said rollers, substantially as specified.

7. The combination with a tank, of bars, roughened or toothed on their upper surfaces and extended upwardly out of the tank at the delivery end, means for reciprocating said bars, rollers adjacent to the upper end of said bars, and two sets of fingers oscillating opposite the said rollers, substantially as specified.



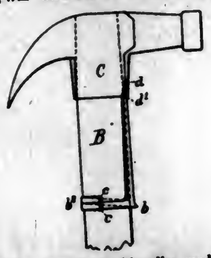
8. The combination with a tank, of horizontal bars roughened or toothed on their under edges, and provided at their infeed ends with upwardly-inclined sections likewise roughened or toothed, substantially as specified.

9. The combination with a tank, of bars, roughened or toothed on their under edges, a stop board or piece attached to such bars, and means for moving the bars downwardly, forwardly, upwardly and rearwardly, substantially as specified.

10. The combination with a tank, of horizontal bars roughened or toothed on their under edges, and provided at their infeed ends with upwardly-inclined sections likewise roughened or toothed, a stop-board supported by the bars above said inclined sections, and means for reciprocating the bars, substantially as specified.

11. The combination with a tank, of horizontal parallel bars roughened or toothed on their lower sides and operating above and entirely clear of the bottom of the tank, means for moving said bars downwardly, forwardly, upwardly and rearwardly, shafts supporting said means, bearings for said shafts, and supports for said bearings independent of and beyond the sides of the tank, substantially as described.

606,210. IRONING-TABLE. Wilbur R. Harriman, Chatham, N. H. Filed Nov. 18, 1897. Serial No. 658,974. (No model.)

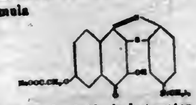


Claim.—1. In an ironing-table, the combination of an ironing-board, the front and rear legs arranged in pairs, the rear legs being hinged at their upper ends to the ironing-board, a frame located a short distance beneath the ironing-board and hinged at its terminals to the front and rear legs near the upper ends thereof, and the braces pivoted at their upper ends to the frame and extending downward and outward from the same and adjustably connected with the legs, substantially as described.

2. In an ironing-table, the combination of an ironing-board, front and rear legs arranged in pairs and provided with rungs 14 and 15, a frame located a short distance beneath the ironing-board and pivoted at its ends to the front and rear legs near their upper ends, and the front and rear braces pivoted at their upper ends to the frame and extending downward and outward to the legs, said braces being provided with side bars having notches arranged to engage the rungs 14 and 15 of the legs, substantially as described.

3. In an ironing-table, the combination with an ironing-board, front and rear legs arranged in pairs, the rear legs being hinged to the ironing-board, a frame located a short distance beneath the ironing-board and pivoted to the front and rear legs, near the upper ends thereof, the adjustable braces extending downward and outward from the frame and engaging the lower portion of the legs, guide-blocks secured to the lower face of the ironing-board and arranged between the upper ends of the front legs, one of the guide-blocks being provided at its inner edge with a projection, and a hook mounted on the frame and arranged to engage the projection for locking the parts when the ironing-table is folded, substantially as described.

606,211. PROTECTOR FOR TOOL-HANDLES. John A. Heuth, Menomonee, Wis. Filed Dec. 3, 1897. Serial No. 660,642. (No model.)

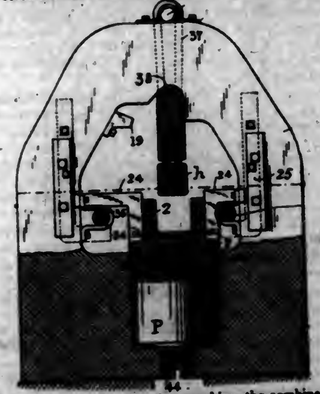


Claim.—A protector for tool-handles made from one piece of metal A embodying within itself its own means of fastening by means of pointed end *d* which may be driven into the eye of the tool side of the handle, and has formed at the other end transverse arms *b* terminating in points *c* so that the said arms may be wrapped around the handle and the points *c* driven in to secure the protector in place, said protector A being thus applied without preparation of the tool or the handle for its reception or retention thereon either before or after its application, all substantially as set forth.

606,212. BLUE DYE AND PROCESS OF MAKING SAME. Bernhard Heyman, Elberfeld, Germany, assignor to the Farbenfabriken of Elberfeld Company, of New York. Filed Dec. 21, 1897. Serial No. 662,917. (Specimens.) Patented in England Mar. 21, 1896, No. 6,686; in Belgium Dec. 3, 1896, No. 91,894; in France Mar. 12, 1894, No. 237,675, and in Italy Mar. 15, 1894, XXVIII, 39,927, LXX, 295.

Claim.—1. The process for producing a new dyestuff which consists in causing paramidodimethylasulfhydicsulfo-acid to act on nitroso 2.7 oxynaphtoxyacetic acid substantially as hereinbefore described.

2. As a new article of manufacture the new dyestuff having most probably the formula



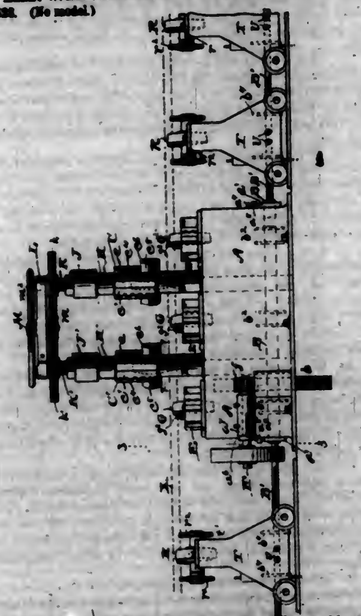
which is a dark powder soluble in hot water with a blue color, in concentrated sulfuric acid (66° Baumé) with a brown color which changes into yellowish green on the addition of a small quantity of ice, soluble in concentrated hydrochloric acid with a yellowish-green color from which solution a violet flaky precipitate is obtained on the addition of water, dyeing chrome-mordanted wool bright-blue shades fast against light and milling substantially as described.

606,218. MACHINE FOR FORMING POLYGONAL TUBES. Campbell P. Higgins, Roselle, N. J. Filed Mar. 13, 1897. Serial No. 627,306. (No model.)

Claim.—1. A power-machine for forming tubes from plates or sheets comprising a movable die, a swinging bending-arm, a mandrel suspended between the die and arm, whereby the arm is adapted to serve as an abutment for the mandrel.

2. In a machine for forming tubes from plates or sheets embracing a die and mandrel, a power device for forcing the mandrel out of the tube consisting of a cross-head connected respectively with the framework of the machine and with the power device to hold the framework of the machine and with the power device to hold the tube in place and a rod interposed between the power device and mandrel to force the latter out of the tube, substantially as described.

3. In a machine for forming tubes from plates or sheets, the combination with the die and tube of a power device having a removable connecting-rod arranged to bear upon the end of the mandrel or the tube and force the same from the die, substantially as described.



4. In a polygonal-tube-forming machine, the combination of a movable die, a suspended mandrel and an arm adapted to serve as a relative fixed abutment therefor.

5. In a polygonal-tube-forming machine and combination of a movable die, a mandrel and a movable arm adapted with one face to act as an abutment for the mandrel and with another to bend the metal being formed.

6. In a polygonal-tube-forming machine the combination of a movable die, a mandrel and a movable arm adapted with its one face to both abut the mandrel and bend the metal being formed thereon, and also in another position to bend the metal with another face.

606,214. MACHINE FOR STRAIGHTENING SHAFTS, TUBES, &c. Harry W. Hill, Cleveland, Ohio. Filed Apr. 3, 1897. Serial No. 630,332. (No model.)

Claim.—1. In a machine for straightening shafts, in combination, the obliquely-placed draft-rolls G G arranged in pairs and mounted upon a fixed base, the obliquely-placed upper draft-rolls D D likewise arranged in pairs between the lower pairs of draft-rolls, means for adjusting said upper draft-rolls vertically, and mechanism for positively driving one set of draft-rolls, substantially as specified.

2. In a machine for straightening shafts, in combination, a base, a shaft, sprocket-wheels secured thereto, pairs of draft-rolls mounted obliquely upon the base, independent sprocket-wheels rigid with said rolls, and sprocket-chains transmitting motion to the sprocket-wheels last named from those on the said shaft, upper pairs of obliquely-placed draft-rolls and means for adjusting said upper draft-rolls vertically, substantially as specified.

3. In a machine for straightening shafts, in combination, the base, pairs of positively-driven and obliquely-placed lower draft-rolls mounted upon said base, vertical standards, vertically-adjustable cross-heads which embrace and are guided by said standards, means for rigidly fastening said cross-heads to said standards, pairs of obliquely-placed draft-rolls mounted in said cross-heads, yokes secured to said standards above said cross-heads, and adjustment-screws for moving said cross-heads, which screws are supported by said yokes, substantially as specified.

4. In a machine for straightening shafts, in combination, two vertically-movable cross-heads, pairs of draft-rolls mounted thereon, vertical standards for guiding said cross-heads, yokes connecting their upper ends, screws working through said yokes and swiveled to said cross-heads and having cylindrical upper ends, gears secured to said screws, a cross-bar embracing the cylindrical parts of said screws and supported thereon, a vertical shaft mounted in and supported by said cross-bar, and a pinion secured to said screw in mesh with said gears, substantially as specified.

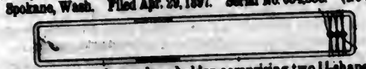
5. In a machine for straightening shafts, in combination, a fixed base, pairs of obliquely-set draft-rolls mounted thereon, and vertically-adjustable pairs of oblique upper draft-rolls, a counter-shaft mounted in adjustable bearings, sprocket-wheels secured respectively to the said shaft and to the lower draft-rolls, sprocket-chains, a main driving shaft, a cylindrical sleeve in which the latter shaft is eccentrically mounted, means for locking said sleeve to the base, and suitable connections between the two shafts, substantially as specified.

6. In a machine for straightening shafts, in combination, the base, obliquely-set pairs of lower draft-rolls mounted thereon, vertical standards, cross-heads, each consisting of two plates bolted together and having in their proximate faces, near their ends, vertical grooves which embrace the standards, and, between their ends, recesses for the reception of an upper pair of draft-rolls, pairs of draft-rolls mounted in said plates extending into said recesses, and means for vertically adjusting said cross-heads, substantially as specified.

7. In a machine for straightening shafts, the combination of a base, a housing fixed obliquely thereon and composed of two similarly-shaped sections *c c*, each of which has an inwardly-offset boss c^3 surrounding one of the bearings of the roll-shafts, with two draft-roll shafts mounted in bearings in said housing sections, a draft-roll, and a rigidly-connected sprocket-wheel upon each of said shafts, the hubs of said rolls being adjacent to one of said inwardly-projecting bosses c^3, and the sprocket-wheels being at the opposite ends of said rolls, substantially as specified.

8. In a machine for straightening shafts, a draft-roll housing consisting of two sections of the same size and shape, each having on its inner face an inwardly-offset boss c^3, substantially as specified.

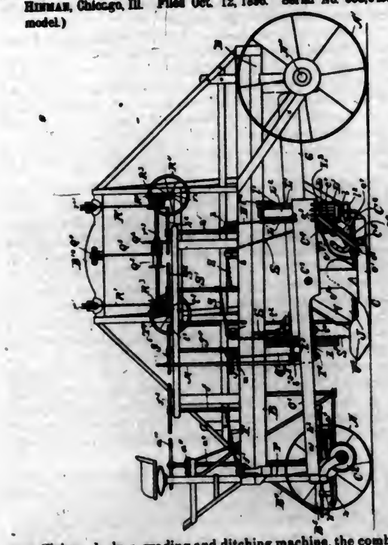
9. In a machine for straightening shafts, a draft-roll housing consisting of two sections of the same size and shape each consisting of a horizontal base and a vertical flange on the inner edge of said base, which flange has the sector-shaped upward extension c^4, and is also offset inward and provided on this inward offset with the boss c^3, substantially as specified.



10. In a machine for straightening shafts, in combination, straightening devices comprising upper and lower pairs of obliquely set draft-rolls, an operating-shaft, mechanism for transmitting motion therefrom to the lower draft-rolls, an adjustable carriage having a bearing for said shaft and in which it may slide, a pair of obliquely-set draft-rolls mounted upon the carriage, and mechanism for transmitting motion from the shaft to said draft-rolls, whereby the end of the shaft being straightened is supported and its longitudinal movement is assisted, substantially as specified.

11. A wheel-carriage for supporting a shaft which is being straightened in a fixed straightening-machine, consisting of two side plates, a cross-bar extending between and secured to said plates and having a bearing for a shaft, a housing connecting the upper ends of said plates, a pair of oblique draft-rolls mounted in said housing, sprocket-wheels secured to said rolls, a rotating shaft loosely mounted in said cross-bar and adapted to slide through the same, two sprocket-wheels secured upon said shaft by a spline and groove, and sprocket-chains connecting the upper and lower sprocket-wheels, substantially as specified.

12. In a machine for straightening shafts, in combination, a base, one set of lower draft-rolls arranged in pairs and mounted obliquely upon said base, a set of vertically-adjustable upper draft-rolls arranged



obliquely and in pairs, movable carriages on both sides of the base, obliquely-placed pairs of draft-rolls mounted on said carriages, a shaft mounted in the base and extended on both sides thereof, bearings carried by the carriages which support said shaft, whereby the carriages may be moved toward and from the base without changing their operative relation to said shaft, and mechanism for transmitting motion from this shaft to the lower pairs of draft-rolls on the base and to the draft-rolls on the carriages, substantially as specified.

606,215. CROCHET OR LACE HOLDER. WILLIAM O. HILL, Spokane, Wash. Filed Apr. 29, 1897. Serial No. 634,358. (No model.)

Claim.—A crochet or lace holder comprising two U-shaped, end-joined and separable rod-frames, each having two side limbs the outer edges of which encompass a uniform transverse width or space, for practically the entire length of the holder, thereby permitting a maximum length of uniformly-wide lace to be produced on the holder and afterward easily removed therefrom; one frame having end dowel-pins and the other frame having end recesses receiving said pins, substantially as described.

606,216. GRADING AND DITCHING MACHINE. CLEMENT F. HINMAN, Chicago, Ill. Filed Oct. 12, 1896. Serial No. 608,643. (No model.)

Claim.—1. In a grading and ditching machine, the combination, of the main supporting-frame, the plow at one side thereof, the carrier extending transversely from the plow to a point beyond the opposite side of the frame, the front ground-wheels, the rear ground-wheel on the delivery side, in the line of the preceding front wheel, and the rear ground-wheel on the plow side running outside of the line of its preceding front wheel, substantially as set forth.

2. In a grading and ditching machine, the combination, of the main frame, the plow at one side thereof, the carrier arranged transversely of the main frame and extending from the plow side to points beyond the opposite side, the rear wheel running in the line of the plow, the preceding front wheel running inside of the line of the plow, the second rear ground-wheel, and the preceding front wheel in line with the last-said rear wheel, substantially as set forth.

3. In a grading and ditching machine, the combination of the main frame, the rear axle, the rear ground-wheels, substantially equidistant from the central vertical plane of the frame, the plow at one side of the frame, the elevator extending from the plow side transversely to points beyond the opposite side, the front axle, a front ground-wheel thereon relatively near the said central vertical plane of the frame, and a second front wheel on said axle relatively farther from the frame, substantially as set forth.

4. In a grading and ditching machine, the combination of the main supporting-frame, the rear wheels, the front wheels, the axle for the front wheels pivotally connected to the main frame, the draft devices, and means independent of the draft devices for adjusting the axle relatively to the main frame, the plow connected to the main frame, and the carrier for receiving and transporting the earth from the plow, substantially as set forth.

5. In a grading and ditching machine, the combination of the main frame, the plow connected thereto, the earth-carrier, the rear ground-wheels, the front wheels, the axle for the front wheels, the draft devices, devices independent of the draft mechanism for adjusting the line of the front axle relatively to the longitudinal lines of the machine, and means accessible to the operator for actuating said adjusting devices, substantially as set forth.

6. In a grading and ditching machine, the combination of the main frame, the plow secured thereto, the earth-carrier, the rear ground-wheels, the draft devices, the front ground-wheels, the support for the last-said wheels, and means for moving one of the wheels to a transverse line in front of the transverse lies of the other independently of the draft devices, substantially as set forth.

7. In a grading and ditching machine, the combination of the main frame, the plow secured thereto, the earth-carrier, the rear ground-wheels, the front ground-wheels, the support for the front wheels, the draft devices adapted to be turned laterally relative to the main frame, and means for moving one of the front ground-wheels to a transverse line in advance of the transverse line of the other, independently of the draft devices, substantially as set forth.

8. In a grading and ditching machine, the combination of the main frame, the plow secured thereto, the earth-carrier, the rear ground-wheels, the front ground-wheels, the tongue, the frame hinged to the tongue and pivotally connected to the main frame, and means for moving one of the front ground-wheels to a transverse line in advance of the transverse line of the other, and turning both to positions inclined to the longitudinal lines of the machine, independently of the tongue, substantially as set forth.

9. In a grading and ditching machine, the combination of the main frame, the plow secured thereto, the earth-carrier, the rear ground-wheels, the tongue, the laterally-vibratable frame hinged to the tongue, the ring-like connecting device interposed between the main frame and the vibrating frame and loosely connected to the latter, the front ground-wheels and the vibrating front axle between the ring-like connecting device and the vibrating tongue-frame, substantially as set forth.

10. In a grading and ditching machine, the combination of the main frame, the plow secured thereto, the earth-carrier, the rear ground wheels, the draft devices, connected to the main frame, the front ground-wheels, the front axle, vibratable relatively to the main frame independently of the draft devices, one or more chains connected to the axle near its ends, means supported on the main frame for winding and unwinding said chain or chains, substantially as set forth.

11. In a grading and ditching machine, the combination of the wheeled supporting-frame, the plow-beam connected thereto, the plow pivoted to the beam and the yielding lock or holder permanently secured to the beam and adapted to prevent the plow from turning on said pivot until it meets with predetermined resistance, substantially as set forth.

12. In a grading and ditching machine, the combination of the wheeled frame, the plow-beam connected thereto and supported thereby, the plow pivoted to the said beam, a yielding lock or holder for the plow, supported on a pivot or a hinge, and a spring for preventing said holder from yielding until the plow exerts a predetermined pressure backward, substantially as set forth.

13. In a grading and ditching machine, the combination of the wheeled frame, the plow-beam secured thereto, the plow connected to said beam and adapted to move backward and upward to escape from the ground, a yielding lock or holder to retain the plow in operative position under ordinary pressure, and a spring for retaining said holder in its locking position and adapted to yield when the plow meets excessive resistance, substantially as set forth.

14. In a grading and ditching machine, the combination of the wheeled frame, the plow-beam connected thereto, the plow connected to the beam and adapted to move backward relatively thereto, and the toggle-like bars pivotally connected to the plow and adapted to be arranged to approximately positively lock the plow in operative position, substantially as set forth.

15. In a grading and ditching machine, the combination of the wheeled supporting-frame, the plow-beam connected thereto, the plow pivoted to the beam, the toggle-bars pivoted together and one pivoted to the beam and the other to the plow, and one or more springs connected to the toggle-bars and arranged to exert a tension upon both, across the plane of their axis of union, substantially as set forth.

16. In a grading and ditching machine, the combination of the wheeled supporting-frame, a push-beam hinged on a horizontal axis near the rear end of the supporting-frame, a plow-beam supplemental thereto, means for flexibly connecting the plow beam to the push-beam, and means for adjusting the plow-beam independently of the push-beam, substantially as set forth.

17. The combination, in a ditching and grading machine, of the wheeled supporting-frame, the plow-beam, means for suspending the plow-beam from the main frame, and a push-beam hinged on a horizontal axis near the rear end of the main frame and adapted to rise and fall independently of the plow-beam, and means for flexibly connecting the push-beam to the plow-beam, substantially as set forth.

18. In a grading and ditching machine, the combination of the wheeled supporting-frame, the push-beam supported by a hinge near the rear end of the main frame and extending forward therefrom, the plow-beam supplemental to the push-beam, and adapted to be moved or adjusted independently thereof, and means for connecting the push-beam and the plow-beam, substantially as set forth.

19. In a grading and ditching machine, the combination of the wheeled supporting-frame, the push-beam hinged on an axis near the rear end of the main frame and extending forward therefrom, the plow-beam supplemental to the push-beam, and movable independently thereof and normally substantially parallel thereto, and means for connecting the push-beam to the plow-beam, substantially as set forth.

20. In a grading and ditching machine, the combination of the wheeled supporting-frame, the push-beam hinged on an axis near the rear end of the main frame, the plow-beam supplemental to the push-beam and connected thereto and movable independently thereof, and means for adjusting the plow-beam laterally toward and from the push-beam, substantially as set forth.

21. The combination, in a grading and ditching machine, of the wheeled supporting-frame, the plow-beam, having an inward-extending arm, a rod as at I^3 for imparting motion to the plow-beam, the aforesaid inwardly-extending arm being connected to the said rod and adapted to move vertically relatively thereto, and devices on the main frame for lifting the plow-beam, substantially as set forth.

22. In a grading and ditching machine, the combination of the wheeled supporting-frame, the plow-beam, means for suspending the plow-beam from the main frame, a vibratable bar or bars I^7 connected to the main frame, devices extending to the operator's platform for vibrating the said bar, and an arm as at i connecting said bar with the plow-beam, whereby the operator can move the plow bodily out or in relatively to the main frame, substantially as set forth.

23. In a grading and ditching machine, the combination of the wheeled supporting-frame, the plow-beam, having its ends adjustable vertically, and movable laterally relatively to the main frame, the geared plates as at I^4, I^5, the swinging arm or arms I, I^7 connected to and actuated by said geared plates, whereby they can be adjusted laterally transversely of the frame, and means connecting the said bar or bars with the plow beam, substantially as set forth.

24. The combination of the wheeled transporting-frame, the plow-beam connected thereto and vertically adjustable at its ends, the laterally-adjustable power transmitting pin or rod, as at I^9, the arm connected to the plow-beam and extended inward therefrom and loosely connected to the said power-transmitting rod I^9, and the spring bearing against the inward-extending arm on the plow-beam, substantially as set forth.

25. The combination of the wheeled supporting-frame, the plow-beam connected to said frame and adjustable vertically thereon, and adapted to be rocked or tilted around longitudinal lines, a power-transmitting device connecting the plow-beam and the main frame and a spring interposed between the plow-beam and the draft-transmitting devices adapted to permit the beam and plow to rock as aforesaid, substantially as set forth.

26. The combination of the wheeled supporting-frame, the plow-beam vertically adjustable on the frame, the laterally-adjustable power-transmitting devices connecting the plow-beam to the main frame, whereby the beam may be held on lines farther from or nearer to the longitudinal center of the frame and the spring carried by said power-transmitting devices, and bearing against the plow-beam, substantially as set forth.

27. In a grading and ditching machine, the combination of the wheeled supporting-frame, the plow-beam, the push-beam, hinged at its rear end near the rear end of the main frame, and extending forward from its hinge, means for adjusting the plow-beam vertically independently of the push-beam, and a laterally-adjustable power-transmitting device connecting the push-beam with the plow-beam, substantially as set forth.

28. In a grading and ditching machine, the combination of the wheeled supporting-frame, the plow, the plow-beam flexibly supported from the main frame, and a bar or arm extending upward from the beam, by which the operator can rock or tilt the plow around longitudinal axes, while the machine is advancing, substantially as set forth.

29. In a grading and ditching machine, the combination of the wheeled supporting-frame, the plow-beam, means for adjusting the plow-beam vertically, said plow-beam being adapted to move at its rear end laterally toward and from the longitudinal center of the main frame, and a yielding holder for the plow-beam adapted to prevent such lateral movement until a predetermined pressure, laterally, has been reached, substantially as set forth.

30. In a grading and ditching machine, the combination of the wheeled supporting-frame, the vertically-adjustable plow-beam adapted to move laterally out and in relatively to the main frame, and a yielding holder for the plow-beam adapted to resist to a limited extent its lateral movements and arranged to exert a draft on the plow-beam at points relatively near the bottom of the plow, substantially as set forth.

31. In a grading and ditching machine, the combination of a wheeled supporting-frame, a vertically and laterally adjustable plow-beam, and a two-part holder for the beam adapted to resist its lateral movement, one member thereof being secured to the beam, and one connected independently thereof to the main frame, and a spring arranged to resist the yielding of the said holder under the lateral pressure of the beam, substantially as set forth.

32. In a grading and ditching machine, the combination of the main supporting-frame, the plow-beam flexibly connected to the main frame and adapted to have its rear end swing laterally relatively thereto, and a two-part holder for the beam to resist its lateral movement, one member being connected to the main frame, and the other connected to the plow, and one of said members adapted to move vertically relatively to the other, substantially as set forth.

33. The combination of the main supporting-frame, the plow-beam, connected thereto and vertically adjustable thereon, a holding-bar L' adapted to bear inward against the lateral movement of the plow, and a spring for retaining said holding-bar in normal position, substantially as set forth.

34. In a grading and ditching machine, the combination of the main supporting frame, the plow-beam connected thereto and vertically adjustable thereon, a bar or plate L carried by the plow-beam, a roller or abutment l bearing against said bar L and a yielding carrier for said abutment connected to the main frame, substantially as set forth.

35. In a grading and ditching machine, the combination of the main supporting-frame, the plow-beam connected thereto and vertically adjustable thereon and adapted to yield laterally at its rear end, and a spring interposed between the plow-beam and the main frame, and arranged to resist the lateral movement of the plow-beam until a predetermined lateral pressure thereon has been reached, substantially as set forth.

36. The combination of the main supporting-frame, the plow-beam vertically adjustable thereon and adapted to have its rear end swing laterally relatively thereto and also adapted to be tilted or rocked on longitudinal axes through the plow, a spring interposed between the plow-beam and the main frame to resist the said tilting or rocking, and a spring interposed between the beam and the main frame to resist the lateral movement of the beam, substantially as set forth.

37. The combination of the main supporting-frame, the plow-beam vertically adjustable thereon and adapted to move laterally relatively thereto, a bar or plate L secured to the plow-beam, a roller or abutment l^2 bearing against one side of said bar, and a roller or abutment l bearing against the opposite side thereof, both of said rollers being connected to the main frame and supported thereby, and one of them being adapted to yield laterally when a predetermined pressure has been reached, substantially as set forth.

38. The combination of the main supporting-frame, the plow-beam secured thereto and vertically adjustable thereon and adapted to move out and in at its rear end relatively thereto, a roller or abutment l^3, arranged to receive the inward lateral pressure of the plow, a roller or abutment l, arranged to receive the outward lateral pressure of the plow, and a spring arranged to hold the roller or abutment l in normal position until a predetermined outward lateral pressure has been reached, substantially as set forth.

39. The combination of the main supporting-frame, a rising-and-falling power beam or bar connected to the main frame, a plow-beam supplemental thereto and adapted to have its rear end rise and fall independently thereof, a vertically-yielding holder interposed between the plow-beam and the power-beam, and a laterally-yielding holder interposed between said beams, substantially as set forth.

40. The combination of the main supporting-frame, the rising-and-falling power beam or bar connected to the main frame, the plow-beam supplemental thereto and adapted to rise and fall and move laterally relatively thereto, and a two-part holder adapted to resist the lateral movement of the plow-beam, one member thereof being secured to and moving vertically with the power-beam, and the other member being secured to and moving vertically with the plow-beam, substantially as set forth.

41. In a grading and ditching machine, the combination of the main supporting-frame, the plow-beam supported thereon and vertically adjustable, and adapted to be tilted or rocked around longitudinal axes, a lever or bar secured to the plow-beam and extending upward above or toward the main frame, means for locking the lever in either of several positions, and a holder for the plow against lateral displacement situated relatively low and in the longitudinal lines of the plow, substantially as set forth.

42. In a grading and ditching machine, the combination of the main supporting-frame, the vertically-adjustable plow-beam supported from the frame and carrying the plow, said beam and plow being adapted to tilt or rock around longitudinal axes, means on the main frame for lifting the rear end of the plow, means on the main frame for lifting the front end of the plow independently of the rear end, and a lever or bar secured to and extending upward from the plow for effecting the tilting or rocking thereof while it is in operation, substantially as set forth.

43. In a grading and ditching machine, the combination of the main supporting-frame, the plow connected thereto, and adapted to rise and fall independently thereof, and a lever or bar connected to and extending upward from the plow-beam and rising and falling therewith and adapted to rock or tilt the plow relative to the frame, substantially as set forth.

44. In a grading and ditching machine, the combination of the main supporting-frame, the plow-beam, a platform or operator's support on the main frame, devices accessible to the operator while on said platform for tilting and rocking the plow while in motion, devices on the main frame for adjusting the rear end of the plow-beam vertically, and devices on the main frame for adjusting the front end of the plow vertically, independently of the rear end, substantially as set forth.

45. In a grading and ditching machine, the combination of the main supporting-frame, the plow-beam adjustable both vertically and laterally, bodily, relatively to the main frame, means for raising and lowering the plow-beam, means for moving it bodily laterally, and means accessible from above the main frame for tilting or rocking the plow on longitudinal axes while in operation, substantially as set forth.

46. In a grading and ditching machine, the combination of the main supporting-frame, the plow-beam supported thereby, lateral adjusting devices for moving the plow-beam bodily out and in relatively to the main frame, and devices independent of the said lateral adjusting devices for tilting or rocking the plow around longitudinal axes while in operation, substantially as set forth.

47. The combination of the main supporting-frame, the plow-beam adapted to rise and fall relative to the main frame and supported thereon, and the tilting lever or bar M rigidly secured to the plow-beam and extending upward to be accessible from above the main frame, substantially as set forth.

48. In a grading and ditching machine, the combination of the main supporting-frame, the plow and the carrier having a roller at the receiving end, and a roller at the delivery end, means for adjusting one of said rollers for tightening the belt, and means for moving the outer roller to either of several positions to vary the points of delivery and to elongate the load-supporting part of the belt, substantially as set forth.

49. In a grading and ditching machine, the combination of the main supporting-frame, the plow, and the carrier having a frame, an inner roller at the receiving end of the carrier, adjustable on said frame, and a roller at the outer or delivery end of said carrier, and means for moving the said outer roller to either of several distances, and a belt having two outwardly-moving portions, whereby slack is provided for elongating the load-carrying part of the belt, substantially as set forth.

50. In a grading and ditching machine, the combination of the main frame, the plow, and the carrier having an endless belt arranged to have an outward-movement load-carrying portion, and a second outward-moving, inactive portion, rollers beneath the belt at the receiving end thereof, a roller beneath the belt at the delivery end thereof, and a longitudinally-adjustable support for the last-said roll at the delivery end, substantially as set forth.

51. The combination with the main frame and the plow, of the carrier having an endless belt arranged to provide a load-carrying portion supported on one or more rollers at the receiving end and one or more rollers at the delivering end, and an inactive portion traveling continuously parallel to the load-carrying portion, an adjustable support for the roller or rollers beneath the delivery end of the load-carrying portion, and an adjustable support for the inactive portion of the belt, whereby the load-carrying portion can be elongated, and the inactive portion shortened, substantially as set forth.

52. The combination with the main frame, and the plow, of the carrier-belt having a load-carrying portion and an inactive portion, the roller under the active portion of the belt at its receiving end, the roller under the active portion at its delivery end, one or more outwardly-movable rollers for supporting the inactive portion of the belt, and means for moving outward the roller beneath the outer end of the active portion of the belt, substantially as set forth.

53. The combination with the main frame and the plow, of the carrier having the endless belt with the active portion *j* and the inactive portion *j'*, of the rollers beneath the receiving end of the active portion, the outward movable roller under the delivery end of the active portion, a support for the inactive portion, and a driving-roller engaging with the inactive portion of the belt, substantially as set forth.

54. The combination with the main frame and the plow, of the carrier-belt having the active portion *j* and the inactive portion *j'*, the roller beneath the receiving end of the active portion, the outwardly-movable roller beneath the active portion at its delivery end, the outwardly-moving roller at the inner end of the inactive portion, and the stationary roller at the outer end of the inactive portion, substantially as set forth.

55. The combination with the main frame and the plow, of the carrier-belt having the active portion *j* and the inactive portion *j'*, the support for the inner or receiving end of the active portion, the outwardly-movable support for the delivery end of the active portion, the outwardly-movable support for the inner end of the inactive portion, the stationary roller for the outer end of the inactive portion, and means for transmitting power to the last-said roller, substantially as set forth.

56. The combination with the main supporting-frame and the plow, of a carrier-belt, a roller beneath the active or load-carrying portion of the belt, a roller beneath the outer or delivery end of the active portion, and one or more intermediate rollers movable outwardly simultaneously with the said outermost roller but with different speeds, substantially as set forth.

57. The combination with the main frame and the plow, of the carrier-belt adapted to have its active or load-carrying portion varying the position of the outer delivery end of the belt and elongated, a series of two or more relatively stationary rollers beneath the inner or receiving part of the active portion of the belt, a series of two or more rollers beneath the outer or delivery portion of the belt which are movable in relation to the first aforesaid series but are stationary relatively to each other, and a third series of intermediate rollers which are movable beneath the belt relatively to both the aforesaid series of rollers, substantially as set forth.

58. The combination with the main frame and the plow, of the carrier-belt having an active or load-carrying portion and an inactive portion, and means for varying the position of the outer delivery end of the belt and elongating the active portion of the belt without varying the tension between its receiving end and its delivery end, substantially as set forth.

59. The combination with the main frame and the plow, of the carrier having a bearing on or against the main frame, between the ends of the carrier, and provided with a carrying-belt, a roller or support for the outer end of the active or load-carrying portion of the belt, means for moving the said roller outward relatively to the aforesaid bearing, and a supplemental support for an inactive portion of the belt, substantially as set forth.

60. The combination with the main frame and the plow, of the carrier having a vertically-adjustable bearing upon or against the main frame and provided with a belt with an inactive portion and an active or load-carrying portion, situated partly inside of said bearing and partly outside thereof, a roller or support for the outer or delivery end of the active portion of the belt, and means for moving the said roller or support outward and inward relatively to the said bearing to lengthen or shorten the active portion of the belt, and simultaneously shorten or lengthen the inactive portion, substantially as set forth.

61. The combination with the main frame and the plow, of the carrier-belt and the supporting-frame for said belt having a main section, provided with a series of rollers, and a second section movable relatively to the first, and provided with a second series of rollers, and supporting devices interposed between the rollers of the second series and the main frame, and supplemental to the first frame-section, substantially as set forth.

62. In a grading and ditching machine, the combination with the main frame and the plow, of the carrier having an endless belt adapted to have its active or load-carrying portion elongated, and a supporting-frame for the said belt having a main section, a series of belt-supporting rollers on said main section, a supplemental frame-section adapted to move longitudinally of the main section and to be passed across the vertical planes of the rollers on the main section, and a second roller or series of rollers mounted on said supplemental section, substantially as set forth.

63. The combination with the main frame and the plow, of the carrier having an endless belt, a frame for the carrier formed with a main section, a roller or series of rollers supported on said main section, and a supplemental frame-section supported on and movable longitudinally of the main section and arranged to move across the vertical planes of the roller or rollers on the main section, and means independent of the main section for supporting the supplemental section from the main frame, substantially as set forth.

64. The combination with the main frame, and the plow, of the carrier having a main section, with a roller or series of rollers thereon, means for adjusting said main section vertically, a supplemental frame-section supported on and movable longitudinally of the main section and arranged to travel across the vertical planes of the roller or rollers on the main section, and means on the supplemental frame-section and movable therewith for supporting the belt, substantially as set forth.

65. The combination with the main frame and the plow, of the carrier having an endless belt, a carrier-frame having a main section, a roller or rollers on the main section to support the belt, a supplemental frame-section movable longitudinally of the main section, and one or more belt-supporting rollers on the supplemental section movable relatively to both frame-sections, substantially as set forth.

66. The combination with the main frame, and the plow, of the carrier having a traveling belt or load-supporting device, a carrier-frame having a main section, means thereon for supporting the belt, a supplemental frame-section movable longitudinally of the main section, belt-supporting devices on the supplemental frame-section, and means connected to the main frame, independently of the main carrier-frame section, for sustaining the belt-supporting devices on the supplemental frame-section, substantially as set forth.

67. The combination with the main frame, and the plow, of the carrier having a traveling belt or load-supporting device, a main carrier-frame section, a supplemental frame-section movable longitudinally of the main section, a series of belt-supporting devices on the supplemental carrier-frame section movable longitudinally thereof, and means for automatically separating and drawing together the said belt-supporting devices, substantially as set forth.

68. The combination with the main frame, and the plow, of a carrier having an endless belt arranged to provide an active or load-carrying portion, *j*, and an inactive portion, as at *j'*, a main carrier-frame section, a supplemental carrier-frame section movable longitudinally of the main section, and a support for the inactive portion of the belt mounted upon and traveling with the said supplemental frame-section, substantially as set forth.

69. The combination with the main frame, and the plow, of the carrier-belt, and a frame or support for the belt having an inner or main section and an outer section at the delivery end of the belt which is adjustable longitudinally on and vertically independently of the inner section, substantially as set forth.

70. The combination with the main frame, and the plow, of the carrier-belt, the frame or support therefor having a main or inner section, a series of rollers thereon, a supplemental section between the plow and the main section and movable relatively thereto, and a third section at the delivery end of the belt adjustable vertically relatively to the main section, substantially as set forth.

71. The combination with the main frame, and the plow, of the carrier-belt, the frame or support therefor having a main section, a supplemental section between the plow and the main section and movable relatively thereto, and a third section at the delivery end of the belt which is movable both longitudinally and vertically relatively to the main section, substantially as set forth.

72. The combination with the main frame, and the plow, of the carrier frame or support having a main section, means for supporting said section at its outer end from the main frame, means for supporting it at its inner end from the main frame, a supplemental frame-section movable across the vertical planes of the connection of the supporting devices with the outer end of the main section and the single carrier-belt extended continuously around said main section and said supplemental section, substantially as set forth.

73. The combination with the main frame, and the plow, of the carrier-belt, the frame or support therefor having the main or inner section supported from the main frame, and an outer section for the delivery end of the belt movable toward and from the main frame, supplemental devices for supporting said outer movable section from the main frame, and means for holding the belt uniformly taut, independently of the position of the outer end thereof, substantially as set forth.

74. The combination with the main frame, and the plow, of the carrier-belt, and the frame or support therefor having a main section provided with a bearing on or against the main frame on a transverse line between the ends of said main section, a supplemental frame-section for the delivery end of the belt movable outwardly from and toward the said bearing, and means for holding the belt uniformly taut independently of the position of the supplemental frame-section, substantially as set forth.

75. The combination with the main frame, and the plow, of the carrier-belt, and the frame therefor having the main section provided with a bearing on or against the main frame, means for vertically supporting said section at points inside of said bearing, means for supporting said section from the main frame at points outside of said bearing, and a supplemental frame-section adjustable longitudinally of the main section and movable across the vertical plane of the aforesaid supporting devices outside of said bearing, substantially as set forth.

76. The combination with the main frame, and the plow, of the carrier-belt having a roller or support for the receiving part adjacent to the plow, and a roller or support at the place of delivery, means for adjusting the distance between the said rollers or supports to vary the tension of the belt, and means supplemental to those aforesaid for varying the distance between the said rollers or supports to elongate or shorten the active or load-carrying portion of the belt, substantially as set forth.

77. The combination with the main frame, and the plow, of the carrier-belt, and the frame or support therefor having a main section, a supplemental or second section adapted to move longitudinally of the main section, and a third section at the delivery end of the belt movably longitudinally of the main section, and vertically adjustable relatively to both the first and the second sections, substantially as set forth.

78. The combination with the main frame, and the plow, of the carrier-belt, and the frame or support therefor having a main section, and a supplemental section movable longitudinally of the main section, and one or more belt-supporting rollers on the supplemental section, devices for automatically adjusting said rollers to differing distances from each other, and means for moving the supplemental frame-section and connected to the roller-adjusting devices, substantially as set forth.

79. The combination with the main frame and the plow, of the carrier-belt, and the frame or support therefor having a main section, a supplemental frame-section movable longitudinally of the main section, a series of two or more belt-supporting rollers on the supplemental section, and a system of lazy-tong levers connected to the said rollers for moving or spacing them when the supplemental frame-section is moving, substantially as set forth.

80. The combination with the main frame, and the plow, of the carrier-belt, and the frame or support therefor having a roller for the receiving part of the belt adjacent to the plow and a roller at the delivery part of the belt, means for increasing the distance between the two said rollers, a series of two or more belt-supporting rollers between the two aforesaid, and a system of lazy-tong levers connected to the rollers of the said series and adapted to move or space them when the distance between the extreme rollers is being varied, substantially as set forth.

81. The combination with the main frame, and the plow, of the carrier, the frame or support therefor having a bearing on or against the main frame and extended to points outside of the said bearing, a lever, as at *v*, bearing against the main frame at points inside of the aforesaid bearing of the carrier-frame, means connecting the said lever to that part of the carrier-frame outside of the said bearing, and adjustable draft devices connecting the upper end of said lever to the main frame, substantially as set forth.

82. The combination with the main frame, and the plow, of the carrier-belt, the frame or support therefor having a bearing upon or against the main frame, and extending to points outside of said bearing, a lever or bar, as at *v*, arranged to bear upon the main frame at points inside of the aforesaid bearing of the carrier-frame, a connection, *u*, between said lever or bar and the outwardly-projecting part of the carrier-frame, and draft devices on the main frame connected to said lever or bar, substantially as set forth.

83. The combination with the main frame, and the plow, of the carrier-belt, the frame or support therefor having a thrust-bearing upon or against the main frame, a lever or bar arranged to have a thrust upon the main frame at points inside of the aforesaid bearing, outwardly-adjustable connecting devices for joining said lever or bar to that part of the carrier-frame which projects outward from the said bearing, and draft devices connecting the said lever or bar to the main frame, substantially as set forth.

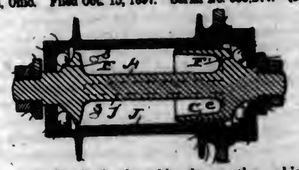
84. The combination with the main frame, and the plow, of the carrier-belt, a frame or support therefor, a series of belt-supporting rollers, devices for moving one end of one or more of the rollers for increasing the tension of one side of the belt independently of the other side, and means extending to the operator's platform on the main frame for moving said adjusting devices, substantially as set forth.

85. The combination with the main frame, and the plow, of the carrier-belt, the frame or support therefor, the series of belt-supporting rollers on said frame, means controllable from the main frame and at one side of the elevator-belt for moving the end or ends of one or more of the rollers at that side of the belt, to vary the tension of said side independently of the other, and a supplemental set of devices controllable from the main frame at the opposite side of the belt for moving one end of a roller or rollers independently of the opposite end, substantially as set forth.

86. The combination with the main frame and the platform, of the elevator-belt having an active or load-carrying portion and a surplus inactive portion, a frame formed in two parts, of which one is adapted to be moved longitudinally of the other, means controllable by the operator from the main frame for positively moving the movable part in one direction to elongate the active portion of the belt, and also positively moving it in the opposite direction to shorten said active portion and means for adjusting vertically the entire elevator bodily, substantially as set forth.

87. The combination with the main frame, and the plow, of the carrier-belt, and the frame therefor, formed in two sections of which one is movable longitudinally of the other, the chain connected to the movable section, the rotary chain-driving device mounted on the other section, and means for actuating said chain-driving device, substantially as set forth.

88. The combination with the main frame, and the plow, of the carrier-belt, the carrier frame or support having a main section adjacent to the main frame, and an outer section at the delivery part of the carrier-belt and movable from and toward the main frame, a carrier-belt extending longitudinally, continuously around both the inner section and the outer movable section and a driving drum or wheel engaging with the belt and mounted on the inner frame-section substantially as set forth.



89. In a grading and ditching machine, the combination with the plow, and the main frame, of the carrier having an endless belt, a vertically-adjustable driving-drum engaging with the belt, a roller, a vertically-adjustable roller adjacent to the driving-drum, means extending to the operator's platform for adjusting said roller vertically, whereby the tightness and extent of the belt upon the drum can be varied and a vertically-movable support for the adjusting devices substantially as set forth.

90. In a grading and ditching machine, the combination of the main frame, the plow, the longitudinally-extensible elevator having its lower end supported on a roller which is inclined to the path of the plow, and an earth-guide or moldboard vertically adjustable independently of the plow and arranged in the angle between said plow and said roller, substantially as set forth.

91. In a ditching and grading machine, the combination of the main frame, the draft devices, means independent of the draft devices for guiding the main frame, the plow, the rear wheels of which one is in the line of the plow, and the front wheels of which one is arranged to be turned toward or from the unplowed land, substantially as set forth.

92. In a ditching and grading machine, the combination of the main frame, the plow, the carrier, the scraper arranged below the operative surface of the return part of the carrier near its end, and yielding devices for supporting the scraper, substantially as set forth.

606,217. BACK-PEDALING BRAKE. LOUIS B. HOFFMAN, Cleveland, Ohio. Filed Oct. 15, 1897. Serial No. 655,277. (No model.)

Claim.—1. In a brake for a bicycle, or other vehicle, in combination, a sprocket or other driving wheel, a hub to be driven, a stationary braking member within the hub, a movable braking member within the hub and normally loosely surrounding the stationary member, said movable member revolving with the hub and adapted to be forced toward the axis of the hub and thus into contact with the stationary member, and cooperating engaging cam-surfaces on the movable braking member and driving-wheel, whereby the forward rotation of the driving-wheel revolves said revolving member without forcing it inward, and backward movement of the driving-wheel relative to the hub forces said revolving member inward and into contact with the stationary member, substantially as described.

2. In a brake for a bicycle or other vehicle, a hub to be driven, a sprocket or other driving wheel, a split sleeve, lugs thereon, a limited cam engagement between said lugs and wheel, whereby the forward movement of said wheel causes a forward circular movement of said lugs and a movement of said wheel rearward with respect to said hub causes an inward movement of said lugs, and a stationary member with which said sleeve is adapted to contact when said lugs are moved inward, substantially as described.

3. In a bicycle-brake, in combination, a hub to be driven, a split sleeve carried by the hub, lugs on said split sleeve projecting through slots in said hub, and by engaging with the walls of said slots locking said sleeve to said hub, a sprocket or other driving wheel carried by said hub and surrounding said lugs and having recesses which receive said lugs and engage therewith by a cam-surface, whereby when said driving-wheel is revolved forward it drives said lugs in a circular direction, but when revolved rearward relative to the hub it drives them inward, and a stationary member from which said sleeve is normally free but with which it is adapted to contact when said lugs are driven inward, substantially as described.

4. In a brake for a bicycle or other vehicle, in combination, a hub, a sleeve within the same, said sleeve being divided part way of its length by one or more slots extending from one end, whereby that end of the sleeve forms spring-arms which may be forced inward from their natural position, and the other end of the sleeve forms a rigid body, a stationary braking member within the sleeve, and means for forcing the spring-arms of the sleeve radially inward into contact with the stationary member, substantially as described.

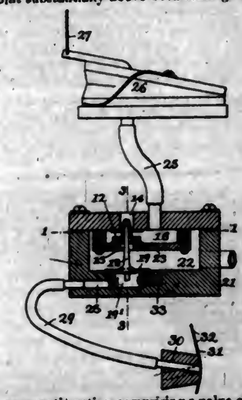
5. A split sleeve for a brake, consisting of a substantially cylindrical body divided by a plurality of slots extending in a direction substantially parallel with the axis from one end, but stopping short of the other end, whereby said sleeve has a plurality of projecting spring-arms, each of said arms having a lug formed on it near its free end, substantially as described.

606,218. FILTER. WOLCOTT A. HULL, New York, N. Y. Filed May 7, 1897. Serial No. 635,510. (No model.)

Claim.—1. In a filter, the combination with a case having a detachable cover, of a block of filtering material arranged within the case, a hollow rod passing through the cover and the block of filtering material and detachably engaged with the top of the case and provided with an opening or openings for the passage of fluid and means fitted to said rod beyond the cover for turning said rod, and clamping the cover in place, substantially as specified.

2. In a filter, the combination with a case having a detachable cover, of a block of filtering material arranged within the case, a rod passing through the cover and the block of filtering material and detachably engaged with the top of the case, and means for turning said rod consisting of a handpiece detachably fitted to the rod and a hollow screw for securing said handpiece to the rod, substantially as specified.

3. In a filter, the combination with a case having a detachable cover, of a block of filtering material arranged within the case, a rod passing through the cover and the block of filtering material and detachably engaged with the top of the case, a packing arranged within said cover, a plate for holding said packing in place, and means for securing the said plate to the cover, substantially as specified.



4. In a filter, the combination with a case having a detachable cover, of a block of filtering material arranged within the case, a packing arranged within said cover, a plate for holding said packing in place, means consisting of a rod passing through the cover and the block of filtering material and detachably engaged with the top of the case for securing said plate and consequently said packing in place, and means for turning said rod consisting of an end piece and a hollow screw for securing said end piece to the rod, substantially as specified.

5. In a filter, the combination of a case, a detachable cover, a packing-securing plate adjacent the cover, a block of filtering material, and a single central rod for fastening the packing-securing plate to the cover and the block of filtering material to the cover and for uniting all of these parts with the case, substantially as specified.

606,219. PNEUMATIC ACTION FOR MUSICAL INSTRUMENTS. CHARLES B. KENDALL, Boston, Mass., assignor to the American Automatic Banjo Company, of New Jersey. Filed Mar. 9, 1898. Serial No. 673,286. (No model.)

Claim.—1. In a pneumatic action comprising a valve-chamber connected by oppositely-disposed ducts to an exhaust-chest and to the atmosphere respectively, the combination of a primary, a valve

located between the ducts and provided with oppositely-disposed seating-faces therefor, and a valve-pin extending from the primary through one of the ducts, and forming a support for suspending the valve at a point substantially above both seating-faces of the valve.

2. In a pneumatic action comprising a valve-chamber connected by oppositely-disposed ducts to an exhaust-chest and to the atmosphere respectively, the combination of a primary, a valve located between the ducts and provided with oppositely-disposed seating-faces therefor, and a valve-pin pivotally supported upon the primary, and extending therefrom through one of the ducts, and forming a support for the valve at a point substantially above both seating-faces of the valve.

3. In a pneumatic action comprising a valve-chamber, connected by oppositely-disposed ducts to an exhaust-chest and to the atmosphere respectively, the combination of a primary, a valve located between the ducts and provided with oppositely-disposed seating-faces therefor, and a valve-pin pivotally mounted upon the primary and extending therefrom through one of the ducts and forming a pivotal support for suspending the valve at a point substantially above both of the respective planes of the seating-faces of the valve.

4. In a pneumatic action comprising a valve-chamber connected by oppositely-disposed ducts to an exhaust-chest and to the atmosphere respectively, the combination of a primary, a valve located between the ducts, provided with oppositely-disposed seating-faces therefor, and having a conical projection extending into one of the ducts to center the valve therewith, and a valve-pin extending from the primary through one of the ducts and forming a support for suspending the valve at a point substantially above both seating-faces of the valve.

5. In a pneumatic action, the combination of a valve, a primary therefor, and a connecting-pin having its ends seated against the valve and against the primary respectively, and a spring engaging with the valve at a plane between the ends of the connecting-pin.

6. In a pneumatic action, the combination of a valve, a primary therefor, a connecting-pin having its ends pivotally seated against the valve and the primary respectively, and a spring engaging the valve at a plane between the ends of the connecting-pin for pressing the valve toward its primary.

7. In a pneumatic action comprising a valve-chamber connected by oppositely-disposed ducts to an exhaust-chest and to the atmosphere respectively, the combination of a valve located between the ducts, a spring engaging the valve and normally pressing it upon the duct leading to the exhaust-chest, a primary for the valve and a valve-pin extending from the primary through one of the ducts and forming a pivotal support for the valve, the latter being suspended at a point above the plane of its engagement with its spring.

606,220. PICKER DEVICE FOR STRINGED MUSICAL INSTRUMENTS. CHARLES B. KENDALL and JACOB P. TIRRELL, Boston, Mass., assignors to the American Automatic Banjo Company, of New Jersey. Filed Mar. 31, 1898. Serial No. 675,955. (No model.)

Claim.—1. A guiding-cam for a picker having an aperture encircling a projection of the picker, the side walls of which are located at a suitable distance apart to allow of the desired amplitude of lateral movement of the picker, the end walls being inclined for guiding the picker at the conclusion of its stroke into the desired plane of its return movement.

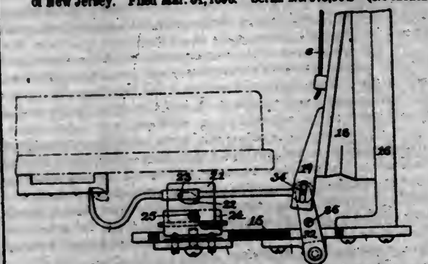
2. In a stringed musical instrument, a picker arranged to vibrate in a substantially horizontal plane, a guiding-cam for the lateral vibrations of the picker, having an aperture encircling a projection of the picker, the side walls of the aperture being located at a suitable distance apart to allow of the desired amplitude of lateral vibrations, and the end walls being inclined to guide the picker at the conclusion of its longitudinal movement in each direction into the desired plane of its return movement.

3. In a stringed musical instrument, in combination with the picker thereof, a motor, and a resilient connection between the picker and the motor.

4. In a stringed musical instrument, a resiliently-supported guiding-cam for the picker.

5. In a stringed musical instrument, in combination with the picker thereof, a pivotally-mounted guiding-cam for the picker, and means for resiliently opposing the oscillations of the cam, thereby cushioning the reciprocating strokes of the picker.

606,221. ENLARGEABLE TELESCOPIC CASE OR TRAVELING-BAG. KARL KRUPPA and OSCAR LEHRER, Fort Reno, Okla. Filed Sept. 16, 1897. Serial No. 651,898. (No model.)



Claim.—1. In an extensible-traveling-bag section the combination of a bottom, side walls rigidly connected thereto, an extension-bottom, and extension side walls foldably connected with the extension sides and bottom and constructed and arranged to be turned down inside of the upturned bottom extension to form new end walls, when the case is diminished.

2. In a traveling-bag having duplicate sections telescoping the one into the other, a section comprising in its construction an end wall foldably connected to an extension of the bottom proper and to collapsible side extensions and constructed and arranged to be turned down inside of the upturned bottom extension to form a new end wall when the case is diminished.

3. In an extensible-traveling-bag side-wall section the combination of four triangular pieces, constructed of rigid material, bound all around with an endless metal tire or rod, covered on both sides with flexible material stitched through and through between each triangular piece where they join and form a square, and also where they join the other parts of the side wall, reinforced at the corners, and points of the triangles, substantially as described.

4. A traveling-bag handle having a slot longitudinal thereof and means secured to the bag for slidably and pivotally connecting the handle to the bag.

606,222. PICKER DEVICE FOR STRINGED MUSICAL INSTRUMENTS. WILLIAM A. LORENZ, Hartford, Conn., and CLARENCE E. DE LUE, Boston, Mass., assignors to the American Automatic Banjo Company, of New Jersey. Filed Mar. 31, 1898. Serial No. 675,964. (No model.)

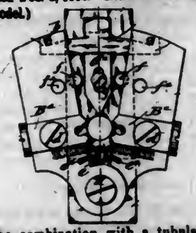
Claim.—1. In a stringed musical instrument, in combination with a reciprocating and laterally-movable picker, a controller pivotally and frictionally engaging with the picker, with means for oscillating the controller during the relatively reciprocating movements of the picker, thereby moving the picker laterally.

2. In a stringed musical instrument, in combination with a reciprocating and laterally-movable picker, a guiding-cam therefor, and a controller pivotally and frictionally clamped to the picker, with means for holding other portions of the controller from following the reciprocating movements of the picker.

3. In a stringed musical instrument, in combination with a reciprocating and laterally-movable picker, a guide and controller for the lateral movements of the picker, consisting of a cam, and of a controller connected to a relatively-fixed portion of the instrument, and clamped to the picker with sufficient frictional engagement to cause the picker to follow the cam.

4. In a stringed musical instrument, a pivotally-mounted reciprocating picker, a guiding-cam therefor, and a controller connected to a relatively-fixed portion of the instrument, and frictionally attached to the picker in substantial concentricity with its pivot, whereby the frictional engagement of the relatively-fixed portion of the controller causes the picker to follow its guiding-cam.

5. In a stringed musical instrument, a pivotally-mounted reciprocating picker, a guiding cam therefor and a controller frictionally clamped to the picker concentrically with the pivot thereof, and extending therefrom substantially at right angles to the line of the reciprocation of the picker into engagement with a relatively-fixed portion of the instrument.



6. In combination with the picker of a stringed musical instrument, a guiding-cam therefor supported for longitudinal, lateral and angular adjustment upon a relatively-fixed portion of the instrument, whereby it may be adjusted while the instrument is in operation.

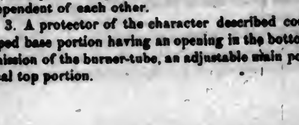
7. In combination with the picker of a stringed musical instrument, a guiding-cam therefor pivotally mounted upon a support which is fixed relatively to the picker, and provided with means for adjusting the angular position of the cam upon its pivotal support in a direction longitudinally of the movement of the picker.

8. In combination with the picker of a stringed musical instrument, a guiding-cam therefor, a pivot-screw upon which the cam is mounted, and by means of which it may be adjusted laterally to the movement of the picker, and adjusting-screws located upon opposite sides of the pivot-screw for adjusting the cam angularly upon its pivotal support in opposite directions longitudinally of the movement of the picker.

9. In combination with the picker of a stringed musical instrument, a guiding-cam therefor, a block adjustably clamped to a relatively-fixed portion of the instrument, a screw connecting the cam with the block whereby the position of the cam may be adjusted both laterally and longitudinally.

606,223. SCREW-CUTTING DIE-HEAD. KARL MISCHKE, New York, N. Y. Filed Feb. 8, 1897. Renewed Oct. 22, 1897. Serial No. 656,066. (No model.)

Claim.—1. The combination, with a tubular stock, of spring-actuated jaws pivoted to said stock, screw-cutting dies in said jaws, a spring-actuated locking-plate provided with a tubular shank whereby it is guided in said tubular stock, and a releasing device carried by said locking-plate, substantially as set forth.



2. The combination, with a tubular stock, of spring-actuated jaws pivoted to said stock, screw-cutting dies in said jaws, a spring-actuated locking-plate located in front of said stock and provided with a tubular shank guided in said tubular stock, and a releasing device carried by said locking-plate, substantially as set forth.

3. The combination with a tubular stock, of spring-actuated jaws pivoted to said stock and provided with locking-orifices, screw-cutting dies supported by said jaws, means for guiding and stopping said jaws, a spring-cushioned locking-plate provided with a tubular shank, forwardly-projecting locking-pins carried by said locking-plate, a guard-plate carried by said locking-plate and located below the screw-cutting dies, and an adjustable releasing device carried by said locking-plate, substantially as set forth.

4. The combination with a tubular stock, of spring-actuated jaws pivoted to the same, screw-cutting dies supported by said jaws, a T-shaped guide-head for engaging the upper ends of said jaws, means for arresting the outward motion of said jaws, a spring-cushioned locking-plate having a tubular shank guided by said stock, said plate being adapted to interlock with the jaws when they are in closed position, and a longitudinally and laterally adjustable releasing device connected with the locking-plate, substantially as set forth.

5. The combination with a tubular stock having a T-shaped head, spring-actuated jaws pivoted to the lower part of the head and provided with locking orifices, a T-shaped guide-piece attached to the upper part of said head, said guide-piece engaging the upper ends of the jaws, shoulders at the outer ends of said guide-piece, engaging pins on said jaws, screw-cutting dies supported by said jaws, a spring-cushioned locking-plate provided with a tubular shank guided in the stock, having locking pins adapted to engage said locking-orifices in the jaws, and a releasing device attached to said locking-plate provided with an adjustable head, substantially as set forth.

606,224. MANTLE OR HOOD FOR WELSBACH OR OTHER INCANDESCENT LIGHTS. JULIUS MOELLER, London, England, assignor to the Welsbach Light Company, Gloucester City, N. J. Filed Dec. 1, 1896. Serial No. 614,081. (No model.) Patented in England Jan. 31, 1895, No. 2,294.

Claim.—1. An illuminant appliance for incandescent lights consisting of independent rings linked together, substantially as described.

2. An illuminant appliance for incandescent lights consisting of independent rings linked together and provided with supplemental rings, substantially as described.

3. An illuminant appliance for incandescent lights provided on its surface with projecting supplemental links adapted to become incandescent, substantially as described.

4. An illuminant appliance for an incandescent light made from fabric consisting of independent rings of thread linked together substantially as and for the purpose set forth.

606,225. GAS-BURNER. RAGLAND MORLAND, New York, N. Y., assignor to the American Lighting Company, of New Jersey. Filed July 7, 1897. Serial No. 643,700. (No model.)

Claim.—The combination of a nipple provided with converging walls terminating in an opening, a gas-mixing tube, a disk provided with a plurality of apertures, a gas-chamber between the under surface of the disk and the outer surface of the converging walls of the nipple, a projection on said disk adapted to enter the opening in the nipple, and a coupling for connecting the mixing-tube with the nipple, substantially as specified.

606,226. PROTECTOR FOR INCANDESCENT BURNERS. JOHN W. MCKINNEY, Philadelphia, Pa., assignor of three-fourths to Philip Lewin, Julius L. Lewin, Marcus Lewin, and Maurice S. Lewin, same place. Filed June 15, 1897. Serial No. 640,894. (No model.)

Claim.—1. A removable protector of the character described, consisting of independent portions, a cup-shaped base portion, an adjustable main portion, and a top or cap portion.

2. A protector of the character described, consisting of a cup-shaped base portion, an adjustable cylindrical main portion, and a cylindrical top or cap portion, and a removable top for the cap portion, said parts being removable from the burner and chimney and independent of each other.

3. A protector of the character described consisting of a cup-shaped base portion having an opening in the bottom thereof for the admission of the burner-tube, an adjustable main portion and a cylindrical top portion.

4. A protector of the character described consisting of a cup-shaped base portion having an opening in the bottom thereof, the edges of said opening and of the base portion being provided with a metallic binding, an adjustable main portion and a top portion.

5. A protector of the character described consisting of a cup-shaped base portion having an opening in the bottom thereof for the admission of the burner-tube, the edges of said opening and of the base portion having a rigid binding, a cylindrical main portion provided with rigidly-bound edges, means for adjusting the same and a top portion.

6. A protector of the character described consisting of a cup-shaped base portion having an opening in the bottom thereof for the burner-tube, the edges of said opening and of the base portion having a rigid binding, a cylindrical main portion provided with rigidly-bound edges, means for adjusting the same and a cylindrical top portion having reinforced edges.

7. A protector of the character described consisting of a cup-shaped base portion having an opening in the bottom thereof for the burner-tube, the edges of said opening and of the base portion having a rigid binding, a cylindrical main portion provided with rigidly-bound edges and with means for adjusting the same, a cylindrical top portion having reinforced edges, a removable flanged band upon the top portion and a wire disk within the band.

8. A protector of the character described consisting of a cup-shaped base portion having an opening therein for the admission of the burner-tube, the edges of said opening and of the base portion having a rigid binding, a cylindrical main portion provided with rigidly-bound edges and with means for adjusting the same, a cylindrical top portion having reinforced edges, a removable flanged band upon the top portion, and a concavo-convex wire disk removably secured within said band, all of said parts being removable from the burner and chimney and independent of each other.

606,227. CAN-LABELING MACHINE. THEODORE C. HOUSEKNECHT, JUDSON H. LAKE, and JASPER CLARK, Hudson, N. Y.; said Clark assignor to said Housknecht. Filed Jan. 12, 1895. Renewed Mar. 12, 1898. Serial No. 673,693. (No model.)

Claim.—1. In combination with the main frame having a label-holder; a mechanism for rolling the can over the label; and a device operated through said can-rolling mechanism for raising or lifting one end of the label.

2. In combination with the main frame provided with a label-holder and paste-boxes; a can-traversing mechanism; a pivoted paste-applying frame operatively connected with the can-traversing mechanism; and a device operated by the traversing mechanism to lift the end of the label.

3. In combination with the main frame, the reciprocating frame L, having the cross-bar x; the plate u; and the lever v arranged in position to be acted upon by the bar x.

4. In combination with a label-holder and mechanism for applying paste to the labels and for rolling a can over the label, the adjustable spring-scraper r, adapted to bear upon the labels near one end and to be adjusted for labels of different lengths, substantially as shown and described.

5. In a can-labeling machine, the combination with a track or way; of a can-traversing mechanism mounted upon said way or track; a second track; and a roller independent of the can-traversing mechanism, mounted upon the second track and arranged to press the label against the can.

6. In a can-labeling machine, the combination with a track or way; of a can-traversing mechanism mounted upon said way or track; a second track; a roller independent of the can-traversing mechanism, mounted upon the second track and arranged to press the label against the can; and a connection between the roller and the can-traversing mechanism.

7. In combination with a can-traversing mechanism and the tracks A'; the roller B' provided with boxes C' to fit upon the tracks; and the levers E' connected with the can-traversing mechanism and the roller-shaft.

8. In combination with a can-traversing mechanism, and the tracks A'; the roller B' provided with housings C'; the slotted levers E' connected with the can-traversing mechanism; and the springs F' to force the roller against the can.

9. In a can-labeling machine, the combination with a bed or way and a chute at the end thereof; a can-traversing mechanism mounted to travel on said way toward and from the chute; a roller to press the label against the can; and means whereby the roller is caused to press the label against the can, and to rise above the chute to clear the cans therein.

10. In a can-labeling machine, the combination with a bed; of tracks on opposite sides thereof; two can-grasping disks mounted to run directly upon the tracks; and means for moving one of said disks toward and from the other.

11. In a can-labeling machine, the combination with a bed; of tracks on opposite sides thereof, one of said tracks being cut away on its upper face, as at g; and means for moving one of said disks toward and from the other.

12. In combination with a track and a bed; a reciprocating cross-head or frame; the rigid arm R provided with disk S; the pivoted arm V provided with disk W; the spring-catch X to engage and hold the arm V; the rod Y and a stop to disengage the catch; and the cam b to act upon and rock the arm V.

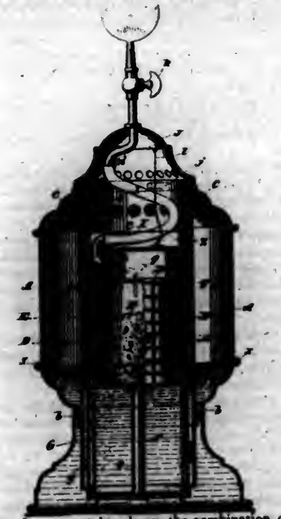
13. In a can-labeling machine, the combination with a bed; of a smooth track and a rack-bar on opposite sides thereof; two can-grasping disks, one of which is toothed and the other plain, running directly upon the rack-bar and smooth track respectively; and means for moving the plain-faced disk toward and from the toothed disk.

14. In a can-labeling machine, the combination with a bed or support to receive the labels; of a pair of disks between which the can is held; devices at opposite ends of the bed for causing the disks to automatically grasp and release the cans; and means whereby the said disks are held in their open or release position during their return movement.

15. In a can-labeling machine, the combination with a bed or support to receive the labels; of a track; a pair of can-grasping disks mounted to travel upon the track; and means whereby one of said disks is tipped out of a vertical plane to release the can, and returned to position to grasp the can.

16. In a can-labeling machine, the combination with a main frame provided with paste-boxes, a label-holder, and an intermediate can-discharge orifice; of a frame pivoted to the main frame between the paste-boxes and the label-holder and provided with paste-applying blocks; said pivoted frame being arranged to swing back and forth from the paste-boxes to the labels.

17. In a can-labeling machine, the combination with a main frame provided with paste-boxes, a label-holder, and an intermediate can-discharge orifice; of a frame pivoted to the main frame and provided with paste-applying blocks, said pivoted frame being arranged to swing back and forth from the paste-boxes to the label; and a can-traversing mechanism operated by or through said pivoted frame.



18. In a can-labeling machine, the combination with a main frame and its paste boxes, label-holder, and can-discharge orifice; of the pivoted frame provided with paste-applying blocks; a can-traversing mechanism operated by the swinging frame; and means for causing said can-grasping mechanism to automatically grasp and release the cans.

19. In a can-labeling machine, the combination with a track; of a reciprocating frame provided with the arms R and V having two or more holes; and the removable and interchangeable disks applied to said arms to run upon the track.

20. In a can-labeling machine, the combination with a track; of a reciprocating frame provided with arms R and V; removable and interchangeable disks applied to said arms to run upon the track; an arm E' adjustably secured to the frame; and a presser-roll B' carried by the arm.

21. In a can-labeling machine, the combination with a track; of a reciprocating frame having arms R and V which move in or have fixed relation to the track; and removable and interchangeable can-grasping disks secured to said arms to run upon the track.

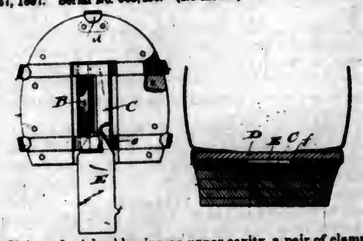
606,228. ACETYLENE-GAS-GENERATING LAMP. HENRY OEHL, New York, N. Y. Filed Aug. 4, 1897. Serial No. 647,016. (No model.)

Claim.—1. In an acetylene-lamp, the combination of a water-containing casing, a removable cylinder supported within said casing, a carbid-cage removably connected with the cylinder, and a gas-tank contained within said cylinder and adapted to surround said carbid-cage.

2. In an acetylene-lamp, the combination of a water-containing casing, a removable cylinder supported within said casing, a carbid-cage removably connected with the cylinder, and a gas-tank adapted to be guided by and move within the cylinder and to surround the carbid-cage.

3. In an acetylene-lamp, the combination of a water-containing casing, a removable cylinder supported within said casing, a carbid-cage removably connected with the cylinder, a gas-tank adapted to be guided by and move within the cylinder and to surround the carbid-cage, a supply-pipe connected with the lamp, and a flexible connection between the supply-pipe and the gas-tank.

4. In an acetylene lamp, the combination of a water-containing casing, a removable cylinder supported within said casing, a carbid-cage removably connected with the cylinder, a hood fitting within said cage and adapted to surround the carbid therein, a gas-tank adapted to be guided by and move within the cylinder and to surround the carbid-cage, and a supply-pipe connected with the lamp, and a flexible connection between the supply-pipe and the gas-tank.



5. In an acetylene-lamp, the combination of a water-containing casing, a removable cylinder supported within said casing, a carbid-cage removably connected with the cylinder, a foraminous cup supported by said cylinder below the cage, a gas-tank adapted to be guided by and move within the cylinder and to surround the carbid-cage, a supply-pipe connected with the lamp, and a flexible connection between the supply-pipe and the gas-tank.

6. In an acetylene-lamp, the combination of a water-containing casing, a removable cylinder supported within said casing, a carbid-cage, a spider removably secured to the cylinder and adapted to connect with the carbid-cage to support the same in place, and a gas-tank adapted to be guided by and move within the cylinder and to surround the carbid-cage.

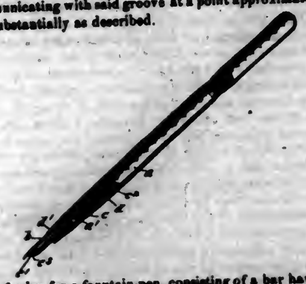
7. In an acetylene-lamp, the combination of a water-containing casing, a removable cylinder supported within said casing, a dome removably secured to the cylinder and provided with a gas-supply pipe, a carbid-cage, a spider removably secured to the cylinder and adapted to connect with the carbid-cage to support the same in place, a gas-tank adapted to be guided by and move within the cylinder and to surround the carbid-cage, and a flexible connection between said gas-tank and the gas-supply pipe.

8. In an acetylene-lamp, the combination of a water-containing casing, a carbid-support normally below the normal water-level in said casing, a gas-tank surrounding said carbid-support, a cylinder within which said gas-tank is adapted to move, and a guiding or supporting ring connected to the casing and adapted to maintain the cylinder elevated and the carbid out of contact with the water.

606,229. HEEL. JAMES R. O'NEILL, Waupaca, Wis. Filed Dec. 27, 1897. Serial No. 663,490. (No model.)

Claim.—1. A heel having an upper cavity, a pair of clamp-slides consisting of recurved metal plates having a lateral adjustment in the heel-cavity and provided with outwardly-extended hook-arms movable in corresponding guides in the heel, a wedging lock-plate engageable with the clamp-slides, and a hook-plate fast to the rear upper portion of said heel, this hook-plate and hook-arms of said clamp-slides being for engagement with a boot or shoe sole.

2. A heel having an upper cavity, a pair of clamp-slides consisting of recurved metal plates having lateral adjustment in the heel-cavity and provided with outwardly-extended hook-arms movable in corresponding guides in the heel, a wedging lock-plate engageable with the clamp slides and provided with a lateral spur that enters an aperture in the bend of one of said slides, and a hook-plate fast to the rear upper portion of said heel, this hook plate and hook-arms of the aforesaid clamp-slides being for engagement with a boot or shoe sole.



606,230. GRAVE-VAULT. GIDEON G. OWEN, Houston, Ohio. Filed May 27, 1897. Serial No. 638,437. (No model.)

Claim.—A receptacle of the class described, comprising a base provided with a flat-surfaced elevated central portion 2, and a depressed edge portion 3 provided with a cement-groove of less width than the depressed surface, said elevated portion being cut away at the corners at 4, the side walls 5 having flat lower edges to fit the depressed portions 3 at opposite sides of the central portion 2 and to cover the said groove, and having contiguous to their extremities the cross-sectionally-triangular inwardly-extending vertical enlargement 7 presenting angularly-disposed side faces fitting the cut-away portions 4 of the base, said sides being flat between their extremities and the enlargement 7 and provided in such flat portions with grooves 9, the ends 6 seated against the flat end portions of the sides and the adjacent faces of the enlargement 7 and provided with vertical grooves 10 registering with the groove 9 and with the groove of the base, said sides and ends being provided at their upper edges with continuous grooves communicating with the vertical grooves 9 and 10, and the top or cover provided with the inwardly-extending central portion 14 cut away at the corners at 15 and fitting within the sides and ends and against the side faces of the enlargement 7, said top or cover extending over the grooves of the upper edges of the sides and ends, and all the said grooves being adapted to be filled with cement from a single point and forming keys, when filled, for holding the parts against lateral displacement, substantially as described.

606,231. FOUNTAIN-PEN. GEORGE S. PARKER, Janesville, Wis. Filed July 26, 1897. Serial No. 646,804. (No model.)

Claim.—1. In a fountain-pen, the combination with a feeder-bar, the inner end whereof is formed to come into approximate contact with the wall of the ink-reservoir, of a longitudinal groove along the upper side of said feeder-bar, said groove, starting at the inner end, gradually increasing in depth to the portion under the nib of the pen, and a longitudinal capillary slit *d* in the opposite or under side of the feeder starting at its inner extremity, passing along its under side and only communicating with said groove at a point approximately under the pen, substantially as described.

2. A feeder for a fountain-pen, consisting of a bar having a longitudinal groove along the side thereof next the pen and communicating with the ink-reservoir, said bar also being provided with a capillary slit passing along the under side thereof and opening into the ink-reservoir throughout a portion of its length, and a capillary passage affording communication between said capillary slit and said groove, substantially as described.

3. A feeder for a fountain-pen, consisting of a bar having a longitudinal groove in the side next the pen communicating with the ink-reservoir, said groove gradually increasing in depth from the inner end to the outer extremity of the bar, said bar also having a capillary slit in its under side communicating at one end with the reservoir and at the other end with said groove, substantially as and for the purpose described.

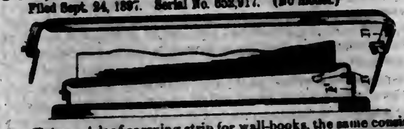
4. A feeder for a fountain-pen, consisting of a bar having a longitudinal groove in the side thereof next the pen, the inner end of said bar being formed to come into approximate contact with the side of the reservoir, said bar also having a capillary slit *d* passing along the under side thereof and opening into the ink-reservoir throughout a portion of its length, a capillary slit *d'* along the bottom of said groove, and a capillary passage affording communication between said slit *d* and said slit *d'*, substantially as described.

5. In a fountain-pen, a feeder-bar provided with a capillary ink-duct opening in the reservoir at or near the lower interior wall or side of said reservoir, said capillary duct extending downwardly to an enlarged or deepened portion, said enlarged portion opening into a groove immediately under the pen on the opposite of said bar, to form a continuation of said duct, said groove forming the continuation being enlarged to form an ink-holding chamber immediately under the nib of the pen, the upper portion of said groove communicating with the reservoir to form a vent, substantially as and for the purposes described.

606,232. DUST-GUARD FOR CAR-AXLE BOXES. JAMES S. PATTEN, Baltimore, Md. Filed Dec. 26, 1896. Serial No. 617,090. (No model.)

Claim.—1. The combination, with the axle journal and box, of the cap, which is free and independent of said box, the dust-guard proper, comprising two flat, alined, and slidable members, and springs supporting the lower member and bearing upon the upper side of said cap, and also pressing in opposite directions between the cap and upper member of the guard, as shown and described.

2. The dust-guard for car-axle boxes, which comprises two alined sliding plates, or flat members, integral springs which draw the said plates together or toward each other, and also project laterally from the body of said guard, for exerting pressure against a rear wall of the axle-box, substantially as shown and described.



3. The combination with a car-axle and axle-box, of the improved dust-guard, comprising upper and lower alined, sliding members, springs, one end of which bears upon the upper member, the lower portion being attached to the lower member, and having an intermediate portion projecting from the latter as specified, whereby such springs are adapted to exert lateral pressure on the guard, substantially as shown and described, in addition to their primary function.

4. The combination with the dust-guard proper, and a suspension cap or bar arranged across its upper end, of a spring whose legs pass through the cap, and one of them having a shoulder that adapts it to engage the cap, so that the spring bears against and also retains its hold on the same, as shown and described.

5. The combination with the car-axle, axle-box, guard proper, and suspension-cap, of the duplicate wire springs D, which are connected with the lower member of the guard and whose upper portions have an angle where they pass through the cap, the upper extremities of the springs that project beneath said cap bearing on the upper member of the guard as shown and described.

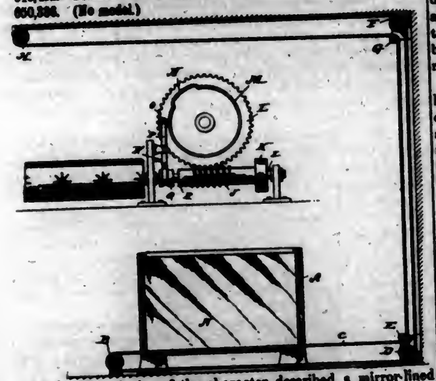
6. The improved dust-guard, whose lower slidable member has a thick, concave upper edge provided with the transverse notches 11, which are beveled or inclined downward from the outer edge of the concave, as shown and described, for the purpose specified.

606,233. WALL-BOOK. GEORGE R. PEARL, Jamestown, N. Y. Filed Sept. 24, 1897. Serial No. 652,917. (No model.)

Claim.—A leaf-carrying strip for wall-books, the same consisting of a strip of sheet metal, folded upon a line extending through the longitudinal center of the strip, and the ends of the strip thus formed being bent at right angles to the body of the strip, and the arms thus formed being provided with eyes or openings for engaging the pintles of the hinges, substantially as shown and described.

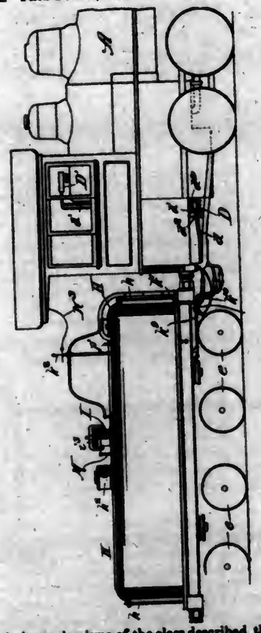
606,234. CRUSHING-ROLL. ALFONSO PERANT, Brooklyn, N. Y. Filed Apr. 24, 1897. Serial No. 633,601. (No model.)

Claim.—1. A roll consisting of a shaft having sections of differing diameters, a roll-cylinder having sections of corresponding different diameters mounted thereon, and means for securing the roll-cylinder to the shaft, substantially as specified.



2. A roll consisting of a shaft provided with sections of differing diameters, each of which is tapering, a roll-cylinder having sections of corresponding different diameters mounted thereon, and means for securing the roll-cylinder to the shaft, substantially as specified.

606,235. PATTERN-EXHIBITOR. ADOLPHUS PETERSON, Lansdowne, Pa. Filed Jan. 16, 1897. Serial No. 619,451. (No model.)



Claim.—In a display apparatus, a collapsible box lined with mirrors, curved brackets hinging the sides to the bottom of the box, a frame removably journaled to the box, reels and idle-rolls journaled to the frame and a belt carrying display-figures, passing from the reels over the idle-rolls and through the space between the ends and the bottom of the box, as and for the purpose described.

606,286. AUTOMATIC MYRIOSCOPE. ADOLPHUS PETERSEN, Lansdowne, Pa. Original application filed Jan. 16, 1897, Serial No. 619,452. Divided and this application filed Sept. 2, 1897. Serial No. 650,336. (No model.)

Claim.—In a device of the character described, a mirror-lined box having its sides terminating a slight distance from the bottom, a shaft journaled parallel with the sides, an extension formed with said shaft, a pulley, a sleeve formed therewith, said pulley and sleeve being loosely mounted on the extension, a worm-screw formed on the sleeve, a worm-wheel journaled at right angles to the shaft meshing with the worm-screw, a cam-flange formed on the face of the wheel, a centrally-pivoted lever carrying a roll bearing against the side of the flange, a clutch splined on the shaft embraced by the other end of the lever, whereby said clutch will be moved longitudinally of the shaft to engage and disengage the end of the sleeve by a corresponding movement of the lever, a roll journaled on the shaft, idle-rolls journaled parallel with the first-named roll, and an endless belt run over said rolls and through the mirror-box, as and for the purpose described.

606,287. OIL-BURNING LOCOMOTIVE. GEORGE W. PRESCOTT, Highland, Cal. Filed Dec. 14, 1896. Serial No. 615,575. (No model.)

Claim.—1. In mechanisms of the class described, the combination of a locomotive provided with a fire-box, a lining of refractory material in the fire-box, an arched upper roof covering a portion of the front of the fuel-chamber, a relatively lower roof covering a portion of the rear of the fuel chamber, a hydrocarbon-fuel burner arranged in the lower portion of the rear wall of the fire-box so as to direct the fuel across the fire-box and against the front wall thereof, and a right-angular pipe or passage arranged with its inlet-opening toward the front end of the locomotive and connected with the fire-box in the front portion thereof, so as to admit air at substantially right angles to the injection of the fuel, substantially as described.

2. In mechanisms of the class described, the combination of a locomotive provided with a fire-box or fuel-chamber, a liquid-hydrocarbon burner arranged in such fuel-chamber, a tender provided with an oil supply reservoir and a water-reservoir, an oil-supply pipe connecting the burner with the supply-chamber, a steam-pipe leading from the source of steam-supply to and around the burner and to the source of water-supply, a valve on said steam-pipe to govern the admission of steam and a second valve on said pipe arranged in the water-supply chamber, whereby steam or water may be sent through such pipe for the purposes described, substantially as described.

3. In mechanisms of the class described, the combination of a locomotive provided with a fire-box or fuel-chamber, an oil-burner arranged in such chamber, a tender provided with an oil-reservoir, an oil-supply pipe connecting the oil-reservoir with the oil-burner, a vertical perforated tube surrounding the inlet of the oil-supply pipe in the oil-chamber, a vertically-movable valve in the vertical tube, a helically-coiled spring for normally holding the vertically-movable valve closed, a pin for holding the vertically-movable valve in its open position, and means for connecting the pin on the vertically-movable valve with the locomotive so that when the normal relation of the tender and locomotive is disturbed the pin is withdrawn and the valve closed, substantially as described.

4. In mechanisms of the class described, the combination of a locomotive provided with a fire-box or fuel-chamber, an oil-burner arranged in such chamber, a tender provided with an oil-reservoir, an oil-supply pipe connecting such reservoir with the oil-burner, a vertical perforated tube surrounding the inlet of the oil-supply pipe in the oil-chamber, a vertically-movable valve in the vertical tube, a helically-coiled spring for normally holding said vertically-movable valve closed, a pin for holding the vertically-movable valve in its open position, means for connecting the pin on the vertically-movable valve with the locomotive, a supply-valve in the oil-supply pipe, and means connecting the supply-valve on the supply-pipe with the locomotive, so that when the normal relation of the tender and locomotive is disturbed such mechanisms are operated and both of the valves closed, substantially as described.

5. In mechanisms of the class described, the combination of a locomotive provided with a fire-box or fuel-chamber, an oil-burner in such chamber, a tender provided with a water-reservoir and an oil-reservoir, an oil-supply pipe in the oil-reservoir and connected with the oil-burner, a steam-supply pipe, leading from a source of steam-supply arranged contiguous to the oil-supply pipe through such reservoir and having its open end arranged in the water-supply chamber, and means for admitting either steam or water into such steam-supply pipe as desired, substantially as described.

6. In mechanisms of the class described, the combination of a locomotive provided with a fire-box or fuel-chamber, an oil-burner in such chamber, a tender provided with a water-reservoir and an oil-reservoir, an oil-supply pipe in the oil-reservoir and connected with the oil-burner, a steam-supply pipe leading from a source of steam-supply around the burner to the oil-reservoir, around the oil-supply pipe and through such reservoir, and with its open end arranged in the water-supply chamber, and means for admitting either steam or water into such steam-supply pipe as desired, substantially as described.

7. In mechanisms of the class described, a tender providing an oil-reservoir, a water-drip valve arranged flush with the bottom of the oil-receptacle, and an oil-supply valve in the lower portion of the oil-supply chamber with its inlet-opening arranged slightly above the bottom portion thereof, substantially as described.

8. In mechanisms of the class described, a tender in which there are combined inner side walls and cover to provide an oil-receptacle, a water-drip valve arranged with its inlet-opening flush with the bottom of the oil-receptacle, an oil-supply pipe with its inlet-opening arranged in such oil-reservoir slightly above the bottom portion thereof, and a combined air and gas vent arranged in the upper portion of the oil-receptacle with an automatic valve so that when the normal position of the tender is disturbed such valve will be automatically closed and oil prevented from escaping therefrom, substantially as described.

606,288. BURNER FOR LIQUID HYDROCARBONS. GEORGE W. PRESCOTT, Highland, Cal. Filed Dec. 14, 1896. Serial No. 615,576. (No model.)

Claim.—1. An oil-burner provided with an oil-supply passage, a valve in such passage adjacent to the exit-opening to regulate the

outflow of the oil, a steam or fluid pressure chamber underneath the oil-supply passage having its exit-opening underneath and substantially in line with the exit-opening for the oil and provided with a movable valve to regulate the amount of steam under pressure escaping from its exit-passage, substantially as described.

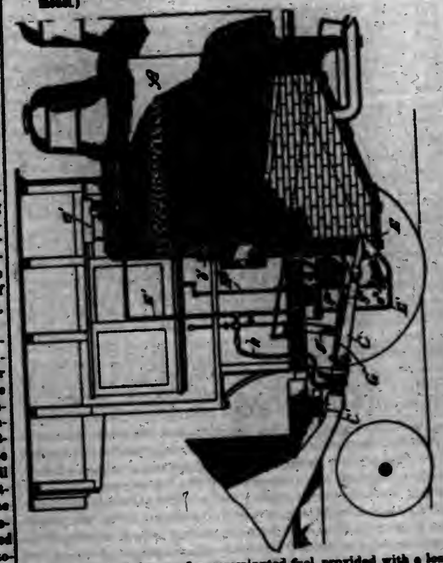
2. An oil-burner provided with an oil-supply passage, a rotatable valve in such passage adjacent to the exit-opening to regulate the supply of oil passing through the passage, a steam or fluid pressure chamber arranged under the oil-passage and with its exit-opening directly under and substantially in line with the oil-exit, a steam-supply valve arranged in the exit-opening of the steam-chamber to regulate the amount of steam under pressure issuing from said chamber to atomize the oil, substantially as described.

3. An oil-burner provided with an oil-supply chamber and an exit-opening, a rotatable valve in the burner adjacent to and intermediate the exit-opening and supply-chamber for regulating the flow of oil to the exit-opening, a fluid-pressure chamber located under the oil-supply chamber and with its exit-opening arranged under the exit-opening for the oils, and a slide-valve arranged in such opening to regulate the size of the opening and thereby the amount of steam under pressure escaping therefrom to atomize the oil, substantially as described.

4. An oil-burner provided with a central interior oil-supply chamber and an exit-passage leading from such chamber and an encompassing or inclosing chamber around the oil-supply chamber and adapted to be connected with a source of steam under pressure on one side and cool-water supply on the other side to keep the oil in the burner at substantially uniform temperature, and with steam-supply chamber connected with a source of steam-supply and having its exit-openings arranged underneath the exit-opening of the oil-chamber, a rotatable valve located between the oil-supply chamber and the exit-passage to govern the supply of oil entering the exit-passage and a slide-tapered valve arranged in the exit-opening of the steam-chamber to regulate the size of said opening, the amount of steam under pressure issuing therefrom and the atomizing of the oil, substantially as described.

5. An oil-burner provided with a central interior oil-supply chamber and an exit-passage leading from such chamber and an encompassing or inclosing steam-chamber around the oil-supply chamber and adapted to be connected with a source of steam under pressure on one side and cool-water supply on the other side, and with an independent steam-supply chamber connected with source of steam-supply and having its exit opening arranged underneath the exit-opening of the oil-chamber, a rotatable valve located between the oil-supply chamber and the exit-passage to govern the supply of oil entering the exit-passage, a slide tapered valve arranged in the exit-opening of the independent steam-pressure chamber to regulate the size of said opening, the amount of steam under pressure issuing therefrom and the atomizing of the oil, and a pressure drip-valve located in the lower portion of the independent pressure-chamber to automatically operate and allow the water to drip therefrom when the pressure in such chamber falls below a predetermined point, substantially as described.

6. An oil-burner provided with an oil-supply chamber and an exit-passage, a rotatable valve in the burner intermediate the supply-chamber and its exit-opening to govern the supply of oil, a steam or fluid pressure passage arranged underneath and with its exit-opening adjacent to that of the oil-supply passage, a valve in the steam-pressure exit-opening to govern the supply of steam under pressure, and means for adjustably supporting the burner so as to tilt it at the desired angle and form an oil-trap, substantially as described.



7. An oil-burner provided with a substantially rectangular oil-supply chamber and an irregular-shaped exit-passage, a partition dividing such chamber and passage, a valve in such partition to regulate the outflow of the steam, and means for tilting the burner out of a horizontal plane to form an oil-trap in the burner, substantially as described.

8. A multiple liquid-hydrocarbon burner provided with one oil-chamber and at least two independent exit-passages, a rotatable valve for each of such passages whereby the outflow of oil to the passages is regulated, a rotatable operating-rod shaft D' for each of such valves, a handle portion rigidly secured to each of such rotatable rods, gear mechanism independently and rotatably mounted upon each of said rods, mechanism for connecting and disconnecting the handle portions with the gears as desired and means for operating the gears, the whole so arranged that the valves may be operated independently or simultaneously, substantially as described.

9. A multiple liquid-hydrocarbon burner provided with one oil-chamber and at least two independent exit-passages, a rotatable valve for each of such passages whereby the supply of oil to the passages is regulated, a rotatable operating-rod shaft D' for each of such valves a handle portion rigidly secured to each of such rotatable rods, gear mechanism independently and rotatably mounted upon each of said rods, mechanism for connecting and disconnecting the handle portions with the gears as desired and means for operating the gears so that the valves may be operated independently or simultaneously, and lever mechanism connecting the rods D' with the stems of the rotatable valves for transmitting power and motion thereto, substantially as described.

10. An oil-burner provided with an oil-supply passage having an exit-passage and with a steam-supply chamber surrounding a portion of the oil chamber, a supply-pipe leading to the oil-supply passage a steam-supply pipe leading to the chamber surrounding the oil-passage, a branch pipe leading from the steam-chamber to the oil-supply pipe and provided with a valve thereon so that when desired the oil passage or supply pipe may be cleaned by steam under pressure, substantially as described.

606,289. BURNER FOR PULVERIZED COAL. GEORGE W. PRESCOTT, Highland, Cal. Filed Dec. 14, 1896. Serial No. 615,578. (No model.)

Claim.—1. A burner for comminuted fuel provided with a longitudinal fuel-passage therethrough and an independent passage for fluid-pressure having its exit-opening arranged underneath in line

with and adjacent to the burning exit-opening of the fuel-passage in the burner, so as to feed the fuel direct to the furnace, and a valve-gate in the fuel-passage movable transversely of the passage to govern the passage of fuel therethrough, substantially as described.

2. A burner for comminuted fuel provided with a longitudinal fuel-passage and an independent passage for fluid under pressure having the exit opening of the pressure-passage arranged adjacent to, in line with, and underneath the burning exit-opening of the fuel-passage so as to feed the fuel direct to the furnace, a pivoted valve gate or door forming the upper wall of the fuel-passage and movable transversely of the fuel-passage to control the flow of fuel therethrough, and a valve in the exit-opening of the pressure-passage, substantially as described.

3. In mechanisms of the class described the combination of a burner for comminuted fuel provided with a longitudinal fuel-passage and a passage for fuel under pressure having the exit-opening of the pressure-passage arranged adjacent to and underneath the exit opening of the fuel-passage, a pivoted valve gate or door forming the upper wall of the fuel-passage and movable transversely of the fuel-passage to control the flow of fuel therethrough, a valve in the exit-opening of the pressure-passage, and a flexible pipe connecting the fuel-passage of the burner with a supply-reservoir, substantially as described.

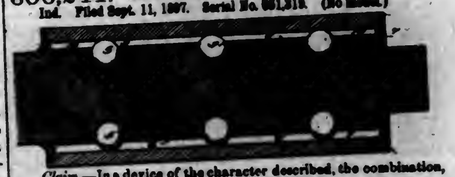
4. In mechanisms of the class described the combination of a burner for comminuted fuel provided with a longitudinal fuel-passage and a passage for fluid under pressure having the exit-opening of the pressure-passage arranged adjacent to and underneath the exit-opening of the fuel-passage, a pivoted valve gate or door forming the upper wall of the fuel-passage and movable transversely of the fuel-passage to control the flow of fuel therethrough, a valve in the exit-opening of the pressure-passage, a flexible delivery-pipe connecting the fuel-passage of the burner with a source of fuel-supply, and means for agitating such delivery-pipe, substantially as described.

5. In mechanisms of the class described, the combination of a burner provided with a longitudinal fuel-passage therethrough and a fluid-pressure passage with its exit-opening arranged adjacent to and underneath the exit-opening of the fuel-passage, a gate in such fuel-passage movable transversely in such passage, means connecting such gate with mechanism in the cab of the locomotive, a tender provided with a hopper-shaped receptacle for the reception of fuel in a comminuted condition, a flexible delivery-tube connecting the fuel-passage of the burner with the fuel-receptacle of the tender, a cam arranged on a movable part of the locomotive and means connecting the cam with the delivery-pipe so as to agitate the same during the movement of the locomotive, substantially as described.

6. In mechanisms of the class described, the combination of a burner provided with a longitudinal fuel-passage therethrough and a fluid-pressure passage with its exit-opening arranged adjacent to and underneath the exit-opening of the fuel-passage, a valve-gate in such fuel-passage movable transversely in such passage, means connecting such gate with mechanism in the cab of the locomotive to open and close the same, a tender provided with a hopper-shaped receptacle for the reception of fuel in a comminuted condition, a flexible delivery-tube connecting the fuel-passage of the burner with the fuel-receptacle of the tender, a cam arranged on a movable part of the locomotive, a flexible rod connecting the cam with the delivery-tube to agitate the same during the movement of the locomotive, and means for throwing the rod into and out of engagement with the cam, substantially as described.

7. In mechanisms of the class described, the combination of a burner provided with a longitudinal fuel-passage therethrough and a fluid-pressure passage with its exit-opening arranged adjacent to and underneath the exit-opening of the fuel-passage, a valve-gate in such fuel-passage movable transversely in such passage, means connecting such gate with mechanism in the cab of the locomotive to operate the same, a tender provided with a hopper-shaped receptacle for the reception of fuel in a comminuted condition, a flexible delivery-tube connecting the fuel-passage of the burner with the fuel-receptacle of the tender, a cam arranged on a movable part of the locomotive, means connecting the cam with the delivery-pipe so as to agitate the same during the movement of the locomotive, and a fluid-pressure injector arranged in the delivery-tube to assist in the passage of fuel therethrough and clean such delivery-tube, substantially as described.

8. In mechanisms of the class described, the combination of a burner for comminuted fuel provided with a longitudinal fuel-passage and a fluid-pressure passage with its exit-opening arranged adjacent to and underneath the exit-opening of the fuel-passage, means connecting the fluid-pressure passage with a source of fluid-pressure supply, a pivotal gate movably arranged transversely in the fuel-passage and forming an upper wall thereof, a valve in the exit-opening of the pressure-chamber, rod-and-lever mechanism connecting the gate of the fuel-passage with a handle in the locomotive-cab, mechanism arranged in the locomotive-cab connected with the valve in the pressure-chamber for operating the same, a tender provided with a hopper-shaped receptacle for holding fuel in a pulverized or comminuted condition, a flexible tube connecting the fuel-passage of the burner with the hopper-shaped receptacle, a cam on the drive-wheel axle of the locomotive, a flexible rod pivotally mounted on the locomotive connected with the flexible tube and arranged to be engaged with the cam on the driving-wheel axle to agitate the flexible tube, mechanism arranged in the locomotive-cab and connected with the flexible agitating-rod to hold the same in or out of engagement with the cam, substantially as described.



606,240. ATOMIZER. ROBERT W. PRESCOTT, Cleveland, Ohio. Filed July 24, 1897. Serial No. 645,758. (No model.)

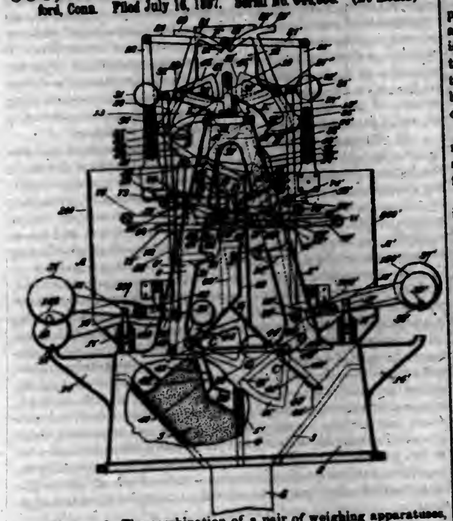
Claim.—1. In an atomizer, the combination of a liquid-chamber, a piston-chamber centrally located within said liquid-chamber and projecting from one end thereof, a suitable piston and piston-rod, a valve-controlled liquid-inlet communicating with said liquid-chamber and the projecting end of said piston-chamber, said projecting end provided with a valve adapted to control atmospheric communication with said piston-chamber and further provided with a suitable atomizing-nozzle, substantially as set forth.

2. In an atomizer, the combination of a liquid-chamber, a piston-chamber centrally located within and projecting from one end of said liquid-chamber, a suitable piston and piston-rod, a valve-controlled liquid-inlet communicating with said liquid-chamber and the projecting portion of the piston-chamber, said projecting portion provided with a valve adapted to control atmospheric communication with said piston-chamber, the extremity of the latter provided with a helical atomizing-nozzle, substantially as set forth.

606,241. BALL-BEARING. STEPHEN T. RANDOLPH, Covington, Ind. Filed Sept. 11, 1897. Serial No. 651,319. (No model.)

Claim.—In a device of the character described, the combination, with a suitable bearing-box, of a shaft therein having annular grooves in its periphery, a casing surrounding said shaft and formed in sections having their edges beveled and extending slightly above the centers of the balls, whereby said balls are kept in the grooves, removable sections secured to the axle and having their edges conforming to the shape of the edges of the sections forming the casing, said

removable sections being adapted to be removed to permit the balls to be placed in the annular grooves, substantially as described.



606,242. PLOW. ANDREW REINSTEDT, Marcus Hook, Pa. Filed May 20, 1897. Serial No. 637,567. (No model.)

Claim.—1. In a plow, the combination of a moldboard having a guide thereon and a slot at the lower portion thereof, a landside with an elongated guide having an upper beveled edge, an adjustable plate engaging the guide and the moldboard and projecting through the slot thereof, an elongated plow-point held on the beveled edge of the guide on the landside, and a single clamping-plate for holding the said parts in their adjusted position, substantially as and for the purposes specified.

2. In a plow, the combination of a moldboard having an adjustable share, an adjustable plow-point, and a triangular clamping-plate engaging said devices and forming the sole means of securing them in an adjusted position, substantially as and for the purposes specified.

606,243. WEIGHING-MACHINE. FRANCIS H. RICHARDS, Hartford, Conn. Filed July 16, 1897. Serial No. 644,633. (No model.)

Claim.—1. The combination of a pair of weighing apparatuses, one provided with a load-reducing instrumentality operative to reduce a load before the final discharge thereof; and actuator means intermediate said load-reducing instrumentality and the other apparatus, whereby the operation of said load-reducing instrumentality is effected at one predetermined period by and on the operation of said other apparatus.

2. The combination of a pair of weighing apparatuses, each provided with a load-reducing instrumentality operative to reduce a load before the final discharge thereof; and actuator means intermediate each apparatus and the load-reducing instrumentality of its companion apparatus, whereby the operation of the load-reducing instrumentality of one apparatus is effected at one predetermined period by and on the operation of the other apparatus.

3. A weighing-machine comprising a plurality of apparatuses, each provided with a load-reducing instrumentality operative to reduce a load before the final discharge thereof, the operation of the load-reducing instrumentality of one apparatus being effected at one predetermined period by and on the operation of another of said apparatuses.

4. A weighing-machine comprising a plurality of apparatuses, one provided with a load-reducing instrumentality operative to reduce a load before the final discharge thereof, the operation of said instrumentality being effected at one predetermined period by and on the operation of another of said apparatuses.

5. The combination of a plurality of weighing mechanisms; a load-reducing instrumentality for each of said weighing mechanisms, and operative to reduce a load before the final discharge thereof, the operation of the load-reducing instrumentality of one weighing mechanism being effected by and on the operation of another of said weighing mechanisms.

6. The combination of a plurality of weighing mechanisms, one provided with a load-reducing instrumentality operative to reduce a load before the final discharge thereof; and means adapted to effect the operation thereof, and controlled by and on the operation of another of said weighing mechanisms.

7. The combination of a pair of weighing mechanisms, each provided with a load-reducing instrumentality operative to reduce a load before the final discharge thereof; and means adapted to effect the operation of the load-reducing instrumentality of one weighing mechanism on the operation of the other weighing mechanism.

8. A weighing-machine comprehending a plurality of weighing mechanisms, one provided with a load-reducing instrumentality operated by and on the operation of another of said weighing mechanisms to reduce a load before the final discharge thereof, and adapted to cut off such reduction at one predetermined period on the operation of its own weighing mechanism.

9. A weighing-machine comprehending a plurality of weighing mechanisms, each provided with a load-reducing instrumentality operated by and on the operation of another of said weighing mechanisms to reduce a load before the final discharge thereof, and adapted to cut off such reduction at one predetermined period on the operation of its own weighing mechanism.

10. The combination of a plurality of weighing mechanisms, one provided with a load-reducing valve; and actuator means intermediate said load-reducing valve and another of said weighing mechanisms, and operative to open said load-reducing valve on the operation of said other weighing mechanism, thereby to permit the reduction of the load before the final discharge thereof, and said valve being adapted to close at one predetermined period on the operation of its own weighing mechanism, thereby to cut off such reduction.

11. A weighing-machine comprehending a plurality of weighing mechanisms, each provided with a load-reducing valve opened by and on the operation of another of said weighing mechanisms to effect the reduction of a load before the final discharge thereof.

12. A duplex weighing-machine comprising a plurality of coacting weighing mechanisms, each having a load-reducing valve operable to open and thereby effect the reduction of the load before the final discharge thereof, and adapted to close at one predetermined period on the operation of its own weighing mechanism, and thereby cut off such reduction.

13. The combination of a plurality of weighing mechanisms, each embodying a load-receiver and beam mechanism therefor; a load-reducing instrumentality for one of said weighing mechanisms, and operative by and on the operation of the beam mechanism of another of said weighing mechanisms, thereby to reduce a load before the final discharge thereof.

14. The combination of a plurality of weighing mechanisms, each embodying a load-receiver and beam mechanism therefor; a load-reducing instrumentality for each of said weighing mechanisms, the load-reducing instrumentality of one weighing mechanism being operated by the beam mechanism of another of said weighing mechanisms, thereby to reduce a load before the final discharge thereof.

15. The combination of a pair of weighing mechanisms, each embodying a load-receiver and beam mechanism therefor; a load-reducing instrumentality for each of said weighing mechanisms; and actuator means intermediate the load-reducing instrumentality of each of said weighing mechanisms and the beam mechanism of the other weighing mechanism, whereby said load-reducing instrumentality is operated, thereby to reduce a load before the final discharge thereof.

16. The combination of a pair of weighing mechanisms, each embodying a load-receiver and beam mechanism therefor; overload-supply means for each of said weighing mechanisms; a load-reducing valve for each of said weighing mechanisms; and actuator means intermediate the load-reducing valve of each of said weighing mechanisms and the beam mechanism of the other weighing mechanism, whereby said load-reducing valve is operated, thereby to reduce a load before the final discharge thereof.

17. In a weighing-machine, the combination of a pair of weighing mechanisms, each embodying a load-receiver having a load-reducer, and said machine having the load-reducer of one weighing mechanism located to discharge the surplus material of the load of the one weighing mechanism into the load-receiver of the other weighing mechanism.

18. In a weighing-machine, the combination of a pair of weigh-

ing mechanisms, each embodying a load-receiver having a load-reducer, said machine having the load-reducer of one weighing mechanism located to discharge the surplus material of the load of the one weighing mechanism into the load-receiver of the other weighing mechanism; and said machine also having supply means for simultaneously supplying material to said receiver during its reception of such surplus material.

19. In a weighing-machine, the combination of a pair of coacting weighing mechanisms, each embodying a load-receiver; and mechanism operative to effect the overload of the receiver of one weighing mechanism during a predetermined period, and then operative to effect the reduction of such overload and the discharge of the surplus thereof into its companion receiver simultaneously with a supply of material to said companion receiver.

20. In a weighing-machine, the combination of a pair of weighing mechanisms, each embodying a load-receiver having load-discharge means and load-reducing means; and actuator means for operating the load-reducing means of each weighing mechanism on the operation of its companion weighing mechanism, and controlled in its operation, at one predetermined period, by the load-discharge means of said companion weighing mechanism.

21. In a weighing-machine, the combination of a pair of weighing mechanisms, each embodying a load-receiver having a closer and a load-reducer; a stream-controller for each of said receivers; reciprocally-effective locking means for each coacting stream controller and closer, and operative to lock the closer shut when the stream-controller is open, and to lock the stream-controller shut when the closer is open; and actuator means for operating the load-reducer of one weighing mechanism on the operation of its companion weighing mechanism, and controlled in its operation at one predetermined period by and on the shutting of the closer of said companion weighing mechanism.

22. In a weighing-machine, the combination of a plurality of weighing mechanisms, each embodying a load-receiver, and one of said receivers having a stream-receiving conduit, and another of said receivers having a load-reducing outlet disposed adjacent to said stream-receiving conduit.

23. In a weighing-machine, the combination of a plurality of weighing mechanisms, each embodying a load-receiver provided with a stream-receiving conduit and a load-reducing opening, each receiver having its opening disposed adjacent to the stream-receiving conduit of another of said receivers.

24. In a duplex weighing-machine, the combination of a pair of weighing mechanisms, each embodying a load-receiver provided with a stream-receiving conduit at the lower part thereof, and a load-reducing opening at the upper part thereof, each receiver having its opening disposed adjacent to the stream-receiving conduit of the other receiver.

25. In a duplex weighing-machine, the combination of a pair of weighing mechanisms, each embodying a load-receiver provided with a stream-receiving conduit and a load-reducing outlet, each of said receivers having its conduit and outlet disposed intermediate said receivers, and also having its outlet disposed directly above the stream-receiving conduit of the other receiver.

26. In a duplex weighing-machine, the combination of a pair of weighing mechanisms, each embodying a load-receiver provided with a stream-receiving conduit and a load-reducing outlet, each of said receivers having its conduit and outlet disposed diagonally opposite to each other, whereby each receiver has its load-reducing opening adjacent to the stream-receiving conduit of the other receiver.

27. The combination of a plurality of weighing mechanisms, each embodying a load-receiver provided with a stream-receiving conduit and a load-reducing opening, each receiver having its opening disposed adjacent to the stream-receiving conduit of another of said receivers; and a load-reducing instrumentality for each weighing mechanism and operative to effect the reduction of the load, whereby the material discharged during the load-reducing period of one receiver will be received by another receiver.

28. The combination of a pair of weighing mechanisms, each embodying a load-receiver, one provided with a stream-receiving conduit, and the other with a load-reducing opening disposed adjacent to said stream-receiving conduit of its companion receiver; a load-reducing instrumentality for that weighing mechanism having the load-reducing opening; and actuator means intermediate said load-reducing instrumentality and the weighing mechanism having the stream-receiving conduit, whereby said instrumentality is operative by and on the operation of said last-mentioned weighing mechanism, thereby to effect a reduction of the load before the final discharge thereof, and whereby the material discharged through the load-reducing opening during the load-reducing period of said receiver will be received by the conduit of the other receiver.

29. The combination of a pair of weighing mechanisms, each embodying a load-receiver provided with a stream-receiving conduit and with a load-reducing opening, the opening of each receiver being adjacent to the stream-receiving conduit of the other receiver; a load-reducing instrumentality for each of said weighing mechanisms; and actuator means intermediate the load-reducing instrumentality of each weighing mechanism and the other weighing mechanism, whereby said instrumentality is operative, by and on the operation of said other weighing mechanism, to effect a reduction of the load before the final discharge thereof, and whereby the material discharged during the load-reducing period of one receiver will be received by the other receiver.

30. In a weighing-machine, the combination of a pair of weighing mechanisms, each embodying a load-receiver provided with a stream-receiving conduit and with a load-reducing opening, the opening of each receiver being in juxtaposition to the stream-receiving conduit of the other receiver; a load-reducing instrumentality for each of said weighing mechanisms; and actuator means intermediate the load-reducing instrumentality of each weighing mechanism and the other weighing mechanism, whereby said instrumentality is operative by and on the operation of said other weighing mechanism to effect a reduction of a load before the final discharge thereof, and whereby the material discharged during the load-reducing period of one receiver will be received by the other receiver, and each of said load-reducing instrumentalities being operative, on the operation of its own weighing mechanism, to cut off the reduction of the load.

31. The combination of a pair of weighing apparatuses, each embodying a load-receiver having a stream-receiving conduit and a load-reducing opening, the opening of each receiver being disposed above the stream-receiving conduit of the other receiver; and a plurality of load-reducing means operative to effect the reduction of a load before the final discharge thereof, and comprising valves disposed in position one adjacent to the load-reducing opening of each receiver.

32. In a weighing-machine, the combination of a pair of weighing apparatuses, each embodying a load-receiver having a stream-receiving conduit and a load-reducing opening, the opening of each receiver being disposed above the stream-receiving conduit of the other receiver; a plurality of load-reducing means operative to effect the reduction of the load before the final discharge thereof, and comprising valves disposed in position one adjacent to the load-reducing opening of each receiver; and actuator means for operating the valve of one apparatus on the operation of the other apparatus.

33. The combination of a pair of weighing apparatuses, each embodying weighing mechanism comprising a load-receiver and beam mechanism therefor, each of said receivers having a stream-receiving conduit and a load-reducing outlet; a plurality of load-reducing valves, one carried by each receiver and adapted to control the reduction of the load before the final discharge thereof; and means operative by the beam mechanism of each apparatus for effecting the operation of the load-reducing valve of the other apparatus.

34. The combination of a pair of weighing apparatuses, each embodying weighing mechanism comprising a load-receiver and beam mechanism therefor, one of said receivers having a stream-receiving conduit, and the other of said receivers having a load-reducing outlet adjacent to said stream-receiving conduit; a load-reducing instrumentality carried by that receiver having the load-reducing outlet, and adapted to effect the reduction of a load before the final discharge thereof; overload-supply means for each of said receivers; stream-controllers for each of said overload-supply means; actuator means intermediate the weighing mechanism and stream-controller of each apparatus for effecting the operation of said stream-controller at one predetermined period; and an actuating instrumentality intermediate said load-reducing instrumentality of one of said weighing apparatuses and the stream-controller actuator of the other apparatus.

35. The combination of a pair of weighing apparatuses, each embodying weighing mechanism comprising a load-receiver and beam mechanism therefor, each of said receivers having a stream-receiving conduit and a load-reducing outlet; a plurality of load-reducing valves, one carried by each receiver and adapted to control the reduction of the load before the final discharge thereof; supply-stream controllers; actuator means intermediate the beam mechanism and stream-controller of each apparatus for effecting the operation of said stream-controller at one predetermined period; and actuator means operative by the stream-controller-actuating means of one apparatus to effect the operation of the load-reducing means of the other apparatus.

36. In a duplex weighing-machine, the combination of a pair of weighing apparatuses, each embodying weighing mechanism comprising a load-receiver and beam mechanism supporting said receiver; overload-supply means for each receiver; stream-controlling means for each of said supply means; a load-reducing instrumentality for each receiver; actuator means intermediate the beam mechanism and the stream-controlling means of each apparatus, whereby the operation of said stream-controlling means is effected at one predetermined period by the beam mechanism; and actuator means intermediate the load-reducing instrumentality of each apparatus and the stream-controlling actuator of the other apparatus, whereby, simultaneously with the operation of the stream-controlling means of one apparatus, the operation of the load-reducing instrumentality of the other apparatus is effected.

37. The combination of a pair of weighing apparatuses, each embodying a load-receiver and beam mechanism for supporting said receiver, and each of said receivers having a stream-receiving conduit and a load-reducing outlet, the outlet of each receiver being disposed above the stream-receiving conduit of the other receiver; overload-supply means for each receiver; stream-controlling means for each of said supply means; an actuator intermediate the beam mechanism and the stream-controlling means of each weighing apparatus, whereby the opening of the stream-controlling means is effected by the beam mechanism; a load-reducing instrumentality for each receiver, and in position to control the flow of material from the receiver-outlet; an actuator for each load-reducing instrumentality, the actuator for the load-reducing instrumentality of one apparatus being in position to be engaged by the stream-controller actuator of the other apparatus on the opening of said stream-controller, thereby simultaneously to operate said load-reducing instrumentality.

38. The combination of a pair of weighing apparatuses, each embodying weighing mechanism comprising a load-receiver and beam mechanism supporting said receiver, each of said receivers having a stream-receiving conduit and a load-reducing outlet, the outlet of each receiver being adjacent to the stream-receiving conduit of the other receiver; a plurality of load-reducing valves, one carried by each receiver and adapted to control the reduction of the load; overload-supply means for each of said receivers; a stream-controlling valve for each of said supply means; actuator means intermediate the beam mechanism and stream-controlling valve of each apparatus for effecting the operation of said stream-controlling means at one predetermined period; and actuator means operative by the stream-controller-actuator means of one apparatus to effect the operation of the load-reducing means of the other apparatus, whereby the discharge of the surplus material of the load of one load-receiver will occur substantially simultaneously with, and form a part of, the supply of material to the other load-receiver.

39. The combination of a pair of weighing apparatuses, each embodying a load-receiver and beam mechanism for supporting said receiver, each of said receivers having a stream-receiving conduit and a load-reducing outlet, the outlet of each receiver being disposed above the stream-receiving conduit of the other receiver; overload-supply means for each receiver; an actuator intermediate the beam mechanism and the stream-controlling means of each weighing apparatus, whereby the opening of the stream-controlling means is effected by the beam mechanism; a stop carried by each of said actuators; a load-reducing valve carried by each of said receivers, and operable to open and close the load-reducing outlet, and comprising a valve-plate and an arm pivotally secured to said receiver and provided with a stop; means for controlling the operation of said load-reducing valves, and comprising a pair of actuators pivotally secured one to each load-receiver, and each provided with an arm adapted to engage its respective valve-arm stop, the actuator for the load-reducing valve of one weighing apparatus having an end thereof extending into position to be engaged by the stop carried by the stream-controller actuator of the other weighing apparatus.

40. A weighing-machine comprising a plurality of coacting weighing mechanisms; a load-reducing instrumentality for one of said weighing mechanisms; and means connecting said weighing mechanisms whereby they coact to have the load-reducing instrumentality of said weighing mechanism reduce the load thereof during the reception of the load by another of said mechanisms.

41. A weighing-machine comprising a pair of coacting weighing mechanisms, each having a load-reducing instrumentality operable to reduce the load thereof; and means connecting said weighing mechanisms whereby they coact to have the load-reducing instrumentality of one weighing mechanism reduce the load on the ascent of the other weighing mechanism to receive its load.

42. In a weighing-machine, the combination of a pair of weighing mechanisms; a load-reducing valve carried by one of said weighing mechanisms; and means for effecting the operation of said valve, and operative by and on the operation of the other weighing mechanism.

43. The combination of a pair of weighing mechanisms each embodying a load-receiver, one of said receivers having a stream-receiving conduit, and the other of said receivers having a stream-outlet; a load-reducing valve carried by said last-mentioned receiver and operative to control the reduction of the load; a load-reducing valve-actuator also carried by said last-mentioned receiver, and extending into position to be operated by and on the operation of the other weighing mechanism.

44. The combination of a pair of weighing mechanisms, one of said weighing mechanisms embodying a load-receiver having an outlet; a load-reducing valve comprising a valve-plate and an arm pivotally secured to said receiver and provided with a stop; a valve-actuator carried by said receiver and having an arm adapted to engage said stop, and also having a part thereof extending into position to be operated by the other weighing mechanism.

45. The combination of a pair of weighing mechanisms; load-supply means for each of said weighing mechanisms; a stream-controller for regulating the supply of material to each weighing mechanism; and reciprocally-effective means intermediate said stream-controllers, and operable, when one of said stream-controllers is in operation, to lock the other against operation.

46. The combination of a pair of weighing mechanisms; load-supply means for each of said weighing mechanisms; a stream-controller for regulating the supply to each weighing mechanism; and a pair of reciprocally-effective stops carried one by each of said stream-controllers, and operative, on the opening of one stream-controller, to lock the other stream-controller shut.

47. In a weighing-machine, the combination of a plurality of coacting rising-poise weighing mechanisms; load-discharge means for each of said weighing mechanisms and operative on the ascent thereof to its poise position; a load-reducing instrumentality for each of said weighing mechanisms; means connecting said weighing mechanisms, whereby they coact to have the load-reducing instrumentality of one of said weighing mechanisms reduce the load thereof during the reception of the load by another of said weighing mechanisms; and reciprocally-effective means operative on the operation of one of said load-discharge means to lock the other against operation.

48. In a duplex weighing-machine, the combination of a plurality of weighing apparatuses, each embodying weighing mechanism comprising a load-receiver and beam mechanism supporting said receiver, and each of said receivers having a stream-receiving conduit and a stream-outlet, the stream-outlet of each receiver being above the stream-receiving conduit of the other receiver; overload-supply means for each load-receiver; a plurality of stream-controllers for regulating the supply to said receivers; a plurality of stream-controller actuators operated by the beam mechanisms for opening said stream-controllers; a load-reducing instrumentality for each of said receivers; an actuator for each of said load-reducing instrumentalities, the load-reducing-instrumentality actuator of one weighing mechanism being operated by and on the operation of the other weighing mechanism, and simultaneously with the opening of the stream-controller of said other weighing mechanism, whereby, during the supply of material to one receiver, a reduction of the overload in the other receiver takes place; load-discharge means for each receiver; locking means intermediate the stream-controller and the load-discharge means of each weighing apparatus, and operative to lock the stream-controller shut when the load-discharge means is open, and to lock the load-discharge means shut when the stream-controller is open; reciprocally-effective locking means intermediate the stream-controller means of said apparatuses, and operative to lock one stream-controller shut when the other stream-controller is open; and reciprocally-effective locking means intermediate the load-discharge means of said apparatuses, and operative to lock one load-discharge means shut when the other is open.

49. In a duplex weighing-machine, the combination of a plurality of weighing apparatuses each embodying weighing mechanism comprising a reciprocatory load-receiver having a closer and beam mechanism supporting said receiver, and each of said receivers having a stream-receiving conduit and a stream-outlet, the outlet of each receiver being directly above the stream-receiving conduit of the other receiver; overload-supply means for each load receiver; a valve for regulating the supply to each of said receivers; a plurality of valve-actuators operated by said beam mechanisms for opening said valves; a load-reducing valve carried by each of said receivers; an actuator for each of said load-reducing valves, the reducing-valve actuator of one weighing mechanism being operated by and on the operation of the beam mechanism of the other weighing mechanism, and simultaneously with the opening of the supply-valve of said other weighing mechanism, whereby, on the supply of material to one receiver, a reduction of the overload in the other receiver takes place; locking means intermediate the supply-valve and the closer of each apparatus, and operative to lock the supply-valve shut when the closer is open, and to lock the closer shut when the supply-valve is open; reciprocally-effective locking means intermediate the supply-valves of said apparatuses, and operative to lock one supply-valve shut when the other is open; and reciprocally-effective locking means intermediate the closers of said receivers and operative to lock one closer shut when the other is open.

50. The combination of a pair of weighing apparatuses each comprising weighing mechanism embodying a load-receiver and beam mechanism, one of said beam mechanisms embodying a supplemental beam-arm operative therewith, and one of said receivers having a stream-receiving conduit, and the other of said receivers having a load-reducing outlet; a load-reducing instrumentality for said last-

mentioned receiver; load-supply means for each of said receivers; a stream-controller for each of said load-supply means; an actuator intermediate said supplemental beam-arm and one of said stream-controllers and operative to open the same; and an actuator for effecting the operation of said load-reducing instrumentality, and in position to be engaged by said stream-controller actuator on the operation thereof by the beam mechanism.

51. In a duplex weighing-machine, the combination with a pair of coacting weighing mechanisms, each embodying a load-receiver and beam mechanism therefor, of mechanism operable to effect the overloading of one receiver before the completion of the load-discharge of the other receiver; and then to effect the reduction of such overload during the supply to the other receiver, whereby the surplus of the load discharged from one receiver assists the loading of the other receiver.

52. In a duplex weighing-machine, the combination of a plurality of weighing apparatuses comprising a plurality of coacting weighing mechanisms embodying a plurality of load-receivers and a plurality of beam mechanisms therefor; overload-supply means for said receivers; a plurality of stream-controlling means; a plurality of material-discharge means; a plurality of alternately-operable load-reducing instrumentalities, the load-reducing instrumentality of one apparatus being controlled by and on the operation of another of said apparatuses through the medium of the weighing mechanism thereof on its return to its normal position to receive a load after the discharge of its preceding load; a plurality of main locking means intermediate said stream controlling means and load-discharge means, and operative to lock the stream-controllers shut when the load-discharge means are open and to lock the load-discharge means shut when the stream-controllers are open, and each of which locking means embodies supplemental locking means operative to maintain the load-discharge means shut on the unlocking of the main locking means; reciprocally-effective locking means intermediate the stream-controlling means, whereby, when one of said stream-controlling means is open the other is locked shut; and reciprocally-effective locking means intermediate the load-discharge means, whereby, when one of said load-discharge means is open the other will be prevented from opening should its supplemental locking means be prematurely tripped.

53. In a weighing-machine, the combination of a pair of weighing mechanisms, each embodying a load-receiver, and one of said weighing mechanisms having a load-reducer operative to discharge the surplus material of the load of one receiver into the load-receiver of the other weighing mechanism.

54. The combination in a weighing apparatus, of a pair of weighing mechanisms, each provided with a load-receiver and with means located and operating for reducing an overload to bring the weighing mechanism to a poise by discharging the surplus material from its load-receiver; and means for delivering the surplus of the load of one weighing mechanism into the load-receiver of the other weighing mechanism, whereby the discharged surplus of the load of one mechanism constitutes a part of the overload of the other mechanism.

55. The combination of a pair of weighing mechanisms, each embodying a load-receiver, and a load-reducer operative to reduce a load and to discharge the surplus material thereof into the other receiver, said reducers being disposed intermediate said weighing mechanisms.

56. In a weighing-machine, the combination of a pair of weighing mechanisms, each embodying a load-receiver, one of said weighing mechanisms having load-discharge means, and the other of said weighing mechanisms having load-reducing means; and actuator means for operating said load-reducing means on the operation of the other weighing mechanism, and controlled in its operation at one predetermined period by the load-discharge means of said weighing mechanism.

57. In a weighing-machine, the combination of a pair of weighing mechanisms; load-supply means for each of said weighing mechanisms, one of said weighing mechanisms having a stream-controller; and means for effecting the operation of said stream-controller at one predetermined period; and the other of said weighing mechanisms having a load-reducing instrumentality operative to reduce the load supplied thereto; and means intermediate the stream-controller-actuating means of one weighing mechanism and the load-reducing instrumentality of the other weighing mechanism for effecting the operation of said load-reducing instrumentality.

58. A weighing-machine comprising a pair of weighing mechanisms, each having a load-receiver, one of said weighing mechanisms having load-reducing means operative to reduce the load supplied to one receiver and to discharge the surplus material thereof into the other receiver intermediate its top and bottom; and means for supplying said other receiver with material at the upper part thereof, whereby said receiver is supplied with material from different sources.

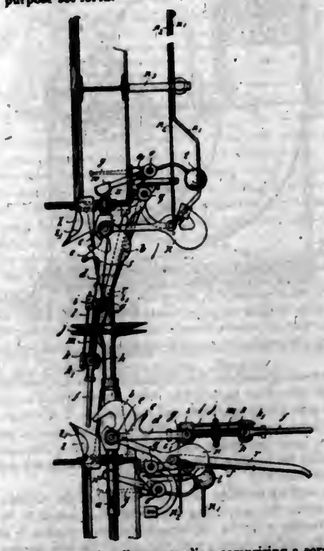
59. A weighing-machine comprising a pair of weighing mechanisms, each having a load-receiver adapted to receive material at the top and also at the side thereof; means for reducing the load of each receiver, and operative to discharge the surplus thereof into the other receiver at the side thereof, and on the ascent of said receiver to receive a load; and means for supplying each of said receivers with material at the top thereof, whereby each receiver is supplied with material from different sources simultaneously during a predetermined period.

60. The combination of a pair of weighing mechanisms; load-supply means for each of said weighing mechanisms; a stream-controller for regulating the supply to each weighing mechanism; load-discharge means for each weighing mechanism; reciprocally-effective locking means intermediate the stream-controller and the load-discharge means of each weighing mechanism and operative to lock the stream-controller inoperative when the load-discharge means is in operation, and to lock said load-discharge means inoperative when the stream-controller is in operation; and reciprocally-effective means intermediate the stream-controllers of said weighing mechanisms and operative when one of said stream-controllers is in operation to lock the other inoperative.

61. The combination of a pair of weighing mechanisms; load-supply means for each of said weighing mechanisms; a stream-controller for regulating the supply to each weighing mechanism; load-discharge means for each weighing mechanism; reciprocally effective locking means intermediate the stream-controller and the load-discharge means of each weighing mechanism and operative to lock the stream-controller inoperative when the load-discharge means is in operation, and to lock said load-discharge means inoperative when the stream-controller is in operation; and reciprocally-effective means intermediate said load-discharge means and operative on the operation of one load-discharge means to lock the other against operation.

62. The combination of a pair of weighing mechanisms; load-supply means for each of said weighing mechanisms; a stream-controller for regulating the supply to each weighing mechanism; load-discharge means for each weighing mechanism; reciprocally-effective locking means intermediate the stream-controller and the load-discharge means of each weighing mechanism and operative to lock the stream-controller shut when the load-discharge means is open, and to lock said load-discharge means shut when the stream-controller is open; reciprocally-effective means intermediate the stream-controllers of said weighing mechanisms and operative when one of said stream-controllers is open to lock the other against opening; and reciprocally-effective means intermediate said load-discharge means and operative on the opening of one load-discharge means to lock the other against opening.

606,244. PLOW ATTACHMENT. SOLOMON H. RITTER, Pottsgrove, Pa. Filed Nov. 5, 1897. Serial No. 657,590. (No model.)



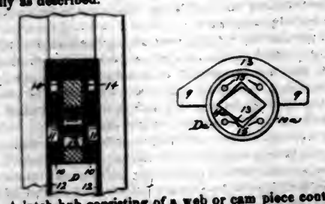
Claim.—1. The combination with plow-handles, and a pivoted beam, of a bracket fixed to said handles and having a slotted shank and a looped end, a worm or screw shaft journaled in the bracket and having one end extended into the looped end thereof, a traveling nut having a stem which passes through the slotted bracket and is attached to the beam, a notched disk or ratchet attached to the protruding end of the worm-shaft, an adjusting-lever fitted loosely on the end of the worm-shaft, a pawl on said lever, a holding-segment carried by the bracket, and a thumb latch-lever, substantially as and for the purposes described.

2. The combination with a pivoted plow-beam, of a fixed bracket, a traveling nut slidably fitted to the bracket and attached to the plow-beam for moving the latter on its pivot, a worm-shaft passing through the nut and journaled in the bracket, and means for rotating and locking the screw-shaft, substantially as described.

3. The combination with a plow-beam pivoted to turn on a vertical axis, of a fixed bracket on a plow-frame, a traveling nut slidably fitted to the bracket and connected with the beam by a vertical pivot parallel to the beam-pivot, a screw-shaft passing through the nut and journaled in the bracket, a ratchet on the screw-shaft, an adjusting-lever carrying a feed-pawl and a locking device, and a fixed segment on the bracket with which the lever-locking device is engaged, substantially as described.

606,245. CAR-COUPLING. ALFRED RUSCHER, Bruck-Ujhain, Austria-Hungary. Filed Apr. 2, 1898. Serial No. 676,192. (No model.)

Claim.—1. An improved railway-coupling comprising a screw coupling-link consisting of bars *d* having disengaging-noses *e*, the nut *i* foldable downwardly, screw *m*, nut *k* and the coupling-bow *f* turnable on its nut *k* only within small limits, in combination with a lifting device for the screw coupling-link consisting of a shaft *q* journaled transversely of the car having means for operation outside the buffers, lifting-arms *r* and an arresting-tooth *p* on said shaft *q* a second shaft *o* a click *o'* thereon disengaging-levers *w* thereon and buffers having rods *x* adapted on receiving end thrust to move said levers *w* for the purpose set forth.



2. An improved railway-coupling comprising a screw coupling-link consisting of bars *d* having disengaging-noses *e*, the nut *i* foldable downwardly, screw *m*, nut *k* and the coupling-bow *f* turnable on its nut *k* only within small limits, in combination with a lifting device for the screw coupling-link consisting of a shaft *q* journaled transversely of the car having means for operation outside the buffers, lifting-arms *r* and an arresting-tooth *p* on said shaft *q* a second shaft *o* a click *o'* thereon disengaging-levers *w* thereon and buffers having rods *x* adapted on receiving end thrust to move said levers *w* and a D-hook *n* suspended from said hook *b* and a device for lifting the D-hook *n* consisting of a rod *n'* connected thereto guides on the carriage for said rod *n'* and draw-rods *n²* attached to rod *n'* and passing to both sides of the carriage, for the purpose set forth.

3. An improved railway-coupling comprising a screw coupling-link consisting of bars *d* having disengaging-noses *e*, the nut *i* foldable downwardly, screw *m* nut *k* and the coupling-bow *f* turnable on its nut *k* only within small limits, in combination with a lifting device for the screw coupling-link consisting of a shaft *q* journaled transversely of the car having means for operation outside the buffers, lifting-arms *r* and an arresting-tooth *p* on said shaft *q* a second shaft *o* a click *o'* thereon disengaging-levers *w* thereon and buffers having rods *x* adapted on receiving end thrust to move said levers *w* and a connecting-rod *l* between the two nuts *i k* of the screw-coupling, for the purpose of securing the same against turning, for the purpose set forth.

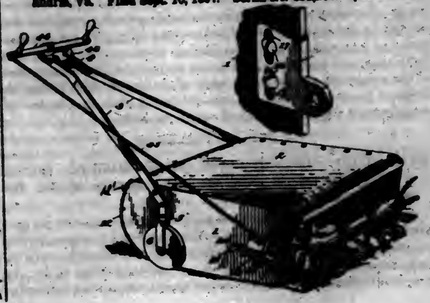
4. An improved railway-coupling comprising a screw coupling-link consisting of bars *d* having disengaging-noses *e*, the nut *i* foldable downwardly, screw *m* nut *k* and the coupling-bow *f* turnable on its nut *k* only within small limits, in combination with a lifting device for the screw coupling-link consisting of a shaft *q* journaled transversely of the car having means for operation outside the buffers, lifting-arms *r* and an arresting-tooth *p* on said shaft *q* a second shaft *o* a click *o'* thereon disengaging-levers *w* thereon and buffers having rods *x* adapted on receiving end thrust to move said levers *w* and a hood adapted to receive the bow *f* of the screw-coupling, for the purpose set forth.

606,246. LATCH. HENRY H. RUSSELL, New Britain, Conn., assignor to the Russell & Erwin Manufacturing Company, same place. Filed Nov. 9, 1897. Serial No. 657,976. (No model.)

Claim.—1. The combination of a latch-case having inwardly-projecting bosses, with a latch-hub having hollow side trunnions with internal bearings into which internal bearings said bosses are received and upon the interior of which bosses the hub has its bearing, substantially as described.

2. A latch-hub consisting of a web or cam piece containing the bearing-hole for the spindle and hollow trunnions rigid with said web-piece, and with their inner diameter large enough to clear the spindle, whereby the spindle may rock or tilt within the hub on said rigid web, substantially as described and for the purpose specified.

3. A latch-hub consisting of the web or cam piece with broad sides, and two separately-formed tubular trunnion-pieces having at their base a flange with its sides extending at a right angle to the axis of said trunnions and resting upon the broad sides of said web or cam piece, the said flanges being rigidly secured to said web, substantially as described.



4. A latch-hub for a square spindle having a diamond-shaped spindle-hole as viewed in the longitudinal direction of the spindle, the shortest diameter of which hole is fitted to the diagonally opposite corners of the spindle, substantially as described.

606,247. INVALID-BED. JOHN M. SCRIBNER, Belmore, Canada; Elmer C. Scribner administrator of said John M. Scribner, deceased. Filed Dec. 23, 1897. Serial No. 663,209. (No model.)

Claim.—In an invalid-bed, the combination with a bedstead having head, foot and sides, of a tilting frame having its longitudinal axis pivoted in the head and foot, swivel-bars pivoted to said tilting frame and having their ends extending to the sides of the bedstead, supports on said sides adapted to engage the ends of said swivel-bars, a jointed spring-frame consisting of a fixed central section, head-section and hinged double foot-section supported upon said tilting frame, guide-bars secured to the sides and central section and adapted to engage eyes on the adjacent ends of the head and foot sections, links connecting the sides with the sides of said head and foot sections, longitudinal bearers on the cross-slats of the head and inner foot sections, levers under said bearers pivoted in the tilting frame and adapted to press on said bearers and raise the outer portion of the head and inner foot section, and wiading devices pivoted to the bedstead in suitable positions controlling said levers by means of flexible connections, substantially as set forth.

606,248. STREET-SWEEPER. ELDRIDGE J. SMITH, Washington, D. C., assignor to the Street Cleaning Company, same place and Alexandria, Va. Filed Sept. 10, 1897. Serial No. 651,307. (No model.)

Claim.—1. In a street-sweeper, the combination with a box or receiver, of a brush journaled upon said box, an oscillating handle, a reciprocating rod operated by said oscillating handle and a connection between said rod and brush whereby the latter is rotated when the rod is reciprocated.

2. In a portable sweeping-machine, the combination with a dirt-receiver, of a brush journaled upon said sweeper, a toothed wheel carried by the brush, a pair of racks arranged respectively above and below the said toothed wheel and adapted to be alternately brought into contact with said wheel to impart a rotary motion thereto, and means for reciprocating the said racks.

3. In a portable street-sweeper, the combination with a box or receiver, of a brush journaled upon said box, a ratchet-wheel carried by the brush, a ratchet-yoke cooperating with the said ratchet-wheel, an oscillating handle, and a connection between said oscillating handle and the ratchet-yoke whereby the brush is given a continuous rotary movement in one direction during the oscillation of the handle.

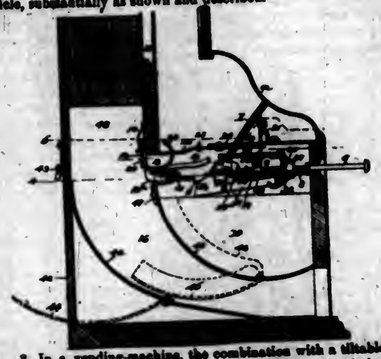
4. In a portable street-sweeper, the combination with the box or receiver, of a brush journaled upon the said box, a ratchet-wheel carried by the brush-head, a ratchet-yoke cooperating with the said ratchet-wheel to drive the brush in one direction, means for reciprocating the ratchet-yoke, and mechanism for throwing the teeth of the said ratchet-yoke into and out of engagement with the ratchet-wheel during its rotation.

5. In a portable street-sweeper, the combination with the box or receiver, having an open front end, a brush journaled at the said front end of the box, an oscillating handle, a connection between said handle and brush for imparting a continuous rotary movement to the latter in one direction, and an adjustable stop-plate for limiting the movement of the said oscillating handle.

6. In a portable sweeping-machine, the combination with a wheeled box or receiver having an open front end and a door at the rear end, handle-bars secured to the sides of the said box and having their lower ends bent outward to accommodate the runner-wheels and provide bearings for the runner-wheel axles, a block carried by the upper portion of the handle-bars, an oscillating handle pivoted to said block, a brush journaled at the front end of the box or receiver, a ratchet-wheel carried by the brush, a ratchet-yoke cooperating with the said ratchet-wheel to rotate the brush, and a connection between the ratchet-yoke and oscillating handle to operate the said yoke.

7. In a portable street-sweeper, the combination with a dirt-receiver, of a rotary brush journaled upon said receiver, a ratchet-wheel carried by the brush, a ratchet-yoke cooperating with the brush to impart a rotary movement thereto, an oscillating plate upon which a portion of said ratchet-yoke bears, said oscillating plate being arranged to shift the position of the ratchet-yoke with respect to the ratchet-wheel, and means for reciprocating the ratchet-yoke.

8. In a portable street-sweeper, the combination with a dirt-receiver, of a rotary brush journaled upon said receiver, a ratchet-wheel carried by the brush, a ratchet-yoke cooperating with the ratchet-wheel to impart a rotary movement to the brush, an oscillating plate upon which a portion of said ratchet-yoke rests said oscillating plate being arranged to shift the position of the ratchet-yoke with respect to the ratchet-wheel, and a spring-plate acting upon a part of the said yoke to insure its operation, and means for reciprocating the ratchet-yoke to rotate the brush.



9. In a portable street-sweeper, the combination with a dirt-receiver, of a rotary brush journaled upon said receiver, a ratchet-wheel carried by the brush, a ratchet-yoke cooperating with the ratchet-wheel to rotate the brush, a rearward extension-piece on said ratchet-yoke, an oscillating plate having a ledge or projection upon which said extension-piece rests, said oscillating plate being arranged to shift the position of the yoke with respect to the ratchet-wheel, and means for imparting a reciprocating movement to the said ratchet-yoke to rotate the brush.

10. In a portable street-sweeper, the combination with a dirt-receiver, of a rotary brush journaled upon said receiver, a ratchet-wheel carried by the brush, a ratchet-yoke cooperating with the ratchet-wheel to rotate the brush, an oscillating plate upon which the said yoke rests, said oscillating plate being arranged to shift the position of the yoke with respect to the teeth of the ratchet-wheel, stops for limiting the movement of the said oscillating plate, and means for reciprocating the ratchet-yoke to rotate the brush.

606,249. COIN-CONTROLLED VENDING-MACHINE. CHARLES E. SHAFF, Grottoes, Va. Filed Sept. 7, 1897. Serial No. 650,802. (No model.)

Claim.—1. In a vending-machine, the combination with the pivoted tiltable table, having the lever-arm projecting horizontally but curved upward, of a horizontal slide having a coin-holding slot or socket, and arranged in line with, but at a lower point than, said arm, and movable toward and from the latter, as shown and described.

2. In a vending-machine, the combination with a coin-chute and reservoir or compartment for holding cigars or other articles, of a tiltable table located below said compartment, a movable coin-carrier and lever mechanism adapted to be acted on by the coin in passing through said chute, for releasing one or more cigars or other article, substantially as shown and described.

3. In a vending-machine, the combination with a tiltable table for temporarily holding cigars or other articles, said table having a curved lever-arm, of a movable coin-carrier adapted to bring the coin into contact with said arm, for tripping the table, as shown and described.

4. In a vending-machine, the combination with the reservoir-passage and the coin-chute having side slots, of the pivoted levers having beveled ends that project into and normally lie in the chute-slots, the pivoted horizontal levers projecting into the reservoir-passage and having a loose connection with the first-named or coin-operated levers, a spring for holding both sets of levers in retracted position, as shown and described.

5. In a vending-machine, the combination of the slidable coin-carrier and device for supporting a cigar or other article to be sold, said device having a curved trip-arm whose base portion is curved to adapt it for sliding contact with the end of the coin-carrier, substantially as shown and described.

6. In a vending-machine, the combination with the reservoir-passage, a movable table or support for the articles to be sold, of a hinged valve for closing the opening at rear of such support, and means connected with the support for acting on the valve to open the same, substantially as shown and described.

7. In a vending-machine, the combination with the reservoir-passage and the tiltable table arranged beneath it, and having a rigid arm or cam, of the hinged valve or plate hanging alongside the table, in such proximity as to adapt it to be acted on by said cam, and a spring for holding the valve normally closed as shown and described.

8. In a vending-machine, the combination with the reservoir-passage, of the tiltable table arranged beneath the same, and having curved fingers which are arranged in vertical planes and made of flexible material that renders them capable of retaining the form into which they may be bent, as shown and described.

9. In a vending-machine, the combination of a tiltable magnet and a movable coin-carrier adapted to tilt the magnet when moved forward substantially as shown and described.

10. In a vending-machine, the combination with the magnet pivoted horizontally and weighted at its front end, of the movable coin-carrier having a projection adapted to strike the magnet and tilt the same when moved inward as specified.

11. In a vending-machine, the combination with a coin-carrier, of the magnet weighted at one end, lugs to which it is pivoted, said lugs having shoulders which support the magnet in normal position, as shown and described.

12. In a vending-machine, the combination with the slotted, slidable coin-carrier of a spring-actuated coin-ejector pivoted beneath the carrier, and having a portion which is adapted to project upward into the slot in the carrier, and means for depressing said ejector while the coin is being moved forward as shown and described.

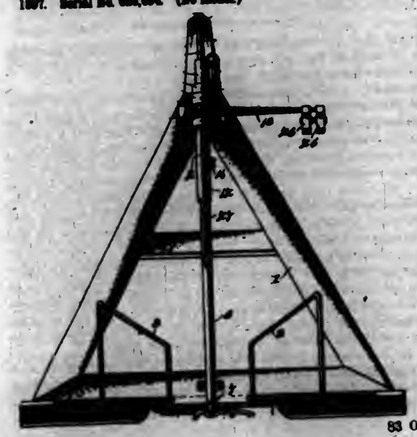
13. In a vending-machine, the combination of a slotted slidable bar for carrying a coin, wipers pivoted to and pendent from such bar, a spring-supported lever arranged beneath the bar and having cam projections which the wipers act on when the bar is moved forward, said lever having a coin-ejecting portion which is adapted to enter the slot in said bar substantially as shown and described.

606,250. GATE. SAMUEL STOUT, Newcomb, Ill. Filed Sept. 17, 1897. Serial No. 651,973. (No model.)

Claim.—1. The combination with the upper and lower bars integrally connected at one end to form a U-shaped whole, of the counterweight secured in the curved connecting portion, the perforated adjustable bar connecting the upper and lower bars adjacent to the said counterweight, the couplings and perforated bar connecting the upper and lower bars at their opposite ends, and the rods held in the perforations in the connecting-bars.

2. The combination with the pair of short posts, of the counterbalanced gate pivotally supported thereby, the second pair of short posts whose sides next the roadway are more distant than the bottom of the gate from the pivotal axis, the third pair of longer fulcrum-posts, levers pivoted to the latter posts and connected to the gate to swing it, and rigid ties connecting the three pairs of posts, substantially as set forth.

3. The combination with the frame made up of the tube bent to U shape and having its ends connected by the normally vertical bar, of the grooved counterweight, and the adjustable pivotal bar holding the counterweight in place.



606,251. DRESS-SHIELD. BENJAMIN F. SUTTON, Brooklyn, N. Y. Filed May 3, 1897. Serial No. 634,949. (No model.)

Claim.—1. A dress-shield comprising a body or inner portion of pliable and flexible material having corrugations which extend from the line of the fold of the shield to within some distance from the edges thereof and form channels in the faces thereof and having a flat margin which constitutes a brace to said channels, substantially as herein described.

2. A dress-shield comprising a body or inner portion of pliable and flexible material having corrugations which extend from the line of the fold of the shield to within some distance of the edges thereof and having a flat or smooth margin and a binding which is folded over the edges and is attached to said flat or smooth margin beyond the termination of the corrugations, substantially as herein described.

606,252. MUSIC-LEAF TURNER. ROBERT H. SWARTZ, Creston, Iowa, assignor of one-half to C. F. Shirvis, same place. Filed Mar. 5, 1897. Serial No. 626,694. (No model.)

Claim.—1. In a leaf-turning apparatus, the combination of turning-arms arranged in contiguous planes and having concentric hubs, provided with contiguous ears or projections, and yieldingly held in their normal positions to prevent accidental rotary movement, a selecting device having a pawl mounted to traverse a path concentric with the hubs of the turning-arms, and adapted to swing in a plane which radiates from the center of the hubs, said pawl being provided with contiguous cam and flat surfaces for engagement with the ears or projections of the hubs, whereby it is adapted to swing from the axis of the hubs until its flat surface engages the ear or projection of the outermost hub, and actuating devices for moving the pawl in its concentric path, substantially as specified.

2. In a leaf-turning apparatus, the combination of turning-arms arranged in contiguous planes and having concentric hubs provided with contiguous ears or projections, said hubs being yieldingly held in their normal positions to prevent accidental rotary movement, a selecting device having a pawl mounted to traverse a path concentric with the hubs, and to swing in a plane radiating therefrom, said pawl being provided with cam and flat surfaces for engagement with the ears or projections of the hubs, and with a light spring to resist the outward-swinging movement of the pawl when its cam-surface engages the edges of the ears or projections, the resistance of said spring being less than the resistance of the turning-arms to rotary movement, whereby the pawl receives an outward-swinging movement to bring its flat surface in contact with the ear or projection of the outermost hub, and actuating devices for imparting rotary movement to the pawl, substantially as specified.

3. In a leaf-turning apparatus, the combination of turning-arms arranged in contiguous planes and having concentric hubs frictionally held from accidental rotary movement, and provided with contiguous ears or projections, a selecting device having a pawl, provided with a light actuating-spring, mounted to traverse a path concentric with the hubs and to swing in a plane radiating therefrom, and provided with means for selecting and engaging the ear or projection of the outermost hub, and actuating devices for imparting rotary movement to the pawl, substantially as specified.

4. In a leaf-turning apparatus, the combination of turning-arms having hubs provided with concentric friction-surfaces, a stationary spring in contact with the friction-surface of each hub, to hold the turning-arms in their several adjusted positions, and means for selecting and consecutively actuating the hubs in opposition to the holding-springs to impart swinging movement to the turning-arms, substantially as specified.

5. In a leaf-turning apparatus, the combination of concentric contractile journals, turning-arms having tubular hubs fitted in said journals and yieldingly held thereby in their adjusted positions, and means for consecutively actuating the arms to impart swinging movement thereto, substantially as specified.

6. In a leaf-turning apparatus, the combination with a spindle yieldingly held in its normal position, and means for actuating the same, of a series of interior journals concentric with said spindle, turning-arms having tubular hubs fitted in said journals and provided with ears arranged in a common plane, a slide fitted upon the spindle and provided with locking devices whereby it may be secured at the desired adjustment, a yielding pawl carried by the slide for engaging the ears of the turning-arm hubs consecutively, and means for adjusting said concentric journals longitudinally of the spindle, substantially as specified.

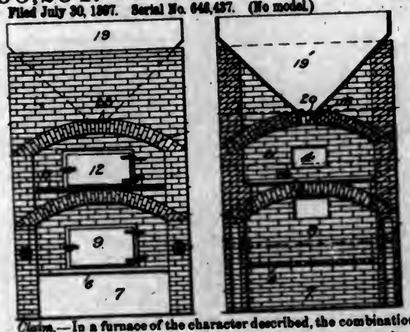
7. In a leaf-turning apparatus, the combination of a tubular bearing, a spindle mounted in said bearing and provided with a return-spring and an actuating-lever, a sleeve mounted upon the tubular bearing and carrying concentric interior journals, means for securing said sleeve at the desired vertical adjustment, turning-arms having their hubs fitted in said journals and provided with projecting ears arranged in a common transverse plane, a slide adjustably fitted upon the spindle, and a selecting-pawl carried by the slide for engaging the ears of the hubs, substantially as specified.

8. In a leaf-turning apparatus, the combination with a spindle mounted in fixed bearings and yieldingly held in its normal position, of interior journals arranged concentric with said spindle and means for adjusting the same parallel with the axis thereof, turning-arms having their hubs fitted in said journals and adjustable therewith, and a selecting device adjustably mounted upon the spindle and provided with means for consecutively engaging the hubs of the turning-arms, whereby the turning-arms and cooperating devices may be adjusted vertically to suit the height of the book or sheet of which the leaves are to be turned, substantially as specified.

9. In a leaf-turning apparatus, the combination with a rack, of a spindle, leaf-turning devices operatively connected with the spindle, an actuating-lever fixed to the spindle, a contractile return-spring attached at one end to the lever for yieldingly holding the spindle in its normal condition, a stop to limit the return movement of the lever, and an extension 10 on the lever for engaging the spring at an intermediate point when the lever is actuated in opposition to the

tension of the spring to bow the latter away from the plane of the spindle, substantially as specified.

606,258. NUT-LOCK. WEBSTER W. SWEIGART, York Road, Md. Filed Mar. 9, 1898. Serial No. 673,316. (No model.)

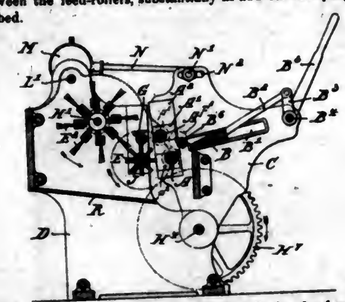


Claim.—1. A nut-lock consisting of a single piece of metal bent to form a washer to receive the bolt and the balance of the metal after the formation of the washer bent to form a spring locking-arm, the portion of the metal forming said spring-arm bent at a point at or near its middle to constitute two members at right angles or approximately at right angles to each other, one of said portions adapted to engage a base for preventing the lock from turning, and the other to engage the edge of the nut to be locked, the entire arm from the point where it leaves the washer being resilient.

2. A nut-lock consisting of a strip of metal bent to form a washer and a spring locking-arm, the portion constituting the latter being bent approximately at right angles at or near its center one portion of the arm in the plane with the washer and the other portion bent outwardly into a plane outside of the washer into the path of the nut to be locked and the extreme end of the arm being bent back below the plane of the inner face of the nut.

3. A nut-lock consisting of a strip of metal bent to form a washer, and the portion of the strip remaining after the formation of the washer bent downward and backward to form a base portion 4 and then at right angles to engage an edge of the nut to lock the latter against turning.

4. The herein-described nut-lock consisting of a single piece of resilient material bent at one end into a washer and bent downward from one side and back to the other side thereof in separated and substantially tangential relation thereto to form a base and then bent into an upright locking-arm at the latter-named side of the washer having a beveled nut-locking edge tangentially disposed in relation thereto, said arm being bowed or curved outwardly from the plane of the washer and terminating in an end bent toward the washer and lying substantially in or slightly back of the plane thereof for the purpose of guiding the corner of the nut onto the arm when the nut is unscrewed, substantially as described.



606,254. FURNACE. FRANK E. SWIFT, Washington, Iowa. Filed July 30, 1897. Serial No. 646,437. (No model.)

Claim.—In a furnace of the character described, the combination of the upper and lower arches dividing the furnace into a combustion-chamber and a roasting-chamber and said arches formed with openings, and the said chambers formed with openings leading to a kiln, the reciprocating dampers for opening and closing the openings in said arches, and the hopper having inclined walls located above the upper arch, substantially as described.

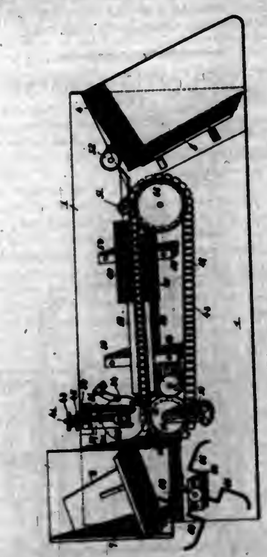
606,255. MACHINE FOR PULLING OR PLUCKING RABBIT-SKINS. JOHN TAYLOR and FRED TAYLOR, Leeds, England. Filed Jan. 9, 1897. Serial No. 618,590. (No model.) Patented in England July 15, 1896, No. 15,665.

Claim.—1. In a machine of the character described, two feed-rollers a plucking-wheel, a flexible covered roll G, a feed-apron provided with a roll around which the skin is adapted to be moved, mechanism for moving the feed-apron and roll to a position between the feed-rollers and a plucking-wheel having a series of arms, the ends of which are V-shaped and adapted to engage with the long hairs of the skin and flexible covered roll G, when the apron-roll is between the feed-rollers, substantially as and for the purposes described.

2. In a machine of the character described, a fixed main frame, a movable frame hinged thereto, two feed-rollers having bearings in said movable frame, a feed-apron provided with a roll about which the skin is placed, said apron and roll being movable in said movable frame, a plucking-wheel, a flexible covered roll G, and a revolving brush all supported in the fixed frame, said wheel adapted to deposit hair from the skin upon the roll G, and said brush adapted to remove said hair from said roll G, and means for adjusting the movable frame with respect to the fixed frame, substantially as and for the purposes described.

3. In a machine of the character described, two feed-rollers, a flexible covered roll, a feed apron or platform carrying a roll upon which the skin is supported, means for shifting said apron and roll to bring the skin between the two feed-rollers, a plucking-wheel adapted to impinge on the long hairs of the skin and flexible covered roll, a brush adapted to remove the hair from the flexible covered roll and deposit it at the end of the machine opposite to that in which the skin travels, substantially as and for the purposes described.

606,256. NON-REFILLABLE BOTTLE. JOHN A. TRIMBLE, Interior, S. D. Filed Oct. 16, 1897. Serial No. 655,302. (No model.)



Claim.—A bottle having a closed neck, the passage of said neck being enlarged at the top, an extension projecting downwardly and outwardly from said enlarged portion at an acute angle thereto, said extension having a passage therein of greater diameter than the enlargement of the neck whereby a cork may be inserted in said extension the large end uppermost, passed sidewise into the neck and be pressed downwardly into place, and a plunger-rod run through an opening in the top of the neck, as and for the purpose described.

606,257. POSTMARKING AND STAMP-CANCELING MACHINE. EDWARD M. VAIL and GIDEON POTTER, Kewanee, Ill. Filed Dec. 16, 1896. Serial No. 615,910. (No model.)

Claim.—1. In a machine for marking mail-matter, the combination of a table for receiving the matter to be marked, a gage at the inner edge of the table, a marking mechanism located at a distance from the table and in about the same horizontal plane therewith, a race extending from the marking mechanism to the table and comprising vertical and parallel strips, the outer strip having an end portion projecting over the table and terminating about opposite the aforesaid gage, a feed-pulley located in front of the extended strip for advancing the letters through the space formed between the said projecting end portion of the strip and the gage, a feed-wheel between the table and inner strip of the race and acting jointly with a roller carried by the projected end of the aforesaid outer strip to give the letters an initial impetus, and an endless conveyer disposed horizontally and wholly below the race and the feeding and marking mechanisms, and having a portion forming a traveling bottom to the race throughout its extent, substantially as set forth.

2. In a machine for marking mail-matter, the combination of a table at one end for receiving the matter to be marked, a marking mechanism at the opposite end, a race extending from the table to the marking mechanism and comprising vertical and parallel strips, a feeder for advancing the letters from the table to the race, a second feeding mechanism at the receiving end of the race for giving the letters an initial impetus, and an endless conveyer below the race and forming a traveling bottom therefor, and connecting the marking mechanism with the feeding mechanism at the receiving end of the race for transmitting motion from one to the other, substantially as set forth.

3. In a machine for marking mail-matter, the combination of a marking mechanism comprising a printing-roller, a sprocket-wheel on a journal of the printing-roller, a feed-wheel parallel with the printing-roller and located at a distance therefrom, a sprocket-wheel on a journal of the feed-wheel, vertically-disposed parallel strips forming a race between the marking mechanism and feed-wheel, and a sprocket-chain connecting the sprocket-wheel of the printing-roller with the sprocket-wheel of the feed-wheel, and having horizontally-extending lips or flanges to project across the space formed between the walls of the race to support the letters and carry them to the marking mechanism, substantially as set forth.

4. In a machine for marking mail-matter, the combination of a horizontally-disposed bed, coöperating printing and impression rollers arranged vertically at one end of the bed, a coöperating feed-wheel and feed-roller placed vertically at the opposite end of the bed, a feed-pulley in advance of the feed-wheel and operatively connected therewith, vertical strips spaced apart and extending between the marking and feeding mechanisms, a sprocket-chain connecting sprocket-wheels applied to journals of the printing-roller and feed-wheel, and lips or flanges extending horizontally from the sprocket-chain across the space formed between the parallel strips to support and carry the letters to the marking mechanism, substantially as set forth.

5. In a machine for marking mail-matter, the combination of a marking mechanism, means for feeding the matter to be marked thereto, a table for receiving the matter after it has been marked, a stop overhanging the table and inclined on its inner edge, a shaft, and corresponding arms extending horizontally from the shaft to pass above and below the stop, and bent between their ends to throw their outer portions in advance of their inner portions, substantially as and for the purpose set forth.

6. In a machine for marking mail-matter, the combination of the marking mechanism, means for feeding the matter to be marked thereto, a table for receiving the matter after it has been marked, a stop overhanging the table and inclined on its inner edge, and a packer comprising a shaft and arms radiating from the shaft to operate above and below the aforesaid stop, and having offsets midway of their ends providing shoulders to receive the outer ends of the letters and limit their movement in one direction, and throwing the outer ends of the arms in advance of their inner ends to give ample clearance for the letters, substantially in the manner set forth.

7. In a machine for marking mail-matter, the combination with the marking mechanism, of a packer comprising a shaft and arms radiating from the shaft and having offsets midway of their ends, and having their outer portions curving rearwardly, substantially as shown and for the purpose specified.

8. In a machine for marking mail-matter, the combination with the marking mechanism, a race, and means for advancing the letters through the race to the marking mechanism, of a rebounding stop to engage with the forward end of the advancing letters and properly position them, and a spring attached at one end to a wall of the race and having its free end toothed and extending across the path of the advancing letters to engage positively therewith and prevent backward movement of the letters, and capable of yielding to permit their free forward movement, substantially as set forth.

9. In a machine for marking mail-matter, the combination of the marking mechanism, a rebounding stop carried by an element of the marking mechanism, means for feeding letters to the marking mechanism comprising a race, and a spring secured at one end to a wall of the race and having its free end toothed and extending across the path of the advancing letters to engage positively therewith and prevent backward movement when struck by the stop on its rebound, and capable of yielding to admit of the free forward movement of the letters, substantially as described.

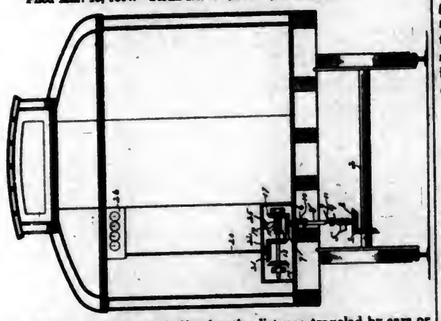
10. In a machine for marking mail-matter, the combination of a marking mechanism, a race leading thereto, means for moving the matter to be marked through the race, a stop carried by an element of the marking mechanism to engage with and properly position the matter, a spring to insure the matter engaging with the said stop, and a toothed spring to prevent a rebound of the matter when engaging with the stop, substantially as set forth.

11. In a machine for marking mail-matter, the combination with a printing-roller, of a roller to coöperate therewith comprising a portion to rotate continuously in one direction and a rebounding impression-surface, substantially as set forth.

12. In a machine for marking mail-matter, the combination of printing and impression rollers having coöperating end portions, one of the rollers having its intermediate portion mounted concentrically with the end portions and adapted to rebound, substantially as and for the purpose set forth.

13. In a machine for marking mail-matter, the combination of printing and impression rollers, a rebounding stop mounted concentric with one of the rollers to properly position the matter to be marked, and a spring-actuated gripper to take hold of and move the matter to be marked between the rollers and against the rebounding stop, substantially as set forth.

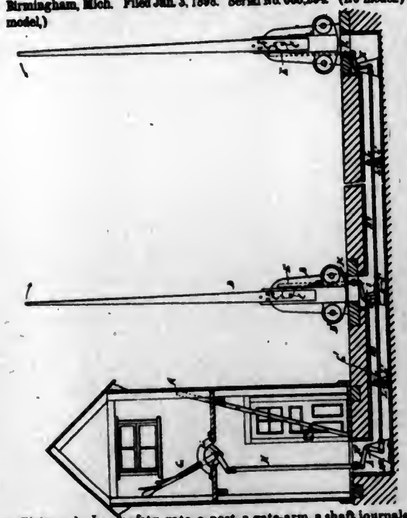
14. In a machine for marking mail-matter, the combination of a printing-roller, an impression-roller comprising circular end portions to coöperate with corresponding parts of the printing-roller, and an intermediate rebounding portion loosely mounted and adapted to be advanced by the letters passing between the two rollers, and means for returning the intermediate portion of the impression-roller to an initial position when released from the letter, substantially as set forth.



15. In a machine for marking mail-matter, the combination of a printing-roller having projecting end portions, an impression-roller formed of corresponding end portions and an intermediate segmental portion concentrically mounted with the end portions to coöperate with the printing-surface, and bearing a stop, and a spring for returning the said segmental portion to a normal position when released, substantially as set forth.

16. In combination, a printing-roller, an impression-roller comprising a rotatable portion and a segment, means for rotating the printing-roller and rotatable portion of the impression-roller continuously in the same direction, a stop attached to the said segment, a spring for returning the segment to a normal position when released from the active portion of the printing-roller, and grippers carried by the printing and impression rollers to take hold of the matter to be marked and advance the latter against the said stop so as to turn the segment, substantially as and for the purpose set forth.

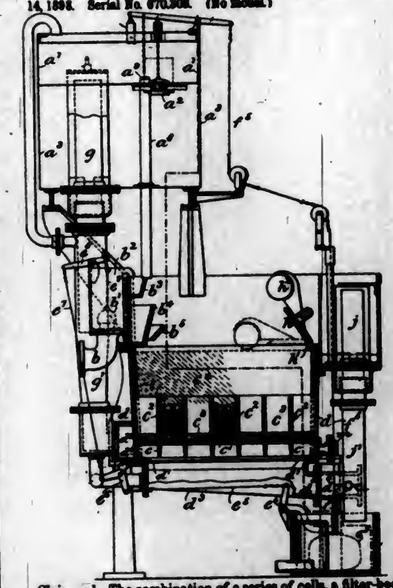
17. In a machine for marking mail-matter, the combination of printing and impression rollers, a yoke having bearings at its ends in which is journaled a shaft of one of the rollers and which are mounted in guides, a stem extending from the yoke and having a threaded portion, a spring mounted upon the stem for moving the yoke to hold the printing and impression rollers at the limit of their inner movement, an adjusting-nut mounted upon the threaded portion of the stem to regulate the space between the opposing portions of the said rollers, and a support for the stem adjustable between the said spring and adjusting-nut, substantially as set forth.



18. In combination, printing and bed rollers, a yoke having one of the rollers journaled thereto and provided with a stem having a threaded portion, a hollow set-screw mounted upon the stem, a spring placed upon the stem and confined between the yoke and the set-screw, and an adjusting-nut mounted upon the threaded portion of the stem and engaging with the set-screw, substantially as and for the purpose set forth.

606,258. MECHANISM FOR INDICATING DISTANCE TRAVELED BY CARS OR VEHICLES. JOHN H. WHITING, Belvidere, Ill. Filed Mar. 13, 1897. Serial No. 627,383. (No model.)

Claim.—A device for indicating the distance traveled by cars or vehicles, consisting of a set of dials located on the vehicle, arms revolving from said dials, a revolving axle, a perpendicular shaft carrying at its lower end a pinion, a pinion mounted on the axle, said pinions engaging each other, an arm connected by a universal joint with said perpendicular shaft, a sleeve receiving the upper end of said arm, said arm adapted to slide longitudinally within said sleeve, a shaft passing through the floor of the car and connected by means of the universal joint with said sleeve, a pinion fixed to the upper end of said shaft, a horizontal shaft journaled within the vehicle, said shaft being adapted to shift longitudinally, a collar located on said shaft, a pinion fixed to said collar, said collar having a spiral slot, a pin located on the horizontal shaft and entering said slot, a perpendicular shaft adapted to transmit motion from the horizontal shaft to the dial-arms, a beveled pinion located at the lower end of the last-said shaft, ratchets located on the upper side of the said beveled pinion, a pawl adapted to engage said ratchets and prevent reverse revolution of the last-said perpendicular shaft, beveled pinions located on the horizontal shaft on opposite sides of the pinion of the last-said perpendicular shaft, but one of the horizontal pinions adapted to engage the pinion of the perpendicular shaft at one time.



606,259. RAILWAY SAFETY-GATE. HARVEY C. WILSON, Birmingham, Mich. Filed Jan. 3, 1898. Serial No. 665,294. (No model.)

Claim.—1. In a safety-gate, a post, a gate-arm, a shaft journaled in said post to carry the gate-arm provided with a gear, a reciprocatory rack-bar meshing with said gear, a bell-crank, a rod connecting said bell-crank with said rack-bar, a lever, an additional bell-crank, a rod connecting the last-named bell-crank with said lever, and rigid connections connecting said bell-cranks whereby the rack-bar will be actuated by said lever, for the purpose set forth.

2. In a safety-gate, two posts, a gate-arm carried by each post, a shaft to actuate each of said arms, a gear to actuate each of the gate-arms, a reciprocatory rack-bar to actuate each of said gears, a guide-bracket within each of said posts in which the corresponding rack-bar reciprocates, antifriction-rollers journaled upon said bracket, two bell-cranks, a rod connecting each bell-crank with the corresponding rack-bar, a lever, an additional bell-crank, a rod connecting the last-named bell-crank with said lever, and rigid connections connecting said bell-cranks, substantially as set forth.

606,260. FILTER. JAMES WILSON, London, England. Filed Feb. 14, 1898. Serial No. 670,308. (No model.)

Claim.—1. The combination of a series of cells, a filter-bed occupying the top portion of the cells, means for supplying liquid to be filtered to the upper side thereof, means for withdrawing the filtered liquid from its under side, means for supplying washing liquid beneath the cells and an air-valve below the cell.

2. The combination of a series of cells, a filter-bed occupying the top portion of the cells, means for supplying liquid to be filtered to the upper side thereof, means for withdrawing the filtered liquid from its under side, means for supplying washing liquid beneath the cells, perforated pipes traversing the cells beneath the filter-bed, and means for supplying washing liquid to the pipes.

3. The combination of a filter-bed, means for supplying liquid to be filtered to the upper side thereof, means for withdrawing the filtered liquid from its under side, means for supplying washing liquid beneath its under side and a hinged screen above it allowing the washing liquid to pass but retaining the filtering material.

4. The combination of a filter-bed, means for supplying liquid to be filtered to the upper side thereof, means for withdrawing the filtered liquid from its under side, a tank beneath the filter-bed, an automatic siphon which discharges liquid when it accumulates above the filter-bed into the tank, a float in the tank, means operated by the float for cutting off the supply of unfiltered liquid, a second tank beneath the filter-bed, an overflow from the first tank leading into the second, a float in the second tank, means operated by this float for supplying washing liquid to the under side of the filter-bed, and means for emptying the tanks.

5. The combination of a series of cells, a filter-bed occupying the top portion of the cells, means for supplying liquid to be filtered to the upper side thereof, means for withdrawing the filtered liquid from its under side, a tank beneath the filter-bed, an automatic siphon which discharges liquid when it accumulates above the filter-bed into the tank, a float in the tank, means operated by the float for cutting off the supply of unfiltered liquid, a second tank beneath the filter-bed, an overflow from the first tank leading into the second, a float in the second tank, means operated by this float for supplying washing liquid to the under side of the filter-bed, and means for emptying the tanks.

6. The combination of a series of cells, a filter-bed occupying the top portion of the cells, means for supplying liquid to be filtered to the upper side thereof, means for withdrawing the filtered liquid from its under side, means for supplying washing liquid beneath its under side and a hinged screen above it allowing the washing liquid to pass but retaining the filtering material.

7. The combination of a filter-bed, means for supplying liquid to be filtered to the upper side thereof, means for withdrawing the filtered liquid from its under side, a tank beneath the filter-bed, an automatic siphon which discharges liquid when it accumulates above the filter-bed into the tank, a screen above the filter-bed and between it and the siphon, a float in the tank, means operated by the float for cutting off the supply of unfiltered liquid, a second tank beneath the filter-bed, an overflow from the first tank leading into the second, a float in the second tank, means operated by this float for supplying washing liquid to the under side of the filter-bed, and means for emptying the tanks.

8. The combination of a series of cells, a filter-bed occupying the top portion of the cells, means for supplying liquid to be filtered to the upper side thereof, means for withdrawing the filtered liquid from its under side, a tank beneath the filter-bed, an automatic siphon which discharges liquid when it accumulates above the filter-bed into the tank, a screen above the filter and between it and the siphon, a float in the tank, means operated by the float for cutting off the supply of unfiltered liquid, a second tank beneath the filter-bed, an overflow from the first tank leading into the second, a float in the second tank, means operated by this float for supplying washing liquid to the under side of the filter-bed, and means for emptying the tanks.

9. The combination of a filter-bed, means for supplying liquid to be filtered to the upper side thereof means for withdrawing the filtered liquid from its under side, a tank beneath the filter-bed, an automatic siphon which discharges liquid when it accumulates above the filter-bed into the tank, a float in the tank, means operated by the float for cutting off the supply of unfiltered liquid, a second tank beneath the filter-bed, an overflow from the first tank leading into the second, a float in the second tank, means operated by this float for supplying washing liquid to the under side of the filter-bed, means for emptying the tanks, a second siphon at a higher level than the first discharging liquid from above the filter-bed into the second tank, an overflow from the second tank, and siphons in the tanks at such a height relatively to the overflow that they come into operation only when the second siphon discharges.

10. The combination of a series of cells, a filter-bed occupying the top portion of the cells, means for supplying liquid to be filtered to the upper side thereof, means for withdrawing the filtered liquid from its under side, a tank beneath the filter-bed, an automatic siphon which discharges liquid when it accumulates above the filter-bed into the tank, a float in the tank, means operated by the float for cutting off the supply of unfiltered liquid, a second tank beneath the filter-bed, an overflow from the first tank leading into the second, a float in the second tank, means operated by this float for supplying washing liquid to the under side of the filter-bed, means for emptying the tanks, a second siphon at a higher level than the first discharging liquid from above the filter-bed into the second tank, an overflow from the second tank, and siphons in the tanks at such a height relatively to the overflow that they come into operation only when the second siphon discharges.

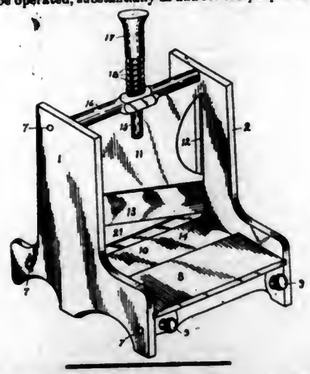
11. The combination of a filter-bed, means for supplying liquid to be filtered to the upper side thereof, means for withdrawing the filtered liquid from its under side, a tank beneath the filter-bed, an automatic siphon which discharges liquid when it accumulates above the filter-bed into the tank, a screen above the filter-bed and between it and the siphon, a float in the tank, means operated by the float for cutting off the supply of unfiltered liquid, a second tank beneath the filter-bed, an overflow from the first tank leading into the second, a float in the second tank, means operated by this float for supplying washing liquid to the under side of the filter-bed, means for emptying the tanks, a second siphon at a higher level than the first discharging liquid from above the filter-bed into the second tank, an overflow from the second tank, and siphons in the tanks at such a height relatively to the overflow that they come into operation only when the second siphon discharges.

12. The combination of a series of cells, a filter-bed occupying the top portion of the cells, means for supplying liquid to be filtered to the upper side thereof, means for withdrawing the filtered liquid from its under side, a tank beneath the filter-bed, an automatic siphon which discharges liquid when it accumulates above the filter-bed into the tank, a screen above the filter and between it and the siphon, a float in the tank, means operated by the float for cutting off the supply of unfiltered liquid, a second tank beneath the filter-bed, an overflow from the first tank leading into the second, a float in the second tank, means operated by this float for supplying washing liquid to the under side of the filter-bed, means for emptying the tanks, a second siphon at a higher level than the first discharging liquid from above the filter-bed into the second tank, an overflow from the second tank, and siphons in the tanks at such a height relatively to the overflow that they come into operation only when the second siphon discharges.

13. The combination of a series of cells, a filter-bed occupying the top portion of the cells, perforated pipes traversing the cells beneath the filter-bed, means for supplying liquid to be filtered to the upper side thereof, means for withdrawing the filtered liquid from its under side, a tank beneath the filter-bed, an automatic siphon which discharges liquid when it accumulates above the filter-bed into the tank, a float in the tank, means operated by the float for cutting off the supply of unfiltered liquid, a second tank beneath the filter-bed, an overflow from the first tank leading into the second a float in the second tank, means operated by this float for supplying washing liquid to the under side of the cells and to the perforated pipes, and means for emptying the tanks.

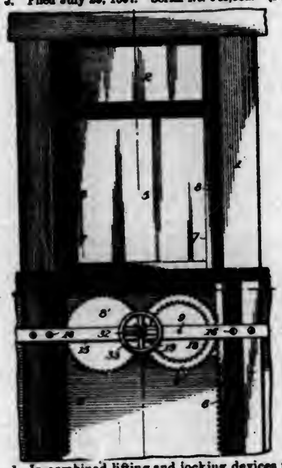
14. The combination of a series of cells, a filter-bed occupying the top portion of the cells, means for supplying liquid to be filtered to the upper side thereof, means for withdrawing the filtered liquid from its under side, means for supplying washing liquid beneath the cells, perforated pipes traversing the cells beneath the filter-bed, means for supplying washing liquid to the pipes, and a screen above the filter-bed allowing the washing liquid to pass but retaining the filtering material.

15. The combination of a series of cells, a filter-bed occupying the top portion of the cells, perforated pipes traversing the cells beneath the filter-bed, means for supplying liquid to be filtered to the upper side thereof, means for withdrawing the filtered liquid from its under side, a tank beneath the filter-bed, an automatic siphon which discharges liquid when it accumulates above the filter-bed into the tank, a screen above the filter and between it and the siphon, a float in the tank, means operated by the float for cutting off the supply of unfiltered liquid, a second tank beneath the filter-bed, an overflow from the first tank leading into the second, a float in the second tank, means operated by this float for supplying washing liquid to the under side of the cells and to the perforated pipes, and means for emptying the tanks.



16. The combination of a series of cells, a filter-bed occupying the top portion of the cells, perforated pipes traversing the cells beneath the filter-bed, means for supplying liquid to be filtered to the upper side thereof, means for withdrawing the filtered liquid from its under side, a tank beneath the filter-bed, an automatic siphon which discharges liquid when it accumulates above the filter-bed into the tank, a float in the tank, means operated by the float for cutting off the supply of unfiltered liquid, a second tank beneath the filter-bed, an overflow from the first tank leading into the second, a float in the second tank, means operated by this float for supplying washing liquid to the under side of the cells and to the perforated pipes, means for emptying the tanks, a second siphon at a higher level than the first discharging liquid from above the filter-bed into the second tank, an overflow from the second tank, and siphons in the tanks at such a height relatively to the overflow that they come into operation only when the second siphon discharges.

17. The combination of a series of cells, a filter-bed occupying the top portion of the cells, perforated pipes traversing the cells beneath the filter-bed, means for supplying liquid to be filtered to the upper side thereof, means for withdrawing the filtered liquid from its under side, a tank beneath the filter-bed, an automatic siphon which discharges liquid when it accumulates above the filter-bed into the tank, a screen above the filter and between it and the siphon, a float in the tank, means operated by the float for cutting off the supply of unfiltered liquid, a second tank beneath the filter-bed, an overflow from the first tank leading into the second, a float in the second tank, means operated by this float for supplying washing liquid to the under side of the cells and to the perforated pipes, means for emptying the tanks, a second siphon at a higher level than the first discharging liquid from above the filter-bed into the second tank, an overflow from the second tank, and siphons in the tanks at such a height relatively to the overflow that they come into operation only when the second siphon discharges.



606,261. ENVELOP-OPENER. WILLIAM YATES, Richmond, Wash. Filed July 14, 1897. Serial No. 644,508. (No model.)

Claim.—An envelop-opener, consisting of uprights 1 and 2, strips 3, 6 and 16 extending therebetween, and rigidly fastened thereto, guideways formed in said uprights, a plunger adapted to move vertically in said guideways, having its lower edge beveled and provided with a cutter-blade which depends therefrom, the lug 14 formed integral with said blade, the spindle rising from the upper edge of said plunger, and passing through said strip 16, said spindle having a knob upon its upper end and a coiled spring surrounding a portion thereof, upon its upper end and a coiled spring surrounding a portion thereof, between said knob and said strip 16, the platform 8, the adjusting-screw 9 journaled in said strip 6 and screwed into the movable strip

5, upon which a cutter plate 10 is mounted, the adjusting-screw 19 journaled in said strip 3 and screwed into said strip 4, the angled gage-plate mounted upon the upper side of said strip 4, and the parts adapted to be operated, substantially as and for the purpose set forth.

606,262. SASH LIFTER AND LOCK. GEORGE C. YOUNG, Washington, N. J. Filed July 29, 1897. Serial No. 646,352. (No model.)

Claim.—1. In combined lifting and locking devices for window-sashes, the combination with the movable sash, of rack-bars depending from said sash at opposite sides thereof, one or more pairs of gear-wheels meshing with each other and with the racks, an additional gear-wheel, and a pinion meshing therewith, and means for operating said wheels in a direction to elevate the sash, and means for checking or locking the said devices against movement in the opposite direction until released by hand, substantially as described.

2. In combined lifting and locking devices for window-sashes, the combination with the movable sash, of rack-bars depending from said sash at opposite sides thereof, one or more pairs of gear-wheels meshing with each other and with the racks, an additional gear-wheel and an engaging pinion, means for operating said devices in a direction to elevate the sash, means for automatically locking said devices against return movement until released by hand, and an auxiliary locking device, the whole operating substantially as described.

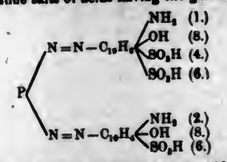
3. In combined lifting and locking devices for window-sashes, the combination with the movable sash, of intermediate rack-and-gear mechanism for operating said movable sash, and a two-part clutch yielding to movement in one direction and resisting movement in the opposite direction, and a spring-actuated push-rod for holding the parts of the clutch together as well as enabling the separation of said parts, substantially as described.

4. In window-sash-lifting mechanism, the combination with the movable sash, of rack-bars depending from said sash at opposite sides thereof, two gear-wheels of equal diameter intermeshing with the racks and with each other, and means for rotating one of said gears, substantially as described.

5. In combined lifting and locking devices for window-sashes, the combination with the movable sash, of intermediate rack-and-gear mechanism for operating said movable sash, the tubular bearing-sleeve constituting one part of a clutch at its inner end, and carrying a pinion meshing with said gear mechanism, a spring supporting the other part of the clutch which engages with the first part, and a push-rod attached to the inner part of the clutch and extending outward through the tubular bearing-sleeve and provided with a push-button or lever, substantially as described.

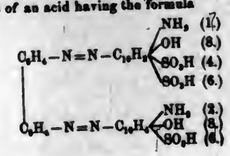
6. In combined lifting and locking devices for window-sashes, the combination with the movable sash, of rack-bars depending therefrom on opposite sides, a pair of gear-wheels meshing with each other and with the racks, one of said wheels having an extended shaft or axis, an additional gear-wheel carried at the inner end of said extended shaft, and a pinion meshing therewith, the spring-pressed two-part clutch operating and constructed as described, and the auxiliary locking-arm formed with the inner part of the clutch and having its outer end turned over the extended shaft, substantially in the manner and for the purpose set forth.

606,263. WINDOW-SHADE ADJUSTER. FRED L. BAILEY, St. Louis, Mo. Filed June 21, 1897. Serial No. 641,722. (No model.)



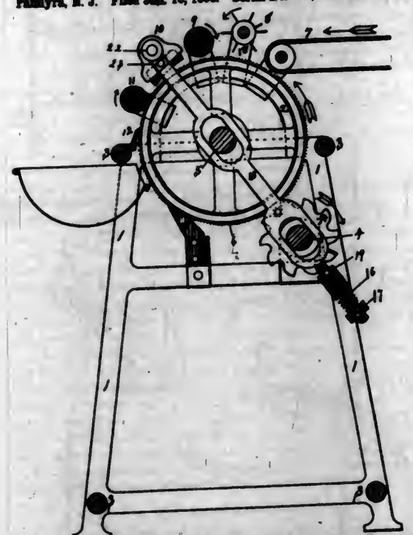
Claim.—1. In a window-shade adjuster, the combination of a rod having brackets at either end, the same being laterally adjustable, rollers mounted at the upper and lower extremities of the brackets, guide-rails secured to the window frame for engaging the rollers and a catch for holding the frame at any desired position, and shade-roller brackets mounted upon a frame for holding the shade-roller substantially as described.

2. The combination in a window-shade adjuster of a rod 5, brackets 3; means for adjusting the brackets 3 laterally on the rod 5, rollers 4 mounted at the upper and lower extremities of the brackets 3, guide-rails 2 secured to the window-frame, brackets 7 for holding the shade-roller, the roller 8 for holding the shade and the catches 11 for securing the frame at any desired position, substantially as described.



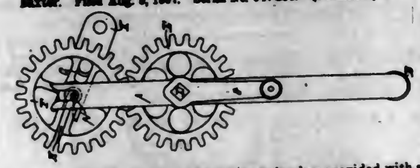
606,264. DARK-BLUE TETRAZO DYE AND PROCESS OF MAKING SAME. JOHANN BARMANN, Elberfeld, Germany, assignor to the Farbenfabriken of Elberfeld Company, of New York. Filed Dec. 20, 1897. Serial No. 662,701. (Specimens.) Patented in France Oct. 20, 1898, No. 283,723; in England Oct. 21, 1898, No. 20,579, and in Italy Dec. 31, 1898, XXVIII, 36,336, LXXI, 208.

Claim.—1. As new articles of manufacture the new tetrazo dyestuffs being alkaline salts of acids having the general formula



in which formula P means a radical of the benzidin series such as diphenyl, ditolyl, diphenolether, which are dark powders easily soluble in water, being rediazotizable in solution or when on fiber, yielding on unmordanted cotton from blackish-blue to blue shades substantially as described.

2. As a new article of manufacture the specific dyestuff being an alkaline salt of an acid having the formula

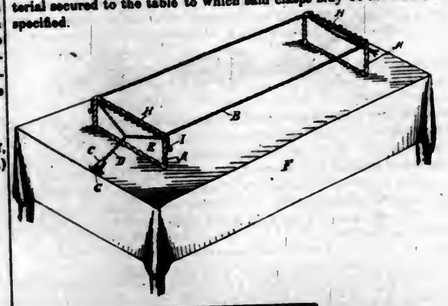


which are in the form of the sodium salt a dark powder with a metallic luster, easily soluble in water with a blackish-blue color, in concentrated sulfuric acid (66° Baumé) with a pure-blue color which changes into violet on the addition of a small quantity of ice while a violet-blue flaky precipitate is obtained on adding a larger quantity of ice to the sulfuric-acid solution, being rediazotizable in solution or when on fiber, yielding on unmordanted cotton blackish-blue shades.

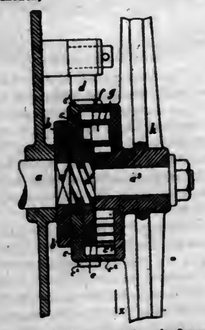
606,265. MACHINE FOR SEEDING RAISINS. HENRY RADDLEY, Fairmyre, N. J. Filed Jan. 10, 1898. Serial No. 666,214. (No model.)

Claim.—In a machine for removing seed from raisins, the combination; consisting of a spiked cylinder, a pressure-roller, a beater with operating mechanism, a second pressure-roller, a doctor for removing the seed, and a series of strippers for removing the seeded raisins from the spikes, all substantially as shown and described.

606,266. FENCE-STAY-WEAVING DEVICE. CHARLES BAXTER and ALBERT SCHRADER, Waukesha, Wis.; said Schrader assignor to said Baxter. Filed Aug. 9, 1897. Serial No. 647,563. (No model.)



Claim.—The combination with a supporting-bar provided with a notch in one end adapted to engage the line-wire of a fence, a wheel journaled to said bar and provided with a slot corresponding to the notch in the bar, a laterally-projecting frame carried by said wheel and provided with a wire-engaging notch in its extreme end, a spindle mounted in said frame in a position parallel to that of the line-wire for holding the coil of stay-wire, and suitable crank-and-gear mechanism for actuating the slotted gear-wheel and frame, substantially as described.



606,267. TABLE-CLOTH SUPPORTER. ALBERT R. BUNDY, Atlanta, Ind. Filed Sept. 27, 1897. Serial No. 653,194. (No model.)

Claim.—1. In combination, frames adapted to be supported upon a table, chains connecting the frames, supporting-chains secured to said frames, strips of suitable material secured to the table and means carried by the supporting-chains for engaging the strips whereby the frames are supported in an upright position, as and for the purpose described.

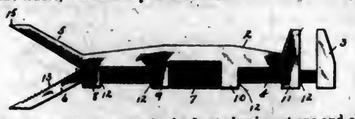
2. The herein-described combination of the frames A adapted to be supported upon a table, open-work H carried thereby, chains B connecting said frames, chains D attached to the frames by the branches E, clasps carried by the chains D, and strips of suitable material secured to the table to which said clasps may be attached, as specified.

606,268. BRAKE FOR HOISTS OR SIMILAR APPARATUS. ANTON BOLZANI, Berlin, Germany. Filed Dec. 23, 1897. Serial No. 663,186. (No model.)

Claim.—1. The combination, with a shaft provided with a screw-threaded portion and having a disk secured to it, of a screw-threaded disk mounted on the said screw-threaded portion, a brake-disk arranged between the two said disks and provided with means for preventing it from revolving in one direction and an internal toothed wheel, an external toothed wheel arranged concentric with the said shaft, a gyratory and revoluble toothed pinion gearing into the two said wheels, and means for supporting and gyrating the said pinion about the said shaft, substantially as set forth.

2. The combination, with a shaft provided with a screw-threaded portion and having a disk secured to it, of a screw-threaded disk mounted on the said screw-threaded portion, a brake-disk arranged between the two said disks and provided with means for preventing it from revolving in one direction and an internal toothed wheel, an external toothed wheel arranged concentric with the said shaft, a pin projecting laterally from the said screw-threaded disk, a toothed pinion mounted on the said pin and gearing into the two said wheels, and means for revolving the said external toothed wheel, whereby the said pinion is both revolved and gyrated, substantially as set forth.

606,269. SEWING-MACHINE THREADER. LOUISA J. BOWMAN, Amoret, Mo. Filed June 9, 1897. Serial No. 640,064. (No model.)



Claim.—A device for threading needles consisting of a straight bar having a longitudinal groove in one side thereof terminating in a seat, and a funnel-shaped guide leading through the bar at a proper distance from the seat, the guide having a lateral slit communicating with an open-ended slot in the bar, substantially as described.

606,270. WRENCH. JOHN BROWN, Conneaut, Ohio. Filed Sept. 22, 1897. Serial No. 652,569. (No model.)

Claim.—1. In a wrench, the frame 2, having the rigid jaw 5, the shank 4 having the sliding jaw 6 provided with serrations 13, said jaws lying upon opposite sides of the plane separating the frame and

the shank, and means for adjusting the shank longitudinally in relation to the frame, substantially as described.

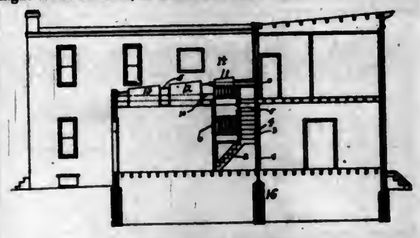
2. In a nut and pipe wrench, the frame having at one end a nut-jaw and at the other end a pipe-jaw, a series of apertured lugs depending from the frame opposite the side thereof whereon the said jaws are situated, a shank seated in said lugs and having at one end a nut-jaw and at the other end a serrated pipe-jaw, said pipe-jaws forming alligator-jaws, and an adjusting nut mounted between two of said lugs and on a screw-threaded portion of the shank, substantially as described.

606,271. PNEUMATIC TIRE AND METHOD OF REPAIRING SAME. CHARLES E. BUCKNER, Flushing, Mich. Filed July 3, 1897. Serial No. 643,473. (No model.)

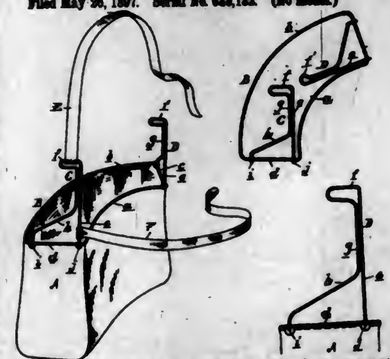
Claim.—1. The improved method of manufacturing and repairing single-tube pneumatic tires which consists of making an opening from two to four inches in either direction from the valve-opening as seen in ordinary single-tube tires; punching a row of eyelet-holes on either side of the opening thus made; inserting the device of thin rubber tubing with valve-tube A attached, through the opening above mentioned; securing it in place by cement, and lacing passed through the eyelet-holes, after protecting the inner tube by a piece of canvas as substantially set forth.

2. A device, consisting of an inflatable tube with sealed ends with valve-tube attached at its center, adapted to be inserted through an opening, existing in the improved tire above described, or in case of ordinary tires an opening made to allow of its insertion into the lumen of the tire and means for its forced inflation and retention after being inserted into the tire as substantially set forth, for the purpose of quickly and easily repairing a single-tube pneumatic tire when the valve-tube becomes injured or broken off.

606,272. SPECTACLE-FRAME. FRANK L. BURROWS, Cranston, R. I., assignor to Dutee Wilcox, Providence, and Charles A. Wilkinson, Warwick, R. I. Filed Nov. 10, 1897. Serial No. 658,031. (No model.)



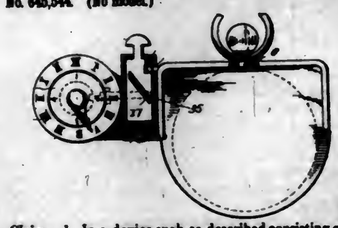
Claim.—1. The combination in spectacle-frames, having an eye-rim with end pieces secured thereto and adapted to meet each other and which are thinned at their outer portions, of a clamping-screw passing through said end pieces, a slot between the outer cut-away portions of the end pieces, a socket or recess in the inner surface of one end piece, a socket in the outer surface of the other of said end pieces, a perforation through said end piece last mentioned, concentric with said socket, a temple-rim having a screw-threaded eye, and a screw-pivot passing through the last-named end piece and into the socket of the other end piece and engaging with its thread said temple-arm, substantially as specified.



2. The combination in spectacle-frames, having an eye-rim with end pieces secured thereto adapted to meet each other and which are thinned at their outer portion, of a clamping-screw passing through said end pieces, a slot between the outer cut-away portions of the end pieces, a socket or recess in the inner surface of one end piece, a tubular socket with convex bottom formed in the other of said end pieces and opening exteriorly, a perforation through said convex end of the last-named socket and concentric therewith, a temple-arm having a screw-threaded eye, and a screw-pivot passing through the socket and perforation of the last-named end piece and engaging with its thread said temple-arm, substantially as shown.

606,273. STAIRCASE FOR DWELLINGS. HARRY R. CASSEL, Philadelphia, Pa. Filed Jan. 23, 1898. Serial No. 667,564. (No model.)

Claim.—In a dwelling, the structure described, consisting of, a lower story providing a hall and a room, and a second story, the said room extending in part under the second story and in part under and outside of a wall of the second story, a lower half-flight of stairway from the hall, a second lower half-flight from the room, the said half-flights meeting at a common midway platform, a single upper half-flight from said platform to the second floor and a built-up headway formed in the lower part of said second-story wall, to supply head room from said lower half-flight from room to said upper half-flight to second floor, as shown and described.



606,274. SEED-BAG HOLDER. CHARLES H. CROATE, Greenville, Mich., assignor to the American Harrow Company, Detroit, Mich. Filed May 26, 1897. Serial No. 638,122. (No model.)

Claim.—The combination with the bag having a segmental wire frame secured thereto surrounding the mouth of the bag and adapted to fit around the body of the wearer, of hanger-arms hinged to the ends of said frame formed of wire and each comprising the portion *e*, the loop *f* bent at right angles thereto, the portion *g* parallel and adjacent to the portion *e*, the outwardly-extending portion *h* and the eyes *i* and *j* at each end and bent around the wire of the frame, and the shoulder-strap adapted to be secured to said loops.

606,275. COMBINED WATCH-POCKET AND WATCH-GUARD. MORTIMER J. CLARK, Summitville, Colo. Filed July 28, 1897. Serial No. 645,544. (No model.)

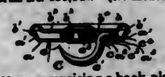
Claim.—1. In a device such as described consisting of a suitable means for holding the watch, a longitudinally-moving bolt adapted to secure said means in its closed position, a combination alarm and lock attached to said bolt, a bell located in the interior of said lock and alarm, said bell having a recess, a dial located on the casing of the lock, a dial-section adapted to coact with the dial on the casing said section having a recess, the recess of said section adapted to register with the bell-recess, a longitudinally-moving dog adapted to enter at its inner end the registering recesses of the bell and the dial-section, said dog adapted to be shifted laterally as the bolt is depressed, and a clapper suitably mounted and adapted at intervals to sound the bell.

2. In a device such as described, a receptacle adapted to contain the watch, a combination lock and alarm attached to the device, a dog entering said combination lock and alarm, a longitudinally-moving bolt adapted to secure the receptacle in its closed position, the dog passing through a perforation in said bolt, said bolt having an inclined perforation, an arm passing through the end of the dog and being located in said inclined perforation of the bolt.

3. In a device such as described, a suitable means for holding the watch, a suitable means for retaining the watch containing means in its closed position, a combination alarm and lock consisting of a bell, a revolving pin attached to said bell, a spring adapted to revolve said pin, said bell having a recess, protrusions located on the inner side of the bell, a dog adapted to enter at its inner end the recess of the bell, a pawl located on said dog and adapted to engage the protrusions of the bell, a clapper suitably located and adapted to come in contact with the protrusions of the bell as the bell is revolved, a suitable means for operating the dog.

4. In a device such as described, a bell having in its interior a recess, a suitable means for revolving said bell, protrusions located on the inner surface of the bell, a dog adapted to enter at its inner end the recess of the bell, a suitable means for operating said dog, a pawl located on said dog and adapted to engage the protrusions of the bell, a clapper suitably located and adapted to come in contact with the protrusions of the bell as the bell is revolved.

5. In a device such as described, a bell adapted to revolve, a casing inclosing said bell, a dial located on said casing, a dial-section adapted to revolve within the casing, the dial-section and the bell each having a recess, said recesses adapted to register, a longitudinally-moving dog entering said bell, a suitable means for operating said dog, the inner end of said dog adapted to enter the registering recesses of the dial-section and the bell, and a clapper suitably mounted and adapted to come in contact with the bell.



6. In a device such as described, a bell adapted to revolve, a pin fixed to the center of said bell, a casing inclosing said bell, a dial located in said casing, said dial having a recess, an indicator-section adapted to revolve in the casing, said section having a recess, a recess of the section adapted to register with the recess of the bell, an indicator-point located on the bell-pin, a dog entering said bell, said dog adapted at its inner end to enter the recesses of the dial-section in the bolt and suitable means for operating the dog, and a clapper suitably mounted and adapted to come in contact with the bell.

606,276. POT-RAIL HOLDER. MARCUS A. COOLEY, Canton, N. Y. Filed Feb. 1, 1898. Serial No. 668,697. (No model.)

Claim.—A pot-bail holder comprising a post slotted to receive a lug of the pot and a thumb-screw for securing the post thereto, the post having a spring on its upper end adapted to receive and hold the bail, substantially as shown and described.

606,277. BUTTON. AUGUSTUS S. CRANE, Newark, N. J. Filed Nov. 19, 1897. Serial No. 659,147. (No model.)

Claim.—1. A button, comprising a back-plate and face-plate, secured together to form a chamber, said back-plate having a perforation or hole, a fastening means rotatively arranged in said hole, having a hook on the outer side of said back-plate, and a laterally-bent and eccentric retaining portion within said chamber in movable and frictional contact with the inner surfaces of said back and face plates, substantially as and for the purposes set forth.

2. A button, comprising a back-plate and a face-plate, secured together to form a chamber, said back-plate having a perforation or hole, a fastening means consisting, essentially, of a shank *c* rotatively arranged in said hole, a hook *c'* on the outer side of said back-plate, a loop c^4 and eccentric portion c^5 within said chamber, said loop c^4 and portion c^5 being in movable and frictional contact with the inner surfaces of said back and face plates, substantially as and for the purposes set forth.

3. A button, comprising a back-plate and a face-plate, secured together to form a chamber, said back-plate having a perforation or hole, a fastening means rotatively arranged in said hole, having a hook on the outer side of said back-plate, and a laterally-bent and eccentric retaining portion movably arranged within said chamber, and means within said chamber with which said retaining portion can be brought in holding or locked engagement, substantially as and for the purposes set forth.

4. A button, comprising a back-plate and a face-plate, secured together to form a chamber, said back-plate having a perforation or hole, a fastening means rotatively arranged in said hole, having a hook on the outer side of said back-plate, a laterally-bent and eccentric retaining portion movably arranged within said chamber, and a groove or depression on the inner surface of said back-plate with which said retaining portion can be brought in holding or locked engagement, substantially as and for the purposes set forth.

5. A button, comprising a back-plate and a face-plate, secured together to form a chamber, said back-plate having a perforation or hole, a fastening means, consisting, essentially, of a shank *c* rotatively arranged in said hole, a hook *c'* on the outer side of said back-plate, a loop c^4 and eccentric portion c^5 within said chamber, said loop c^4 and portion c^5 being movably arranged in said chamber, and means within said chamber, with which said portion c^5 can be brought in holding or locked engagement, substantially as and for the purposes set forth.

6. A button, comprising a back-plate and a face-plate, secured together to form a chamber, said back-plate having a perforation or hole, a fastening means, consisting, essentially, of a shank *c* rotatively arranged in said hole, a hook *c'* on the outer side of said back-plate, a loop c^4 and eccentric portion c^5 within said chamber, said loop c^4 and portion c^5 being movably arranged in said chamber, said a groove or depression on the inner surface of said back-plate with which said portion c^5 can be brought in holding or locked engagement, substantially as and for the purposes set forth.

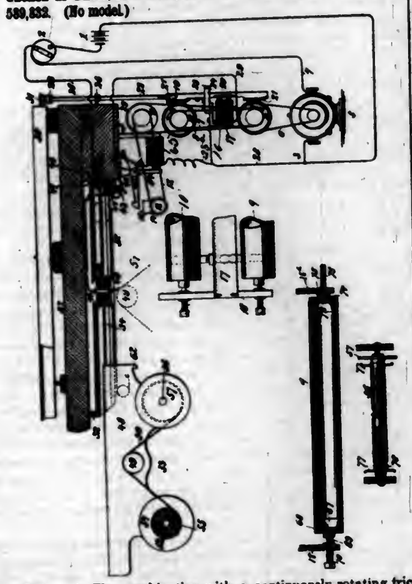
7. A button, comprising a back-plate and a face-plate, secured together to form a chamber, said back-plate having a perforation or hole, a fastening means rotatively arranged in said hole, having a hook on the outer side of said back-plate, a laterally-bent and eccentric retaining portion within said chamber, a projection or protuberance on said retaining portion, and means within said chamber with which said projection or protuberance can be brought in holding or locked engagement, substantially as and for the purposes set forth.

8. A button, comprising a back-plate and a face-plate, secured together to form a chamber, said back-plate having a perforation or hole, a fastening means rotatively arranged in said hole, having a hook on the outer side of said back-plate, a laterally-bent and eccentric retaining portion within said chamber, a projection or protuberance on said retaining portion, and a groove or depression on the inner surface of said back-plate with which said projection or protuberance can be brought in holding or locked engagement, substantially as and for the purposes set forth.

9. A button, comprising a back-plate and a face-plate, secured together to form a chamber, said back-plate having a perforation or hole, a fastening means, consisting, essentially, of a shank *c*, a hook *c'* on the outer side of said back-plate, a loop c^4 and eccentric portion c^5 within said chamber, said loop c^4 and portion c^5 being movably arranged in said chamber, a projection or protuberance on said portion c^5, and means within said chamber with which said projection or protuberance can be brought in holding or locked engagement, substantially as and for the purposes set forth.

10. A button, comprising a back-plate and a face-plate, secured together to form a chamber, said back-plate having a perforation or hole, a fastening means, consisting, essentially, of a shank *c*, a hook *c'* on the outer side of said back-plate, a loop c^4 and eccentric portion c^5 within said chamber, said loop c^4 and portion c^5 being movably arranged in said chamber, a projection or protuberance on said portion c^5, and a groove or depression on the inner surface of said back-plate with which said projection or protuberance can be brought in holding or locked engagement, substantially as and for the purposes set forth.

11. A button, comprising a back-plate and a face-plate, secured together to form a chamber, said back-plate having a perforation or hole, and an enlargement a^6 on the outer surface of said back-plate, a fastening means rotatively arranged in said hole, having a hook adapted to be centrally arranged directly above said enlargement a^6, and a laterally-bent and eccentric retaining portion within said chamber in movable and frictional contact with the inner surfaces of said back-plate and face-plate, substantially as and for the purposes set forth.



12. A button, comprising a back-plate and a face-plate, secured together to form a chamber, said back-plate having a perforation or hole, and an enlargement a^6 on the outer surface of said back-plate, a fastening means, consisting, essentially, of a shank *c* rotatively arranged in said hole, a hook *c'* on the outer side of said back-plate adapted to be centrally arranged directly above said enlargement, a loop c^4 and eccentric portion c^5 within said chamber, said loop c^4 and portion c^5 being in movable and frictional contact with the inner sur-

faces of said back and face plates, substantially as and for the purposes set forth.

606,278. PROCESS OF MAKING SLAG CEMENT. CORNELIUS J. CURTIN, Newark, N. J. Filed Oct. 27, 1897. Serial No. 656,507. (No specimens.)

Claim.—The process herein described for making slag cement, which consists in adding to burnt lime three per cent. of hydrochloric acid, then immersing the same in about twenty per cent. water, then thoroughly mixing the same and combining therewith eighty-five per cent. molten slag, then drying and pulverizing the same, substantially as described.

606,279. ELECTROMECHANICAL MUSICAL INSTRUMENT. GEORGE H. DAVIS, New York, N. Y. Filed May 1, 1896. Serial No. 589,832. (No model.)

Claim.—1. The combination with a continuously-rotating friction-drum, of a vertically-movable striker rod arranged in close proximity to said friction-drum and an armature connected thereto, said striker-rod being arranged to engage and actuate a sounding device when raised, an electromagnet disposed opposite said armature and operating, when energized, to draw the striker-rod into frictional engagement with the rotating friction-drum, and means for automatically making and breaking the magnet-circuit at predetermined intervals, substantially as described.

2. In an electromechanical musical instrument, the combination with electrically-operated playing mechanism, of a base-plate carrying a series of insulated contact-points, a music-roll-holder drawer sliding upon said base-plate and carrying a contact roller or bar arranged to contact with all of said contact-points when the drawer is closed, means for holding said drawer closed, and means for automatically opening said drawer when the latter is released, substantially as described.

3. In an electromechanical musical instrument, the combination with electrically-operated playing mechanism, of a base-plate carrying a series of insulated contact-points, a music-roll-holder drawer sliding upon said base-plate and carrying a contact roller or bar arranged to contact with all of the said contact-points when the drawer is closed, an electrically-controlled catch for holding said drawer closed, and means for automatically opening said drawer when the catch is released, substantially as described.

4. In a take-up roller for perforated music-sheets, the combination with a cylindrical roller having reduced ends as shown, of annular collars adjustably fitted over said reduced ends and having their peripheries flush with the periphery of the body of the roller, means for holding said collars fixed in their adjusted positions, and annular flanges formed on the outer ends of said collars, substantially as described and for the purpose specified.

5. The combination with a cylindrical take-up roller having reduced ends as shown, of annular collars fitted over said reduced ends and having their peripheries flush with the periphery of the body of the roller, said collars having longitudinal slots formed therein, annular flanges formed on the outer ends of said collars, and adjusting-screws screwed in said roller and projecting through said slots, substantially as described.

6. The combination with a musical instrument of a striker-rod guide having a circular-shaped body and a hole made therethrough, being lined with felt and having a pointed extension.

7. The combination with a musical instrument of a key extension, the same having a circular-shaped body, from which a pointed projection extends, and a felt or elastic disk secured to one of the faces of said body.

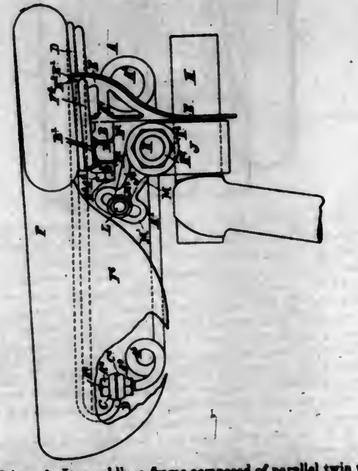
8. The combination with a revolubie friction-drum, of a vertical striker-rod the upper end of which engages the key or other striking mechanism, and the other end suspended in close proximity to said drum, and an electromagnet adapted when energized to attract a soft-iron armature carried by said striker-rod and thereby cause the latter to be drawn into frictional contact with the revolving drum and be forced upward to actuate the key or striking mechanism, substantially as described.

9. The combination with a delivery-roll, of a music-sheet coiled thereabout, a second cooperating rewinding-roll about which said sheet is recoiled, guides or collars adjustable endwise upon said receiving-roll, and means intermediate the rolls, cooperating with the music-sheet to control the action of sound-producing devices of a musical instrument.

606,280. MUFFLER FOR ENGINES. GEORGE L. GARDNER, Dayton, Ohio, assignor of one-half to F. D. Bittinger, same place. Filed Aug. 23, 1897. Serial No. 649,122. (No model.)

Claim.—1. A muffler or exhaust-breaker for engines, comprising a casing having a closed upper end, an inner tubular member located within said casing and forming an annular passage between it and the inner surface of said casing, a shank upon the lower end of said tubular member adapted to be secured to the exhaust-pipe of the engine, a circuitous passage through said tubular member including said annular passage, and a rotatably-mounted wheel in said circuitous passage, substantially as and for the purpose described.

2. A muffler or exhaust-breaker for engines, comprising a casing having a closed upper end, an inner tubular member located within said casing and forming an annular passage between it and the inner surface of said casing, a shank upon the lower end of said tubular member adapted to be secured to the exhaust-pipe of the engine, a circuitous passage through said tubular member including said annular passage, and a rotatably-mounted wheel in said circuitous passage whose blades are formed with openings, substantially as and for the purpose described.



3. A muffler or exhaust-breaker for engines, comprising a casing having a closed upper end, an inner tubular member located within said casing and forming an annular passage between it and the inner surface of said casing, a shank upon the lower end of said tubular member adapted to be secured to the exhaust-pipe of the engine, a circuitous passage through said tubular member including said annular passage, a rod or shaft extending transversely of said shank, and a rotatably-mounted wheel on said rod or shaft, the blades of which terminate a short distance from the inner surface of the passage through said shank and are formed with openings, substantially as and for the purpose described.

4. A muffler or exhaust-breaker for engines, made up of a plurality of members, the lower of which has a shank upon it adapted to be attached to the exhaust-pipe of the engine, a cone-shaped spout leading from the upper end of said shank forming an annular cavity between it and the inner surface of said lower member, a cap secured to the upper end thereof, having a series of openings therein, tubes leading downwardly from said openings and fitting within said annular cavity, an intermediate tubular member fitting upon said lower member and having a cone-shaped or tapered opening at its upper end forming an annular cavity between it and the inner surface of said intermediate member, an upper member whose top is formed with a series of openings, and tubes leading downwardly from said openings and fitting within the annular cavity in the upper end of said intermediate member, substantially as and for the purpose described.

5. A muffler or exhaust-breaker for engines, made up of a plurality of members, the lower of which has a shank upon it adapted to be attached to the exhaust-pipe of the engine, a transversely-extending rotatably-mounted wheel in the passage through said shank, a cone-shaped spout leading from the upper end of said shank forming an annular cavity between it and the inner surface of said lower member, a cap secured to the upper end thereof having a series of openings therein, tubes leading downwardly from said openings and fitting within said annular cavity, an intermediate tubular member fitting upon said lower member and having a cone-shaped or tapered opening at its upper end forming an annular cavity between it and the inner surface of said intermediate member, an upper member whose top is formed with a series of openings, and tubes leading downwardly from said openings and fitting within the annular cavity in the upper end of said intermediate member, substantially as and for the purpose described.

6. A muffler or exhaust-breaker for engines, comprising a tubular casing having a closed upper end, a tubular portion located within said casing and forming an annular passage between it and the inner surface of said casing, the said inner tubular portion being made up of a plurality of members, the lower of which has a shank upon it adapted to be attached to the exhaust-pipe of the engine, a cone-shaped spout leading from the cavity between it and the inner surface of said lower member, a cap secured to the upper end thereof having a series of openings therein, tubes leading downwardly from said openings and fitting within said annular cavity, an intermediate tubular member fitting upon said lower member and having a cone-shaped or tapered opening at its upper end forming an annular cavity between it and the inner surface of said intermediate member, an upper member whose top is formed with a series of openings, tubes leading downwardly from said openings and fitting within the annular cavity in the upper end of said intermediate member, and an annular disk secured to the lower end of the tubular casing surrounding the shank on the lower member of said tubular portion and provided with a series of openings in line with said annular passage, substantially as and for the purpose described.

606,281. SADDLE. HARRY W. G. PLUMPTRE, London, England. Filed Feb. 9, 1897. Serial No. 622,653. (No model.)

Claim.—1. In a saddle, a frame composed of parallel twin wires occupying the same horizontal plane, and bent to conform to the outline of the saddle, and a cushion secured to the frame between said wires, substantially as set forth.

2. In a saddle, a frame comprising two like sections arranged side by side in the same horizontal plane, each consisting of parallel twin wires, and having a straight body portion and an outwardly-extending loop at the rear, and clamps for securing the sections together, substantially as set forth.

3. In a saddle, a frame comprising two like sections arranged side by side in the same horizontal plane, each consisting of parallel twin wires and having a straight body portion and an outwardly-extending loop at the rear, the body portions of the sections being separated to provide an intervening space and arranged to diverge toward the rear, a transverse stiffening-plate, and means for securing the sections and stiffening-plate together, substantially as set forth.

4. In a saddle, the combination with a frame comprising parallel twin wires arranged side by side in the same horizontal plane and bent to conform to the outline of the saddle, of an elongated cushion provided with a web having an edge bead and secured in place between said wires, substantially as described.

5. In a saddle, the combination with a frame comprising parallel twin wires arranged side by side in the same horizontal plane, and bent to conform to the outline of the saddle, of an inflatable tubular cushion likewise bent to conform to the outline of the saddle and secured in place between said wires, substantially as described.

6. In a saddle, the combination of the frame comprising two independent separated sections each consisting of parallel twin wires and having a straight body portion and an outwardly-extending loop at the rear, the said body portions being arranged to diverge toward the rear, means for securing the sections in position, and an elongated cushion secured to the frame between said wires and conforming to the outline of the frame, substantially as set forth.

7. In a saddle, the combination of the frame consisting of two independent sections each having an elongated body portion and an outwardly-extending loop at the rear, supporting-springs, means for securing the adjacent ends of the sections and springs together, a transverse stiffening-plate supported on said springs and engaging the loop portions of said sections, and a cushion, substantially as set forth.

8. In a saddle, the combination of the frame consisting of parallel twin wires and having a pendent sections each composed of parallel twin wires and having a straight body portion and an outwardly-extending loop at the rear, two supporting springs, means for securing the adjacent ends of said sections and springs together, a transverse stiffening-plate carried by said springs and engaging the under side of said sections, and an elongated cushion conforming to the outline of the frame and secured in place between said twin wires, substantially as set forth.

9. In a saddle, the combination of the wire frame terminating at the rear in outwardly-extending loops, the supporting-springs, and the retainers provided with openings at right angles to each other and adapted to secure the adjacent ends of said loops and springs together, substantially as set forth.

10. In a saddle, the combination of the frame consisting of two like sections, each composed of parallel twin wires and terminating at the rear in an outwardly-extending loop, the supporting springs, the tubular retainers adapted to receive the rear ends of said springs and provided with transverse slotted openings for the ends of said loops, and means on said springs for tightening said retainers, substantially as set forth.

11. The combination with the saddle having substantially parallel supporting-springs, of a clip adapted to be secured to the saddle-post, a slotted bolt therefor through which said springs pass, segmentally-slotted plates pivoted on said bolt at the sides of the clip and adapted to clamp the springs thereto, and a second bolt passing through the clip and the segmental slots of said plates, substantially as and for the purpose described.

12. The combination with the saddle having substantially parallel supporting-springs, of a split clip adapted to be secured to the saddle-post, and provided with wings extending forwardly therefrom, a bolt passing through the body of the clip and slotted to receive said springs, a block fitted to said slot, plates pivoted at their inner ends on said bolt and having segmental slots at their outer ends, and a second bolt passing through said wings and segmental slots, substantially as and for the purpose described.

606,282. LOCK. JOSEPH A. GRAY, Carrolltown, Pa. Filed June 25, 1897. Serial No. 642,308. (No model.)

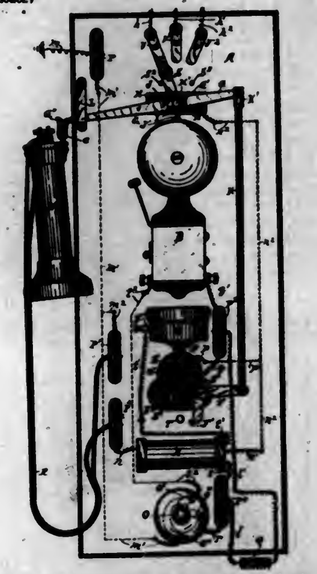
Claim.—1. In a combined latch and lock, the combination with a spindle-controlled gravity-bolt, of a gravity-tumbler mounted above the bolt for differential vertical movement with respect thereto and having at one end a longitudinal guide-slot and at its enlarged end a longitudinal slot, 15, with extensions, 16, 18, of different lengths, a fixed stud playing in the guide-slot to permit the tumbler to have a swinging and sliding adjustment thereon, and another fixed stud playing in the slot, 15, to enter the short extension, 18, and sustain the tumbler in a position above and out of the path of the bolt, said tumbler having a locking-shoulder, 14, adapted to drop in rear of the bolt when the tumbler is moved to a position for the stud, 17, to enter the long extension, 16, of the slot, the whole combined and arranged for service, substantially as described.

2. In a combined latch and lock, the combination with a spindle-controlled gravity-bolt, of a gravity-tumbler mounted above the bolt for differential vertical movement with respect thereto, means for guiding and limiting both the horizontal and vertical movement of the tumbler, the latter being provided with a locking-shoulder adapted to drop in rear of the bolt, and means for sustaining the tumbler in a position above and out of the path of the bolt, all substantially as described.

606,288. SPECTACLES. ALBERT L. GREENE, Cranston, R. I.; Fannie I. Greene, administratrix of said Albert L. Greene, deceased, assignor to Charles A. Wilkinson, Warwick, and Dutee Wilcox, Providence, R. I. Filed Mar. 16, 1896. Serial No. 583,299. (No model.)

Claim.—In a device of the class described the combination with the bows having projecting ears provided with means for holding them in mutual engagement, of a cut-away portion in the inner face of each ear, a threaded perforation in one ear having its inner end countersunken, a perforation in the second ear in alinement with the first-named perforation, a temple-piece held within the cut-away portion of the ears and having a perforation in alinement with the perforations of the ears, and a pivot passed through the perforation in one ear and the temple-piece and having its end screw-threaded and in engagement with the threads of the threaded ear perforation to hold the temple-piece in place.

606,284. TRANSPORTATION SYSTEM. WALLACE GROSVENOR, Canalton, N. D. Filed Sept. 17, 1897. Serial No. 652,027. (No model.)



Claim.—1. In a transportation system, the combination with overhead supports of a pair of rails secured to said supports, an extended rack secured to said rails, a truck constructed to straddle said rails and provided with a pair of wheels engaging each rail, a cab or support suspended from and carried by said truck, a pair of gear-wheels mounted on said truck and engaging said rack, an intermediate gear engaging both of said gear-wheels, cranks on a common shaft, with said intermediate gear, and a pair of engines in said cab or on said support, connected one to each of said cranks, substantially as described.

2. In a transportation system, the combination with overhead supports and a rail or rails supported thereby, of a train made up of trucks mounted on and suspended from said rails, and a flexible connection connecting the several trucks, and a reel carried by the motor member of said trucks, on which said cable or flexible connection is wound, substantially as described.

3. In a transportation system, the combination with overhead supports, and a rail or rails supported thereby, of a motor-truck mounted on said rail or rails, a cab or support suspended and carried by said truck, and a brake involving brake-shoes engaging the advance and rear wheels of said truck and connected by a toggle-lever, a lever for operating said toggle, and a spring acting on said toggle and normally holding said shoes in inoperative positions, substantially as described.

606,285. TELEPHONE SYSTEM. WILTON A. GUSTAFSON, Joliet, Ill. Filed Aug. 13, 1896. Renewed Jan. 11, 1898. Serial No. 666,372. (No model.)

Claim.—1. The herein-described electric telephonic apparatus consisting of the combination of the bell-call device, the push-button device, the telephone-transmitter, the telephone-receiver, the secondary induction-coil, the battery, the line-wire contact-plates, the switch-lever mechanism, the receiver-supporting lever and latch mechanism, the binding-posts and conductors, all arranged to operate substantially as and for the purpose set forth, wherein the telephone-transmitter is supported by means of a pivoted arm, and adapted to be turned out of or into service, and adapted when turned out of service to automatically break the primary telephonic circuit, and make the bell-call circuit, and when turned into service to automatically make the said primary circuit and break the bell-call circuit, substantially as and for the purpose set forth.

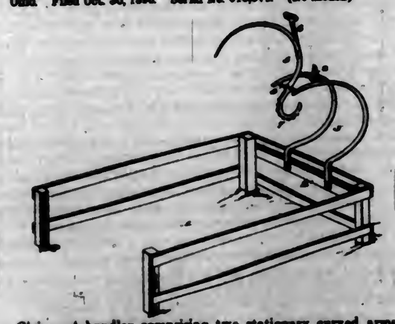
2. In the telephonic apparatus described, in combination with the circuit-conductors, the stud H' having the foot-plate H, the switch-lever S sleeved on said stud, the hooked lever G having the chambered beveled end hub G' sleeved on said stud, the tension-spring S' arranged in said hub-chamber and connecting said levers, the pin I placed through the end portion of said stud in the hollow between the bevel-faces of said hub, the coil-spring placed on said hub and attached at one end to said lever G and attached at its opposite end to a stationary post, substantially as and for the purpose set forth.

3. In the telephonic apparatus described the combination of the hinged transmitter-arm D having the side latch-socket D', the hooked lever G, bell-crank latch-lever F having the beveled latch-piece F', and the non-conducting connecting-rod K, connecting said levers substantially as and for the purpose set forth.

4. In the telephonic apparatus described, the combination of the stud H', the lever G and hub G' thereof having the beveled end, the switch-lever S, and the springs S' and J substantially as and for the purpose set forth.

5. In a telephone system, the combination of the oscillating lever G, the telephone-receiver adapted to be detachably connected to the end of said lever, the switch-lever S, the means for frictionally connecting said levers, and the means for returning said switch-lever to contact with the terminal of the main line substantially as and for the purpose set forth.

606,286. CARD-INDEXING FILE AND LOCKING MECHANISM. HUGH HAMILTON, Rochester, N. Y. Filed Dec. 21, 1897. Serial No. 662,845. (No model.)



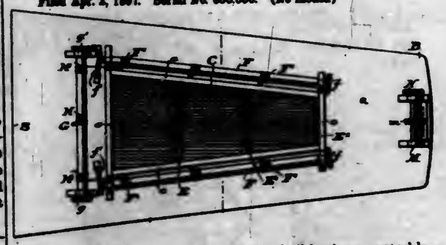
Claim.—1. In a device of the character described, a box, two rods arranged parallel with each other, having their ends secured together and journaled within the box, projections formed with the rods, a pin extending from the box into engagement with one of the projections, and a lock secured to the box the bolt of which is adapted to engage the other of said projections, as and for the purpose set forth.

2. Two rods arranged parallel with each other and secured together at their ends, said rods being journaled within a file-tray, a spring adapted to return the rods to their normal position, a projection formed with the rods, a pawl adapted to engage with said projection to hold the rods against the action of the spring, and means for automatically disengaging the pawl, as shown and described.

3. In combination, a file-tray, two rods arranged parallel with each other and connected together at their ends and journaled within said tray, a spring so arranged as to return the rods to their normal position when released, a projection extending from the rods, a pawl adapted to engage with said projection, an extension formed with the pawl for manipulating the same, a second projection extending from the rods, and a lock adapted to work in conjunction with the last-named projection for preventing the revolving of the rods, as specified.

4. In a file-tray, an adjustable angle-block having right-angular bolts fitted therein, springs forcing said bolts apart, an escutcheon-plate secured over the ends of the bolts, and thumb-screws passed through a slot in the escutcheon-plate into the ends of the bolts, as and for the purpose described.

606,287. FODDER-BUNDLER. HENRY J. KNEVER, Napoleon, Ohio. Filed Oct. 20, 1896. Serial No. 610,571. (No model.)



Claim.—A bundler comprising two stationary curved arms, a pivot extending between the outer ends of said stationary arms, a pawl mounted upon a cross-piece extending between said stationary arms in the rear of said pivot, a curved swinging arm mounted between its ends upon the pivot extending between said stationary arms, a handle extending from the outside of said swinging arm, and a laterally-curved end portion for said swinging arm provided with a plurality of notches or teeth to receive said pawl, substantially as described.

606,288. OXYETHYLACETANILID. OTTO KLEINER, Chicago, Ill., assignor of one-half to Albert E. Palmer, same place. Filed Sept. 18, 1897. Serial No. 652,176. (Specimens.)

Claim.—1. The product, oxyethylacetanilid, herein described, having the formula $C_{10}H_{11}NO_2(1:4)$, and the following characteristics: it is white, very light, fluffy and velvety, and has lustrous scale-crystals, and on the application of nitric acid assumes a marked yellow, changing to an orange color, depending upon the amount of acid and heat applied.

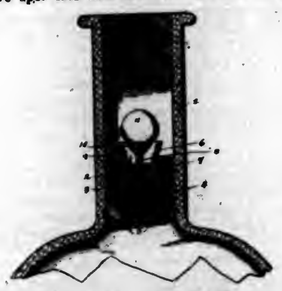
2. The herein-described process of making oxyethylacetanilid from paraamidophenetol, consisting in heating therewith equal molecules of glacial acetic acid continuously in a water-bath, then dissolving the mass in approximately eighty parts of boiling water, with the addition of animal charcoal, then filtering and crystallizing out the solid.

606,289. DUMPING-SCOW. EDUARD LATZ, New York, N. Y. Filed Apr. 2, 1897. Serial No. 630,356. (No model.)

Claim.—1. The combination with the hull having a central longitudinal well, of a plurality of separate and independent bottom doors swinging fore and aft and all opening toward one end of the hull, operating-shafts and flexible connections between each door and said shafts; whereby when the load has been discharged and the scow moved forwardly the flexible connections will allow the doors to close by the pressure of the water against their forward sides; substantially as described.

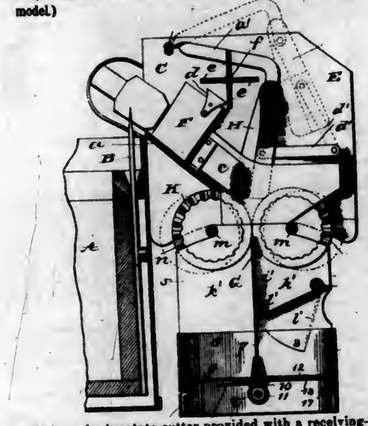
2. The combination with the hull having a central longitudinal well, of a plurality of separate and independent bottom doors swinging fore and aft and all opening downwardly toward one end of the hull, shafts extending longitudinally at opposite sides of the well, and flexible connections extending from said shafts down to the ends of every door; whereby as the scow is drawn forwardly the pressure of water on the forward sides of the doors will swing them toward their closed positions and allow the flexible connections to be easily wound on their shafts; substantially as described.

3. The combination with the hull having a central longitudinal well, of a series of transverse, hinged doors forming the bottom of the well and lying flush with the bottom of the hull; all of said doors swinging downwardly and toward the same end of the hull, transverse shields crossing the well over the hinged edges of the doors, and means for operating the doors; substantially as described.



4. In a dumping-scow provided with a central well for the reception of its load, said well having true walls, C^2, and false walls, C', arranged with an interspace, and having the lower ends of the false walls arranged above the lower ends of the true walls, the combination, with the hull, of the bottom doors swinging fore and aft, and extending entirely across between the true walls; actuating-chains connected with said doors and running upward through the interspaces between the true and the false walls, and means substantially as set forth whereby said chains may be shifted to raise and secure said doors or permit them to drop.

5. In a dumping-scow, provided with a central well for the reception of its load, and also provided with bow and stern passage-ways communicating with said well, the combination with the hull, of the bottom doors swinging fore and aft; means for raising and securing said doors or permitting them to drop; the bow door, L, means substantially as set forth for actuating the same to open or close the bow passage; the stern door, and means substantially as set forth for actuating the same to open or close the stern passage.



606,290. BOTTLE-STOPPER. NICOLS LINDEBERG, Nelson, Minn., assignor of one-half to Jacob P. Larson, same place. Filed Nov. 9, 1896. Serial No. 611,537. (No model.)

Claim.—The combination with a packing-ring or stopper having a central opening, of a tube or passage situated within said opening and having a flange at one end resting against the end of said stop-

per or packing-ring, an apertured plate at the other end of said tube or passage, a stem extending from said plate and provided with a head, a valve upon said stem and a flaring mouth for said tube or passage.

606,291. POTATO CUTTER AND PLANTER. JOSEPH A. MENGEL, McKeansburg, GEORGE K. BUNKLEY, Orwigsburg, and GEORGE H. GERBER, Pottsville, Pa. Filed Aug. 18, 1897. Serial No. 648,897. (No model.)

Claim.—1. A potato-cutter provided with a receiving-chamber, a movable gate-plunger controlling the discharge end of said chamber and forcing the potatoes downward, and a support for potatoes below the gate-plunger, in combination with a vertical knife below and intermediate said support.

2. A potato-cutter provided with a receiving-chamber, a movable gate-plunger controlling the discharge end of said chamber and forcing the potatoes downward, and laterally-movable supports for potatoes below said gate-plunger, in combination with a vertical knife below and intermediate said support.

3. A potato-cutter provided with a receiving-chamber, a movable gate-plunger controlling the discharge end of said chamber and forcing the potatoes downward, and movable supports for potatoes below the gate-plunger, in combination with a vertical knife below and intermediate said supports and a distributing-hopper.

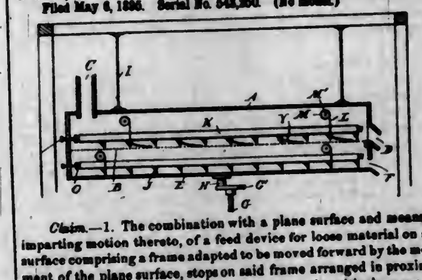
4. A potato-cutter provided with a receiving-chamber, a gate-plunger controlling the discharge end of said chamber and forcing the potatoes downward, and a pair of revoluble potato-supports below the gate-plunger, in combination with a vertical knife below and intermediate said supports.

5. A potato-cutter provided with a receiving-chamber, a vertically-movable gate-plunger controlling the discharge end of said chamber and forcing the potatoes downward, and a pair of laterally-separable rollers, in combination with a knife below and intermediate said rollers.

6. A potato-cutter provided with a receiving-chamber, a pair of separable rollers, a gate-plunger above and intermediate the rollers controlling the discharge end of said chamber and forcing the potatoes downward, means for raising the gate-plunger and means for returning the rollers, in combination with a knife below and intermediate said rollers.

7. A potato-cutter provided with a receiving-chamber having a guide or deflector, and a gate-plunger controlling the discharge end of said chamber and forcing the potatoes downward, laterally-movable supports for potatoes below the gate plunger and a knife for severing potatoes, in combination with a distributing-hopper.

8. A potato-cutter consisting of a pair of laterally-separable potato-supports, a vertical knife below and intermediate said supports and extending downward into and forming a partition for a distributing-hopper, in combination with said hopper and vibratory supports for parts of potatoes above said hopper.



9. A potato-cutter provided with means for severing potatoes, in combination with a distributing-hopper having a horizontally-revoluble bottom provided with a discharge-opening, a valve controlling the opening, a pivoted lever connected to said valve and means on the hopper for engaging the lever.

10. A potato-cutter provided with a distributing-hopper having a horizontally-revoluble bottom and provided with a partition having a potato-cutting knife at its upper end, an opening in the bottom, a valve controlling said opening, a lever pivotally secured to the bottom and connected to said valve, lugs on the hopper for engaging said lever and a spring connected to the lever for moving the valve.

11. A potato-cutter provided with a receiving-chamber, a gate-plunger controlling the discharge end thereof and forcing the potatoes downward, means for severing potatoes, and a distributing-hopper, in combination with means connecting the distributing-hopper and the cutting mechanism.

12. A potato-cutter provided with a receiving-chamber having a movable guide or deflector, a gate-plunger controlling the discharge end of said chamber and forcing the potatoes downward, laterally-movable potato-supports, and means for severing potatoes, in combination with a distributing-hopper.

606,292. SEPARATOR. ORVILLE M. MOSES, Jackson, Mich. Filed May 6, 1896. Serial No. 542,260. (No model.)

Claim.—1. The combination with a plane surface and means for imparting motion thereto, of a feed device for loose material on said surface comprising a frame adapted to be moved forward by the movement of the plane surface, stops on said frame arranged in proximity to said plane surface and shaped to engage and positively move forward the material in the forward movement of the frame and to ride over and pass the material in the return movement of the frame.

2. The combination with the plane surface, devices for imparting motion thereto, of a feed device for the material consisting of a swinging frame having a series of separated stops fixedly secured thereon and arranged in proximity to the surface, the frame moving by the motion imparted to the surface to cause said stops to engage and positively feed and distribute the material over the surface.

3. The combination with a plane surface and means for imparting a movement thereto, of a device for positively feeding loose material on said surface comprising a frame adapted to be moved longitudinally by the motion of the plane surface, a series of separated plates or bars carried by said frame, of a shape adapted to engage and positively feed the material in the forward movement of the frame and being free to rise and ride over the material in the backward movement of the frame, and a stop for limiting the movement of the frame in one direction.

4. A feed device for loose material upon moving plane surfaces comprising an endwise-movable feed-frame, having a series of separated transverse plates or bars, having straight front faces and inclined rear faces, means for limiting the movement of the frame in one direction, the frame being so supported as to be free to rise and ride over the material in its backward or return movement.

5. A feed device for loose material upon a moving plane surface, comprising a reciprocating frame, stops thereon adapted to engage the material and positively feed it in the forward movement of the frame, and devices for supporting said frame over the plane surface so that it is free to rise in the return movement of the frame.

6. The combination of the screen-frame, the screen therein, means for imparting motion thereto, a feed-frame above the screen flexible straps for suspending the feed-frame over the screen, circular disks secured to the screen to which the upper ends of the straps are secured, and means for rotating the disks to adjust the feed-frame, substantially as described.

7. The combination of the screen frame, the screen therein, means for imparting motion thereto, a feed-frame above the screen, comprising longitudinal bars and cross-bars having the vertical front face and inclined rear face, and flexible straps for supporting the feed-frame above the screen, substantially as described.

8. The combination of the screen, the movable feed-frame thereon adapted to have a rising-and-falling movement in relation to the screen, and beaters or cleaners secured to the frame adapted to strike the screen.

606,293. NON-REFILLABLE BOTTLE. JOHN MCCAFFERTY, Wall, Pa., assignor of one-half to John James McCafferty, same place. Filed Aug 3, 1897. Serial No. 646,970. (No model.)

Claim.—1. The combination with the neck of a bottle, of a screw-plug provided with a vertical recess adapted to register with a slot in the upper edge of the said neck, and mechanism retained below said plug by means of which a ball-valve is kept in operative position, substantially as herein shown and set forth.

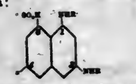
2. The combination with the neck portion of a bottle, provided with a slotted lip and interiorly screw-threaded in its upper portion, of a screw-plug adapted to engage with said interiorly-screw-threaded neck, a central depending portion secured to or formed integral with said plug, a disk upon said depending portion, another plug provided with lateral springs adapted to engage with an annular groove formed upon the inner surface of the neck, a ball-valve seated within a recess within said lower plug, said ball being limited in its movement by the depending portion of said screw-plug, and means for maintaining said depending portion in a central vertical position, all substantially as herein shown and set forth.

3. In a non-refillable bottle, the combination with the interiorly-screw-threaded and vertically-slotted neck portion thereof, of a screw-threaded plug adapted to engage with said interiorly-screw-threaded neck, said plug provided in its lower portion with a lateral vertical slot or recess, a portion depending from said plug, a disk secured or formed upon said depending portion, a cross-plate secured upon the lower end of said portion, another plug adapted to be depressed into the lower end of said neck, springs secured upon said lower plug having their upper ends adapted to form retaining-fingers in connection with an annular groove interiorly formed in the neck of the bottle, a ball-valve within a recess in said lower plug, said recess provided with a downwardly-extended aperture leading through said plug, and means as herein shown for limiting the movement of said valve, all substantially as and for the purpose herein shown and set forth.

4. The combination with a bottle having an interiorly-screw-threaded, slotted neck provided with an inner annular groove, of a screw-plug with a vertical slot adapted to be engaged by said screw-threaded neck, another plug recessed and apertured inserted below the first-mentioned plug a ball-valve adapted to have proper play within said recess in the lower plug, spring-catches for retaining said lower plug below said annular groove, means for limiting the play of said ball-valve, and a projected lug portion for rotating the first-mentioned plug, all substantially as herein shown and set forth.

5. The combination in a non-refillable bottle, of a neck portion interiorly screw-threaded, and provided with a vertical slot in the lip and an inner annular groove, and a screw-plug adapted to be engaged by said screw-threaded neck, said plug having a depending portion with a cross-plate secured to the lower end thereof, another plug adapted to be depressed to a point below said inner groove and retained in said position by spring-catches, a ball-valve located in a recess provided in said lower plug, above an aperture leading downwardly therethrough, means for limiting the play of said valve, and a disk on the lower end of the screw-plug, all substantially as herein shown and set forth.

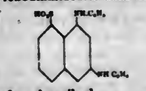
606,294. LUBRICATOR. GEORGE MCNEIL and THOMAS J. ROGERS, Chicago, Ill. Filed Feb. 25, 1897. Serial No. 625,008. (No model.)



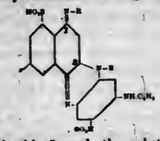
Claim.—The combination with an oil-cup, provided with an interior-threaded surface, of an adjusting-nut, engaging with said threaded surface, and having a tube connected therewith by a number of arms, one of said arms being divided, a locking-screw, inserted in the divided arm, a feed-plug, inserted in the lower end of the attaching-stem, and the removable screw inserted in the upper end of said tube, substantially as described.

606,295. BLUE AZIN DYE AND PROCESS OF MAKING SAME. PHILIPP OTT and THILO KROESER, Elberfeld, Germany, assignors to the Farbenfabriken of Elberfeld Company, of New York. Filed Nov. 23, 1897. Serial No. 659,550. (Specimens.) Patented in England June 16, 1898, No. 11,892; in Germany Feb. 27, 1894, No. 86,224; in France July 7, 1894, No. 230,092, and in Italy July 7, 1894, XXIX, 36,794, LXXII, 167.

Claim.—1. The process for producing new azin dyestuffs by acting with oxidizing agents such as bichromate of sodium on a mixture of equimolecular proportions of parasämidodiphenylaminorthosulfo-acid of the formula

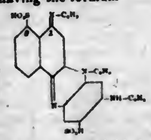


and of a sulfo-acid of a symmetrically-disubstituted 1.3 naphthylene diamin having the formula:



in which formula R represents the phenyl or tolyl radical, *x* either a hydrogen atom or a sulfo group, substantially as hereinbefore described.

2. The process for producing a new azin dyestuff by acting with oxidizing agents such as bichromate of sodium on a mixture prepared from one molecule of parasämidodiphenylaminsulfo-acid and one molecule of diphenylnaphthylenediaminsulfo-acid having the formula

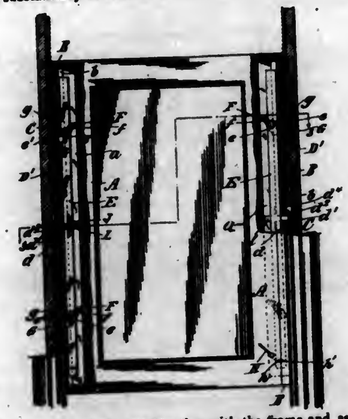


substantially as hereinbefore described.

3. As new articles of manufacture azin dyestuffs obtainable from parasämidodiphenylaminsulfo-acid and sulfo-acids of symmetrically-disubstituted 1.3 naphthylenediamins having the general formula

R and *x* representing in this formula the substituents hereinbefore defined being dark powders, soluble in water with a blue color and dyeing wool in acid-baths blue shades substantially as described.

4. As a new article of manufacture the specific azin dyestuff obtainable from parasämidodiphenylaminsulfo-acid and diphenylnaphthylenediaminsulfo-acid having the formula



representing a darkish-brown powder, soluble in water with a splendid blue color, in concentrated sulfuric acid with a green color which turns into blue on mixing the sulfuric acid with a large quantity of water, dyeing wool brilliant-blue shades fast to the action of alkalies, of acids and likewise fast against milling substantially as described.

606,296. WINDOW-SASH. HENRY PEDERSEN, New York, N. Y. Filed Jan. 7, 1898. Serial No. 665,945. (No model.)

Claim.—1. In a window, the combination with a sash and separable traveler-rails having corresponding longitudinal saw-cuts in their adjacent surfaces, of a metal strip introduced into such saw-cuts and having projecting pins upon such metal strip engaging in curved slots in the sides of the saw-cut, substantially as described.

2. In a window, the combination with a sash and separable traveler-rails having corresponding longitudinal saw-cuts in their adjacent surfaces, of a metal strip introduced into such saw-cuts and having

projecting pins upon such metal strip engaging in curved slots in the sides of the saw-cuts, together with pivots, connecting the sash and traveler-rails, upon which the sash can be revolved when the metal strip is withdrawn into the saw-cut in the sash, and a lever adapted to withdraw such metal strip by giving to it a longitudinal and lateral motion, substantially as described.

3. In a window, the combination with the frame and sash, and separable traveler-rails, said traveler-rails being free to move vertically in the channels of the window-frame and connected to the sash by pivots upon which the sash can be revolved, of a metal strip placed within saw-cuts made in the adjacent surfaces of the sash and traveler-rails, such metal strip having projecting pins engaging in curved slots in the sides of the saw-cuts for the purpose of moving the strip into or out of the saw-cuts, and such metal strip having projecting pins engaging with a plate in the traveler rail when the metal strip is forced into the saw-cut in the traveler-rail, and adapted to lock together the sash and traveler-rail when in that position, substantially as described.

4. In a window the combination with the frame and sash and separable traveler-rails, said traveler-rails being free to move vertically in the channels of the window-frame and connected to the sash by pivots upon which the sash can be revolved, of a metal strip placed within saw-cuts made in the adjacent surfaces of the sash and traveler rails, such metal strip having projecting pins engaging in curved slots in the sides of the saw-cuts for the purpose of moving the strip into or out of the saw-cuts, and such metal strip having projecting pins engaging with a plate in the traveler rail when the metal strip is forced into the saw-cut in the traveler-rail, and adapted to lock together the sash and traveler-rail when in that position, together with a lever or cam adapted to give to the metal strip a longitudinal and lateral motion, substantially as described.

5. In a window, the combination with a sash and separable traveler-rails having corresponding longitudinal saw-cuts in their adjacent surfaces, of a metal strip introduced into such saw-cuts and having projecting pins upon such metal strip engaging in curved slots in the sides of the saw-cut, together with pivots connecting the sash and traveler-rails, upon which the sash can be revolved when the metal strip is withdrawn into the saw-cut in the sash, each pivot being longitudinally split or pierced so as to allow the metal strip to move freely between the parts thereof, and a lever adapted to withdraw such metal strip by giving to it a longitudinal and lateral motion, substantially as described.

6. In a window, the combination with a sash and separable traveler-rails, said traveler-rails being free to move vertically in the channels of the window-frame and connected to the sash by pivots upon which the sash can be revolved, of a metal strip placed within saw-cuts made in the adjacent surfaces of the sash and traveler-rails, such metal strip having projecting pins engaging in curved slots in the sides of the saw-cuts for the purpose of moving the strip into or out of the saw-cuts, and such metal strip having projecting pins engaging with plates in the traveler-rail when the metal strip is forced into the saw-cut in the traveler-rail, and adapted to lock together the sash and traveler-rail when in that position, the pivots upon which the sash is revolved being longitudinally split or pierced allowing the metal strip to move freely between the parts, substantially as described.

7. In a window, the combination with the frame and sash and separable traveler-rails, said traveler-rails being free to move vertically in the channels of the window-frame and connected to the sash by pivots upon which the sash can be revolved, of a metal strip placed within saw-cuts made in the adjacent surfaces of the sash and traveler-rails, said metal strips having projecting pins engaging in curved slots in the sides of the saw-cuts for the purpose of moving the strip into or out of the saw-cuts, and such metal strip having pins engaging with plates in the traveler-rail when the metal strip is forced into the saw-cut in the traveler-rail, and adapted to lock together the sash and the traveler-rail when in that position, together with a lever or cam adapted to give to the metal strip a longitudinal and lateral motion, the pivots upon which the sash is revolved being longitudinally split or pierced, allowing the metal strip to move freely between the parts thereof, substantially as described.

8. In a window, the combination with a sash and separable traveler-rail having corresponding longitudinal saw-cuts in their adjacent surfaces and a metal strip introduced into such saw-cuts and having a projecting pin upon such metal strip, of a metal piece countersunk in the side of either of such saw-cuts pierced by a curved slot adapted to engage with the projecting pin of such metal strip and having a semicircular face at right angles to the plane of such slot adapted to be countersunk in the surface of the sash or traveler-rail at the side of either of such saw-cuts, substantially as described.

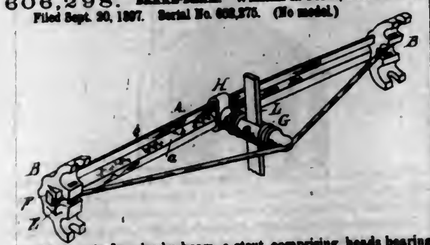
9. In a window, the combination with a sash and separable traveler-rail having corresponding longitudinal saw-cuts in their adjacent surfaces and a metal strip introduced into such saw-cuts and having a projecting pin upon such metal strip, of a metal piece countersunk in the side of either of such saw-cuts pierced by a curved slot adapted to engage with the projecting pin, and such metal piece having a semicircular face at right angles to the plane of such slot adapted to be countersunk in the surface of the sash or traveler-rail at the side of either of such saw-cuts, together with a metal plate semicircular in shape and adapted to be countersunk in the surface of the traveler-rail at the side of the saw-cut, underneath which a projecting pin suitably placed upon the metal strip will engage, for the purpose of locking together the sash to which the metal strip may be attached and the traveler-rail upon which such metal plate is fixed, substantially as described.

10. In a window, the combination with a sash and separable traveler-rails, said traveler-rails being free to move vertically in the channels of the window-frame and connected to the sash by pivots fixed in the sash and passing through holes in the traveler-rails, upon which pivots the sash can be revolved, of bevel-washers placed near the end of the pivot-shaft in the traveler-rail and around which the cord or chain supporting the window passes, the weight of the window pressing the cord or chain between the adjacent bevel-faces of the washers so as to force them apart, one washer against a pin or stop at the end of the pivot and the other washer against the traveler-rail through which the pivot passes, this lateral pressure forcing the traveler-rail tightly against the sash, thus holding the sash firmly at any angle or position in which it may be placed when revolving upon the pivots, substantially as described.

606,297. SCREW-PROPELLER. WILLIS J. PERKINS, Grand Rapids, Mich. Filed Nov. 27, 1895. Serial No. 570,311. (No model.)

Claim.—1. The combination with a propeller-shaft stopping short of the journal-bearings for the blades and provided at its ends with a rigidly-attached journal-box, or hub, of opposite propeller-blades having male and female pivotal bearings upon their journal ends, and gearing thereon, racks having longitudinal movement and engaging said gearing, a non-rotating sleeve capable of longitudinal movement on and partially covering said hub, substantially as described.

2. The combination with a propeller-shaft and hub thereon forming pivotal supports for propeller-blades, of a sleeve encircling said shaft and partially revolving said blades through suitable mechanism, and an adjustable collar or stop on said shaft to determine amount of said blades' rotation.



3. The combination with a propeller-shaft and a hub rigid thereon, of two propeller-blades journaled in said hub near its periphery on opposite sides of a central and third journal-bearing positively connecting said propeller-blades, means for turning the blades in either direction, and an adjustable collar on said shaft to limit their turning movement, substantially as described.

4. The combination with a propeller-shaft, and a plurality of shifting propeller-blades suitably journaled, of a hub rigid on said propeller-shaft, and a removable non-rotating section or collar at the center of the propeller-blade journal-box, said collar partly inclosing and capable of longitudinal movement on said hub, substantially as described.

5. The combination with a propeller-shaft, of two propeller-blades, each provided with a journal bearing, two pinions placed within the journal-boxes within a hub on said shaft, two racks adapted to engage with the respective pinions on opposite sides of the axis of the hub, an inward extension of one of the journals of one of the propeller-blades having a socket or opening and an inward extension of the journal on the other of said propeller-blades adapted to engage with said socket or opening, thereby forming auxiliary journals of the propeller-blades within the hub, substantially as described.

6. The combination with the blades of a propeller-wheel, of a hub composed of two parts E and F separably secured together, journals on said propeller-blades rigidly attached thereto, adapted to turn said blades, racks adapted to engage with the pinions on the journals of said propeller-blades, a movable sleeve or collar to which the said racks are secured, a sleeve partly inclosing and capable of longitudinal movement upon the journal-box, or hub, and also inclosing the said racks and a portion of the propeller-shaft, suitable stuffing-boxes preventing the water from passing through into the boat, a sleeve connected with the said collar and extending into the boat, and suitable means for giving the longitudinal movement to the said sleeve and thereby to the racks for the purpose of setting the propeller-blades in any required position, substantially as described.

606,298. BRAKE-BEAM. WILLIAM A. PENNS, Detroit, Mich. Filed Sept. 20, 1897. Serial No. 602,575. (No model.)

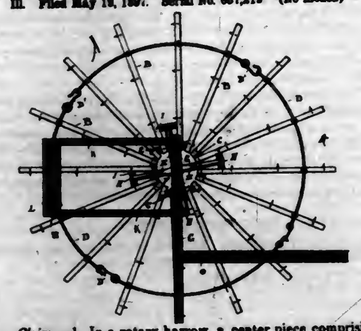
Claim.—1. In a brake-beam, a strut comprising heads bearing on the compression and tension members respectively, adjusting means on one of said heads to adjust the length of the strut and a rocking support for the brake-lever swiveled between the heads, the turning of which does not adjust the strut.

2. In a brake-beam, a strut comprising heads bearing on the compression and tension members respectively and an intermediate adjusting means for adjusting the length of the strut, consisting of a collar screw-threaded on one of the heads and a central portion swiveled between these heads carrying the brake-lever.

3. In a brake-beam, a strut comprising socketed heads, adjusting means screw-threaded on one of said heads and a lock-nut therefor, an intermediate swivel portion having pins engaging in said socketed heads and a slot M, in which the brake-lever is pivoted.

4. In a brake-beam, the combination of the compression member, a truss-rod, heads or nuts on the ends of the truss-rod, the brake-heads having sockets into which the heads or nuts are drawn and entering slots extending from the middle of the face portion of the brake-head to the sockets for the truss-rod to be passed through and an extensible strut by means of which the truss-rod is tensioned.

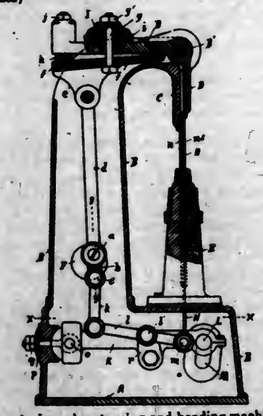
5. In a brake-beam, the combination of the compression member, a truss-rod having end heads or nuts, brake-heads having entering slots for the truss-rod and sockets for the heads the base of said sockets being arranged at an angle to the brake-heads so as to be at substantially right angles with the truss-rod when tensioned and an extensible strut.



606,299. WINDOW-SHADE-BRACKET HOLDER. PAUL H. RADEMANN, Davenport, Iowa. Filed Dec. 11, 1897. Serial No. 661,483. (No model.)

Claim.—1. In a window-shade bracket, a plate, having its edges turned inwardly so as to bear against the casing, a central depressed portion provided with two parallel slits or slots, so as to separate the central depressed portion from the outer raised edges, combined with an adjustable bracket which has its ends inserted into the slots, substantially as shown.

2. In a window-shade bracket, a plate having two longitudinal parallel slits or slots, combined with an adjustable bracket having its inner portion turned outwardly at an angle, and its two opposite projecting ends to catch in said slits or slots, substantially as described.



606,800. ROTARY HARROW. ROLAND RAKESTRAW, Wyoming, Ill. Filed May 19, 1897. Serial No. 637,219. (No model.)

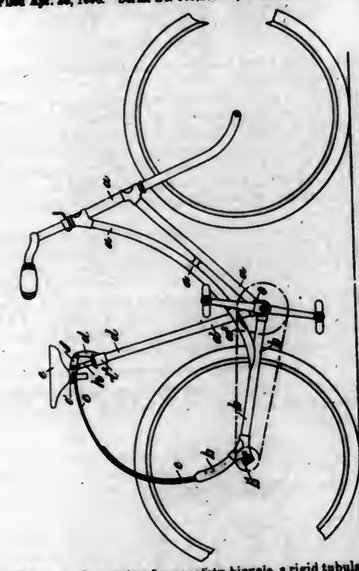
Claim.—1. In a rotary harrow, a center piece comprising a series of radial hollow arms, a tongue pivotally secured to said center piece, a series of harrow-sections of angle-iron, a series of harrow-teeth secured to the said sections, a bar or rod secured to and projecting beyond the inner ends of the sections to engage with the said hollow arms, the track portion secured to each of the sections, means for connecting the sections together at their outer ends, a weight resting on the said track, the arm connected thereto and secured to the tongue, all arranged substantially as and for the purposes set forth and described.

2. In a rotary harrow the combination of the sections A of angle-iron, the track D secured thereto, the bars or rods H secured between the inner adjacent ends of the bars of said sections, the center portion having the hollow arms E for the entrance of the said rods H, the tongue G pivotally secured to the said center portion, the arms K secured to the tongue, the weight M with its rollers N, to run on said track D and the beam O secured to the tongue all substantially as and for the purposes set forth and described.

606,801. SHOE-UPPER TURNING AND BEADING MACHINE. SIMON ROSS, Cincinnati, Ohio. Filed June 1, 1897. Serial No. 638,999. (No model.)

Claim.—1. In a shoe turning and beading machine, in combination with the oscillating beader-jaw, a plate loosely hinged to the arm thereof, driving mechanism, a rod connecting said plate with the driving mechanism, and springs interposed between the working parts of said plate and jaw to cushion the movement of the latter, substantially as described.

2. In a shoe turning and beading machine, mechanism for reciprocating the turning-iron comprising a vertically-adjustable movable



arm, a rock-arm centrally mounted thereon and having hinge connection with the turning-iron, driving mechanism, and crank-and-link mechanism connecting the rock-arm and driving mechanism, substantially as described.

3. In a shoe turning and beading machine the combination of the oscillating arm K pivoted at one end to the frame of the machine and the link *r* connected to the rocking driving-arm *l* to which the turning-iron is hinged, and means for locking said oscillating arm in various positions, substantially as specified.

4. In a shoe turning and beading machine the combination of a stationary and an oscillating beader-jaw, driving mechanism connected to the oscillating jaw, lever mechanism connecting said driving mechanism to the turning-iron, said lever mechanism being mounted upon a vertically-adjustable arm whereby the stroke of the turning-iron is controlled, substantially as specified.

5. In a shoe turning and beading machine the combination with the main shaft, of a connecting-rod pivoted thereto, and to a yielding arm for driving the oscillating beader-jaw, a rock-arm connected at one end by means of a link to the driving mechanism and at the other end to the turning-iron, said rock-arm being pivoted at a point between its ends to a vertically-adjustable arm movably secured to the frame of the machine, substantially as specified.

606,802. VELOCIPEDE. HENRY B. ROTTON, Liverpool, England. Filed Apr. 20, 1898. Serial No. 678,208. (No model.)

Claim.—1. In a spring-frame safety-bicycle, a rigid tubular frame portion *a b*, extending between the front portion and the rear-wheel axle; springs *c* on and extending from the rear end of the tubes *b* of said rigid portion, to a point above and forward of the rear-wheel axle, and carrying at this point the saddle; and a tension-tie connecting the end of the springs *c* with the rigid frame, at a point intermediate the front and rear portions of this frame, and normally holding said springs down under stress to carry the rider without bending, and providing freedom of movement vertically downward to the ends of said springs; substantially as set forth.

2. In a spring-frame safety-bicycle, a rigid tubular frame portion *a b* extending between the front portion and the rear-wheel axle; springs *c* on and extending from the rear end of the tubes *b* of said rigid portion, to a point above and forward of the rear-wheel axle, and carrying at this point the saddle; and a tie connecting said springs *c* with the frame *a b* at a point intermediate the front and rear portion of this frame, consisting of a tube *d* rigidly fixed at its lower end to the frame, and extending up toward the spring end, and connected at its upper end by a free connection to the springs' ends, whereby movement of said springs in the horizontal plane, longitudinally or laterally, is prevented, and free movement, vertically, afforded; substantially as set forth.

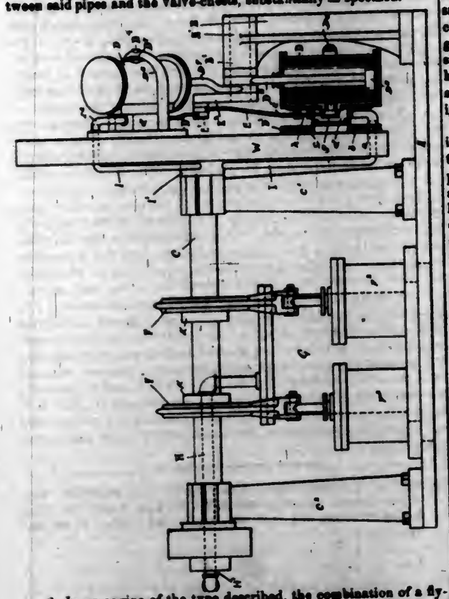
3. The bicycle comprising the rigid tubular frame *a b*, springs *c*, fixed on the ends of the tubes *b* and extending up and forward, and supporting the saddle *c*; the tubes *d* rigidly connected and mounted in the lower part of the frame, and extended up to near the free end of the springs *c*, a connecting-link *f*, hinged on the upper part of *d*, said having movement in the vertical plane, about said hinge, and a spring *k'*, and rod *h* in the upper end of the tube *b*, by which the constant tension on the springs *c* downward is maintained.

4. The combination with the spring *c* and the frame *a b*, of the tube *d*; link *f*, connecting the tube *d* with the end of the spring *c*; the rod *h* connected to the springs *c*, and extending down within the tube *d*; the adjusting-screw plug *i* in the upper end of *d*; the spring *k'* between the under side of the plug *i*, and the end of the rod *h*, pressing said rod *h* and spring *c* down, under constant tension; as set forth.

606,808. OILING DEVICE. JORDAN S. SCARBOROUGH, New Philadelphia, Ohio. Filed July 7, 1897. Serial No. 643,739. (No model.)

Claim.—1. A detachable discharge-spout for oil-receptacles, comprising the cylindrical sleeve 17, the oil-tube 20, the plunger 23 connected therewith and provided with the valve-seat 24 and the valve 25, provided with the stem 26 provided with the bar-nut 30, the sleeve 27 loosely encompassing said stem and the spiral spring 33 encompassing said stem and sleeve and holding said plunger in contact with said valve, substantially as shown and described.

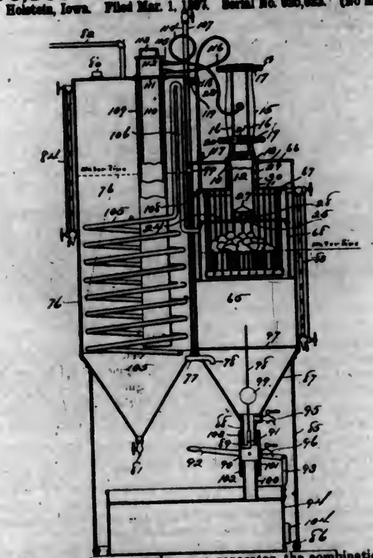
2. A portable oiler, comprising the can 1 provided with the central concentric tube 2, the lateral compartments and an independent orifice for each compartment communicating with the central tube 2, and a gravity-valve adapted to simultaneously close one compartment and open the opposite compartment, in combination with a discharge-spout communicating with the tube 2, a plunger mounted in said spout, a valve mounted in said plunger, and means substantially as described for operating said plunger to positively discharge the oil through said spout, as and for the purpose set forth.



3. In oiling devices, an oil-reservoir, a valve-chamber attachably secured to one end thereof, a plunger-spout or discharge-tube sliding therein, a valve controlling the flow of oil therethrough, a stem attached to said valve and extending through said tube, a sleeve connected with said stem, a spring acting on said sleeve and stem, and means for adjusting said valve-stem, substantially as described.

4. A portable oiler comprising a can 1 provided with the central concentric tube 2 and radial walls 4 forming lateral compartments, each of said walls being provided with a discharge-orifice, gravity-valves controlling said orifices, a cylindrical sleeve 17, an oil-tube 20 sliding therein, a plunger 23 connected with said oil-tube and provided with a valve-seat 24 and a valve 25 having a stem 26, a sleeve 27 loosely encompassing said stem, and a spiral spring 33 encompassing said stem and sleeve 27 and adapted to hold said plunger in contact with said valve, substantially as described.

606,804. FLUID-PRESSURE MOTOR. PHILIPP SCHLACHTER, Streator, Ill. Filed June 7, 1897. Serial No. 639,894. (No model.)



Claim.—1. In a fluid-pressure engine, the combination of a hollow shaft adapted to be connected with a source of fluid-pressure supply, a balance or fly wheel fixed on said shaft, suitably-supported wrist-pins B', E', disks connected to the face of the fly-wheel and having circular apertures and also having the walls of said apertures rabbeted at their inner sides, yokes connected to said disks, piston-cylinders arranged within said yokes and having trunnions journaled therein and also having valve-chests and heads journaled in the rabbets of the disks so as to enable the cylinders to oscillate on their centers of fixture, pistons in said cylinders connected with the wrist-pin B', slide-valves in the valve-chests connected with the wrist pin E', pipes connected to and extending radially from the hollow shaft

and transversely through the fly-wheel, and flexible connections between said pipes and the valve-chests, substantially as specified.

2. In an engine of the type described, the combination of a fly-wheel, suitably-supported wrist-pins, a disk secured to the face of said fly-wheel and having a circular aperture and also having the wall of said aperture rabbeted at its inner side, a yoke connected to the disk, a piston-cylinder arranged in the yoke and having a trunnion journaled therein and also having a valve-chest and a head journaled in the rabbet of the disk, a piston in said cylinder connected with one wrist-pin, and a valve in the chest connected with the other wrist-pin substantially as specified.

606,805. ACETYLENE-GAS GENERATOR. HENRY SCHENKLOTH, Holstein, Iowa. Filed Mar. 1, 1897. Serial No. 625,622. (No model.)

Claim.—1. In an acetylene-gas generator, the combination of a generating-chamber, a gas-supply pipe leading from the generating-chamber at a point above the supply of calcium carbid and a considerable distance below the top of the chamber, and a comparatively small tube leading from a point near the top of the gas-generating chamber into the said supply-pipe and of such a size that the flow of gas therethrough is comparatively insignificant and yet of sufficient size, so that, when the supply of gas within the generating-chamber has become exhausted, an amount will pass through the said tube sufficient to keep the burners connected with the gas-supply pipe ignited for a short time, for the purposes stated.

2. In an acetylene-gas generator, the combination of a generating-chamber, a gas-supply pipe leading therefrom at a point some distance below its top, a pressure-regulating apparatus having a supply-pipe leading thereinto, a pipe leading from the pressure-regulating apparatus, to supply burners, and a tube of comparatively small size leading from a point in the generating-chamber above the point of discharge of the supply-pipe and into the aforesaid pipe leading from the generating-chamber, all arranged and combined substantially in the manner set forth and for the purposes stated.

3. A device for charging or loading an acetylene-gas generator or the like, comprising a tube designed to be placed in the top of the generating apparatus and communicating with its interior, a gas-tight trap at its upper end portion, and a similar trap near its lower end portion, means for opening and closing said traps, and a device for withdrawing the vaporous contents of the space between the said traps.

4. A device for charging or loading an acetylene-gas generator or the like, comprising a flexible tube arranged to communicate with the interior of the generating-chamber, a gas-tight trap at its upper end portion, a similar trap at its lower end portion, means for opening and closing said traps, and a device for exhausting the vaporous contents of the tube between the traps.

5. A device for charging or loading an acetylene-gas generator, comprising a flexible tube arranged to communicate with the interior of a generating-chamber, a clamp at the top of said tube whereby it may be tightly closed, a similar clamp at the lower end portion of the tube, and a device for exhausting the vaporous contents of the tube between the said clamps.

6. A device for charging or loading an acetylene-gas generator, comprising a flexible tube arranged to communicate with the interior of a gas-generating chamber, four uprights secured to the chamber to inclose the tube, two cross-bars arranged on opposite sides of the tube near its lower end, means for slidingly mounting the bars upon said uprights to be capable of a movement toward each other, two relatively long arms pivoted to the ends of one of said bars, two relatively short arms pivoted to the ends of the other bar and also pivoted to the ends of the aforesaid arms, a similar clamping device supported at the upper ends of the said rods, and a device for exhausting the vaporous contents of the tube between the clamps, substantially as and for the purposes stated.

7. A device for charging or loading an acetylene-gas generator, comprising a metal tube slidingly mounted in the upper end of the gas-generating chamber, a gas-tight packing on the exterior of said tube, a device fixed within the generating-chamber and arranged to seal the lower end of said tube when said tube is lowered, a flexible tube secured to the top of the aforesaid tube, a gas tight trap at the lower end of said flexible tube, a similar trap at the upper end of said tube, and means for exhausting the vaporous contents of said flexible tube between the traps, for the purposes stated.

8. A device for charging or loading an acetylene-gas generator, comprising a metal tube slidingly mounted in the upper end of the gas-generating chamber, one or more elastic rings encircling the upper end portion of said tube to engage the sides of the passage leading to the gas-generating chamber, a cross-piece on the interior of the gas-generating chamber, a disk fixed to the central portion of said cross-piece, a collar on said disk, a cap on top of the collar, a rubber ring round in cross-section mounted on said collar and designed to seal the lower end of the said tube when said tube is in its lowered position, a number of uprights secured to the upper end portion of the said tube, a clamping device substantially as shown and described fixed to the said uprights at their lower end portions, a similar clamping device at the upper end portions of said uprights, a flexible tube connected to and communicating with the aforesaid metal tube and extending upwardly through said clamps, and means for exhausting the vaporous contents of said flexible tube between the clamps, substantially as and for the purposes stated.

9. In an acetylene-gas generator, the combination of a tube communicating with the interior of the generating-chamber, a trap at each end of the tube, a pump, a tube connected with the central portion of the aforesaid tube and with the pump, a valve in said tube, a similar tube leading from the pump to the gas-generating chamber, and a valve in this tube, for the purposes stated.

10. In an acetylene-gas generator, the combination of a tube communicating with the interior of the generating-chamber, a trap at each end of the tube, a pump, a pipe connected with the central

portion of the tube and with the pump, a valve in said pipe, a pipe leading from the pump to the generating-chamber, a valve in said pipe, a cut-off valve in the pipe near the generating-chamber, a branch leading from the said pipe to a point of discharge, and a cut-off valve in said pipe, for the purposes stated.

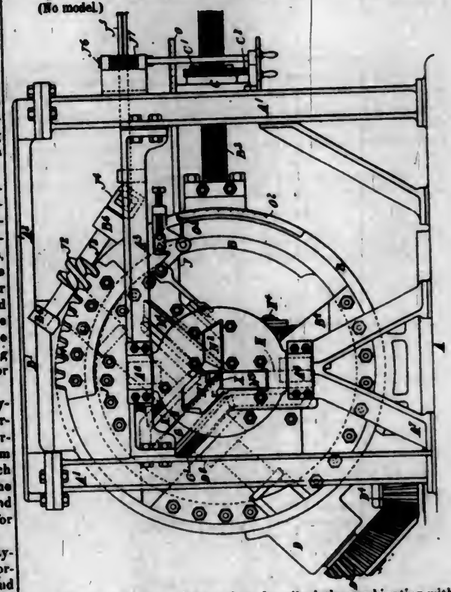
11. In an acetylene-gas generator, the combination of a tube communicating with the interior of the generating-chamber, a trap at each end thereof, a pipe leading from the central portion of said tube, a valve in said pipe, a double-walled cylinder having a space between the walls open at its upper and lower ends and attached to the said cylinder, a cylinder designed to enter the space between the double-walled cylinder, closed at its top and having the said pipe connected therewith, a pipe leading from the same cylinder to the interior of the gas-generating chamber, and a valve in said pipe, substantially as and for the purposes stated.

12. In an acetylene-gas generator, the combination of a flexible tube communicating with the interior of the generating-chamber, a trap near the lower end portion thereof, and a trap near its upper end, a pipe leading from the central portion of said tube, a valve in said pipe, a double-walled cylinder having a space between the walls open at its upper and lower ends and attached to the central cylinder, a cylinder designed to enter the space between the double-walled cylinder, closed at its top and having the said pipe connected therewith, a pipe leading from the same cylinder to the interior of the gas-generating chamber, and a valve in said pipe, substantially as and for the purposes stated.

13. In an acetylene-gas generating apparatus, the combination of two chambers having a pipe to connect them and so arranged that the gas-pressure in the generating-chamber will force the water downwardly in said chamber and upwardly in the other chamber, a water-jacket on the interior and top portion of the generating-chamber to surround and protect the grate, a pipe connecting the interior of the said jacket with the interior of the other chamber to provide means for supplying the jacket with water.

14. In an acetylene-gas generator, the combination of two chambers, a grate at the upper end portion of one of the said chambers, a pipe connecting the chambers at their lower end portions, a water-gage on the generating-chamber numbered from its top downwardly, a like gage on the other chamber numbered in a reverse way and so proportioned relative to each other and to the sizes of the chambers that when the two chambers have been filled until the gages register alike in each the two gages will continue to register alike during the rise and fall of the water in the chambers, as long as the same quantity of water is contained therein.

15. In an acetylene-gas generator, the combination of two chambers, a grate in one chamber, a tube in the top of the chamber leading to the grate, a trap in each end portion of said tube, a pipe leading from the central portion of said tube between the traps, a double-walled cylinder having a space between the walls, open at both ends, and arranged within the other chamber, with said lower end in the water normally contained in said chamber, a top for closing the upper end of the inner part of said double-walled cylinder, a cylinder closed at its top and open at its bottom inserted between the walls of the double cylinder and of a length sufficient to reach the water in the said chamber to form a water seal at its lower end, a pipe leading from the said chamber, and a valve therein, substantially as and for the purposes stated.



16. A device for removing waste calcium carbid from an acetylene-gas generator without exposing said waste, comprising a generating-tank, a tube projecting downwardly from its lower end, a water-tank below the generating-chamber, a tube projecting upwardly from the water-tank, a rubber ring round in cross-section placed on each of said tubes, a larger tube designed to overlap said tubes and the rings thereof, an automatic valve at the top of the upper tube, and means for closing said valve when the said larger tube is lowered, for the purposes stated.

17. A device for removing waste calcium carbid from an acetylene-gas generator without exposing same, comprising a generator-chamber, a tube projecting downwardly therefrom with its lower end flared outwardly, a rubber ring round in cross-section placed on said tube, a cross-bar within the generating-chamber, a rod slidingly mounted in said cross-bar, a ball on said rod designed, when lowered, to close the opening at the lower end of the chamber, a tank below the chamber, a tube projecting upwardly therefrom with its upper ends flared outwardly, a rubber ring round in cross-section placed on the upper end of said tube, a sleeve of larger diameter designed to admit the ends of said tubes and overlap the said rings, an arm on the inner surface of said sleeve to support said rod, substantially as and for the purpose stated.

18. A device for removing waste calcium carbid from an acetylene-gas generator without exposing same, comprising a generating-chamber, a tube projecting downwardly therefrom with its lower end flared outwardly, a rubber ring round in cross-section placed on said tube, a cross-bar within the generating-chamber, a rod slidingly mounted in said cross-bar, a ball on said rod designed, when lowered, to close the opening at the lower end of the chamber, a tank below the chamber, a tube projecting upwardly therefrom with its upper ends flared outwardly, a rubber ring round in cross-section placed on the upper end of said tube, a sleeve of larger diameter designed to admit the ends of said tubes and overlap the said rings, an arm on the inner surface of said sleeve to support said rod, and a cock to connect with the said sleeve, substantially as and for the purposes stated.

19. An acetylene-gas generator, comprising two cylinders, a water-jacket at the upper end portion of one cylinder, a pipe connecting it with the interior of the other cylinder, a grate within the water-jacket, a device for loading the grate with calcium carbid substantially as shown and described, a pump for withdrawing the vaporous contents from the said loading device and discharging said contents either into the generating-chamber or into the top of the other chamber, water-gages on the said chambers numbered in opposite directions as set forth, a gas-supply pipe leading from the generating-chamber into the other chamber bent upwardly therein then coiled and then extended outwardly, a pressure-regulating tank substantially as shown and described having said supply-pipe extending into it, supply-pipe leading from the pressure-regulating tank, a relatively small pipe leading from the top of the generating-chamber into said supply-pipe, a tank below the generating-chamber, means for providing communication between the generating-chamber and said tank, mechanisms substantially as shown and described for breaking the connection between the generating-chamber and the said tank and for closing the lower end of the generating-chamber, all arranged and combined substantially in the manner set forth and for the purposes stated.

606,306. BENDING APPARATUS FOR SHIP-FRAMES. MONTAGUE HERBERT CHURCHILL SEARS and RICHARD ERNEST CHURCHILL SEARS, Shoreham, England. Filed Aug. 7, 1897. Serial No. 647,458. (No model.)

Claim.—1. In a machine such as described, the combination with the main frame, of the roller-frame having segmental guides and the supplemental roller-frame mounted in said guides and movable independently of the main roller-frame to adjust the supplemental frame angularly with relation to the work operated upon: substantially as described.

2. In a machine such as described, the combination with the main frame, of the roller-frame having segmental guides, mechanism for moving the roller-frame horizontally the supplemental roller-frame mounted in the guides on the roller-frame and mechanism for adjusting the position of the supplemental frame angularly with relation to the work operated upon; substantially as described.

3. In a machine such as described, the combination with the main frame, of the roller-frame, having the segmental guides, the supplemental roller-frame mounted in said guides and mechanism for simultaneously adjusting the roller-frame horizontally and the supplemental frame angularly with relation to the work operated upon; substantially as described.

4. In a machine such as described, the combination with the main frame, of the frame carrying the fixed guide-rollers, the supplemental frame carried thereby and movable in an arc at right angles to the work fed through the guides, and the forming-guides carried by the supplemental frame substantially as described.

5. In a machine such as described, the combination with the main frame of the circular roller-frame, mechanism for moving said frame horizontally and guides for said circular frame; substantially as described.

6. In a machine such as described, the combination with the base-plate and bridge-bar, of the main frame having the guides therein, of the circular frame having the bracket and rib or projection thereon, received respectively in the guides of the base-plate and bridge-bar, the one rotating screw secured to said ring, the nut with which the screw engages, the worm-wheel and shaft; substantially as described.

7. In a machine such as described, the combination with the main frame, of the circular ring, the plate or frame mounted in guides in the upper part of the ring, the curved rack mounted on the plate, the shaft carrying the worm meshing with said rack and means for rotating the shaft whereby the plate may be partially rotated; substantially as described.

8. In a machine such as described, the combination with the main frame, of the circular ring, the plate mounted in guides in the upper part of the ring, the curved rack mounted on the plate, the worm-shaft mounted on the ring, the shaft for driving said worm-shaft, the universal connection between said shafts, the worm-wheel, and the feather-and-groove connection between said worm-wheel and driving-shaft; substantially as described.

9. In a machine such as described, the combination with the main frame, of the circular ring, the hollow inclined shaft D^2 supported in bearings on the ring, the shaft F received within the shaft D^2 movable longitudinally therein but not independently rotatable, the frame J carried by the ring, the inclined shaft carried by said frame and having a central passage, the shaft K received therein, and the universal connection between the shafts K and F; substantially as described.

10. In a machine such as described, the combination with the circular ring, the hollow inclined shaft D^2, having the enlarged end, the roller carried thereby, the bevel-gear thereon, the frame at the lower portion of the ring, the roller H formed with hollow bosses, the eccentrically-bored bushes mounted in bearings on the plate within which are received the bosses of the roller, means for moving the bushes to move the roll nearer to the roller G and gear on the roller H with which meshes the gear on the roll G; substantially as described.

11. In a machine such as described, the combination with the main frame, the roller-frame movable longitudinally therein, the fixed drive-shaft, the pinion carried by said shaft and movable longitudinally thereon the train of gearing carried by the roller-frame operatively connected with said drive-pinion; substantially as and for the purpose set forth.

606,307. ANTIRATTLING THILL-COUPLING. WILLIAM E. SHERWOOD, Oneida, N. Y. Filed Aug. 3, 1897. Serial No. 646,976. (No model.)

Claim.—The combination with the axle-clip and thill-iron, a coupling-pin provided with a squared end adapted to fit in a correspondingly-shaped opening in the clip-ear, a projecting bifurcated head for said coupling-pin, a frame having end and side flanges adapted to engage an elastic block and secure the same therein, an upwardly-projecting arm on one end of said frame adapted to fit between the bifurcations formed in the coupling-pin head, a locking-lever pivoted to the other end of said frame, a link pivoted to the locking-lever eccentric with the pivot of said lever, said link being adapted to engage a groove in the projecting end of the coupling-pin, substantially as described.

606,308. BRAKE-BEAM FOR RAILWAY-CARS. THOMAS H. SIMPSON and PHILIP T. HARRISON, Detroit, Mich., assignors to the Monarch Brake-Beam Company, Limited, same place. Filed Jan. 3, 1898. Serial No. 666,318. (No model.)

Claim.—1. A brake-head formed with transverse ribs intermediate the extremities of the head through which the head is bolted to the brake-beam body, said head provided with marginal strengthening-ribs extending from said transverse ribs to the extremities of the head, and with an additional rib located toward one of the outer extremities of said head and connecting the adjacent marginal ribs or braces, said connecting-rib provided with an orifice extending longitudinally of the brake-head, for the purpose set forth.

2. The combination with a brake-beam body, of a guide-pin, and a clip to engage the pin with the body, the inner end of said pin formed with a slot or recess to engage the marginal edge of said body, substantially as set forth.

606,309. NON-REFILLABLE BOTTLE. HENRY STRAWSON, Bradley, Ill. Filed June 21, 1897. Serial No. 641,635. (No model.)

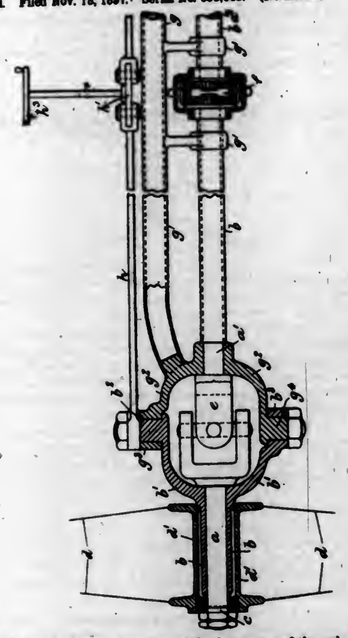
Claim.—1. In combination with a bottle, a neck provided with an external breaking-groove extending approximately half-way thereabout, and an internal breaking-groove extending approximately the remainder of the distance thereabout.

2. In combination with a bottle, a neck provided with an external breaking-groove extending approximately half-way thereabout, an internal breaking-groove extending approximately the remainder of the distance, and shoulders formed beneath said breaking-grooves, a stopper held against said shoulders beneath said breaking-grooves, and a sealing device held above said stopper.

3. In combination with a bottle, a neck having shoulders formed at the lower end thereof, an external breaking-groove extending approximately half-way around said neck, an internal breaking-groove extending approximately the remainder of the distance, and a notch formed on the inside of said neck adjacent to and communicating with said internal breaking-groove to rest against said shoulders, a stopper provided with an annular groove held in the upper portion of said neck above said breaking-grooves, and a spring consisting of a piece of resilient metal formed to fit the annular groove in the stopper and provided with ends extending up into the recess, said ends normally pressing outwardly therefrom.

606,310. DEVICE FOR HEATING WATER BY STEAM. ROBERT STRATTON, Detroit, Mich. Filed Feb. 14, 1898. Serial No. 670,171. (No model.)

Claim.—1. In a device for heating water, the combination of a hollow steam-head having means for connecting it to a source of steam, a series of open-ended combining-tubes at right angles to the steam-head, a fin on the body of the steam-head to which the inner ends of said combining-tubes are united, said fin having apertures leading from the steam-head into the combining-tubes and forming segmental openings for the admission of water into the tubes on opposite sides of the fin.



2. In a device for heating water, the combination of a hollow steam-head having means for connecting it to a source of steam, two series of open-ended combining-tubes arranged upon opposite sides thereof at right angles thereto, and two fins formed correspondingly on opposite sides of the body and to which the combining-tubes are united, said fins forming dividing-partitions across the inner ends of the combining-tubes and having perforations for admitting steam into said tubes.

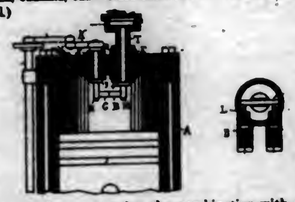
3. In a device for heating water, the combination of the hollow

steam-head formed with male and female coupling members at its opposite ends and one or more rows of combining-tubes united to the steam-head by longitudinal fins integrally cast with the steam-head and combining-tubes, and steam-passages in said fins from the steam-head into the combining-tubes.

4. In a device for heating water, the combination of the hollow steam-head formed with male and female coupling members at its opposite ends respectively, the fins C formed on opposite sides of said steam-head, the grooves D formed correspondingly therewith in the steam-head, the open-ended combining-tubes B united at their inner ends to the fins, the segmental water-inlets c into the combining-tubes and the steam-passages E extending from the grooves in the steam-head into the mouth of the combining-tubes.

606,811. DRIVING-GEAR FOR MOTOR-CARS. WILLIAM SYDENHAM, FREDERICK WATKINSON, and ARTHUR SYDENHAM, London, England. Filed Nov. 18, 1897. Serial No. 658,015. (No model.)

Claim.—1. The combination of the four parts of the axle, differential gear connecting the two middle parts, parallelograms connecting the middle and outer parts, joints at the angles of the parallelograms and axial joints in their sides.



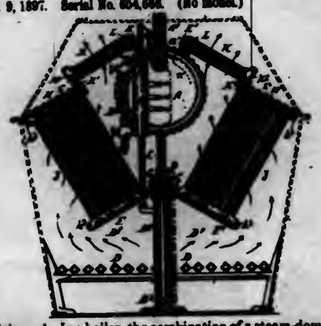
2. The combination of the four parts of the axle, differential gearing connecting the two middle parts, universal joints connecting the middle and outer parts, four sleeves forming bearings for the four parts of the axle, vertical joints connecting the outer and middle sleeves, and means for turning the outer sleeves about the joints.

3. The combination of the four parts of the axle, differential gear connecting the two middle parts, parallelograms connecting the middle and outer parts, joints at the angles of the parallelograms, axial joints in their sides, four sleeves forming bearings for the parts, vertical joints connecting the outer and middle sleeves and means for turning the outer sleeves about the joints.

4. The combination of the four parts of the axle, differential gear connecting the two middle parts, universal joints connecting the middle and outer parts, four sleeves forming bearings for the parts, vertical joints connecting the outer and middle sleeves, pinions fixed to the outer sleeves, racks gearing with the pinions, and a cam actuated by the steering-gear traversing the racks.

5. The combination of the four parts of the axle, differential gear connecting the two middle parts, parallelograms connecting the middle and outer parts, joints at the angles of the parallelograms, axial joints in their sides, four sleeves forming bearings for the parts, vertical joints connecting the outer and middle sleeves, pinions fixed to the outer sleeves, racks gearing with the pinions and a cam actuated by the steering-gear traversing the racks.

606,812. ELECTRIC IGNITER FOR GAS-ENGINES. ARNOLD J. TAGKLE, Oakland, Cal. Filed Oct. 6, 1897. Serial No. 654,155. (No model.)



Claim.—1. In a gas-engine, the combination with the cylinder or combustion-chamber thereof, a bushing extending into cylinder or combustion-chamber through which a stem actuated by some moving part of the engine passes, carrying upon its inner end an electrode connected to one terminal of an electric circuit, a spring-controlled stem having a bar coming in contact with yielding pins rigidly fastened to its outer end, passing into cylinder or combustion-chamber through a sleeve mounted in an insulated bushing and carrying upon its inner end an electrode for yielding engagement with the first-mentioned electrode, which may travel in either direction and being connected with other terminal of electric circuit.

2. In a gas-engine, the combination with the cylinder or combustion-chamber thereof, of a positively-actuated electrode for coming in contact with a second movable electrode having a rigid cross-bar on the outer end of its stem, said stem passing into cylinder through an insulated sleeve having at its outer end an enlargement to receive said bar and two chambers opening into said enlarged part of sleeve, and a spring-seated pin having an enlarged head contained within each of said chambers and bearing respectively against opposite ends and on one and the same, side of said bar.

3. In an electric igniter, the combination with a positively-actuated electrode of a second movable electrode having a rigid cross-bar on the outer end of its stem, an insulated sleeve surrounding said stem and having at its outer end an enlargement to receive said bar, and two spring-seated pins carried by said sleeve and bearing respectively against opposite ends and on one and the same side, of said bar.

606,818. SECTIONAL BOILER. HARRISON H. TAYLOR, Detroit, Mich., assignor of one-half to George Thrall, Grosse Isle, Mich. Filed Oct. 9, 1897. Serial No. 654,666. (No model.)

Claim.—1. In a boiler, the combination of a steam-dome, a water-distributing pipe located thereabeneath and communicating therewith, and a series of steam-generating sections on opposite sides thereof connected at the base with the water-distributing pipe, and at the top with the steam-dome, the sections on opposite sides of the dome and pipe diverging at their upper ends, substantially as set forth.

2. In a boiler, the combination of a steam-dome, a water-distributing pipe located under the longitudinal center of the dome, and a series of sections on opposite sides thereof each consisting of a lower manifold and an upper manifold united by vertical uptake-pipes, each of said lower manifolds outwardly and downwardly inclined from the water-distributing pipe and connected therewith, and each of the upper manifolds similarly inclined and connected with the steam-dome, the outer extremities of said manifolds diverging on opposite sides of the dome and pipe, substantially as set forth.

3. In a boiler, the combination of a steam-dome, a water-distributing pipe, a series of vertical pipes connecting the distributing-pipe and dome, and a series of independent steam-generating sections on opposite sides thereof connected at the base with the distributing-pipe, and at the upper end thereof connected with the steam-dome, each of said sections constructed with a lower and with an upper manifold, said manifolds connected by uptake-pipes, outwardly diverging on opposite sides of the dome, substantially as set forth.

4. In a boiler, the combination of a steam-dome, a water-distributing pipe parallel therewith and therebeneath, a series of pipes connecting the distributing-pipe with the bottom of the dome, and boiler-sections outwardly diverging at their upper ends on opposite sides of the dome, said sections connected at their base with the distributing-pipe and at their upper ends with the dome, substantially as set forth.

5. In a boiler, the combination of an elongated steam-dome, an elongated distributing-pipe extending longitudinally of the dome and therebeneath, a series of pipes connecting the distributing-pipe with the base of the dome, a series of lower manifolds extending at a downward and outward incline on each side the distributing-pipe and connected therewith, a series of upper manifolds on each side the dome parallel with the lower manifolds, and a series of uptakes connecting the upper and lower manifolds, said upper manifolds connected with the steam-dome, said uptakes on opposite sides of the dome and pipe being outwardly diverging at their upper ends, substantially as set forth.

6. In a boiler, the combination of an elongated steam-dome, a water-distributing pipe underneath the dome and extending longitudinally therewith, a series of sections on opposite sides thereof constructed with upper and lower parallel manifolds connected by uptakes outwardly inclined at their upper ends on opposite sides of the dome and pipe, right and left hand threaded nipples connecting the lower manifolds separately into the distributing-pipe, a series of pipes parallel with said nipples connected into the steam-dome, and a series of right and left hand threaded nipples connecting the last-named pipes into the upper manifolds, substantially as set forth.

7. In a boiler, the combination of an elongated steam-dome, an elongated water-distributing pipe, a series of connecting-pipes connecting the distributing-pipe with the base of the dome, a series of lower manifolds connected with the distributing-pipe, a series of upper manifolds connected into the steam-dome, and a series of uptake-pipes connecting each of the lower manifolds with the corresponding upper manifolds, the upper ends of the uptake-pipes having an enlarged threaded head, and the upper manifold constructed with openings to permit the passage of the lower end of the uptake-pipes therethrough to engage the lower manifold, substantially as set forth.

8. In a boiler, the combination of a steam-dome, a water-distributing pipe therebeneath, a series of pipes connecting the distributing-pipe with the dome, and a series of sectional steam-generators on opposite sides thereof communicating at their base with the distributing-pipe, and at their upper ends with the steam-dome, said sections outwardly diverging at their upper ends on opposite sides of the dome and pipe, substantially as set forth.

9. In a boiler, the combination of a steam-dome, a supporting water-distributing pipe therebeneath and communicating therewith, a series of lower manifolds communicating with the distributing-pipe and forming a crown-sheet above the grate, a series of upper manifolds, a series of pipes connecting the upper and lower manifolds, a series of pipes leading into the steam-dome, and connections uniting said latter pipes with the upper manifolds, substantially as set forth.

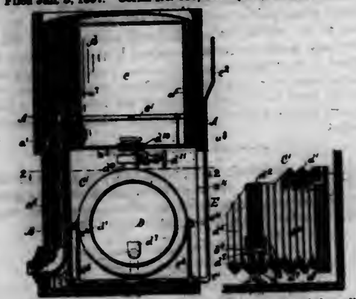
10. In a boiler, the combination of a steam-dome, a water-distributing pipe connected therewith, lower manifolds on opposite sides thereof connected with the distributing-pipe, upper manifolds on opposite sides of the dome and pipe connected with the dome, and uptake-pipes connecting the manifolds, the upper manifold provided with plugs on the upper side for cleaning the uptakes, said uptakes diverging at their upper ends on opposite sides of the dome and pipe, substantially as and for the purpose described.

11. In a boiler, the combination of a steam-dome, a water-distributing pipe connected therewith, lower manifolds on opposite sides thereof connected with the distributing-pipe, upper manifolds on opposite sides of the dome and pipe connected with the dome, and uptake-pipes connecting the manifolds, said uptakes diverging at their upper ends on opposite sides of the dome and pipe, said manifolds provided with plugs at one end thereof, substantially as and for the purpose described.

12. In a boiler, the combination of a steam-dome, a water-distributing pipe connected therewith, lower manifolds on opposite sides thereof connected with the distributing-pipe, upper manifolds on opposite sides of the dome and pipe connected with the dome, and uptake-pipes connecting said manifolds, respectively, said uptakes diverging at their upper ends on opposite sides of the dome and pipe, and said lower manifolds assembled close together, substantially as and for the purpose set forth.

13. In a boiler, the combination of a steam-dome, a water-distributing pipe connected therewith, lower manifolds on opposite sides thereof connected with said pipe, upper manifolds on opposite sides of the dome and pipe connected with said dome, and uptake-pipes connecting said manifolds, the upper and lower manifolds, respectively, assembled close together forming a flue therebetween, said uptakes diverging at their upper ends on opposite sides of the dome and pipe, substantially as set forth.

14. In a boiler, the combination of a steam-dome, a water-distributing pipe connected therewith, lower manifolds on opposite sides thereof connected with said pipe, upper manifolds on opposite sides of the dome and pipe connected with said dome, and uptake-pipes connecting said manifolds, said uptake-pipes diverging at their upper ends on opposite sides of the dome and pipe and constructed with right-hand threads at their extremities of less diameter at the bottom than at the top, whereby said uptake-pipes may be simultaneously connected with the corresponding upper and lower manifolds, substantially as set forth.



15. In a boiler, the combination of a steam-dome, a water-distributing pipe connected therewith, steam-generating sections connected at their lower ends with said pipes, and additional pipes connecting the upper ends of said sections with the steam-dome, said dome provided with an interior shield beneath the adjacent ends of the last-mentioned pipes, substantially as set forth.

606,814. BICYCLE-SEAT. WILLIAM H. THOMAS, Indianapolis, Ind. Filed Oct. 22, 1896. Serial No. 609,661. (No model.)

Claim.—The combination with a rigid bicycle-seat and the saddle post of a bicycle, of a spring-frame secured to the seat at a single point, said frame comprising two oppositely-coiled springs, forward horizontal projections from the top of each coil and similar rearward projections from the bottom of said coils, said bottom projections being united and secured to the saddle-post whereby the torsional elasticity of said arms will be developed, all substantially as described and for the purposes specified.

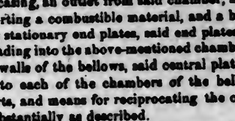
606,815. SMOKE-CONSUMER. THOMAS THOMSON, Scranton, Pa. Filed Jan. 5, 1897. Serial No. 618,047. (No model.)

Claim.—1. A drain-testing apparatus of the kind described comprising a casing, a chamber in said casing, said chamber having its outer walls placed a distance from the inner faces of the walls of the casing, an outlet from said chamber; means in the chamber for supporting a combustible material, and bellows for supplying a current of air to the chamber on the side of the combustible material opposite the outlet and a bell fitting over the chamber, said bell having its sides depending in the space between the walls of the chamber and the inner faces of the casing and there immersed in a sealing fluid so as to adapt it to be raised by the pressure of the air created by the operation of the bellows aforesaid and provide a steady pressure on the drain to be tested, substantially as and for the purpose described.

2. In combination with a drain-testing device a casing and chamber within said casing and means within the chamber for supporting a combustible material, means for supplying a current of air into the chamber and an outlet opposite the combustible material from that in which the air is supplied, and a bell fitting over the chamber having its sides immersed in a sealing fluid between the walls of the cham-

ber to the inner faces of an outer casing, and the said bell adapted to be raised or lowered by the pressure of the air which may be pumped into it, and means for pumping the air into said chamber, substantially as specified.

3. An apparatus of the character indicated, comprising a casing, a chamber in said casing, an outlet from said chamber, means in the chamber for supporting a combustible material, and a bellows, said bellows comprising stationary end plates, said end plates being provided with ports leading into the above-mentioned chamber, a central plate between the walls of the bellows, said central plate having an inlet-port leading to each of the chambers of the bellows, valves upon said inlet-ports, and means for reciprocating the central plate of the bellows; substantially as described.



4. An apparatus of the character indicated, comprising a casing, a chamber in said casing, means in said chamber for supporting a combustible material, an outlet from said chamber, means for supplying a current of air to said chamber on the side of the combustible material opposite the outlet, and means for closing the passage into the chamber from the member for supplying the air thereto; substantially as described.

5. An apparatus of the character indicated, comprising a casing, a chamber in said casing, means in said chamber for supporting a combustible material, an outlet from said chamber, means for supplying a current of air to said chamber on the side of the combustible material opposite the outlet, and a positively-operative valve in the passage between the chamber and the member for supplying air thereto.

6. An apparatus of the character indicated, comprising a casing, a chamber in said casing, means for supporting a combustible material in said chamber, an outlet from said chamber, a bellows communicating with said chamber, said bellows comprising stationary end plates, said end plates being provided with valved ports leading into the chamber, a central plate attached to the walls of said bellows, said central plate having an inlet-port leading into each of the chambers of the bellows, valves upon said inlet-ports, a transverse rock-shaft, arms upon said shaft, pivots securing said arms to the central plate of the bellows, and an operating-lever upon said shaft; substantially as described.

7. An apparatus of the character indicated, comprising a casing, an upright partition or wall within said casing, a downwardly-extending tube or water-leg situated between said upright partition or wall and the wall of the casing, an outlet-pipe in said tube or water-leg and casing, said outlet-pipe having its upper end open, a bell covering the chamber C and the open end of the outlet-pipe, a grate across said chamber adapted to supporting combustible material, a bellows in the compartment below said chamber, said bellows comprising stationary end plates, said end plates having valved ports leading into the chamber, a central plate attached to the walls of said bellows, said central plate having an inlet-port with openings into the two chambers of the bellows, valves upon said inlet-ports into the bellows-chambers, positively-operative valves in the outlet-ports from the bellows to the first-mentioned chamber, a shaft mounted below the bellows, arms extending from said shaft; pivots upon said arms securing the same to the central plate of the bellows, and a crank-arm upon said shaft adapted to reciprocate the same, substantially as described.

606,816. SPRING-PROTECTING DEVICE FOR RAILWAY COUPLING ATTACHMENTS. William Thornburgh, Shelby, Ohio, assignor to the Thornburgh Coupler Attachments Company, Limited, Detroit, Mich. Filed Nov. 19, 1897. Serial No. 659,085. (No model.)

Claim.—1. In a spring-protecting device for railway-couplers, a draft-spring housing provided with two followers, springs arranged tandem within said housing, and means to separate said springs from each other at their adjacent ends, said followers arranged to abut one against the other to limit the compression of the springs, for the purpose described.

2. A spring-protecting device for railway-couplers consisting of followers, a spring housed in each of said followers, and separated the one from the other, said followers constructed to abut the one against the other to limit the compression of said springs, substantially as described.

3. A spring-protecting device for railway-couplers consisting of followers, a spring housed in each of said followers, and separated thereby the one from the other, said followers constructed to abut the one against the other to limit the compression of said springs, substantially as described.

4. A spring-protecting device for railway-couplers consisting of interlocked followers constructed to abut the one against the other to limit the compression of said springs, one of said followers constructed of separable sections to engage the interlocking portion of the other follower, substantially as described.

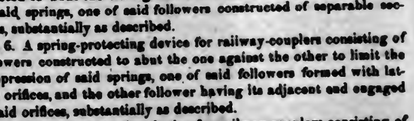
5. A spring-protecting device for railway-couplers consisting of followers arranged to engage tandem springs, said followers constructed to abut the one against the other to limit the compression of said springs, one of said followers constructed of separable sections, substantially as described.

6. A spring-protecting device for railway-couplers consisting of followers constructed to abut the one against the other to limit the compression of said springs, one of said followers formed with lateral orifices, and the other follower having its adjacent end engaged in said orifices, substantially as described.

7. A spring-protecting device for railway-couplers consisting of followers arranged to engage tandem springs, said followers constructed to abut the one against the other to limit the compression of said springs, one of said followers formed with lateral orifices, and the other follower having its adjacent end engaged in said orifices, substantially as described.

8. The spring-protecting followers herein described, consisting of two box-shaped followers the one interlocked with the other, whereby each of said followers may have a limited movement toward and from the other, substantially as described.

9. A spring-protecting device consisting of two followers having their adjacent ends G^2, and G^4 interlocked to limit the movement of each of said followers, one of said followers formed with lateral orifices to receive the adjacent end of the opposite follower, substantially as described.



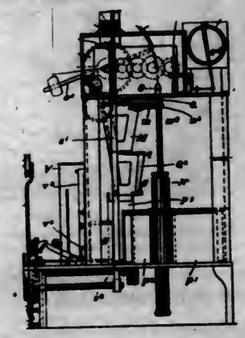
10. The combination with a draft-spring housing constructed with side walls having inwardly-projecting shoulders or stops toward the opposite extremities thereof, and with intermediate recesses, of spring-protecting followers arranged to move back and forth in said recesses, and independent springs separated one from the other located within said housing, said followers arranged to abut the one against the other to limit the compression of the springs as said housings move one toward the other, the opposite movements of the housings being limited by said stops, substantially as described.

11. The combination with a draft-spring housing, constructed with side walls having inwardly-projecting shoulders or stops toward the opposite extremities thereof, and with intermediate recesses, of spring-protecting followers arranged to move back and forth in said recesses, and independent springs arranged tandem and separated one from another located within said housing, said followers arranged to abut the one against the other to limit the compression of the springs as said housings move one toward the other, the opposite movements of the housings being limited by said stops, substantially as described.

12. In a spring-protecting device for railway-couplers, a draft-spring housing, a yoke, springs arranged tandem in said housing, means to separate said springs from each other at their adjacent ends, and two followers arranged within said housing to abut the one against the other to limit the compression of the springs, substantially as described.

13. A spring-protecting device for railway-couplers consisting of two followers, independent springs housed in said followers and separated the one from the other, said followers constructed to abut the one against the other to limit the compression of said springs, substantially as set forth.

606,817. WRENCH. George B. Van Scholck, Coldwater, Mich., assignor of one-half to F. W. Stewart, same place. Filed Nov. 30, 1897. Serial No. 660,944. (No model.)



Claim.—1. In a wrench, the combination of a shank provided with teeth, a stationary jaw mounted on the shank, a sliding jaw arranged on the latter and provided with an opening or way to receive the same, a dog loosely arranged within the sliding jaw and provided with teeth for engaging the shank, an operating-lever pivoted between its ends to the dog, and a link pivoted to the lever and to the sliding jaw and forming a toggle connection between the dog and the sliding jaw, substantially as and for the purpose described.

2. In a wrench, the combination of a shank provided with teeth, a stationary jaw mounted on the shank, a sliding jaw arranged on the latter and provided with an opening or way to receive the same, a dog loosely arranged within the sliding jaw and provided with teeth for engaging the shank, an operating-lever pivoted between its ends to the dog, a link pivoted to the lever and to the sliding jaw and forming a toggle connection between the dog and the sliding jaw, and a spring engaging the toggle connection and adapted to break the same to throw the dog out of engagement with the shank, substantially as described.

3. In a wrench, the combination of a shank provided with a stationary jaw, a sliding jaw mounted on the shank and having a casing provided with notches, a dog arranged within the casing, a lever pivoted between its ends to the dog, a link connecting the lever and the sliding jaw and forming a toggle connection, said link being provided at its outer edge with a notch, a spring engaging the notch of the link and provided with legs fitting in the notches of the casing, and a stop forming a support for the spring between the ends of the same, substantially as described.

4. In a wrench, the combination of a shank provided with teeth, a stationary jaw, a sliding jaw composed of a casing and a block arranged between the sides of the casing and provided with a recess forming a face arranged at an angle to the shank and serving as a stop, a dog arranged within the sliding jaw, a lever pivoted between its ends to the dog, a link connecting the lever and the sliding jaw and arranged to engage the said face, and a spring for holding the link normally in engagement with the face of the block, substantially as described.

606,818. AUTOMATIC APPARATUS FOR TAKING PHOTOGRAPHS. Robert W. Venus, London, England. Filed Mar. 23, 1898. Serial No. 675,494. (No model.)

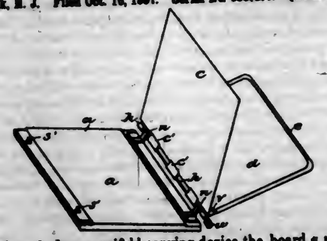
Claim.—1. In an automatic photographic machine, the combination with the tanks adapted to contain the developing and fixing solutions, carrier mechanism for immersing the negative successively in the solutions, suitable motor mechanism for operating said carrier mechanism, and a thermostat for controlling the speed of the motor mechanism.

2. In an automatic photographic machine, the combination with the tanks adapted to contain the developing and fixing solutions, heating means adapted to heat the solutions in the tanks, a thermostat adapted to control the supply of heat to maintain said solutions at a constantly even temperature, carrier mechanism for immersing the negative in said solutions, substantially as described.

3. In an automatic photographic machine, the combination with the tanks for the developing and fixing solutions, carrier mechanism for immersing the negatives successively in said solutions, the motor mechanism for operating said carrier mechanism, the fler for governing the speed of said motor mechanism and having adjustable wings, a thermostat and connections therefrom to the adjustable wings for regulating the speed of the motor according to the temperature, substantially as described.

4. In an automatic photographic apparatus, the combination with the tanks for the developing and fixing solutions arranged upon different levels, of the carrier mechanism comprising an upper carrier adapted to immerse the negative in the upper developing-tank, a lower carrier adapted to immerse the negative in the fixing solution, and means for effecting the transfer of the negative from one carrier to the other, substantially as described.

5. In an automatic photographic machine, in combination, a lens and shutter, a holder for the sensitive surfaces, in rear of said lens, tanks for containing the developing and fixing solutions, the carrier mechanism in duplicate for receiving the exposed negative and immersing it in the solutions, the clock mechanism, the timing-disk operated by said clock mechanism, and connections from said timing-disk to the shutter and carrier mechanism, whereby the operation of said parts and the transfer of the negative are effected by the clock mechanism, substantially as described.

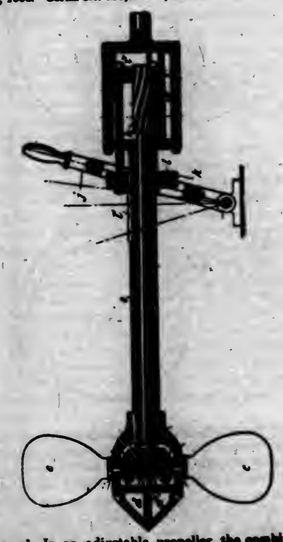


606,819. AUGER. Henry G. Watrous, Wallingford, Conn. Filed Nov. 16, 1897. Serial No. 658,676. (No model.)

Claim.—In a boring-tool, the combination of two parallel ribs, coiling around a common axis, and terminally provided, one with a router and side lip, and the other with a heel, which has two contiguous inclined faces, situated at a predetermined distance behind the path of the router, substantially as and for the purpose specified.

606,820. WITHDRAWN.

606,821. MANIFOLDING-BOOK. Howard Whitfield, Red Bank, N. J. Filed Oct. 16, 1897. Serial No. 655,409. (No model.)

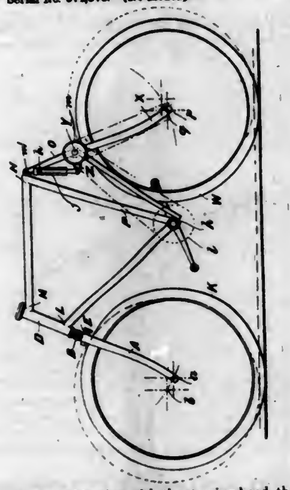


Claim.—1. In a manifold-copying device the board *a* provided with the foundation-leaf *c* and frame *c*, hinged to one side of the board *a* by means of the rod *h*, the frame *c* carrying the carbon *d* in combination with a suitable pad as *d'* secured to the opposite side of the board *a*, substantially as described.

2. The grooved arbon-carrying frame *c* hinged to the board *a* by means of the detachable clamps *r* and rod *h* in combination with a manifold book or pad as *b* and foundation-leaf *c*, substantially as set forth.

3. In a manifold-copying device the carbon-carrying frame *c*, having its edges grooved as described, in combination with a carbon-sheet having its edges reinforced to hold it within the said frame, substantially as described.

606,822. SCREW-PROPELLER. Paul A. H. Wirard, Philadelphia, Pa., assignor to the Otto Gas Engine Works, same place. Filed Jan. 13, 1898. Serial No. 676,964. (No model.)



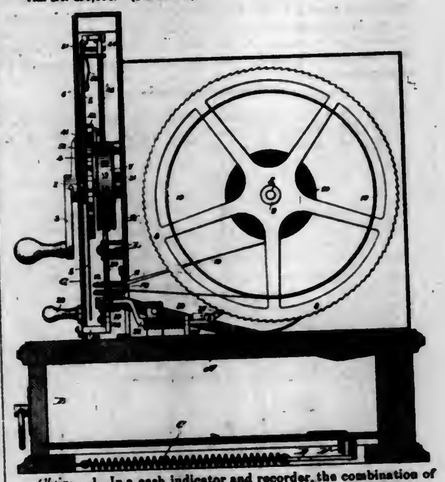
Claim.—1. In an adjustable propeller, the combination of the rotary propeller-driving shaft, consisting of a hollow portion *a*, and a second portion *a'* connected therewith outside of the circumference

of the hollow portion of the shaft, whereby a chamber or space of greater diameter than the hollow shaft is provided between the two portions of the shaft, a propeller-hub carried by the hollow portion of the shaft, propeller-blades mounted in the hub by radially-arranged journals, an adjusting-shaft located within the hollow shaft and rotating therewith, but capable of independent rotary adjustment, motion-communicating means between the end of the adjusting-shaft and the propeller-blades, mechanism located in the space between the two portions of the propeller-driving shaft, operatively connected with the adjusting-shaft and rotating with both shafts, and a shaft-adjusting device stationary with reference to the rotation of said shafts and operatively connected with said mechanism by a loose or sliding connection, whereby the pitch of the blades may be changed while they are being revolved.

2. In an adjustable propeller, the combination of the rotary propeller-driving shaft, consisting of a hollow portion *a*, and a second portion *a'* connected therewith outside of the circumference of the hollow portion of the shaft, whereby a chamber or space of greater diameter than the hollow shaft is provided between the two portions of the shaft, a propeller-hub carried by the hollow portion of the shaft, propeller-blades mounted in the hub by radially-arranged journals, an adjusting-shaft located within the hollow shaft and rotating therewith, but capable of independent rotary adjustment, motion-communicating means between the end of the adjusting shaft and the propeller-blades, mechanism located in the space between the two portions of the propeller-driving shaft, operatively connected with the adjusting-shaft and rotating with both shafts, a ring connected with said mechanism sliding in the hollow portion of the shaft and rotating therewith, a device or lever stationary with reference to the rotation of both shafts and connected with said ring to slide it in the hollow portion of the shaft to effect the adjustment of the pitch of the blades while they are being revolved.

3. In an adjustable propeller, the combination of a hollow shaft having an enlarged chamber, a shaft in the hollow shaft held against end play but free to rotate therein, a quick-pitch screw on the end of this shaft, a nut fitted on this screw and held in the chamber so as to be movable only longitudinally therein, an operating-lever, a sleeve fitted to slide on the hollow shaft, a trunnioned ring connecting the sleeve and the lever, rods extending from the sleeve through the end or head of the chamber to the quick-pitch nut, and an adjustable screw-propeller on the end of the hollow shaft and controlled and adjusted by the interoal shaft.

606,828. CYCLE. JOHN A. WROBSKI, Bortid, Russia. Filed Mar. 18, 1898. Serial No. 674,376. (No model.)



Claim.—1. In combination with the steering-head, the bolt B at the lower end thereof, the forks A, A, at opposite ends of the bolt, the ball-bearings B^3 between the forks and the steering-head, the spring-barrel extending transversely of the forks, and an arm extending down from the steering-head in between the forks, and connected with the spring in the barrel, substantially as described.

2. In combination, the frame having a rigid portion N, O, P, the rear fork X, the pivotal connection for the rear forks arranged at the end of the part O, a spring i for applying tension to the said rear forks, a barrel *j* containing said spring, a cross-head h bearing on the spring, the links and arms *z* connected with the fork X the said barrel depending in rear of the seat-standard, and sprocket connections between the crank-axle and the pivotal connection and between said pivotal connection and the rear wheel, said pivotal connection including a shaft carrying sprocket-wheels, substantially as described.

3. In combination with the front forks pivoted to the steering-head at their upper ends, a barrel E extending between the forks transversely thereof and having a spring therein, the arm connected with the steering-head and extending into the said barrel to be under pressure of the spring and having a finger-piece *c* to bear on the outer side of the barrel, substantially as described.

606,324. CASH INDICATOR AND RECORDER. WILLIAM W. WYTHE and WILLIAM H. WYTHE, Orange, N. J., assignors to the National Cash Register Company, Dayton, Ohio. Filed Oct. 26, 1893. Serial No. 450,088. (No model.)

Claim.—1. In a cash indicator and recorder, the combination of a shaft, an indicating-dial and a type-wheel fast thereon side by side, the indicating-dial being provided on its face with a series of indicating-numbers exposable singly through a sight-opening in the casing, and the type-wheel being provided with a series of type-numbers on its periphery, a platen coöperating with the type-wheel, feeding mechanism for moving the record-strip past the printing-point, an operating-handle, and connections between said handle and the feeding mechanism and platen, to advance the record-strip and effect the printing by the operation of said handle.

2. In a cash indicator and recorder, the combination of a shaft, an indicating-dial and a type-wheel fast thereon, a platen coöperating with the type-wheel, an automatically-opening cash-drawer, a lock for holding the same closed, an operating-handle independent of the drawer, and connections between said handle and the platen and drawer-lock, for effecting the printing and releasing the drawer by the operation of said handle.

3. In a cash indicator and recorder, the combination of a casing having a sight-opening shaft, an indicating-dial fast thereon and provided upon its face with a series of indicating-numbers exposable singly at the sight-opening in the casing, a type-wheel also fast upon said shaft and provided with a series of type-numbers on its periphery, a platen coöperating with the type-wheel, feeding mechanism for moving the record-strip past the printing-point, a cash-drawer, a lock therefor, an operating-handle, and connections between said handle and the feeding mechanism, platen and drawer-lock, for advancing the record-strip, effecting the printing and releasing the drawer by the operation of said handle.

4. In a cash indicator and recorder, the combination of a shaft, an indicating dial and a type-wheel fast thereon, a platen coöperating with the type-wheel, feeding mechanism for moving the record-strip past the printing-point, an automatically-opening cash-drawer, a lock therefor, a gong, a striker therefor, an operating-handle independent of the cash-drawer, and connections between said handle and the feeding mechanism, platen, drawer-lock and gong-striker, for advancing the record-strip, effecting the printing, releasing the drawer and sounding the gong by the operation of said handle.

5. In a cash indicator and recorder, the combination of a shaft,

an indicating-dial and a type-wheel fast side by side thereon, a spring-actuated platen coöperating with the type-wheel, feeding mechanism for advancing the record-strip, an operating-lever, and connections between said lever and the feeding mechanism and platen, for advancing the record-strip and retracting the platen to effect the printing by the positive stroke of said lever.

6. In a cash indicator and recorder, the combination of a shaft, an indicating-dial and a type-wheel fast thereon, a spring-actuated platen coöperating with the type-wheel, feeding mechanism for moving the record-strip past the printing-point, an automatically-opening cash-drawer, a lock therefor, an operating-lever independent of the drawer, and actuating connections between said lever and the feeding mechanism, platen, and drawer-lock, for the purpose described.

7. In a cash-indicator, the combination of a casing provided with a sight-opening, an indicating-dial adapted to expose its numbers singly at said opening, an oscillatory screen-plate interposed between said dial and sight-opening and frictionally connected with the dial so as to be moved by the latter, and means for limiting the movement of the screen-plate, for the purpose described.

8. In a cash-indicator, the combination of a casing having a sight-opening, an indicating-dial adapted to expose its numbers singly at said opening, an oscillatory screen-plate interposed between said dial and sight-opening and frictionally connected with the dial, and means for moving the screen-plate in one direction independently of the dial, for the purpose specified.

9. In a cash-indicater, the combination of a casing provided with a sight-opening, an indicating-dial adapted to expose its numbers singly at said opening, an oscillatory screen-plate loosely mounted on the axis of said dial and frictionally connected with the dial so as to be moved by the latter, and means for limiting the movement of the screen-plate, for the purpose described.

10. In a cash-indicator the combination of a casing having a sight-opening, an indicating-dial adapted to expose its numbers singly at said opening, an oscillatory screen-plate interposed between said dial and sight-opening and frictionally connected with the dial, a cash-drawer, a lock therefor, an operating-handle, and connections between said handle and the drawer-lock and screen-plate, for releasing the drawer and moving the screen-plate away from the sight-opening by the operation of said handle.

11. In a cash-indicator having a casing provided with a sight-opening, the combination of a shaft, an indicating-dial and a type-wheel fast thereon, an oscillatory screen-plate loose thereon and frictionally connected with the dial, a platen coöperating with the type-wheel, an operating-handle, and connections between said handle and the platen and screen-plate, for effecting the printing and moving the screen-plate away from the sight-opening by the operation of said handle.

12. In a cash-indicator and recorder having a casing provided with a sight-opening, the combination of a shaft, an indicating-dial and a type-wheel fast thereon, an oscillatory screen-plate loose thereon and frictionally connected with the dial, a platen coöperating with the type-wheel, feeding mechanism for moving a record-strip past the printing-point, an operating-handle, and connections between said handle and the feeding mechanism, platen and screen-plate, for the purpose described.

13. In a cash indicator and recorder having a casing provided with a sight-opening, the combination of a shaft, an indicating-dial and a type-wheel fast thereon, an oscillatory screen-plate loose thereon and frictionally connected with the dial, a platen coöperating with the type-wheel, feeding mechanism for moving a record-strip past the printing-point, a cash-drawer, a lock therefor, an operating-handle, and connections between said handle and the feeding mechanism, platen, drawer-lock and screen-plate, for the purpose described.

14. In a cash-recorder, the combination of an adjustable type-wheel, a platen coöperating therewith, an operating-handle, connections between the same and the platen for actuating the latter, and a lock for said handle controlled by the position of the type-wheel and controlling the positive movement of said handle to prevent operation of the handle except when the type-wheel is in proper position to coöperate with the platen.

15. In a cash-indicator, the combination of a casing having a sight-opening, an indicating-dial adapted to expose its numbers singly at said opening, an oscillating screen-plate coöperating with the dial to alternately hide and expose its numbers at said opening, an operating-handle, connections between the handle and screen-plate for moving the latter away from the sight-opening, and a lock for the handle controlled by the position of the indicating-dial, to prevent operation of the handle except when one of the numbers upon the dial is in proper position behind the sight-opening.

16. In a cash indicator and recorder, the combination of an indicating-dial and a type-wheel moving together, an oscillating screen-plate coöperating with the dial and a platen coöperating with the type-wheel, an operating-handle, connections between the same and the screen-plate and platen for actuating the former to expose the number upon the dial and the latter to effect its printing by the type-wheel, and a lock for said handle controlled by the position of the dial and type-wheel, to prevent operation of said handle except when said dial and type-wheel are in proper position to indicate and print one of their numbers.

17. In a cash indicator and recorder, the combination of a casing having a sight-opening, a shaft, an indicating-dial fast upon the shaft and adapted to expose its numbers singly at the sight-opening, an oscillatory screen-plate coöperating with the dial to alternately hide and expose its numbers at the sight-opening, a type-wheel also fast upon the shaft, a platen coöperating therewith, an operating-lever, connections between the same and the screen-plate and platen for actuating them, a notched disk also fast upon the shaft, and a latch or locking device coöperating with said notched disk and with the operating-lever to prevent operation of the latter except when the indicating-dial and type-wheel are in proper indicating and printing positions.

18. The combination of the casing having the sight-opening 6, the shaft 2, the handle 3 and pointer 4 fast thereon, the latter moving over a series of numbers upon the casing, the dial 5 and type-wheel 7 also fast on the shaft 2, paper-strip-feeding mechanism, a platen coöperating with the type-wheel, and means intermediate the handle and platen and feeding mechanism for actuating the platen by the movement of the handle and advancing the paper strip.

19. The combination of the shaft 2, the type-wheel 7 fast thereon, the lever 20 carrying the platen 15 coöperating with the type-wheel, the arm 31 loose upon the shaft 2 and coöperating with the lever 20, the inking-roller 32 carried by the arm 31, the spring 22 for the lever 20, the operating-lever 45, and the trip 26 carried thereby and coöperating with the lever 20, substantially as described.

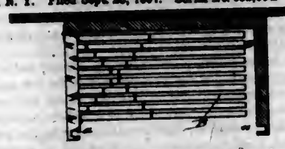
20. The combination of the casing having the sight-opening 6, the shaft 2, the handle 3 and pointer 4 fast thereon, the latter coöperating with the series of numbers on the casing, the dial 5 and type-wheel 7 fast on the shaft 2, the screen-plate 51 coöperating with the dial, the lever 20, the platen 15 carried thereby and coöperating with the type-wheel, the spring 22, and the lever 45 coöperating with the screen-plate 51 and carrying the trip 26 coöperating with the lever 20, substantially as described.

21. In a cash-recorder, the combination of a shaft, a type-carrier moving therewith, a platen coöperating with the type-carrier, a money-drawer, a lock therefor, an operating handle or lever independent of the money-drawer, and connections between said lever and the platen and drawer-lock, for effecting the printing and releasing the drawer by the operation of said lever.

22. In a cash-recorder, the combination of a shaft, a type-carrier fast thereon, a platen coöperating with the type-carrier, means for drawing a record-strip between the platen and type-carrier, an operating-lever, and connections between said platen and record-strip mechanism, for advancing said strip and effecting the printing at the positive stroke of said lever.

23. In a cash-recorder, the combination of a shaft, a type-carrier fast thereon, a platen coöperating with said carrier, means for drawing a record-strip between the platen and carrier, an automatically-opening money-drawer, a lock therefor, an operating-lever independent of the money-drawer, and connections between said lever and the platen, record-strip mechanism and drawer-lock, for effecting the printing, advancing the record-strip and unlocking the drawer by the operation of said lever.

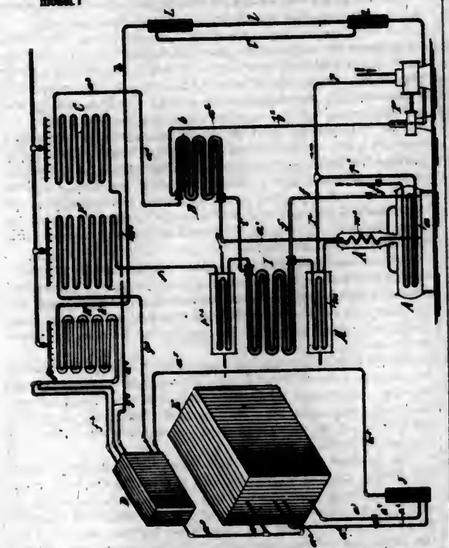
24. In a cash-indicator provided with a casing having a sight-opening, the combination of a shaft, an indicating-dial fast thereon and adapted to expose its numbers singly at said sight-opening, a screen-plate movable back and forth between said opening and the indicating-dial, a money-drawer, a lock therefor, an operating-lever, and connections between said lever and the screen-plate and drawer-lock, for moving the screen-plate away from the sight-opening and unlocking the drawer by the operation of said lever.



25. The combination of the shaft 2, the notched disk 41 and type-wheel 7 fast on said shaft, the lever 20 carrying the platen 15 coöperating with the type-wheel, the spring 22, the lever 45 carrying the trip 26 coöperating with the lever 20, and the lever 45^a coöperating with the disk 41 and lever 45, substantially as described.

26. The combination of the shaft 2, dial 5, type-wheel 7, lever 20, platen 15, spring 22, lever 45, trip 26, drawer B, latch-bar 47, and arm 46 interposed between the lever 45 and latch-bar 47, substantially as described.

27. The combination of the casing having the sight-opening 6, the oscillatory shaft 2, the dial 5 fast thereon, the oscillatory screen-plates 51 and 52, the springs 53 frictionally connecting the plates with the dial, and the lever 45 coöperating with the plate 51, substantially as described.

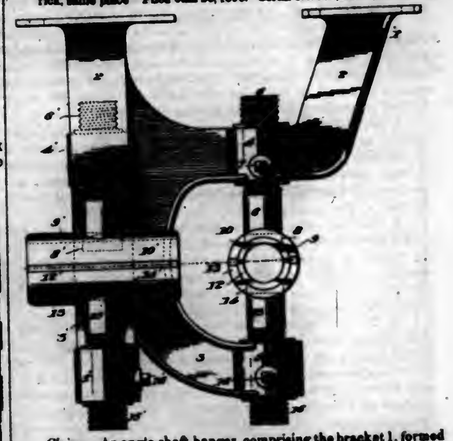


28. In a cash-recorder, the combination of the ratchet-wheel 8, provided with the storage flange or drum 19, and having the supply-roll of the record-strip carried upon its hub and led thence past the printing-point and wound upon the drum 19, and means for turning the ratchet-wheel, substantially as described.

606,825. PHOTOGRAPH-CABINET. THOMAS F. ADAMS, New York, N. Y. Filed Sept. 23, 1897. Serial No. 652,894. (No model.)

Claim.—A cabinet for storing and exhibiting photographs, consisting of a stationary rear wall at the back of the storage-chamber, a side wall hinged to the said rear wall, a series of picture-frames hinged directly to the inner side of said side wall, and a locking device located outside of and adjacent to said cabinet for holding the side wall and frames directly supported thereby in open position, substantially as set forth.

606,826. ABSORPTION REFRIGERATING-MACHINE. FRANK ALLEN, Brooklyn, N. Y. Filed Apr. 12, 1897. Serial No. 631,867. (No model.)



Claim.—1. The combination of a generator provided with steam-heating devices, a pump for returning the strong water of ammonia to the generator, an exhaust steam heater connected with the exhaust-port of the pump-engine and with the steam-coil in the generator, and a coil in said exhaust-steam heater through which the strong ammonia-water is passed on its return to the generator so as to be heated up to the required high temperature, substantially as set forth.

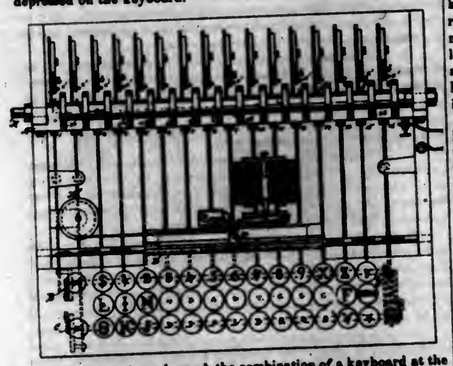
2. The combination of a generator, suitable means for heating the same, an escape-pipe for the hot ammonia-vapors, a primary heater and cooler comprising an interior coil for the hot ammonia-vapors, and an exterior coil for the strong ammonia-water, a condenser connected with the interior coil of the said primary heater and cooler, a secondary heater and cooler, comprising an interior coil for the weak ammonia-water, and an exterior coil for the strong ammonia-water, an escape-pipe connecting the generator with the interior coil of the secondary heater and cooler, a pipe connecting the exterior coil of the primary and secondary heater and cooler, a cooler for the weak ammonia-water connected with the interior coil of the secondary heater and cooler, a cooling-tank, a coil in the same for the expanded ammonia-vapors, a second coil in said tank connected with the condenser, a third coil connected with the cooler for the weak ammonia-water, an absorber connected with the first and third coils of the cooling-tank, a pump, a pipe connecting the absorber with the pump, means connected with the last pipe for preventing too great suction on the absorber, a pipe connecting the pump with the exterior coil of the primary heater and cooler, a steam-heater, a coil in the latter connected at one end with the said exterior coil of the secondary heater and cooler, and a return-pipe connecting the coil in the steam-heater with the generator, substantially as set forth.

3. The combination, with an absorber, of a pump for returning the strong ammonia-water from the absorber back to the generator, a pipe connecting the absorber with said pump, two jars located vertically one above the other in said return-pipe, a direct pipe connecting said jars, and a by-pass pipe connecting the upper ends of one jar with the other, said jars and by-pass pipe preventing the undue suction of the pump on the absorber, substantially as set forth.

606,827. SHAFT-HANGER. FREEMAN BENOUT and JAMES H. BRANDON, East Liverpool, Ohio, assignors of one-third to James C. Deidrick, same place. Filed Jan. 20, 1898. Serial No. 667,321. (No model.)

Claim.—An angle-shaft hanger, comprising the bracket 1, formed with the integral arms 2, 3, and 2' 3', the latter being arranged at a right angle to the former, the alined, internally-threaded hubs 4 and 5 formed integral with the arms 2, 3, and the alined internally-threaded hubs 4' 5' formed integral with the arms 2' 3' in combination with the threaded studs 6, 15, adjustably secured in said hubs 4 and 5, and the box-bearings 9 and 13, secured between the inner ends of said studs, the studs 6' 15' adjustably secured in the hubs 4' 5', and the box-bearings 9' 13 secured between the inner ends of said studs 6' and 15', substantially as and for the purpose set forth.

606,828. NUT-LOCK. FRANKLIN RIEH, Trenton, N. J. Filed Apr. 14, 1897. Serial No. 632,076. (No model.)



Claim.—The combination with a bolt having a threaded portion of two different diameters, with an unthreaded rectangular portion between them, of a holding-nut engaging the threaded portion of the greater diameter, and having notches on diametrically-opposite sides, and a key having diametrically oppositely disposed projections fitted to said notches and adapted to fit upon the rectangular portion of the bolt, and a lock-nut upon the outer end of said bolt, with an enlarged socket upon its inner face receiving the rectangular portion of the bolt, substantially as herein shown and described.

606,829. PRINTING-TELEGRAPH. BYRON A. BROOKS, Brooklyn, N. Y. Filed Jan. 20, 1894. Serial No. 497,553. (No model.)

Claim.—1. In a printing-telegraph, a combined transmitter and distributer, comprising a continuously-revolving shaft, a set of key-levers, a circuit changer or changers and mechanism between the levers and shaft whereby the depression of any key changes the circuit to send an impulse over the line after a predetermined time corresponding to the key.

2. In a printing-telegraph, a combined transmitter and distributer comprising a uniformly-revolving shaft, a set of key-levers, a circuit changer or changers and mechanism between the levers and shaft whereby the depression of any key changes the circuit to send an impulse over the line after a predetermined time corresponding to the key, combined with a distributer at the receiving end revolving synchronously with the shaft and an electromechanical receiver.

3. In a printing-telegraph, a combined transmitter and distributer at the sending end, a keyboard, a line-wire, a distributer at the receiving end, an electromechanical receiver and mechanism combined with said keyboard whereby the depression of any key changes the circuit at a predetermined time corresponding to the revolution of the distributer and closes a local circuit corresponding to the key depressed on the keyboard.

4. In a printing-telegraph the combination of a keyboard at the sending end, a type-carrier at the receiving end having a plurality of rows of types, a plurality of magnets at the receiving end, means for distributing to the receiving-magnets the impulses transmitted by the operation of keys at the sending end, a longitudinally-traveling platen, a translating device and means for electrically energizing said translating device, whereby the platen and type-carrier have a relative vibratory motion to present one or the other of said rows in position to print by the operation of keys on the keyboard.

5. In a printing-telegraph, the combination of a keyboard at the sending end, a type-carrier at the receiving end having a plurality of rows of types, a longitudinally-traveling paper-carriage, a translating device, means for electrically energizing the said translating device, whereby the platen and type-carrier have a relative vibratory motion to present one or the other of said rows in position to print and means for causing the impression of the type, both the translating device and means for causing the impression of the types being controlled by the operation of keys on the keyboard.

6. The combination of a keyboard, a type-bar carrying a plurality of rows of type, a vibrating and longitudinally-traveling platen and a translating device energized by a current of electricity whereby the platen is caused to vibrate transversely to the line of print by the operation of keys on the keyboard.

7. The combination of a type-carrier carrying a plurality of rows of types, a keyboard, a vibrating and longitudinally-traveling paper-carriage, translating devices controlled by a current of electricity by which the paper-carriage is caused to travel longitudinally and to vibrate transversely to the line of print so as to impress any one of the type of the several rows.

8. The combination of a keyboard, a type-carrier having a plurality of rows of types, a longitudinally-traveling platen, a translating device and means for electrically energizing said translating device whereby the platen and type-carrier have a relative vibratory motion to present one or the other of said rows in position to print by the operation of keys on the keyboard and mechanism at the sending end whereby the shifted member is automatically returned to its normal position.

9. In a printing-telegraph, the combination of a keyboard at the sending end, a type-carrier at the receiving end having a plurality of rows of type, a vibrating and longitudinally-traveling paper-carriage, a magnet by which the type-carrier is operated, a magnet by which the platen is vibrated transversely to the line of print, and means for distributing to the respective magnets the impulses transmitted by the operation of corresponding keys on the keyboard.

10. The combination of a keyboard, a type-carrier carrying a plurality of rows of type, a vibrating and longitudinally-traveling paper-carriage, means energized by a current of electricity for moving said paper-carriage longitudinally and vibrating it transversely to the line of print so as to impress any one of the types of the several rows and means for automatically returning it to its initial position.

11. In a printing-telegraph the combination of a keyboard at the sending end, a type-carrier at the receiving end having a plurality of rows of types, a longitudinally-traveling paper-carriage, a translating device controlled by a current of electricity whereby the platen and type-carrier have a relative vibratory motion to present one or the other of said rows of type in a plurality of new printing positions to print in a single line, means for holding the vibratory member in position and means for returning it to its normal position and for holding it there.

12. In an electromechanical printing mechanism the combination of a keyboard containing character-keys and a shift-key with a series of type-carriers corresponding to the character-keys on the keyboard each provided with a plurality of types and a paper-carriage, said type-carriers and paper-carriage having a vibratory movement with relation to each other so as to print the several types in line, a source of electrical energy and means controlled by the operation of said shift-key whereby the shifted member is automatically locked when the shift-key is depressed and unlocked when said key is released.

13. In a printing-telegraph, key-levers and a revolving shaft provided with contact-points at the sending end, combined with a distributer composed of a synchronously-revolving arm, and suitable contact-points, a type-carrier carrying a plurality of rows of types, a paper-carriage, said carriage and carrier having a vibratory movement in relation to each other and electrotranslating devices by means of which they are operated at the receiving end.

14. In a printing-telegraph, the combination of a keyboard at the sending end containing character-keys and a shift-key with a plurality of type-carriers at the receiving end each provided with a plurality of types and a paper-carriage said type-carriers and paper-carriage having a vibratory movement with relation to each other, a line-wire and means controlled by said shift-key whereby the paper-carriers are shifted to receive the impression of the several types on the type-carriers, an automatic lock for locking the shifted member and mechanism at the sending end whereby an impulse is sent over the line to unlock said member and allow it to return to its normal position.

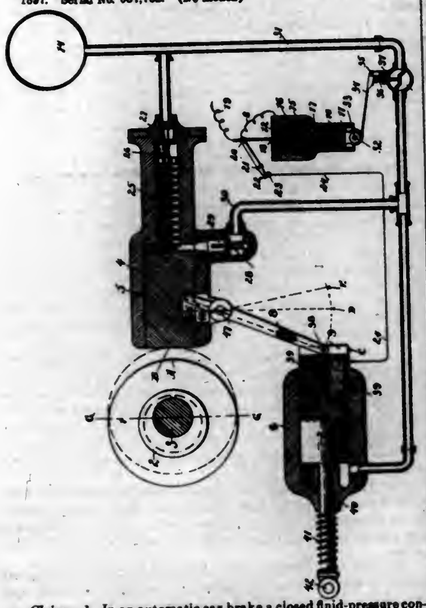
15. In a printing-telegraph the combination of a keyboard containing character-keys and shift-keys, means for sending a succession of impulses over a line-wire by the operation of said keys, an electromechanical printing mechanism comprising a plurality of type-carriers each provided with a plurality of rows of type and a paper-carriage, said carriage and type-carriers having a vibratory movement with relation to each other controlled by the operation of shift-keys on the keyboard.

16. The combination with a keyboard of a scale and pointer, means for causing said pointer to advance at each printing impulse by the operation of the printing mechanism, a magnet for releasing said pointer and means for automatically returning it to its initial position.

17. In a printing-telegraph, a keyboard, a uniformly-revolving shaft, a circuit changer or changers at the sending end combined with a synchronously-revolving shaft at the receiving end, local circuits corresponding to keys and electromechanical printing mechanism comprising a plurality of type-carriers each provided with a plurality of rows of type and a paper-carriage, said carriage and carriers having a vibratory movement with relation to each other controlled by a current of electricity.

18. The combination of a keyboard, a type-carrier having a plurality of rows of types, a platen, said platen and type-carrier having a vibratory motion with relation to each other and an electromagnet by which said vibration is caused, mechanical means for retaining the vibrating member in position during the operation of printing and means for releasing said vibrating member and returning it to its normal position.

19. The combination with a type-carrier provided with a plurality of rows of type, a keyboard, a vibrating and longitudinally-traveling platen, a translating device energized by a current of electricity whereby the platen is vibrated to a plurality of new printing positions so as to impress any one of the types of the several rows by the operation of keys on the keyboard, means for holding it in its new printing position and means for returning it to its normal position.



20. The combination of a keyboard, a type-carrier provided with a plurality of rows of type, a vibrating and longitudinally-traveling platen, a translating device energized by a current of electricity whereby the platen is vibrated to a plurality of new printing positions by the operation of keys on the keyboard, means for holding it in its new printing position and means for automatically returning it to its normal position and for holding it there.

21. The combination of a keyboard, a plurality of type-carriers each provided with a plurality of type, a longitudinally-traveling paper-carriage, means controlled by a current of electricity by which the paper-carriage is vibrated from a normal printing position to a plurality of new printing positions, mechanical means for retaining it in position during the operation of printing and means for returning it to its normal printing position and for holding it there.

22. In a printing-telegraph the combination of an electromechanical printing mechanism comprising a plurality of type-carriers each provided with a plurality of rows of type and a paper-carriage, said carriage and type-carriers having a vibratory movement with re-

latlies to each other, a keyboard at the sending end comprising character-keys and shift-keys and means whereby when a shift-key is operated a vibratory movement is effected in the printing mechanism between said type-carriers and paper carriage, means for retaining said vibratory member in its shifted position until printing is effected and means for automatically restoring it to its normal position.

606,880. **ELECTROHYDROSTATIC AUTOMATIC CAR-BRAKE.** JULES BUCHEL and FRANK MCGLOIN, New Orleans, La. Filed May 22, 1897. Serial No. 637,702. (No model.)

Claim.—1. In an automatic car-brake a closed fluid-pressure conduit, a pump for creating a pressure therein, a brake-cylinder connected to the conduit, a controlling-valve in the conduit, a weight tending to keep the valve closed and an electromagnet for varying the pressure of the weight upon the valve.

2. In an automatic car-brake a closed liquid-circuit, a pump operated by the car-axle for forcing the liquid, a connection from the liquid-circuit to the brake-cylinder, a controlling-valve in the circuit adapted to be opened by the pressure from the pump, a weight tending to keep the valve closed and an electromagnet for varying the pressure of the weight upon the valve.

3. In an automatic car-brake, a closed liquid-circuit, a pump for circulating the liquid, a connection leading to the brake-cylinder, a controlling-valve in the liquid-circuit, a weight tending to keep the valve closed, an electromagnet operating said weight and means for making or breaking the electrical circuit whereby the valve will be closed or allowed to open.

4. In an automatic car-brake a closed liquid-circuit provided with a pump operated from the car-axle for forcing the liquid, a connection leading to the brake-cylinder, a controlling-valve in the liquid-conduit adapted to open by the pressure from the pump, an electromagnet the core of which acts upon the valve and closes the same when the circuit is broken.

5. In an automatic car-brake, a closed liquid-conduit with a pump for forcing the liquid, a connection leading to the brake-cylinder, a controlling-valve in the conduit adapted to open with the pump-pressure, a weighted lever bearing upon the valve to close it, the lever being sufficiently thin or elastic to bend under the weight, and means for varying the weight upon the lever.

6. In an automatic car-brake a closed liquid-conduit with circulating-pump, brake-cylinder, and valve, an electromagnet controlling the valve consisting of a fixed cylindrical casing tapered to an edge at the top, a cylindrical core wound with a coil of wire moving in the casing and another coil flared to fit over the top of the casing.

7. In an automatic car-brake the eccentric fastened on the axle, the eccentric-strap consisting of an annular ring upon the eccentric provided with an annular oil-chamber and an opening from the oil-chamber to the bearing-surface between the ring or strap and eccentric.

8. In an automatic car-brake, a closed liquid-conduit, a plunger for forcing the liquid, an eccentric secured on the car-axle and an annular ring mounted to revolve upon the eccentric with its outer periphery bearing against the plunger for operating the same.

9. In an automatic car-brake a closed liquid-conduit, a plunger for forcing the liquid, an eccentric with an annular strap mounted on the car-axle, and a spring tending to keep the plunger bearing against the outer circumference of the eccentric-strap.

10. In an automatic car-brake, a closed liquid-conduit, a plunger for forcing the liquid, an eccentric secured to the car-axle, an eccentric-strap provided with an annular oil-chamber mounted on the eccentric, an opening leading from the chamber to the bearing between the eccentric and strap, and a spring forcing the plunger against the outer periphery of the eccentric-strap.

11. In an automatic car-brake, a closed liquid-conduit, a plunger operated from the car-axle for circulating the liquid, a controlling-valve in the conduit, a connection to the brake-cylinder, a spring bearing against the plunger and an electromagnet for holding the plunger stationary when the controlling-valve is open.

12. In an automatic car-brake, a closed liquid-conduit, a cylinder and plunger for forcing the liquid, a controlling-valve in the conduit, an eccentric with an annular strap mounted on the car-axle, a spring normally tending to force the plunger against the outer periphery of the eccentric-strap, and means for holding the plunger stationary and out of the path of the eccentric when the controlling-valve is open.

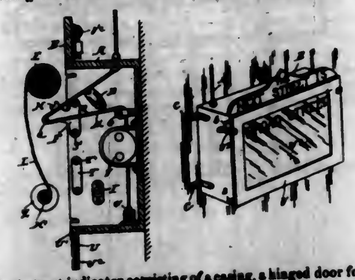
13. In an automatic car-brake, a closed liquid-conduit with a controlling-valve, a plunger for forcing the liquid and operated by an eccentric mounted on the car axle, a spring for forcing the plunger against the eccentric, a lever engaging the plunger and carrying an armature, and an electromagnet adapted to attract the armature and to hold the plunger away from the eccentric when the controlling-valve is open.

14. In an automatic car-brake, a closed liquid-conduit with a controlling-valve, a plunger for circulating the liquid and operated by an eccentric on the car-axle, a spring tending to force the plunger against the eccentric, a lever engaging the plunger and carrying an armature, and an electromagnet mounted upon the piston of the brake-cylinder for attracting the armature and holding the plunger away from the eccentric when the controlling-valve is open.

15. In an automatic car-brake, a closed liquid-conduit, a plunger operated by an eccentric on the car-axle for circulating the liquid, a valve in the conduit controlled by an electromagnet, a lever engaging the plunger and carrying an armature, a second electromagnet for holding the plunger away from the eccentric.

16. In an automatic car-brake, a closed liquid-conduit with a controlling-valve and momentum-pump mounted on each car, electromagnets the cores of which act as weights controlling the valves, an engine and dynamo on the locomotive, the electromagnets being the circuit from dynamo, and means for controlling the speed of the engine and thereby varying the strength of the current to the magnets.

17. In an automatic car-brake, a closed liquid-conduit with controlling-valve and momentum-pump mounted on each car, electromagnets for controlling the valves, a dynamo and engine on the locomotive, the circuit-wires connecting the dynamo with the magnets, the speed-governor for the engine and a lever bearing on the top of the governor by which the speed of the engine and also the strength of the current from the dynamos may be controlled.



18. In an automatic car-brake a closed liquid-conduit with a controlling-valve and a momentum-pump mounted on each car, electromagnets for controlling the valves, a dynamo provided with double armatures, circuit-wires connecting the dynamos with the magnets, and a multipole switch for connecting one or both armatures with the circuit for breaking the said circuit.

19. In an automatic car-brake, a closed liquid-conduit, circulating-pump and brake-cylinder, a valve opening upward, a lever bearing on the valve, a spring forcing the valve-stem up against the lever, the electromagnet with its core acting as a weight for the lever, and means for varying the strength of the current in the coils of the electromagnet whereby the weight of the core upon the lever is varied.

606,881. **STATION-INDICATOR.** EDGAR H. B. CREW, Philadelphia, Pa. Filed Feb. 19, 1898. Serial No. 670,905. (No model.)

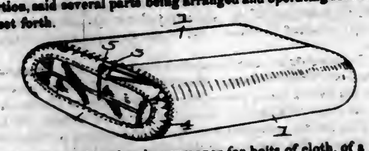
Claim.—1. A street or station indicator consisting of a suitable casing, fixtures secured within said casing, reels journaled within said fixtures and adapted to be removed therefrom, keepers for holding said reels in place, rods connected with said keepers, a registering-strip being attached to the reels and passing over the rods, grooved pulleys carried by the reels, and an actuating-cord passing over suitable guide-rolls and over one of the grooved pulleys for bringing about the rotation of the reels, as specified.

2. A street-indicator consisting of a casing, a hinged door for closing the front thereof, said door having a pane of glass therein, fixtures secured within the casing, reels adapted to be journaled within said fixtures or removed therefrom, a registering-strip having the names of the streets printed thereon upon both sides, and in reversed order, said strip being connected with the reels so as to be wound thereon, keepers for holding the reels in position, arms pivoted upon the same horizontal lines with the keeper, guide-rods connecting said arms and keepers over which the registering-strip passes, grooved pulleys carried by the reels, an actuating-cord passing over the upper grooved pulley, guide-rolls over which the cord passes, and a spring for drawing the cord in one direction, as specified.

3. A street-indicator consisting of a casing, a hinged door for closing the front thereof, said door having a pane of glass therein, fixtures secured within the casing, reels adapted to be journaled within said fixtures or removed therefrom, a registering-strip having the names of the streets printed thereon upon both sides, and in reversed order, said strip being connected with the reels so as to be wound thereon, keepers for holding the reels in position, arms pivoted upon the same horizontal lines with the keeper, guide-rods connecting said arms and keepers over which the registering-strip passes, grooved pulleys carried by the reels, an actuating-cord passing over the upper grooved pulley, guide-rolls over which the cord passes, a spring for drawing the cord in one direction, and ratchet mechanisms for preventing the retrograde movement of the reels, as specified.

4. A street-indicator consisting of a casing, a hinged door for closing the front thereof, said door having a pane of glass therein, fixtures secured within the casing, reels adapted to be journaled within said fixtures or removed therefrom, a registering-strip having the names of the streets printed thereon upon both sides and in reversed order, said strip being connected with the reels so as to be wound thereon, keepers for holding the reels in position, arms pivoted upon the same horizontal lines with the keeper, guide-rods connecting said arms and keepers over which the registering-strip passes, grooved pulleys carried by the reels, an actuating-cord passing over the upper grooved pulley, guide-rolls over which the cord passes, a spring for drawing the cord in one direction, a suitable battery located within the casing, a signal-bell located within the electric circuit, and means dependent upon the movement of the cord for closing the circuit to sound the bell, as specified.

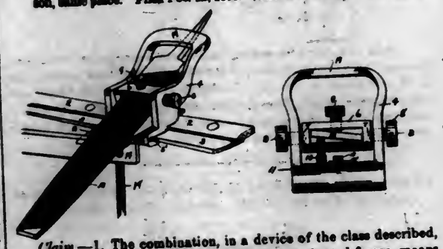
5. A street or station indicator consisting of a casing, fixtures secured therein, reels removably journaled within the fixtures, keepers for holding said reels in place, rods connected with said keepers parallel with the reels, and a registering-strip attached to the reels and run over the rods, as and for the purpose set forth



6. In a station-indicator, a casing, reels journaled therein, an electric circuit, a bell located in said circuit, a cord passing over a grooved pulley on the end of one of the reels, a spring for drawing the cord in one direction and means for completing the electric circuit when the cord is drawn against the action of said spring as and for the purpose set forth.

7. In a station-indicator, a casing, reels journaled therein, a grooved pulley on one of the reels, a cord passed around said pulley, a spring drawing said cord in one direction, batteries in the casing a bell in the circuit, one terminal being at one end of the spring and the other at the opposite end of said spring when extended, and a circuit-closer carried by the cord, as and for the purpose set forth.

606,882. **WRAPPER-COVERING.** BARLEY H. CURRIER, Bluffton, Ind. Filed Aug. 10, 1897. Serial No. 647,673. (No model.)



Claim.—1. A wrapper composed of a central portion 1, edge portions 2, draw-strings therein and a series of eyes secured to the main portion 1, said draw-strings being adapted to engage with different ones of said eyes from time to time, according to the size of the bolt of cloth to be covered or wrapped, substantially as set forth.

2. A wrapper for cloth, composed of a central portion 1, edge portions 2, draw-strings in the outer edges of said edge portions, means for controlling said draw-strings to adapt said wrapper to packages of different sizes and flaps centrally secured to the edges of the main portion, said several parts being arranged and operating substantially as set forth.

3. The combination, in a wrapper for bolts of cloth, of a central or main portion 1 composed of comparatively heavy and strong cloth, edge portions 2 secured thereto composed of lighter and more flexible cloth, draw-strings secured in the edges of said edge portions, a series of eyes secured to the edges of the main portion, string-fasteners secured at or near the ends of the wrapper where the free ends of the draw-string emerge, and end-covering flaps secured to the edges of the central portion of said main portion, the whole being arranged and operating substantially as set forth.

606,888. **ATTACHMENT FOR SHARPENING LAWN-MOWERS.** AARON B. DOTY, Minneapolis, Minn., assignor of one-half to Carl A. Nelson, same place. Filed Feb. 12, 1898. Serial No. 670,062. (No model.)

Claim.—1. The combination, in a device of the class described, of a file-holder, consisting of a main frame, a pivoted frame, means for adjusting the position of a file interposed in said pivoted frame, a file, and means for bringing successively all parts of the knife or blade to be sharpened to a predetermined position with respect to the file and holder, substantially as described.

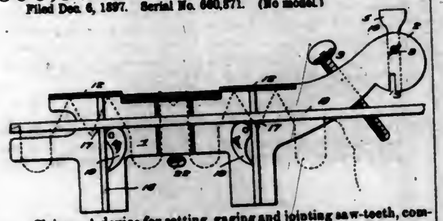
2. The combination, in a device of the class described, of a file-holder frame, a file, a pivoted frame, means for adjusting the position of the file and holding the same therein, means for limiting the downward movement of said pivoted frame and file, and means whereby all parts of the knife or blade to be sharpened are brought to a predetermined position with respect to the file and holder, substantially as described.

3. The combination, in a device of the class described, of a file-holder frame, a file, a pivoted frame, a plate 11, means for regulating the lateral pitch of said file, and means for limiting the downward swing of said pivoted frame and file, substantially as described.

4. The combination, in a device of the class described, of a frame 4, a frame 6 pivoted therein, adjusting-screws 9 and 10 provided in said frame 6, a plate 11 adjustably secured to said frame 4, an adjusting-screw 13 provided on said plate 11, and a file interposed in said pivoted frame, substantially as described.

5. The combination, in a device of the class described, of a file-holder frame, a pivoted frame, a file, a plate 11 adjustably secured in said frame 4, screws 9 and 10 whereby the lateral pitch of said file is regulated, an adjusting-screw 13, a collar 15 and a set-screw thereon, substantially as described.

606,884. **BICYCLE-BRAKE.** JOHN M. DOWNER, Toronto, Canada. Filed Dec. 14, 1896. Serial No. 616,150. (No model.)



Claim.—1. In a bicycle-brake the combination with the crank-hanger and crank-axle, of the stationary sleeve or ring carried by the

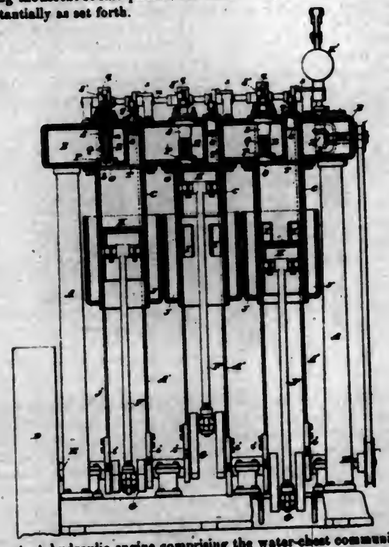
hanger, the sprocket-wheel having a limited movement on the crank-axle, a brake-shoe pivoted to the sprocket-wheel and adapted to bear against the inner face of the stationary sleeve, and the cam on the crank-axle adapted to operate the brake-shoe, substantially as described.

2. In combination with the crank-hanger and crank, the stationary sleeve carried by the hanger, the sprocket-wheel rotatably mounted upon the axle, a spring-pressed brake-shoe pivoted to the sprocket within the wheel, the cam on the axle adapted to contact with the brake-shoe, and the projection from the crank engaging an elongated slot or recess in the sprocket, substantially as described.

606,335. SAW-SET. JOSEPH FREDERICKSON, Gaylord, Mich. Filed Dec. 6, 1897. Serial No. 660,871. (No model.)

Claim.—A device for setting, gaging and jointing saw-teeth, comprising a body portion formed on one side with the fixed parallel ribs 16 16 intersected by the slot 17 adapted to receive a file-blade, and the cam-levers 19 19 pivoted to the same side of said body portion near each of said ribs, so as to lock said file-blade in position in said ribs, substantially as shown and described.

606,336. SAFE FOR PASSENGER-CARS. ISAAC FRIED, Harrisburg, Pa. Filed Mar. 30, 1897. Serial No. 629,974. (No model.)

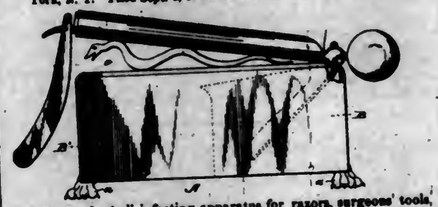


Claim.—A safe of the class described, provided with retaining-recesses, in combination with a series of stay-braces and means, substantially as described, for securing the ends of said braces within said safe, as and for the purpose set forth.

606,337. HYDRAULIC ENGINE. JOHN GILL, Jersey City, N. J., assignor of one-half to Harry G. Peckham, same place. Filed Nov. 26, 1897. Serial No. 659,772. (No model.)

Claim.—1. A hydraulic engine comprising the series of cylinders having the free discharge-ports at their lower end and the inlet and outlet openings for water and air respectively at their upper end, combined with the crank-shaft, the pistons within said cylinders, the piston-rods connecting the cranks of said shaft with said pistons, valves for said inlet and outlet openings, means for operating said valves, cut-off mechanism for said inlet-valves, and the water-chest communicating with said cylinders and also with a source of water-supply; substantially as set forth.

2. A hydraulic engine comprising the water-chest communicating with a source of water-supply, and the three cylinders connected at their upper end with said water-chest and at their lower end having the free discharge-ports for water, combined with the crank-shaft, the pistons within said cylinders, the piston-rods connecting the three cranks of said shaft with said pistons, inlet-valves controlling the inlet-ports for water from said water-chest to said cylinders, means for permitting the escape of the air from said cylinders during the ascent of said pistons, cut-off mechanism for said valves, and means for opening and closing said valves; substantially as set forth.

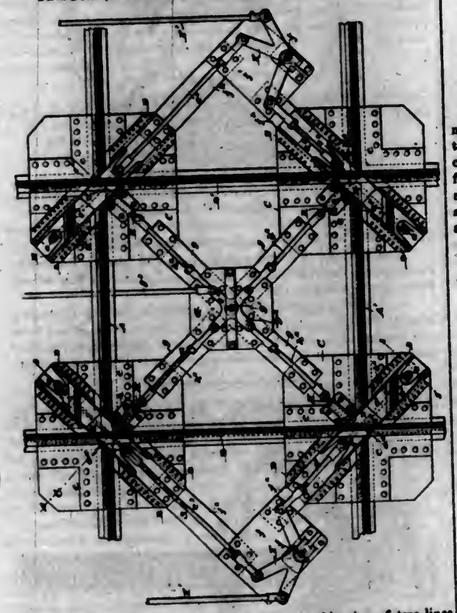


3. A hydraulic engine comprising the water-chest communicating with a source of water-supply, and the three cylinders connected at their upper end with said water-chest and at their lower end having the free discharge-ports for water, combined with the crank-shaft, the pistons within said cylinders, the piston-rods connecting the three cranks of said shaft with said pistons, inlet-valves controlling the inlet-ports for water from said water-chest to said cylinders, the inlets adapted to admit air to said cylinders during the descent of the pistons, means for permitting the escape of the air from said cylinders during the ascent of said pistons, and means for operating said valves; substantially as set forth.

4. A hydraulic engine comprising the water-chest communicating with a source of water-supply, and the three cylinders connected at their upper end with said water-chest and at their lower end having the free discharge-ports for water, combined with the crank-shaft, the pistons within said cylinders, the piston-rods connecting the three cranks of said shaft with said pistons, inlet-valves controlling the inlet-ports for water from said water-chest to said cylinders, the tubular openings extending from the upper ends of said cylinders up through said water-chest to the atmosphere, valves controlling said tubular openings and adapted to open during the ascent of said pistons, and means for operating said inlet and outlet valves; substantially as set forth.

5. A hydraulic engine comprising the series of cylinders having the free discharge-ports at their lower end and the inlet-opening for water at their upper end, combined with the crank-shaft, the pistons within said cylinders, the piston-rods connecting the cranks of said shaft with said pistons, the valves for said inlet-openings, the water-chest communicating with a source of water-supply and connected with said cylinders, the rock-shaft extending above and lengthwise of said water-chest, the governor connected with said crank-shaft and said rock-shaft, the eccentrics on said crank-shaft, the eccentric-rods connected therewith, the lever-arms connected with said rods and hung from said rock-shaft, the pawl-arms carried by said lever-arms, the projections on said rock-shaft below said pawl-arms for tripping the latter, and the lever-arms connected with the stems of said valves and adapted to be operated by said pawl-arms; substantially as set forth.

606,338. DISINFECTING APPARATUS. FRANCIS GIBB, New York, N. Y. Filed Sept. 3, 1897. Serial No. 650,966. (No model.)

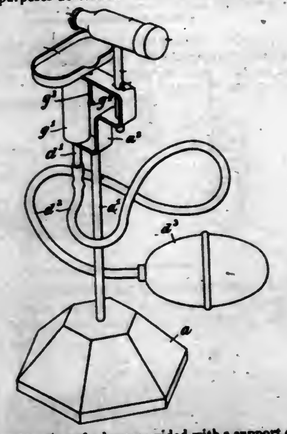


Claim.—1. A disinfecting apparatus for razors, surgeons' tools, and the like comprising a casing having within itself the supply-chamber and the waste-chamber, a disinfecting-chamber mounted upon said casing and inclined longitudinally thereon to return the waste liquid to said waste-chamber, and an atomiser also mounted on the casing and having its feed-tube connected to the supply-chamber and its discharge-nozzle extended into the lower end of said disinfecting-chamber, substantially as described.

2. A disinfecting apparatus for razors, surgeons' tools and the like, comprising a casing containing within itself a supply-chamber and a waste-chamber, a longitudinally-inclined disinfecting-chamber mounted on said casing and having means for closing its upper end, a return duct or channel inclined reversely to said disinfecting-chamber and arranged to receive from the lower end of the disinfecting-chamber and to discharge to the waste-chamber, and an atomiser situated contiguous to the lower end of said disinfecting-chamber, substantially as described.

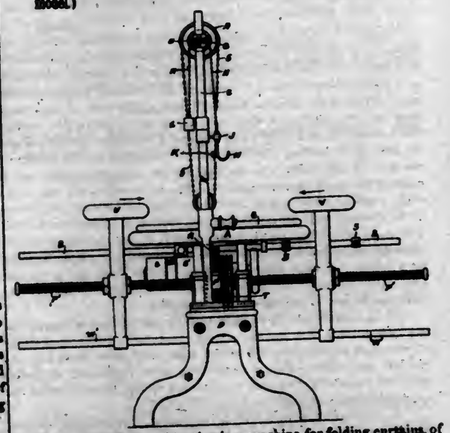
3. A disinfecting apparatus for razors, surgeons' tools, and the like comprising a box or casing having a hinged cover and provided within itself with the supply and waste chambers, the supply-chamber having a channeled or grooved top, a disinfecting-chamber mounted on the hinged cover and arranged with its lower end to discharge the waste to the groove or channel, and a suitable atomiser connected to the supply-chamber and arranged to discharge into the disinfecting-chamber, substantially as described.

606,339. RAILROAD-CROSSING. CHARLES HAMEL, Boston, Pa. Filed Dec. 3, 1897. Serial No. 660,909. (No model.)



Claim.—1. In a railroad-crossing, the combination of two lines of intersecting, crossing tracks, base-plates at each intersection to which the tracks are secured, guideways carried by said base-plates and extending diagonally with respect to the tracks, rail-blocks mounted in said guideways to slide therein, means for moving said blocks into one or another position to make one or the other line of tracks practically continuous through the crossing, and a locking mechanism for said blocks, substantially as set forth.

2. In a railroad-crossing, the combination of two lines of intersecting, crossing tracks, base-plates at each intersection to which the tracks are secured, guideways carried by said base-plates and extending diagonally with respect to the tracks, rail-blocks mounted in said guideways to slide therein, means for moving said blocks into one or another position to make one or the other line of tracks practically continuous through the crossing, a locking-bolt for each of said blocks, and means for simultaneously moving all of said locking-bolts, substantially as set forth.

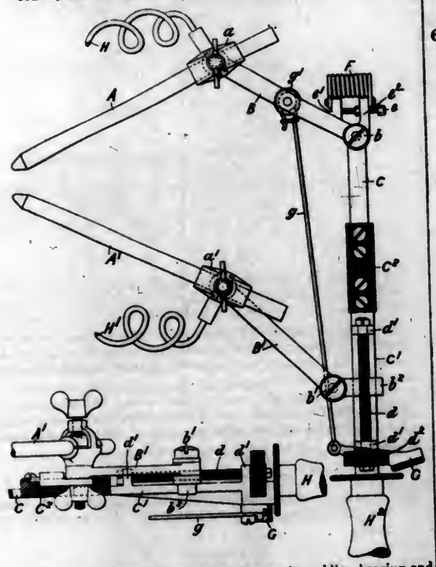


606,340. FLASH-LIGHT-POWDER APPARATUS. ALEXANDER HEMSLEY, Philadelphia, Pa. Filed Aug. 17, 1897. Serial No. 648,507. (No model.)

Claim.—1. The combination of a base provided with a support oppositely notched at one end, a rod provided with lugs on opposite sides adapted to engage the notches of said support to prevent turning of said rod carrying a lamp, an air-chambered device provided with means for forcing air therethrough and a pan provided with a tube adapted to be moved on said chambered device, substantially as and for the purposes described.

2. The combination of a base provided with a support oppositely notched at one end, a rod provided with lugs on opposite sides adapted to engage the notches of said support to prevent turning of said rod carrying a lamp, an air-chambered device provided with means for forcing air therethrough, a pan provided with a tube adapted to be moved on said chambered device, and means connected with said support and pan adapted to limit the range of movement of said pan, substantially as and for the purposes described.

606,341. MACHINE FOR FOLDING CURTAINS. JAMES HESELWOOD, Leeds, England. Filed Aug. 26, 1897. Serial No. 649,582. (No model.)



Claim.—1. The combination in a machine for folding curtains, of a balanced carrier having pins on its under side to engage the curtain at its center, a rod adjacent to the carrier for supporting the curtain at about its center, two narrow tables below and lengthwise at each side of the rod, a fixed main table and means for moving the narrow tables toward and from each other above the fixed main table, substantially as set forth.

2. The combination in a machine for folding curtains, with a fixed table, of two narrow tables above the fixed table, screw-shafts operatively connected to said narrow tables for moving the same toward and away from each other and above the fixed table, belts and driving-pulleys, a belt-shifter and tappets engaged by the narrow moving tables for operating the belts and reversing the mechanism, substantially as set forth.

3. The combination in a machine for folding curtains, with a fixed table and two narrow jaoles above the fixed table and means for

moving the narrow tables toward and from each other, of a carrier and pins on its under side, hooks at its ends and a rod carried by said hooks for supporting the curtain, and weights for balancing the carrier, substantially as set forth.

606,842. APPARATUS FOR WELDING, BRAZING, AND SOLDERING BY ELECTRICITY. ALBERT HIRSCH, Berlin, Germany. Filed Dec. 21, 1897. Serial No. 662,736. (No model.) Patented in England Oct. 16, 1895, No. 19,442.

Claim.—1. A tool or instrument for use in welding brazing and soldering by the heat of the electric arc, consisting in the combination of a pair of carbon-holding clamps, such as *a a'*, pivotally attached to a pair of lever-arms B B' mounted on insulated portions of the same bar or stem, the one being pivoted to the end of the bar or stem and the other to a slide working on said stem, a micrometer-screw mounted on the stem and adapted to traverse the slide thereon, said screw having a milled head in proximity to the handle of the tool, an adjustable stop for limiting the outward angular movement of the carbon-carrying lever which is pivoted to the end of the stem, a spring connected to the said lever and to the bar or stem so as to produce angular motion of the carbon in the outward direction, a thumb-lever pivoted at the opposite side of the bar to the micrometer-screw and in proximity to the handle of the tool and coupled by a link to the outer carbon-carrying lever so as to act in opposition to the spring for bringing the carbons momentarily together for striking the arc, all substantially as specified.

2. In a hand-tool for electric welding and analogous operations, the combination of a handle, a stem supported thereby, a plurality of electrode-carriers pivoted to the stem, electrodes carried by the carriers and inclined toward each other at an angle and manually-operated means for swinging an electrode-carrier so as to bring the electrodes into such position as to strike the arc.

3. In a tool for electric welding or analogous operations, the combination of a stem or support, a plurality of electrode-carriers one at least of which is pivotally carried thereby, electrodes carried by the electrode-carriers and inclined toward each other, manually-operated means for adjusting one of the electrode-carriers with respect to the other, and manually-operated arc-striking means, substantially as described and for the purposes set forth.

4. In a tool for electric welding and analogous operations, the combination of a plurality of electrode-carriers carried by a common support and provided with electrodes inclined toward each other, one at least of the said electrode-carriers being pivoted to its support and provided with manually-operated means for moving it toward the other electrode-carriers to bring the electrodes into such a position as to form the arc, and a spring acting upon the said electrode-carrier to separate the electrodes to strike the arc, substantially as described and for the purposes set forth.

5. In a portable electric welding apparatus, the combination of the following instrumentalities in operative relation, to wit, a handle provided with an electrode-support, a plurality of electrode-carriers carried by the said support and movable with respect thereto, one at least of the said electrode-carriers being pivotally carried by the said support, manual means for manually adjusting one of the electrodes and manually-operated arc-striking apparatus, the entire structure being supported from the handle in order to constitute a portable and transportable tool wherein the electrodes are capable of a fine manual adjustment with respect to each other and wherein the arc may be manually struck, substantially as described.

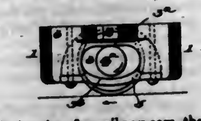
606,848. HOOF-PAD. CORNELIUS J. HORTON, White Plains, N. Y. Filed May 22, 1897. Serial No. 637,662. (No model.)

Claim.—1. A hoof-pad provided with an apertured plate having a ventilating-backing extending over the apertures therein.

2. A hoof-pad provided with an apertured plate, having connected thereto a frog or heel-piece, and a ventilating-backing for said plate.

3. A hoof-pad provided with an apertured plate, a ventilating-backing upon the rear surface thereof, and a pointed frog or heel-piece upon one end of said plate.

4. A hoof-pad provided with an apertured plate, a ventilating-backing therefor, and a frog or heel-piece upon one end of said plate, said frog having a tapering central extension and outwardly-inclined sides adapted to receive the oblique extremities of the metal shoe.

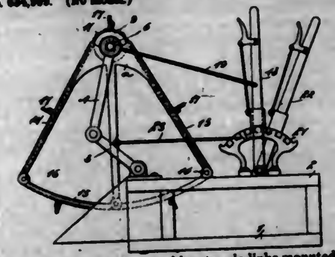


606,844. PROTRACTOR. MARTIN S. HOY, Wilkinsburg, Pa. Filed Mar. 18, 1897. Serial No. 628,121. (No model.)

Claim.—The quadrant provided with the slot 4, the blade 2 extending at one end beyond the quadrant, the head 6 secured to one corner of the quadrant and provided with the curved slot at its outer end, and the friction-rollers 12 which bear against the outer edge of the tongue of the square or angle, combined with the bevel or rule 11, the slotted head 8 secured to its inner end, and which head 8 corresponds in shape and size to the head 9; and the clamping-screw which passes through the head 9, the slot 4 in the tongue and the rule, substantially as shown and described.

606,845. SIDE BEARING FOR RAILWAY-CARS. CHARLES F. HUSTON, Chicago, Ill., assignor to the Chicago Railway Equipment Company, same place. Filed Dec. 30, 1897. Serial No. 664,689. (No model.)

Claim.—1. In a side bearing for railway-cars, the combination with an antifriction-roller, of a suspension frame or carriage having an upper horizontal track and a lower centrally-inclined track; substantially as and for the purposes specified.



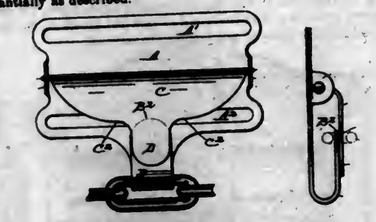
2. In a side bearing for railway-cars, the combination with a suitable frame provided with journal-slots having a plain upper edge and an arc-shaped lower edge, of an antifriction-roller having trunnions journaled in said slots, substantially as and for the purposes specified.

3. In a side bearing for railway-cars, the combination with a suspension frame or carriage having arc-shaped concentric sides, each side having a journal-slot constituting a horizontal upper and a centrally-inclined lower track, of an antifriction-roller having trunnions the face and trunnions of said roller tapering on lines converging to the center of the car-bolster; substantially as and for the purposes specified.

4. In a side bearing for railway-cars, the combination with an antifriction-roller provided with trunnions, of a suspension frame or carriage having slots for the reception of the trunnions of the roller, and provided with a detachable section or bar constituting the bottom of one of said trunnion-slots; substantially as and for the purposes specified.

606,846. GRAIN-REEL FOR REAPING-MACHINES. MARSHAL G. KERR and PETER P. KERR, Keensburg, Ill. Filed May 4, 1897. Serial No. 634,999. (No model.)

Claim.—1. In a reaping-machine, toggle-links mounted to swing on the frame thereof, means for swinging said links, relatively to the platform and one relatively to the other, a tubular shaft carried by the upper link, a reel-shaft extended through said tubular shaft, means for rotating said reel-shaft, sprocket-wheels on said shaft, sprocket-chains engaging said wheels, guideways for said sprocket-chains, comprising downwardly-diverging side portions, and a bottom portion suspended in the arc of a circle, and reel-boards attached to the chains, substantially as specified.



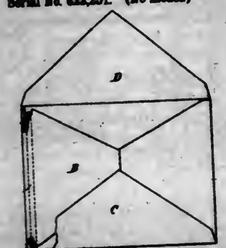
2. In a reaper, a link pivotally connected to the frame thereof, another link pivoted to the first-named link, levers having link connections with said links, means for holding the levers as adjusted, a tubular shaft supported by the upper link, a reel-shaft extended through the tubular shaft, means for rotating the reel-shaft, sprocket-wheels on the reel-shaft, another tubular shaft on the reel-shaft between said sprocket-wheels, guideways supported by the tubular shafts and each comprising downwardly-diverging side portions and bottom portions formed in the arc of a circle, rollers at the junction of the side and bottom portions, chains movable in the guideway and engaging with the sprocket-wheels, and reel-boards attached to said sprocket-chains, substantially as specified.

3. In a reaping-machine, a reel, and means for causing said reel to travel in the arc of a circle at its lower portion and in an inwardly-inclined direction at the front and rear, substantially as specified.

606,847. TRACE-CARRIER. WILLIAM P. KELLOGG, Troy, N. Y. Filed Mar. 26, 1897. Renewed May 11, 1898. Serial No. 680,419. (No model.)

Claim.—1. In a back-band buckle, the combination with the web-plate provided with parallel web-slots and journal-bearings, of an upwardly-turned trace-hook depending from the lower side of the web-plate, a wedge-plate journaled in the web-plate, a tongue comprising a downward extension of the wedge-plate overlapping the hook, and a stop outside the mouth of the hook for locking a chain-link upon the hook, substantially as described.

2. In a back-band buckle, the combination with the web-plate, and upwardly-turned hook depending from its lower edge, of a wedge-plate, and a hook-lapping tongue depending from the lower edge of the wedge-plate, inclined outwardly from the outer side of hook to the lower edge of the wedge-plate whereby it forms a stop outside the mouth of the hook for locking a chain upon the hook and the wedge-plate against vibratory opening-and-closing movements, substantially as described.

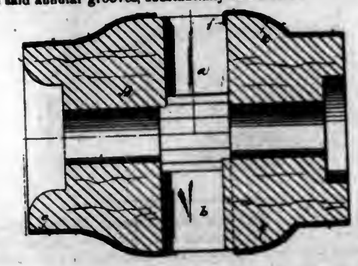


606,848. SKELETON STRUCTURE FOR FIREPROOF PARTITIONS. PAUL KÜHNE, Stapleton, N. Y., assignor to the Staten Island Construction Company, same place. Filed July 26, 1897. Serial No. 646,196. (No model.)

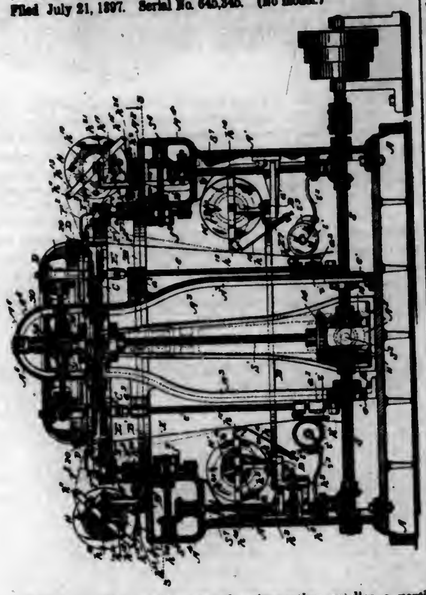
Claim.—1. In a skeleton structure for fireproof partition-walls, the combination of a metallic strut provided with transverse holes near its edges, flanged clamping-strips applied to each edge and having transverse holes immediately adjacent to the flanges and registering with the holes in the strut, and keys or wedges driven through the holes in the clamping-strips and strut and being in contact at each end with the flat surfaces of said flanges, substantially as set forth.

2. In a skeleton structure for fireproof partition-walls, the combination with the ceiling and floor irons, and struts connected with said irons and provided with transverse holes near their edges, of U-shaped clamping-strips provided with holes registering with the holes in said struts, and keys driven into the registering holes of the strips and struts, for clamping the filling material between the said clamping-strips, substantially as set forth.

606,849. ENVELOP. JOHN A. LEFFERTS, New York, N. Y. Filed Feb. 6, 1897. Serial No. 622,251. (No model.)



Claim.—1. An envelop having a cutting-thread lying in the interior thereof and adapted to open the envelop and a notch in the edge of one of the end flaps of the envelop and under the free flap thereof adapted to receive the free end of such thread whereby when the envelop is sealed the free end of the thread is folded down and held against the outside of the envelop substantially as and for the purpose set forth.



2. In an envelop a cutting-thread lying within the envelop adjacent to one end thereof and having one end bent over the edge of an end flap of the envelop and secured between the adjoining gummed surfaces of such end flap and a side flap and a notch in the opposite edge of such end flap adapted to seize such thread at a point near the free end thereof, substantially as and for the purposes set forth.

606,850. VEHICLE-HUB. WILLIAM T. LEWIS, Racine, Wis., assignor to the Mitchell & Lewis Company, Limited, same place. Filed Sept. 20, 1897. Serial No. 652,250. (No model.)

Claim.—The combination with a wooden vehicle-hub, provided with series of spoke-holes, at about the center thereof, and shallow annular grooves on each side of said spoke-holes, of a pair of continuous metallic bands, corresponding in their general contour to that of said hub and forced tightly thereon from opposite ends and stopping on each side of the line of the said spoke-holes, the said bands being in contact with the wood of said hub except at the lines of the said annular grooves, substantially as set forth.

606,851. CIRCULAR-WARP-KNITTING MACHINE. ARTHUR R. LINDNER, Wilmington, Del., assignor to Julius Kayser, New York, N. Y. Filed July 21, 1897. Serial No. 645,245. (No model.)

Claim.—1. The combination of reciprocating needles, a vertically-reciprocating presser-ring above said needles, vertically and horizontally reciprocating sinkers below the needles, upper and lower thread-guides, and means for raising and lowering and intermittently shifting said thread-guides.

2. The combination of reciprocating needles, a reciprocating presser-ring above the needles, a vertically-reciprocating sinker-ring, horizontally-reciprocating sinkers in said ring, upper and lower thread-guides, and means for vertically reciprocating and intermittently shifting said thread guides.

3. The combination of reciprocating needles, a vertically-reciprocating presser-ring above said needles, a vertically-reciprocating sinker-ring below said needles, horizontally-reciprocating sinkers guided in said sinker-ring, two sets of thread-guides, a mechanism for imparting intermittent or step-by-step rotary motion to said thread-guides in opposite directions to each other, and mechanism for imparting a vertically-reciprocating motion to said thread-guides.

4. The combination of a circular series of knitting-needles, means for reciprocating said needles, a vertically-reciprocating presser-ring above said needles, vertically and horizontally reciprocating sinkers below said needles, two sets of thread-guides, guide-rings on which the thread-guides are mounted, means for intermittently moving said guide-rings and the thread-guides mounted thereon in opposite direction around the circular series of needles, and means for vertically reciprocating said guide-rings and said thread-guides supported thereon.

5. The combination of two sets of thread-guides, guide rings for supporting said thread-guides, said guide-rings having ratchet-teeth, a ring-shaped guide-frame for said rings, two pawl-carrier rings one for each guide-ring, pawls arranged in pairs on each pawl-carrier ring, a driving-shaft, a cam on said shaft, a mechanism between said cam and the pawl carrier rings by which intermittent or step-by-step rotary motions in opposite directions are imparted to the guide-rings and thread-guides.

6. The combination of a circular series of reciprocating needles, a main guide-ring extending around said needles, two independent thread-guide-carrier rings guided in ways of the main guide-ring, two sets of thread-guides fixed to said thread-guide-carrying rings, two pawl-carrier rings one for each thread-carrier ring each provided with pawls arranged in pairs and adapted to engage the ratchet-teeth of both thread-guide-carrier rings, means for imparting intermittent or step-by-step rotary motion in opposite directions to said pawl-carrier rings, and means for intermittently raising and lowering the main guide-ring whereby a vertically-reciprocating motion is imparted to the thread-guide.

7. The combination of two sets of thread-guides, thread-guide-carrier rings, a guide-ring in which the thread-guide-carrier rings are mounted, pawl-carrier rings arranged in said guide-ring inside of the thread-guide-carrier rings, said pawl-carrier rings being each provided with pawls arranged in pairs and adapted to engage the ratchet-teeth of the thread-guide-carrier rings, means for imparting an intermittent or step-by-step rotary motion to said pawl-carrier rings alternately in opposite directions whereby a continuous step by-step motion is imparted to the thread-guide-carrier rings, and means for imparting a vertically-reciprocating motion to the guide-ring and hence to the thread-guides.

8. The combination of a circular needle bed-plate, a circular series of movable needle-carriers arranged in said bed-plate and provided with inwardly-extending shanks, groups of needles arranged in said carriers, and means for operating said needle-carriers, said means embracing horizontal bell-crank levers, and an oscillating ring concentric with said bed plate for actuating said levers.

9. The combination of a circular needle bed-plate, a circular series of movable needle-carriers guided in said bed-plate and provided with inwardly-projecting shanks, groups of needles arranged in said carriers, means for operating said needle-carriers, said means embracing horizontal bell-crank levers, and an oscillating ring engaging said bell-crank levers, a cam on the driving-shaft, and a lever connected to said cam and said oscillating ring.

10. The combination of a vertical driving-shaft provided with cams, an annular needle bed-plate surrounding said shaft, needle-carriers disposed in groups and guided in said bed-plate and provided with shanks, a mechanism between one of said cams and said shanks imparting a reciprocating motion to the same, a sinker-ring below the needle bed-plate sinker-carriers arranged in groups and guided in said sinker-ring, a mechanism between the second cam and the sinker-carriers imparting a reciprocating motion to said sinker-carriers, and a mechanism by which a vertically-reciprocating motion is imparted to the sinker-ring.

11. The combination of a vertical driving-shaft provided with two cams, an annular needle bed-plate surrounding said shaft, needle-carriers disposed in groups and movable in said bed-plate, groups of needles in said needle-carriers, a mechanism between said needle-carriers and one of the driving-cams for imparting reciprocating motion to said carriers, a presser-ring above said needles, means for imparting vertically-reciprocating motion to said presser-ring from the driving-shaft, a sinker-ring below the needles, means for imparting vertically-reciprocating motion to said sinker-ring, sinker-ring carriers arranged in groups and guided in said sinker-ring, a mechanism between said sinker-ring carriers and the lower cam on the driving-shaft for imparting a reciprocating motion to said sinkers.

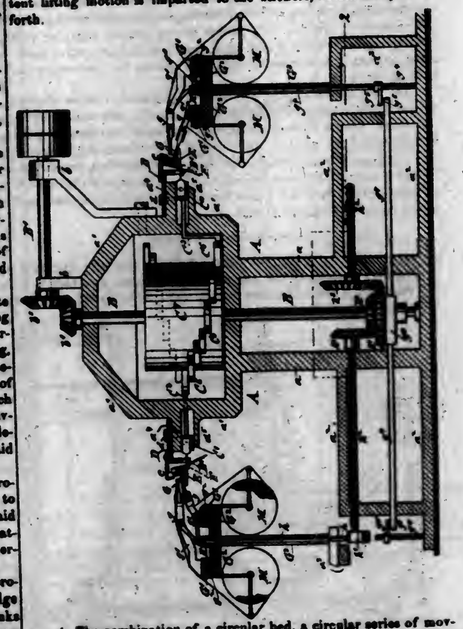
12. The combination of a circular needle bed-plate, a circular series of reciprocating needles on said bed-plate, a vertically-reciprocating presser-ring above said needles, a vertically-reciprocating sinker-ring below said bed-plate, a series of horizontally-reciprocating sinkers guided in said sinker-ring, two sets of thread-guides, means for imparting a vertically-reciprocating motion to said thread-guides, means for imparting an intermittent or step-by-step motion to said thread-guides in opposite direction to each other, and intermittently-movable bobbin-rings carrying bobbins respectively for the upper and lower thread-guides, said bobbins moving with their corresponding thread-guides in opposite directions to each other.

13. The combination of a stationary needle bed-plate, a circular series of reciprocating needles guided in said bed-plate, a vertically-reciprocating presser-ring above said needles, a vertically-reciprocating sinker-ring below said needles, horizontally-reciprocating sinkers guided in said sinker-ring, two sets of thread-guides, a vertically-reciprocating main guide-ring, two carrier-rings for said thread-guides, and means for imparting an intermittent step-by-step motion to said carrier-rings in opposite directions to each other, said carrier-rings being arranged in sections, each one being operated independently of the other with the corresponding group of thread-guides supported thereon.

14. In a knitting-machine, the combination of a circular needle-bed provided with radial ways, a series of needle-slides movable in said ways, a series of needle-carriers connected with each needle-slide, each needle-carrier being adapted to receive a series of needles, and means for imparting a reciprocating motion to said slides.

15. In a knitting-machine, the combination of a needle bed-plate provided with an exterior ring having radial grooves and an interior ring connected with the exterior ring and provided with a less number of radial grooves, a series of needle-carriers the shanks of which slide in the radial grooves of the outer ring, each needle-carrier carrying a series of needles a series of needle-slides having radial shanks adapted to slide in the radial grooves of the inner ring, a series of needle-carriers being connected with each of said needle-slides, and means for reciprocating said needle-carriers.

16. In a knitting-machine, the combination of a needle bed-plate provided with an outer ring having radial grooves, and an inner ring provided with a less number of radial grooves, a series of needle-carriers, the shanks of which slide in the radial grooves of the outer ring, each needle-carrier carrying a series of needles, a series of needle-slides having radial shanks adapted to slide in the radial grooves of the inner ring, a series of needle-carriers being connected to each needle-slide, an actuating reciprocating ring, bell-crank levers pivoted to said bed-plate and connected with the shanks of said needle-slides and said reciprocating ring, and means for reciprocating said ring.



17. In a knitting-machine, the combination of a sinker-ring provided with radial grooves, sinker-slides having shanks adapted to move in said grooves, sinker-carriers vertically adjustable on said sinker-slides, each carrying a group of sinkers, means for reciprocating said sinker-slides, and means for raising and lowering said sinker-ring.

18. In a knitting-machine, the combination of a sinker-ring provided with an outer ledge, having radial grooves, and an inner ledge having a smaller number of radial grooves, sinker-slides having shanks adapted to slide in the grooves of the outer ledge, sinker-carriers vertically adjustable on said sinker-slides, and adapted to carry a series of sinkers, actuating-slides having shanks adapted to slide in the grooves of the inner ledge, said actuating-slides having each a series of sinker-slides connected therewith, means for reciprocating said actuating-slides, and means for raising and lowering said sinker-ring.

19. In a knitting-machine, the combination of a sinker-ring provided with an outer ledge having radial grooves, and an inner ledge having a smaller number of radial grooves, sinker-slides having shanks adapted to slide in the grooves of the outer ledge, sinker-carriers vertically adjustable on said sinker-slides, and adapted to carry a series of sinkers, actuating-slides having shanks adapted to slide in the grooves of the inner ledge, said actuating-slides having each a series of sinker-slides connected therewith, bell-crank levers pivoted to said sinker-ring and adapted to engage the inner ends of the shanks of said actuating-slides, a reciprocating ring for actuating said bell-crank levers, and means for reciprocating said reciprocating ring.

20. In a circular-knitting machine, the combination of a circular series of needles, a circular series of sinkers operating in connection with said needles, and a thread-guide-carrier ring surrounding said needles and sinkers and constructed in detachable sections, and means for actuating said carrier-ring.

said guide-rings in opposite directions to each other, a lifting-ring on which the ends of the guide-carriers rest, stickers for intermittently raising said lifting-ring, a central driving-shaft, and actuating mechanism between said shaft and the stickers by which an intermittent lifting motion is imparted to the stickers, substantially as set forth.

4. The combination of a circular bed, a circular series of movable needle-carriers disposed in said bed and provided with inwardly-extending radial shanks, groups of needles disposed in said carriers, a series of cams engaging said shanks to thrust said carriers, means for retracting said carriers, two thread-guides, means for oscillating and intermittently shifting said thread-guides, and sinkers.

5. The combination of a circular bed, a circular series of movable needle-carriers disposed in said bed, and provided with inwardly-extending shanks, groups of needles disposed in said-carriers, means for operating said needle-carriers embracing a separate cam for each needle-carrier, two thread-guides, means for intermittently shifting said thread-guides in opposite directions across said needles and means for intermittently moving said thread-guides between said needles.

6. The combination of a circular bed, a circular series of movable needle-carriers disposed in said bed and provided with inwardly-extending shanks terminating in different planes, means for operating said needle-carriers embracing superposed cams engaging said shanks, two thread-guides, means for shifting said thread-guides in opposite directions across said needles, and means for moving said thread-guides between said needles.

7. The combination of a vertical driving-shaft, a series of cams on said shaft, an annular bed surrounding said shaft, needle-carriers adapted to move radially on said bed and engaged by said cams, needles supported in said carriers, ring-shaped guideways larger in diameter than said bed, movable rings mounted on said guideways, thread-guides mounted on said movable rings, mechanism for shifting said rings, and mechanism for oscillating said thread-guides.

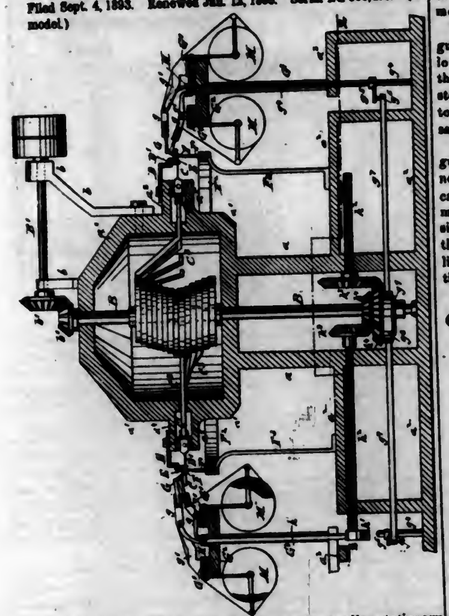
8. The combination of a vertical driving-shaft, a series of cams on said shaft, an annular bed surrounding said shaft, needle-carriers adapted to move radially on said bed and engaged by said cams, needles supported in said carriers, ring-shaped guideways larger in diameter than said bed, a lifting-ring, pivoted carriers mounted on said guide-rings carrying thread-guides and having shanks engaging said lifting-ring, intermediate mechanism between said lifting ring and driving-shaft for raising said lifting-ring to oscillate said thread-guides, and intermediate mechanism between said guide rings and said shaft for intermittently moving said guide-rings.

9. The combination of a vertical driving-shaft, a series of cams on said driving-shaft, a circular casing surrounding said cams and provided with flanges forming an annular bed, needle-carriers adapted to slide radially in said bed and provided with shanks engaging said

606,852. CIRCULAR-WARP-KNITTING MACHINE. ARTHUR R. LINDNER, Wilmington, Del., assignor to Julius Kayser, New York, N. Y. Filed Sept. 4, 1893. Renewed Jan. 12, 1898. Serial No. 666,475. (No model.)

Claim.—1. The combination of reciprocating needles, stationary needle-guides, stationary pressers above the needles, sinkers pivoted to the pressers, thread-guides, and means for oscillating and intermittently shifting said thread-guides, substantially as set forth.

2. The combination of a cylindrical supporting-frame, having circumferential guide-flanges, needle-carriers, guided in ways of said flanges, needles supported in said carriers, radial shanks applied to said carriers, guides for said shanks, helical springs applied to the guides and the needle-carriers, a central driving-shaft, and cams on said shaft and adapted to engage said shanks and impart reciprocating motion to the needle-carriers, substantially as set forth.



3. The combination of two sets of thread-guides, carriers for said thread-guides, guide-rings on which the guide-carriers are mounted, means for imparting intermittently a step-by-step rotary motion to

cams, groups of needles disposed in said needle-carriers, pressers engaging said needles, a series of thread guides mounted outside said bed, means for lifting said thread-guides, and means for oscillating said thread guides.

10. The combination of a vertical shaft provided with cams, an annular bed surrounding said shaft, needle-carriers disposed in groups and movable in said bed, said groups having shanks engaging said cams, groups of needles in said needle-carriers, and adjunctive mechanism operating in connection with said needles for performing the knitting operation.

11. The combination of a vertical driving-shaft, a series of cams on said driving-shaft, a circular casing surrounding said cams and provided with flanges forming an annular bed, needle-carriers adapted to slide radially in said bed and provided with shanks engaging said cams, groups of needles disposed in said needle-carriers, pressers attached to said bed and engaging said needles, a series of thread-guides mounted outside said bed, means for shifting said thread-guides, and means for oscillating said thread-guides.

606,853. CIRCULAR-WARP-KNITTING MACHINE. ARTHUR B. LINDNER, Wilmington, Del., assignor to Julius Kayser, New York, N. Y. Filed Sept. 4, 1893. Renewed Jan. 12, 1898. Serial No. 666,476. (No model.)

Claim.—1. The combination of reciprocating needles, stationary needle-guides, oscillating pressers above the needles, stationary sinkers below the needles, thread-guides, and means for oscillating and intermittently shifting said thread-guides, substantially as set forth.

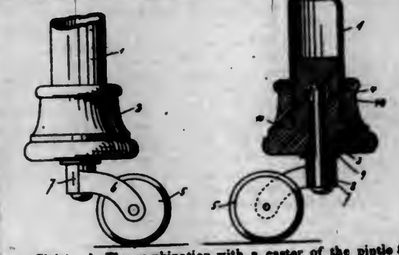
2. The combination of reciprocating needles, stationary guides for the same, yielding pressers above the needles, stationary sinkers supported below the needles, thread-guides, and means for oscillating and intermittently shifting said thread-guides, substantially as set forth.

3. The combination of reciprocating needles, stationary needle-guides, pressers hinged to said needle-guides above the needles, stationary sinkers supported below the needles, thread-guides, and means for oscillating and intermittently shifting said thread-guides, substantially as set forth.

4. The combination of reciprocating needles, stationary needle-guides, pressers hinged to the needle-guides above the needles, stationary sinkers located below the needles and between the needle-guides and pressers, two sets of thread-guides, and means for oscillating and intermittently shifting said thread-guides, substantially as set forth.

5. The combination of reciprocating needles, stationary needle-guides, pressers hinged to the needle-guides above the needles, stationary sinkers located below the needles, two sets of thread-guides, mechanism for imparting an intermittent or step-by-step rotary motion to said thread-guides in opposite directions to each other, and mechanism for imparting oscillating motion to said thread-guides, substantially as set forth.

6. The combination of reciprocating knitting-needles, stationary needle-guides, pressers hinged to the needle-guides above the needles, said pressers having beveled or rounded-off ends adapted to press the beards of the needles, sinkers below the needles, two sets of thread-guides, and means for oscillating and intermittently shifting said thread-guides, substantially as set forth.

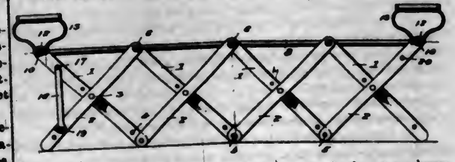


7. The combination of a cylindrical supporting-frame having circumferential flanges, needle-carriers guided between said flanges, means for reciprocating said needle-carriers, a set of needles in said carriers, stationary needle-guides supported in the top flange of the supporting-frame, pressers hinged to the needle-guides, one for each needle carrier, sinkers below the needles, a stationary sinker-ring for supporting the sinkers, thread-guides, and means for oscillating and intermittently shifting said thread-guides, substantially as set forth.

8. The combination of a cylindrical supporting-frame having circumferential flanges, needle-carriers guided between said flanges, a set of needles supported in said carriers, radial shanks applied to said carriers, means for guiding said shanks, a central driving-shaft, eccentrics on said shaft, and loose straps on said eccentrics, the shanks being connected with said straps so that a positive reciprocating motion is imparted to the needle-carriers, substantially as set forth.

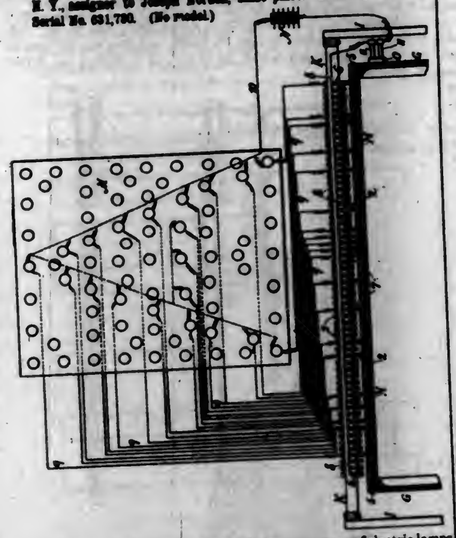
9. The combination of reciprocating needles, stationary needle-guides, oscillating pressers above the needles, stationary sinkers below the needles, two sets of thread-guides, guide-rings in which the thread-guides are mounted, means for imparting intermittently or step-by-step rotary motion to said guide-rings in opposite directions to each other, and mechanism for imparting an oscillating motion to said thread-guides, substantially as set forth.

10. The combination of reciprocating needles, stationary needle-guides, oscillating pressers applied to the needle-guides above the needles, sinkers located below the needles, two sets of thread-guides, carriers for said thread-guides, guide-rings on which said carriers are mounted, means for imparting an intermittent rotary motion in opposite directions to said guide-rings, a lifting-ring engaging the ends of the thread-guide carriers, and means for intermittently raising the lifting-ring for simultaneously oscillating the thread-guides, substantially as set forth.



606,854. CASTER. MORTIMER G. MERRITT and FRANKLIN L. GROFF, Rome, N. Y., assignors to the Rome Metallic Bedstead Company, same place. Filed Dec. 8, 1896. Serial No. 614,963. (No model.)

Claim.—1. The combination with a caster of the pintle 8, the spring 10 secured to the side of the pintle and diverging therefrom, the washer 9 secured on the pintle and securing the spring 10 substantially as set forth.



2. The combination with a leg having a caster-socket 3 with a shoulder 4ª at its upper end, of a caster having a pintle 8 and a divergent spring 10 both adapted to enter the socket, the washer 9 secured to the pintle and securing the spring to the side of the pintle, substantially as set forth.

606,855. FOLDING COT. CALVIN F. MOORE, Chicago, Ill. Filed Feb. 16, 1898. Serial No. 670,540. (No model.)

Claim.—The combination in a folding cot, of a lazy-tong lever forming the opposite parallel sides of the cot, the screw-eyes 6 6 connecting the upper contiguous ends of said levers, the transverse braces 10 10, the handles pivoted to the outer ends of said braces, the flexible bottom formed with the parallel side hems 8 8 and the end hems 9 9 encompassing said braces and the cords 15 15 extending through said side hems and screw-eyes and having their outer ends fixed in said transverse braces 10 10, substantially as shown and described

606,856. ELECTRICAL SIGN. MORTIMER NORDEN, New York N. Y., assignor to Joseph Norden, same place. Filed Apr. 13, 1897. Serial No. 631,780. (No model.)

Claim.—1. The combination with the monogram of electric lamps and the circuit connections to and from the same, of bars and spring-contacts carried by the bars, a shaft, heads, letter-bars and contacts upon the letter-bars and means for revolving the same and closing the circuits to the electric lamps by the pins acting upon the pairs of contact-springs, a segment bar and contact-brush in the main circuit for closing the circuit through the spring-contacts and for breaking such circuit when the segment separates from the contact-brush, substantially as set forth.

2. In an automatic mechanism for electric signs, a shaft and heads, means for revolving such shaft and heads, removable letter-bars and contact-pins carried by such heads and a circular range of bars and contact-springs carried by the same and circuit connections, a segment-bar upon one of the heads and a contact-brush and circuit connections, substantially as set forth.

606,857. WHIFFLETREE-HOOK. HÅKAN OLSON, Sugerville, Ill. Filed Oct. 28, 1897. Serial No. 656,863. (No model.)

Claim.—1. The combination with a whiffletree having a slot in the end and two intersecting alined holes and the collar or ferrule, of the hook comprising the curved arm having an inwardly-extending lug at the end, the shank integral with said arm formed with a horizontal slot and with a recess in its rear side, the pin passing through said slot, and the spring seated in said recess, substantially as described.

2. The combination with the whiffletree having a slot in the end and two intersecting alined holes and the collar or ferrule, of the hook comprising the curved arm having an inwardly-extending lug at the end, the integral shank formed with a horizontal slot and with a recess in the rear side, the pin passing through said slot, the spring seated in said recess, and the head at the end of the shank, substantially as described.

606,858. VALVE-REVERSING GEAR. FREDERICK QUINN, Oliver, Ill. Filed Jan. 20, 1898. Serial No. 667,206. (No model.)

Claim.—A valve-reversing gear, comprising the rock-shaft 8, the bell-crank lever 9, the connecting-rod 19 connecting the longer arm 18 of said lever 9 with the valve-operating rod 21, means for securing said bell-crank lever in two or more fixed positions and the eccentric-rod 5 pivoted to the contiguous ends of said rods 19 and 21, as and for the purpose set forth.

606,859. MUD-GUARD. RANDOLPH H. REID, Philadelphia, Pa., assignor of one-half to James McCormick, same place. Filed July 12, 1897. Serial No. 644,223. (No model.)

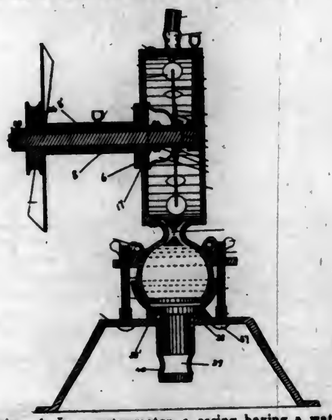
Claim.—1. In a mud-guard, a casing, an auxiliary back adapted to be secured to the bicycle-frame, and an adjustable securing device between the back and the casing, said casing being pivotally attached to said back.

2. In a detachable mud guard for cycles, the combination with a suitable casing, an auxiliary back adjustably mounted on the same, means for securing said auxiliary back to the frame of a wheel, a roller in said casing, and a flexible guard wound upon said roller, substantially as described.

606,860. FOUNTAIN ATTACHMENT FOR PENHOLDERS. CARL J. REES, New York, N. Y. Filed Aug. 19, 1897. Serial No. 648,767. (No model.)

Claim.—1. A fountain attachment for pens and penholders, comprising a body, a fingered tip at the forward end of the body and having transverse cells in its upper face, and a spring secured to the under side of the body and having its forward end curved upwardly and extending into close proximity to the under face of the tip, substantially as described.

2. A fountain attachment for pens and penholders, comprising a body, a tip integral with the body and provided with three fingers having transverse cells on their upper faces, the central finger being disconnected from the side fingers at the outer end, and a spring secured to the under side of the body and having its forward end curved upwardly under the tip and formed with claws, substantially as described.



3. A fountain attachment for pens, comprising a body, a tip integral with the body and provided with three fingers the side fingers being connected at the outer ends and the intermediate finger being disconnected at said outer end with the side fingers, the fingers being provided with transverse cells in their upper faces, and a spring secured at about its center to the body and having its ends curved upwardly, the forward end being provided with claws, substantially as described.

4. In a fountain attachment for pens and penholders, a spring-body consisting of a bar, and a spring member attached to the bar, the ends whereof are curved in opposite directions, the forward end terminating in claws, and a tip or feeder forming a continuation of the said bar and extending over and beyond the claws of the spring member of the body, the tip or feeder being slotted and cellular, for the purpose specified.

5. A fountain attachment for pens and penholders, comprising a body provided at the under side with a spring, the ends whereof are curved in opposite directions, and a tip integral with the body and consisting of fingers having transverse cells in their upper faces, substantially as described.

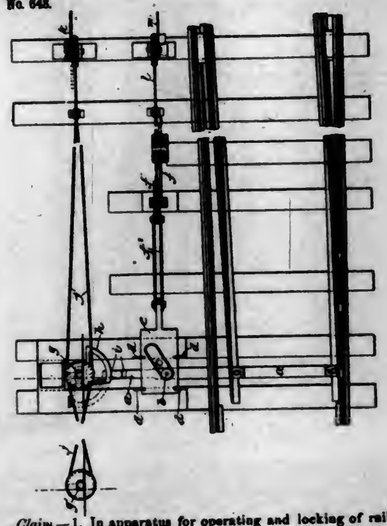
6. A fountain attachment for pens and penholders, consisting of a body, a tip integral with the body and formed of a plurality of fingers having cells in their upper faces, and a spring on the under side of the body, the said spring being secured to the body at about its center and having its forward end formed with claws, substantially as described.

606,861. **WATER-MOTOR.** ALBERT ROSENBERG, Baltimore, Md. Filed May 18, 1897. Serial No. 637,125. (No model.)

Claim.—1. In a water-motor, a casing having a water-wheel therein; a spindle, rigidly secured to said water-wheel, projecting outside of said casing; an inlet to said casing; means for permitting the tilting of said casing; and an outlet from said casing through said tilting means; substantially as described.

2. In a water-motor; a casing having a water-wheel therein; a spindle, rigidly secured to said water-wheel, projecting outside of said casing; an inlet to said casing; a support therefor and means for permitting said casing to be tilted; an outlet from said casing through said tilting means and through said support; substantially as described.

3. In a water-motor, a casing having a water-wheel therein; a spindle, rigidly secured to said water-wheel, projecting outside of said casing; an inlet to said casing; one member, of a joint whereby the said casing may be tilted, secured to said casing; the other member, of said joint, secured to a support; means for securing the members together, and an outlet from said casing through the members of said joint; substantially as described.

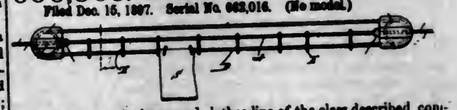


4. In a water-motor, a casing having a water-wheel therein; a spindle, rigidly secured to said watet-wheel, projecting outside of said casing; an inlet to said casing; means for permitting the universal adjustment of said casing; and an outlet from said casing through said universal adjusting means; substantially as described.

5. In a water-motor, a casing having a water-wheel therein; a spindle, rigidly secured to said water-wheel, projecting outside of said casing; an inlet to said casing; one member of a universal joint rigidly secured to said casing; the other member, of said joint, secured to a support; means for securing the members of said joint together; and an outlet from said casing through the members of said universal joint; substantially as described.

6. In a water-motor, a casing having a water-wheel therein; a spindle, rigidly secured to said water-wheel, projecting outside of said casing; an inlet to said casing; a support therefor and means for permitting the universal adjustment of said casing; and an outlet from said casing through said universal adjusting means and through said support; substantially as described.

7. In a water-motor, a casing having a water-wheel therein; a spindle, rigidly secured to said water-wheel, projecting outside of said casing; an inlet to said casing; a ball rigidly secured to said casing; a socket, for said ball, secured to a support; means for securing the ball in the socket; and an outlet from said casing through said ball and socket; substantially as described.



606,862. **LOCK FOR RAILWAY-SWITCHES.** CARL H. SCHAERR, Stockholm, and JOHANNES M. J. LOUDIN, Wirtan, Sweden. Filed Aug. 27, 1896. Serial No. 604,120. (No model.) Patented in Sweden Apr. 29, 1895, Nos. 6,971 and 7,196; in Norway Nov. 22, 1895, No. 4,996; in France Jan. 21, 1896, No. 253,856; in Hungary Feb. 10, 1896, No. 5,469; in England Mar. 27, 1896, No. 6,752; in Austria May 6, 1896, No. 45/1,726; in Switzerland May 12, 1896, No. 12,608; in Turkey May 30, 1896, No. 530; in Canada July 4, 1896, No. 52,824, and in Finland Oct. 3, 1896, No. 648.

Claim.—1. In apparatus for operating and locking of railway-switches the combination of a cross-bar connected to the switch-points, a cam-plate adapted to move the said cross-bar, a switch-lever connected to the said cam-plate, a second switch-lever connected to the first-mentioned switch-lever, a cam or hook connected to a signal and adapted to hold the said cross-bar in either of its extreme positions, when the signal shows "clear," and a lever for operating said signal, substantially as and for the purpose set forth.

2. In apparatus for operating and locking of railway-switches the combination of a cross-bar movable in the direction of its length and adapted to move the switch-points, a cam-plate movable in the direction of the rails and adapted to move the said cross-bar, a switch-lever adapted to move the said cam-plate, a second switch-lever provided with signs showing the position of the switch and by means of suitable transmissions, such as wire rope, connected to the first-mentioned lever, a cam or hook connected to a signal-disk and catching in suitable notches in the said cross-bar so as to hold the switch-point in either of its extreme positions, and a lever provided with signs showing the position of said signal-disk and connected so as to operate the same, as and for the purpose set forth.

606,863. **CLOTHES-LINE.** PHILIP SUSSOTT, New York, N. Y. Filed Dec. 16, 1897. Serial No. 662,016. (No model.)

Claim.—1. An improved clothes-line of the class described, comprising a longitudinal main suspending cable, pulley-blocks mounted upon and carried by said cable, an endless rope or cable passing around said pulley mechanism and forming the clothes-line proper, and a series of rings embracing and connecting the main suspending cable and the clothes-line proper and adapted to slide upon said members, substantially as and for the purpose set forth.

2. An improved clothes-line of the class described, comprising a longitudinal main suspending cable, pulley-blocks pivotally connected with and suspended from said main cable and adapted to swing thereon, an endless rope or cable passing around said pulley mechanism and forming the clothes-line proper, and a longitudinal series of rings extending between and connecting the main cable and the clothes-line cable and loosely mounted in position so that they slide freely upon said members, substantially as and for the purpose set forth.

3. An improved clothes-line of the class described, comprising a longitudinal main suspending cable provided with projections or flanges and passing through eyes or openings in pulley-blocks, the pulley-blocks being suspended from said main cable and adapted to swing thereon and bearing against said projections or flanges, an endless rope or cable passing around said pulley mechanism and forming the clothes-line proper, and the rings extending between and connecting the main cable and the clothes-line cable and arranged in a longitudinal series thereon between the pulley mechanism, said rings being adapted to freely slide, substantially as and for the purpose set forth.

606,864. **HEATING OR VULCANIZING APPARATUS.** GEORGE W. SLATER, Philadelphia, Pa. Filed Mar. 10, 1898. Serial No. 673,202. (No model.)

Claim.—1. In a heating or vulcanizing apparatus, the combination of a base, a flue or combustion-chamber supported thereupon, a bed supported upon said combustion-chamber and a clamping device, the latter consisting of a yoke having lips for engagement with lugs on said combustion-chamber, a member located above said bed, and a thumb-screw passing through said yoke and engaging said member.

2. A hollow base, a flue supported thereon, a bed mounted on said flue, a follower above the same, a screw carrying said follower and a yoke in which said screw is fitted, said flue having on its sides outwardly-turned lugs and said yoke having on its under ends inwardly-turned lips, which latter are removably engaged with said lugs.

3. A hollow base, a flue supported thereon, a bed mounted on said flue, a follower above the same, a screw carrying said follower and a yoke in which said screw is fitted, said flue having on its sides outwardly-turned lugs and said yoke having on its under ends inwardly-turned lips, which latter are removably engaged with said lugs, said bed having downwardly-projecting lugs which enter said flue.

4. In a heating and vulcanizing apparatus, a heater, a flue, a removable bed closing the top of said flue, a follower above said bed and a device for clamping said bed and follower to said flue, said bed having lugs which enter said flue, and the corners of the latter being cut away, forming discharge-openings, whereby the products of combustion directed against said bed are retarded by said lugs and discharged through said corner-openings.

5. In a device of the character stated, a flue with outwardly-projecting lugs on the sides thereof, a bed supported on said flue, a follower above said bed, a screw carrying said follower, and a yoke to which the said screw is fitted, said yoke having inturned lips which engage said lugs, the contiguous faces of said lips and lugs being reversely curved.

606,865. **WHEEL.** REGINALD H. SMITH, London, England. Filed June 20, 1897. Serial No. 642,269. (No model.)

Claim.—1. In a wheel, a slotted hub, an axle passing therethrough, springs applied to opposite sides of the hub in a line therewith, and springs applied between the outer side of the hub and the inner sides of the wheel, and a lever secured to the axle, combined with a series of pivoted levers placed upon opposite sides of the hub, the outer one of each series of levers having its outer end pivoted to the wheel, substantially as shown.

2. In a wheel, a slotted hub, the axle passing therethrough, and springs placed in opposite ends of the slot in the hub, and having their inner ends to bear against opposite sides of the axle, combined with a lever connected to the axle, and a series of levers connected to each end of the lever secured to the axle, the outer end of each one of each series being connected to the rim; and springs placed between the hub and the rim of the wheel, substantially as specified.

606,866. **ENVELOP.** GEORGE SOUTHARD, Indianapolis, Ind. Filed Dec. 21, 1897. Serial No. 662,808. (No model.)

Claim.—The combination, with an envelop having suitable slits therethrough, of a sealer adapted to fold over the open edge of the envelop and provided with ends which are adapted to pass through said slits, the ends and one side of the sealer being adapted to be secured together, substantially as shown and described.

606,867. **CARRIER FOR BICYCLES, &c.** WILLIAM M. TWEART, Yorkton, Canada. Filed Nov. 18, 1897. Serial No. 658,057. (No model.)

Claim.—1. A carrier for bicycles and similar vehicles which is adapted to be connected with the forward upright tubular head of the frame, said carrier consisting of a cross head or bar provided with a clamp which is adapted to be connected to said tubular head, rods connected with the ends of said cross-head, and adjustable vertically thereon, a bottom frame hinged to, or pivotally connected with the lower ends of said rods, a sliding extension connected with said bottom frame, a supplemental frame hinged to or pivotally connected with the upper ends of said main rods, and adapted to be held in an upright, or lowered into a horizontal position, said supplemental frame being provided with a network which is adapted to form a basket, and said supplemental frame, and the extension of the bottom being provided with straps, substantially as shown and described.

2. A carrier for bicycles and similar vehicles, consisting of a cross head or bar which is adapted to be clamped to the forward part of the frame of the vehicle, said cross head or bar being provided at each end with main rods which are connected therewith, and to the lower end of which is hinged or pivoted a bottom frame which is adapted to be held in a forwardly-directed position or to be folded upwardly a supplemental frame pivotally connected with the upper ends of said main rods and adapted to be held in a forwardly-directed position or in an upright position, said supplemental frame being provided with a network which is adapted to serve as a basket, and said bottom and said supplemental frame being provided with straps, substantially as shown and described.

3. A carrier for bicycles and similar vehicles, which is adapted

to be connected with the forward part of the frame thereof, said carrier consisting of a cross head or bar, the ends of which are carved downwardly and provided with vertically-adjustable rods, a bottom frame hinged to the lower ends of said vertically-adjustable rods, and adapted to be held in a forwardly-directed position, or to be folded into an upright position, said bottom being provided with an extension which is adjustable thereon, and a supplemental frame pivotally connected with or hinged to the upper ends of said rods, and adapted to be held in a forwardly-directed position or in an upright position, and said supplemental frame and the extension of the bottom being provided with straps, substantially as shown and described.

4. A carrier for bicycles and similar vehicles, which is adapted to be connected with the forward part of the frame thereof, said carrier consisting of a cross head or bar, the ends of which are carved downwardly and provided with vertically-adjustable rods, a bottom frame hinged to the lower ends of said vertically-adjustable rods, and adapted to be held in a forwardly-directed position, said bottom being provided with an extension which is adjustable thereon, and a supplemental frame hinged to the upper ends of said rods, and adapted to be held in a forwardly-directed position, or in an upright position, and said supplemental frame and the extension of the bottom being provided with straps, and said supplemental frame being also provided with a network which is adapted to serve as a basket, substantially as shown and described.

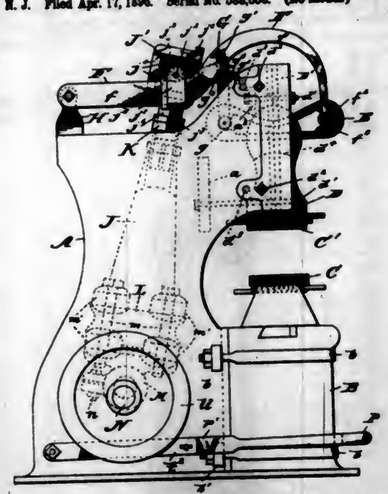
606,868. SAFETY-STIRRUP. JOHN W. THORN, Mechanicsburg, Va. Filed July 3, 1897. Serial No. 643,369. (No model.)

Claim.—1. A stirrup, consisting of a yoke, a rearwardly-tilting foot-piece, and a spring engaging between said yoke and foot-piece and adapted to return said foot-piece to its substantially horizontal position with relation to the yoke when displaced therefrom, substantially as set forth.

2. A stirrup, consisting of a supporting-yoke bifurcated at its lower ends, cross-bars connecting said bifurcated ends, a foot-piece supported by said cross-bars and pivotally attached to the rear one thereof, and a spring engaging between said foot-piece and the forward cross-bar and adapted to return said foot-piece into contact with said cross-bars when displaced therefrom, substantially as set forth.

3. A stirrup, consisting of a supporting-yoke bifurcated at its lower ends, the forward arms of the bifurcated portions being slightly shorter than the rear arms thereof, cross-bars connecting said bifurcated ends, and a pivoted foot-piece supported by said cross-bars, the construction being such that the forward end of said foot-piece is raised slightly above its rear end, substantially as set forth.

606,869. CURRENT-INDICATOR. THOMAS W. VARLEY, New York, N. Y., assignor to himself, and Carl P. Lenk and Rudolph A. Lenk, Brooklyn, N. Y. Filed July 2, 1897. Serial No. 643,253. (No model.)



Claim.—1. The combination with the two astatic needles and a pivotal support, of a connection between the needles extending laterally, an arm for indicating the extent of movement and a case or support for the pivot open between the astatic needles for allowing the ammeter to be applied with the needles at the opposite sides of a stationary conductor, substantially as set forth.

2. The combination with the astatic needles and an indicating-arm extending out from one of the needles, of an arch connection between the needles and beneath the arm, a counterweight at the opposite side of the pivot to the arm and a support for the pivot that allows the astatic needles to be applied above and below a stationary conductor, substantially as set forth.

3. The combination with the astatic needles and an indicating-arm extending out from one of the needles, of an arch connection between the needles and beneath the arm, a counterweight at the opposite side of the pivot to the arm and a yoke for supporting the pivots and an inclosing case open between the needles for allowing the instrument to be applied to a stationary conductor, substantially as set forth.

4. The astatic needles, a pivot for the upper needle, an arch connecting the upper and lower needles, and an indicating-arm in combination with an inclosing case having a recess that allows the case to be applied to a conductor so that the conductor is between the astatic needles, and a magnet for returning the needles to a normal position, substantially as set forth.

606,870. POWER-HAMMER. CHARLES A. VAUGHN, Vineland, N. J. Filed Apr. 17, 1896. Serial No. 588,056. (No model.)

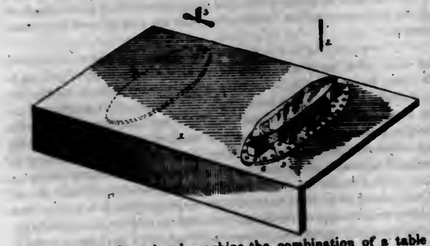
Claim.—1. In a power-hammer, the combination with a supporting-frame having an open central portion, of a cranked driving-shaft mounted in said frame, an eccentric-strap mounted on the crank of said shaft, a forked pitman secured to said eccentric-strap, a hammer-helve or operating-lever pivoted to the supporting-frame, connections between said forked pitman and helve, a hammer-head carried at the forward end of said helve, guide-plates on the frame between which said hammer-head slides, and an anvil secured to the said supporting-frame beneath said hammer.

2. In a power-hammer, the combination with a supporting-frame having an open central portion, of a cranked driving-shaft mounted in said frame, an eccentric-strap mounted on the crank of said shaft, a forked, spring-cushioned pitman secured to said eccentric-strap, a hammer-helve or operating-lever pivoted to the supporting-frame, adjustable connections between said forked pitman and helve, a hammer-head carried at the forward end of said helve, spring guide-plates on the frame between which said hammer-head slides, and an anvil secured to the said supporting-frame beneath said hammer.

3. In a power-hammer, the combination with a supporting-frame having a central opening therethrough, of a cranked driving-shaft mounted in suitable bearings in said frame, an eccentric-strap carried by the crank of said shaft, a forked pitman elastically secured to said eccentric-strap, said forked pitman having a split upper end in which is adjustably mounted an open-sided housing in which housing are carried journal-boxes, a hammer-helve or operating-lever pivoted at the rear of the main frame, an adjustable yoke carrying a journal to be held between the boxes at the upper end of the pitman supported by said hammer-helve, a flexible strap carried at the forward or free end of said hammer-helve, said strap being supported at its rear end by a cushioned hanger depending from the said operating-lever, a hammer-head supported by said strap, grooved spring guide-plates adjustably mounted on the main frame between which said hammer-head slides and a suitable anvil below said hammer.

4. In a power-hammer, the combination with the main frame having a central opening, of a driving-shaft mounted in said main frame, a forked pitman carried by said driving-shaft, a hammer-helve or operating-lever pivoted at the rear of said main frame, adjustable connections between said pitman and said operating-lever, a flexible strap supported at the forward end of the hammer-helve, a cushioned hanger depending from said hammer and supporting the rear end of said strap, a hammer-head having an aperture through which said flexible strap passes, grooved guide-plates between which the hammer-head slides, said guide-plates being provided with rearwardly-extending legs, springs interposed between said legs and the main frame to normally force the spring-plates outwardly, and bolts securing said plates to the frame, so as to permit adjustment of said plates relative to the main frame.

5. In a power-hammer, the combination of the main frame A having a central opening, of the driving-shaft N mounted in said main frame, an eccentric-strap M carried by said shaft, a forked pitman J having a transverse web L at its lower end, said web being adapted to be secured between elastic cushions m' in order to give an elastic support for said pitman, said pitman having a split upper end, a sleeve K screw-threaded into the split end of said pitman, a housing j' having a depending portion j^6 screw-threaded into said sleeve, boxes j^4 carried by said housing, a hammer-helve or operating-lever F, a yoke j^5 adjustably mounted on the said hammer-helve, a journal j^3 carried by said yoke on which the boxes j^4 have their bearing, a strap E, one end of which is supported at the extreme forward end of said hammer-helve F, a depending hanger G by which the rear end of said strap is supported, a rod g^3 pivoted to the hammer-helve and passing through the hanger G, and a cushioning device carried at the free end of said rod to receive the impact of the hanger, a hammer-head D carried by said strap, grooved spring guide-plates d' between said hammer, and an anvil B beneath said hammer.



6. In a power-hammer, the combination with a main supporting-frame having a central opening, of a driving-shaft mounted in said frame, an eccentric-strap carried thereby, a forked pitman elastically supported on said strap, a hammer-helve pivoted at the rear of the main supporting-frame, adjustable connections between the said forked pitman and said hammer-helve, a hammer-head operated by said hammer-helve, a treadle pivoted to the main frame, a brake carried by said treadle, a weighted lever pivoted on the main frame engaging said treadle and normally forcing said brake against the brake-wheel mounted on the driving-shaft, and a belt-tightener adjustably secured to the main frame and connected with said foot-treadle so that when the treadle is depressed and the brake released said belt-tightener is thrown into operative relation to the belt and the driving-shaft is rotated.

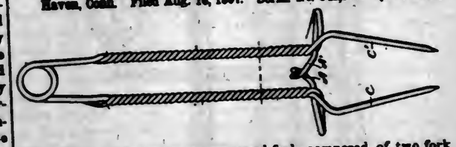
7. In a power-hammer, the combination with the main frame, of the driving shaft and hammer-operating mechanism, a pivot-pin or gudgeon adjustably mounted on said main frame, an operating-lever carried by said gudgeon, a belt-tightener pulley supported by said gudgeon and adjustable therewith, means for securing an independent adjustment of said belt-tightening pulley relative to said gudgeon, an operating-treadle, and a connecting-rod between said operating lever and treadle.

8. In a power-hammer, the combination with the main frame, of the driving-shaft, the hammer-operating mechanism, and belt-tightening devices consisting of the plate R pivoted to the main frame, a gudgeon carried by said plate, a lever p^2 mounted on said gudgeon, a belt-tightening pulley s, a hanger S by which said pulley s is supported, adjustably secured to said lever p^2, an operating-treadle P and a rod p^3 connecting said treadle and lever p^2.

9. In a power-hammer, the combination with the main frame, of a driving-shaft, hammer-actuating mechanism operated thereby, a belt-tightener for said driving-shaft consisting of the plate R pivoted to the main frame, said plate R having an upper slotted portion by means of which said plate may be adjusted to various positions, a gudgeon p^4 carried by said plate R, a lever p^2 mounted on said gudgeon, said lever having a slotted scroll or plate p^5, a depending rod or hanger S mounted on said gudgeon, a screw-bolt p^6 by which said hanger S is adjustably secured to the slotted scroll or plate p^5, a belt-tightening pulley s supported by said hanger S, a treadle P and a rod p^3 connecting said treadle and lever p^2.

606,871. GAGE DEVICE FOR BRUSH-MACHINES. MCCLINTOCK YOUNG, Frederick, Md., assignor to the Palmetto Fibre Company, of Illinois. Filed June 15, 1897. Serial No. 640,888. (No model.)

Claim.—1. In a brush-machine the combination of a table or support and a portable brush-block holder provided respectively with means for securing the holder rigidly in different predetermined positions, substantially as described.



2. In a brush-machine the combination of a table or support and a portable brush-block holder provided with interlocking means substantially as described to retain the holder rigidly in different predetermined positions.

3. The combination with boring and tufting mechanisms, of a work-supporting table therefor, two pairs of pins projecting upwardly from said table and adjacent respectively to said mechanisms, a brush-block holder adapted to rest flatly on the table and provided with two rows of holes forming pairs of sockets side by side, and each pair adapted to receive either of the pairs of pins.

4. In a brush-machine the combination of an inclined table or support and a portable brush-block holder provided respectively with means for securing the holder rigidly in different predetermined positions.

5. The combination with an inclined supporting-table provided with two pins, of a brush-block holder formed with a series of pairs of holes arranged side by side and adapted to receive respectively the two pins.

606,872. DOUBLE OR COMPOUND FORK. EDWIN M. BRAMLEY New Haven, Conn., assignor of one-half to Frederick B. Street, East Haven, Conn. Filed Aug. 16, 1897. Serial No. 648,377. (No model.)

Claim.—1. A double or compound fork composed of two fork members respectively furnished with inwardly-projecting coupling-hooks, which may be utilized to couple the two fork members together, and adapt the fork to be used as a lifting-hook.

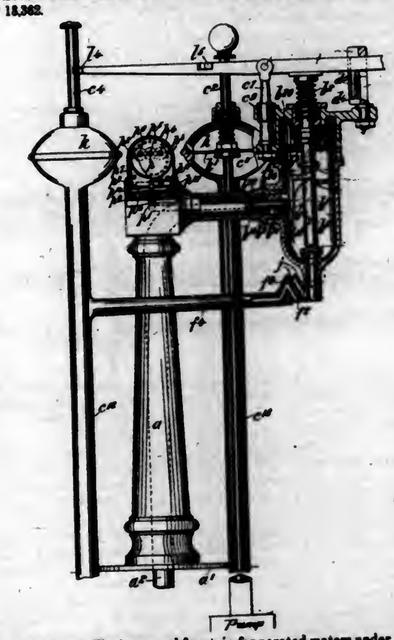
2. A double or compound fork composed of two fork members respectively furnished with inwardly-projecting coupling-hooks which may be utilized to couple the two fork members together and adapt the fork to be used as a lifting-hook, and also furnished with outwardly-projecting guards.

3. A double or compound fork composed of two fork members respectively furnished with inwardly-projecting coupling-hooks which may be utilized to couple the two fork members together and adapt the fork to be used as a lifting-hook, the said coupling-hooks being formed independently of the two fork members and secured thereto.

4. A double or compound fork composed of two fork members respectively furnished with inwardly-projecting coupling-hooks, which may be utilized to couple the two fork members together, and with outwardly-projecting guards, the hook and guard of each fork member being made integral with each other.

5. A double or compound fork composed of two fork members respectively furnished with inwardly-projecting coupling-hooks which may be utilized to couple the two fork members together and adapt the fork to be used as a lifting-hook, and with outwardly-projecting guards, the coupling-hooks and guards of the respective fork members being produced by suitably bending a piece of wire formed independently of and secured to the fork members.

6. A double or compound fork composed of two long main pieces of wire bent midway of their length, having their intermediate portions twisted upon each other to form fork-handles, and having their ends bent to form fork-tines, and two auxiliary pieces of wire intertwined with the handle portions of the fork members, and having their outer ends bent to form outwardly-projecting loop-shaped guards and inwardly-projecting coupling-hooks which latter may be utilized to couple the two fork members together and adapt the fork to be used as a lifting-hook.



7. A double or compound fork, comprising two long main pieces of wire bent midway of their length to form independent open spring-coils lying side by side, having their intermediate portions shaped to form fork-handles, and their ends shaped to form fork-tines, and each of the two members of the fork being provided with inwardly-projecting hooks which may be utilized to couple the two members of the fork together and adapt the fork to be used as a lifting-hook.

8. A double or compound fork, comprising two long pieces of wire shaped to form fork handles and tines, and bent to form two open spring-coils uniting the respective fork members and lying side by side, and the said fork members being respectively provided with inwardly-projecting hooks arranged to coact with each other.

9. A double or compound fork, comprising two long main pieces of wire having their middle portions coiled to form two independent open spring-coils lying side by side, having their intermediate portions twisted upon each other to form twisted fork-handles, and having their ends bent to form oppositely-set fork-tines, and the said fork

also comprising two auxiliary wires intertwined with those portions of the main wires forming the fork-handles and having their outer ends shaped to form inwardly-projecting hooks and outwardly-projecting guards.

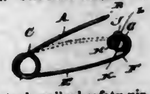
606,878. AERATED-WATER FOUNTAIN OR ENGINE. ALFRED BRAKE and ROBERT J. MCKEE, Wellington, New Zealand; said McKee assignor to said Brake. Filed Oct. 26, 1897. Serial No. 656,656. (No model.) Patented in New Zealand May 27, 1897, No. 9,560; in New South Wales June 5, 1897, No. 7,823, and in England Aug. 6, 1897, No. 18,362.

Claim.—1. The improved fountain for aerated waters under pressure, comprising the measuring-chamber, the pipe connection between said chamber and a suitable receiver, the valve normally closing said communication, the normally open valve controlling the outlet from said chamber, means for simultaneously operating said valves, an automatic gas-operated recorder and mechanism carried by said pipe connection and connected with the recorder, said mechanism being operated by the sudden rise in pressure inside the chamber, substantially as described.

2. A fountain or engine for drawing off aerated waters from bulk consisting of a suitably-supported chamber provided with a spindle carrying a washer to close an opening at the top and a valve to close the bottom of the chamber and a collar, a bell-crank lever adapted to be engaged by said collar, an admission-valve operated by said bell-crank and a lever to operate such spindle whereby all the operations are performed by one movement, substantially as and for the purposes set forth herein.

3. A fountain or engine for drawing off aerated waters from bulk consisting of a suitably-supported chamber provided with a spindle carrying a washer to close an opening at the top and a valve to close the bottom of the chamber and a collar, a bell-crank lever adapted to be engaged by said collar, an admission-valve operated by said bell-crank, a pipe connection connecting said chamber with a receiver, a recorder, mechanism connected with the recorder and operated by the sudden rise in pressure inside the chamber and a lever to operate the spindle whereby all the operations are performed by one movement, substantially as and for the purposes set forth herein.

4. A fountain or engine for drawing off aerated waters from bulk consisting of a suitably-supported chamber provided with a spindle carrying a washer to close an opening in the top and a valve to close the bottom of the chamber and a collar, a bell-crank lever adapted to be engaged by said collar to open an admission-valve, pumps for delivering flavoring-syrups, a lever having a bearing-piece adapted to operate said spindle and having tappets and a grid to operate said pumps and whereby all the operations may be performed by one movement, substantially as and for the purposes set forth herein.



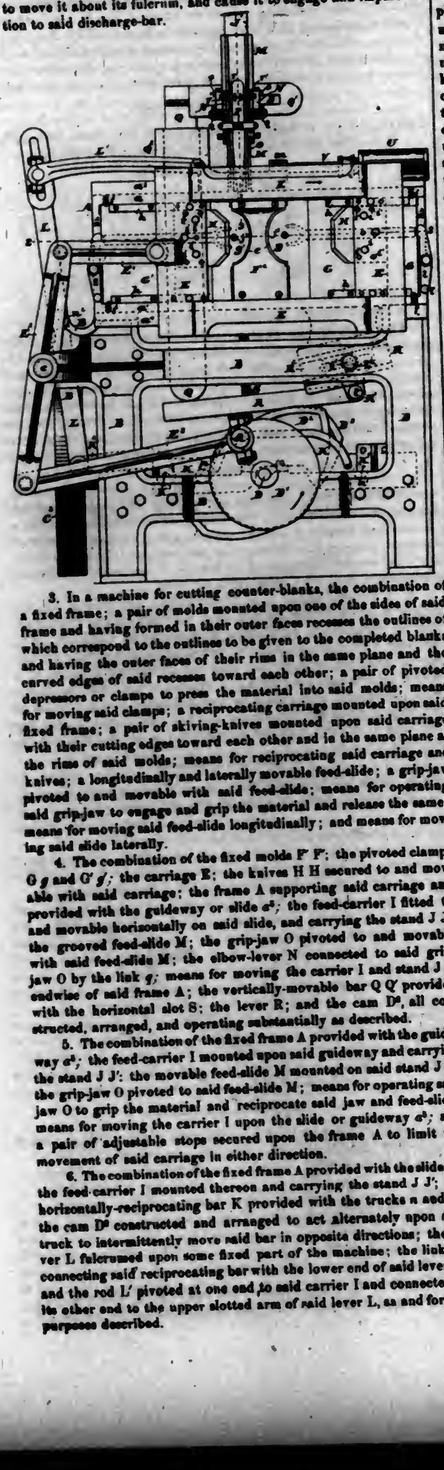
5. A fountain for drawing aerated waters from bulk comprising a chamber, a spindle movable therein and carrying a washer to close an opening at the top of chamber and a valve to close an opening at the bottom of the chamber, a pipe connection from said chamber to a receiver, a bell-crank operating a valve for controlling said pipe connection, a collar on the spindle, a recorder, and mechanism connected with said recorder and operated by the sudden rise in pressure in the chamber, pumps for delivering flavoring-syrups, a rocking lever adapted to operate said spindle, tappets carried by the pump piston-rods adapted to be engaged by said lever and a grid, substantially as described.

6. In a fountain adapted to deliver aerated water from a storage-receptacle containing it under gas-pressure, the combination with the measuring and delivering chamber having a pipe connection with such storage-receptacle, of a recorder, a diaphragm connected with said chamber and adapted to be moved by the pressure of the gas on each operation of the fountain, and a pawl-and-ratchet connection between said diaphragm and recorder, substantially as described.

7. In an aerated-water fountain, the combination with the water-delivery apparatus of the syrup-delivery pipes, the delivery-nozzles therefrom having kinked ends with an air hole in the apex of said kink, and means for sending a puff of air through said nozzle, substantially as described.

8. A fountain or engine for drawing off aerated waters from bulk consisting of a suitably-supported chamber provided with a spindle carrying a washer to close an opening in the top and a valve to close the bottom of the chamber and a collar, a bell-crank lever adapted to be engaged by said collar, an admission-valve operated by said bell-crank, pumps for delivering flavoring-syrups into a mixing-chamber, a lever adapted to operate said pumps and spindle and whereby all the operations may be performed by one movement, and a grid, substantially as and for the purposes set forth herein.

606,874. SAFETY-PIN. HENRY S. BREWINGTON, Baltimore, Md. Filed Nov. 13, 1897. Serial No. 658,435. (No model.)



Claim.—The herein-described safety-pin, formed of a single piece of wire, comprising the pin proper A, the body E, the connecting spring-coil, the curve beyond the pin-point beginning at the point F, turned back and continued to form the coil H, the evenly-bent coil K on the opposite side of the body of the pin, and the cross-bend J on the outside of the body of the pin connecting the two coils, the end of the wire of which the pin is made abutting, at L, against the cross-bend J, all substantially as described.

606,875. COUNTER-CUTTING MACHINE. DANIEL L. CHANDLER, Ayer, Mass., assignor to the Spaulding Brothers Company, Townsend Harbor, Mass. Filed June 19, 1896. Renewed June 26, 1897. Serial No. 642,720. (No model.)

Claim.—1. In a machine for cutting counter-blanks from strips of leather-board or other material, the combination of a fixed frame; a pair of molds having in their outer faces recesses the outlines of which correspond to the desired outlines to be given to the counter-blanks when completed, with the outer faces of their rims in the same plane and their rounded edges toward each other; a pair of clamps for pressing the strip of material into said molds, mounted upon and movable about suitably-arranged axes; a reciprocating carriage mounted upon said frame; a pair of skiving knives secured to said carriage and arranged with their cutting edges in the same plane as the faces of said molds and toward each other; means for operating said clamps to press the strip of material into the molds; means for reciprocating said carriage; a blank-discharging bar carried by each of said clamps; and means for operating one of said discharging-bars by the movement of the knife-carriage at the end of each movement thereof.

2. In a machine for cutting counter-blanks from strips of leather-board or other material, the combination of a fixed mold having in its outer face a recess the outline of which corresponds to the desired outline of the blank to be cut; a fixed punch or male die having its operating end in a plane parallel to and nearly coinciding with the plane of the rim of said mold; a yielding clearer plate or block partially surrounding said punch; a clamp for pressing the strip of material into said mold, and mounted upon and movable about an axis parallel to the plane of the rim of said mold; a female die set in said clamp in position to cooperate with said punch to cut a notch in the straight edge of the blank; a reciprocating frame or carriage; a skiving-knife mounted upon said carriage with its cutting edge in the same plane as the rim of said die; means for operating said clamp to press the strip of material into said mold; means for reciprocating said carriage; a blank-discharging bar carried by said clamp; and a lever mounted upon a fixed fulcrum and constructed and arranged to be acted upon by said carriage at one extreme of its reciprocation, to move it about its fulcrum, and cause it to engage and impart motion to said discharge-bar.

3. In a machine for cutting counter-blanks, the combination of a fixed frame; a pair of molds mounted upon one of the sides of said frame and having formed in their outer faces recesses the outlines of which correspond to the outlines to be given to the completed blanks and having the outer faces of their rims in the same plane and the curved edges of said recesses toward each other; a pair of pivoted depressors or clamps to press the material into said molds; means for moving said clamps; a reciprocating carriage mounted upon said fixed frame; a pair of skiving-knives mounted upon said carriage with their cutting edges toward each other and in the same plane as the rims of said molds; means for reciprocating said carriage and knives; a longitudinally and laterally movable feed-slide; a grip-jaw pivoted to and movable with said feed-slide; means for operating said grip-jaw to engage and grip the material and release the same; means for moving said feed-slide longitudinally; and means for moving said slide laterally.

4. The combination of the fixed molds F' F'; the pivoted clamps G g and G' g'; the carriage E; the knives H H secured to and movable with said carriage; the frame A supporting said carriage and provided with the guideway or slide a^2; the feed-carrier I fitted to and movable horizontally on said slide, and carrying the stand J J'; the grooved feed-slide M; the grip-jaw O pivoted to and movable with said feed-slide M; the elbow-lever N connected to said grip-jaw O by the link q; means for moving the carrier I and stand J J' endwise of said frame A; the vertically-movable bar Q Q' provided with the horizontal slot S; the lever R; and the cam D^2, all constructed, arranged, and operating substantially as described.

5. The combination of the fixed frame A provided with the guideway a^2; the feed-carrier I mounted upon said guideway and carrying the stand J J'; the movable feed-slide M mounted on said stand J J'; the grip-jaw O pivoted to said feed-slide M; means for operating said jaw O to grip the material and reciprocate said jaw and feed-slide; means for moving the carrier I upon the slide or guideway a^2; and a pair of adjustable stops secured upon the frame A to limit the movement of said carriage in either direction.

6. The combination of the fixed frame A provided with the slide a^2; the feed-carrier I mounted thereon and carrying the stand J J'; the horizontally-reciprocating bar K provided with the trucks n and n'; the cam D^2 constructed and arranged to act alternately upon said truck to intermittently move said bar in opposite directions; the lever L fulcrumed upon some fixed part of the machine; the link K^2 connecting said reciprocating bar with the lower end of said lever L; and the rod L' pivoted at one end to said carrier I and connected at its other end to the upper slotted arm of said lever L, as and for the purposes described.

7. The combination, in a counter-cutting machine, of the fixed frame A provided with a slide a^2 and the guide-ribs a^3 and a^4; the molds F' F' having recesses formed therein corresponding to the desired shape and size to be given to the finished blank with their curved edges toward each other and the front faces of their rims in the same plane; a pair of pivoted clamps movable about suitably-arranged axes; means for vibrating said clamps to alternately clamp a section of the material and to release the covered blank; the carriage E mounted upon and movable endwise of said guide-ribs a^3 and a^4; the skiving-knives H H adjustably secured to said carriage E; means for reciprocating said carriage; the feed-carrier I mounted upon the slide a^2; the stand J J' mounted upon said carriage; means for moving said carriage endwise on said slide; the feed-slide M movable up and down upon the guide-arm J' of the stand J; the grip-jaw O pivoted to said slide M; the elbow-lever N pivoted to the slide M and provided with the arms o' and o^3; an adjustable stop-screw set in each of said arms o' and o^3; the springs p secured to the slide M, with their free ends between the stop-screws in the arms o^3 and said slide; the links q connecting the short arm of said lever N to the upper end of the grip-jaw O; the upright bar Q provided with the lateral arm Q' having the horizontal slot s to receive the long arm of the lever N; the lever R mounted upon an adjustable fulcrum; and the cam D, all constructed, arranged, and operating substantially as described.

8. In combination with the longitudinally and laterally movable feed-slide M and the grip-jaw O pivoted thereto, and means for operating said grip-jaw; the plate P provided with the finger r^3 and secured to the bar r pivoted to said feed-carriage, and the springs r^2, as set forth.

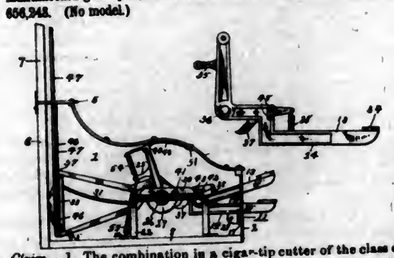
9. In a machine of the character specified, the combination of a pair of fixed molds, a pair of alternately-acting clamps for pressing blank material into said molds, mechanism for presenting one end of an elongated strip of material to the two molds and clamps alternately, and a pair of reciprocating skiving-knives movable over said molds and clamps, each knife acting to simultaneously sever a blank from the strip and to skive the blank.

10. In a machine of the character specified, the combination of a pair of fixed molds, a pair of alternately-acting clamps for pressing blank material into said molds, a feeding device having a longitudinal movement to cause it to move a strip of material forward step by step, and a lateral movement to present the strip to the two molds and clamps alternately, said feeding device including means for alternately gripping and releasing the strip, and a pair of reciprocating skiving-knives movable over said molds and clamps, each knife acting to simultaneously sever a blank from the strip and skive the blank.

11. In a machine of the character specified, the combination of a pair of fixed molds, a pair of alternately-acting clamps for pressing blank material into said molds, a longitudinally-reciprocating feeding device or slide having means for alternately gripping and releasing a strip of material, a feed-slide carrier reciprocated in a path substantially at right angles with the path of the feed-slide, and a pair of reciprocating skiving-knives movable over said molds and clamps, each knife acting to simultaneously sever a blank from the strip and skive the blank.

12. In a machine of the character specified, the combination of a mold, a clamp adapted to press blank material into said mold, a feeding device adapted to move an elongated strip of material step by step and present one end of it to the mold and clamp, and a skiving-knife movable over said mold and clamp and adapted to simultaneously sever a blank fom the strip and skive the blank.

606,876. ENDLESS BELT. ANTHON CHRISTENSEN, Chicago, Ill., assignor, by mesne assignments, to the Anthon Christensen Belting Company, same place. Filed Sept. 30, 1897. Serial No. 653,581. (No model.)



Claim.—1. As a new article of manufacture, an endless belt or band for power transmission formed from a continuous strand formed into parallel, longitudinal loops of a length corresponding to the length of the belt to be produced and the end of the outer convolution being woven transversely back and forth through and between the intermediate convolutions after the manner of a weft, the ends of said strand finally passing transversely through the body of the

belt in opposite directions and in proximity to each other and in the same relation to the longitudinal strands, as and for the purpose set forth.

2. As a new article of manufacture, an endless flat belt or band for power transmission formed from a continuous strand and comprising superimposed layers of longitudinal loops or convolutions, the ends of said strands being alternately woven through and transversely across the portions of the upper convolutions and the lower convolutions, and additional securing threads or strands, said transverse portions being arranged to pass alternately under and over said additional strands, as and for the purpose set forth.

606,877. CIGAR-TIP CUTTER. THOMAS A. COLE, Indianapolis, Ind., assignor, by direct and mesne assignments, to the American Manufacturing Company, same place. Filed Oct. 25, 1897. Serial No. 656,943. (No model.)

Claim.—1. The combination in a cigar-tip cutter of the class described, having a suitable inclosing case arranged with advertising-spaces, and a mechanism for displaying advertising-cards, of the clipping mechanism consisting of the levers 13, the shaft 26, the pivotally-mounted blades 48, and the locking lugs 51, with the alarm-gong mechanism, which is adapted to be actuated by the operation of the levers 13, and the lever-locking bar 11, having the L-shaped notches 12 and the pivotally-mounted dogs 16, whereby the levers 12 are consecutively locked after each operation, substantially as shown and described.

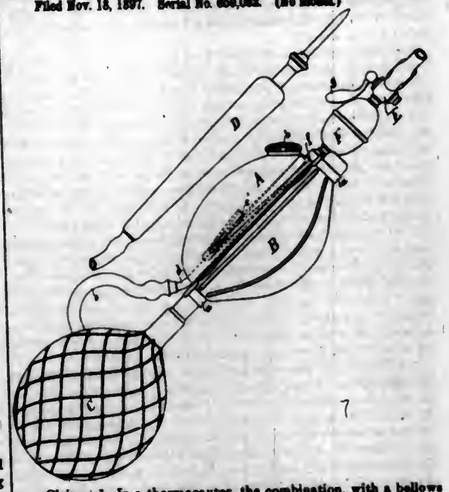
2. In a cigar-tip cutter of the class described, having a suitable case provided with a series of openings to receive the ends of cigars to be clipped, an automatic alarm-sounding device, whereby the alarm is sounded whenever a predetermined number of cigars have been clipped, and a series of advertising-card racks adapted to be displayed consecutively whenever the clipping mechanism connected therewith is operated, the combination of the clipping mechanism consisting of the spring-tensioned pivotally-mounted blades 48, having the cutting edges 52, adapted to slide against the under side of said case 4, opposite the openings 9, the levers, 13, having said blades 48 pivotally mounted upon their upper ends, and the shaft 26, suitably supported by brackets and carrying the levers 13, with the mechanism for successively locking said levers, consisting of a slidably-mounted spring-controlled bar 11, having L-shaped notches 12 to receive the operating-levers 13, and shoulders 15, to engage the ribs 14 on the levers 13 and hold said levers when they are depressed, said bar 11 mounted within the front 2 of said case, all as shown and described.

606,878. ELASTIC TIRE. JULES N. DAGNS, Paris, France. Filed Jan. 12, 1898. Serial No. 666,732. (No model.)

Claim.—1. An improved wheel-tire comprising the ring of wood *f* for receiving the wheel-spokes, a metallic rim or felly *a* resting against said ring *f* and having grooves in its inner face, an india-rubber cover having its edges extending around the edges of the rim *a* and seated in said grooves, and a vibrator-ring within the cover *b* for distending the same, substantially as described.

2. An improved wheel-tire, comprising the ring of wood *f* for receiving the wheel-spokes, a metallic rim or felly *a* resting against said ring *f* and having grooves in its inner face, an india-rubber cover having its edges extending around the edges of the rim *a* and seated in said grooves, and a vibrator-ring within the cover *b* for distending the same, substantially as described.

606,879. FIREPROOF MASK. PHILIP DALLIDET, New York, N. Y. Filed Jan. 27, 1898. Serial No. 668,217. (No model.)



Claim.—1. An improved fireproof mask, constructed of two half spheres or sections hinged or connected together, a projection or extension having an open outer end forming a seat for a sponge, the body portion of said mask being provided with view-openings and ear-openings, and ear-protectors secured over said ear-openings and extending within the mask, said ear-protectors embodying a neck or passage and their inner ends being adapted to be connected with the ear of the user, substantially as and for the purpose set forth.

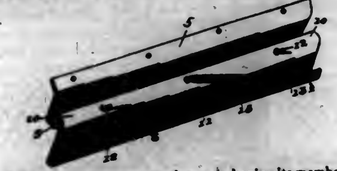
2. An improved fireproof mask, comprising the body portion provided with ear-openings, in combination with inwardly-extending ear-protectors secured over said ear-openings and projecting therefrom within the interior of the body, said ear-protectors having a narrow neck forming a passage communicating with the exterior of the mask through the ear-openings and being provided with a hollow knob-shaped head having an opening in the inner face thereof, substantially as and for the purpose set forth.

3. A fireproof mask, constructed of two half-spheres suitably hinged together, a curved projection provided with a ventilating-opening containing a sponge, the body portion of said mask being provided with view-openings and ear-openings, an inwardly-extending ear-protector secured over said ear-openings constructed of a hollow knob-shaped head having an opening in the inner face thereof, a narrow neck and a passage communicating to the exterior of the mask through the ear-opening, and fastening means for securing the hinged portions together, substantially as and for the purpose set forth.

606,880. THERMOCAUTER. CARL F. DEWITT, Berlin, Germany. Filed Nov. 18, 1897. Serial No. 659,062. (No model.)

Claim.—1. In a thermocauter, the combination, with a bellows and a receptacle for liquid hydrocarbon arranged side by side so that they may be grasped by one hand, and fastening devices connecting together the said parts; of an air vessel connected with the bellows, an air-pipe connected with the air vessel and projecting within the said receptacle, and an outlet-pipe for gas projecting within the said receptacle and provided with a regulating-valve, substantially as set forth.

2. In a thermocauter, the combination, with a hemispheroidal bellows and a hemispheroidal receptacle for liquid hydrocarbon, said bellows and receptacle being arranged with their flat sides abutting against each other, and fastening devices connecting the said parts together; of an air vessel connected with the bellows, an air-pipe connected with the air vessel and projecting within the said receptacle, and an outlet-pipe for gas projecting within the said receptacle and provided with a regulating-valve, substantially as set forth.



606,881. WRENCH. THEODORE DEKKELBAUM, New York, N. Y., assignor to himself and Edward Leander Gingi, same place. Filed Sept. 23, 1897. Serial No. 652,749. (No model.)

Claim.—1. In a pipe-wrench the combination with a handle, of a yoke pivotally connected therewith adjacent to one end thereof, and an independent flexible textile band adapted to encompass a pipe, and to be secured to said handle by being compressed between said handle and said yoke, substantially as described.

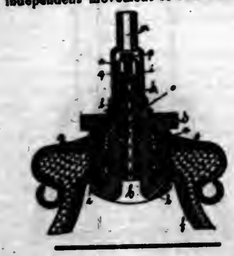
2. In a pipe-wrench, the combination with a handle having a semicircular end, of a yoke pivotally connected therewith adjacent to one end thereof, and an independent flexible textile band adapted to encompass a pipe and to be secured to said handle by being compressed between said handle and said yoke, substantially as described.

606,882. WEATHER-STRIP. HANS H. FRANSEN, Golden, Ill. Filed Sept. 21, 1897. Serial No. 652,440. (No model.)

Claim.—1. A two-part weather-strip having its members hinged together and a reversible spring pivoted to said members, substantially as described.

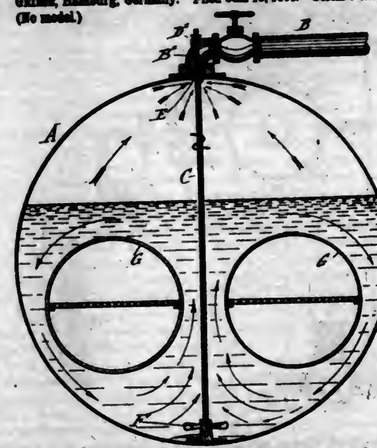
2. A two-part weather-strip having its members hinged together, and a spring arranged diagonally across the movable member, one end of said spring pivotally attached at the hinged joint of said members and its other end confined detachably at the free edge of said movable member, substantially as described.

3. In a weather-strip, the combination with two members, of a spring reversibly connected to the lapping edges of the members and serving as one of the pivots therefor, as and for the purposes described.



4. In a weather-strip, the combination of a fixed member having a flanged edge, a movable member bent at one edge to overlap the flanged edge of the fixed member, pivots passing through the flanged lapped edges of the two members, and a reversible spring having one end connected to the flanged lapped edges of the two members to serve as a pivot therefor and the other end of said spring connected to the movable member, as and for the purposes described.

5. In a weather-strip, the combination with the two members loosely connected at their adjacent edges and the movable member having a longitudinal fold at its free edge, of a reversible spring pivotally attached at one end to the hinged joint between said members and having its free end confined or held in the folded edge of said movable member, as and for the purposes described.



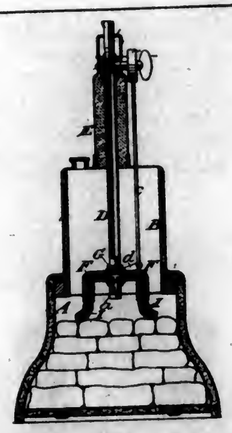
606,883. BACK-PRESSURE VALVE FOR PNEUMATIC TIRES. CARL GRAF, Mühlhausen, Germany, assignor to Ludwig Retzinger and Wilhelm Weidenhoff, Munich, Germany. Filed July 10, 1897. Serial No. 644,457. (No model.)

Claim.—1. In a back-pressure valve, the combination of a valve-seat having an internally-tapered valve-seat therein, a tapered valve cooperating with said valve-seat, an air-conveying nipple in threaded connection with the valve-seat section and adapted to be moved with relation to the valve-seat, a spring connecting the stem of said valve to the nipple whereby a movement of the nipple with relation to the valve-seat will cause a bodily movement of the valve and spring to seat and unseat the valve.

2. In a back-pressure valve, the combination of a headed exteriorly-threaded valve-section having an internally-tapered valve-seat therein, a jam-nut adapted to take the exterior threads of the section to hold a valve-seat section in place, an air-conveying two-part nipple in threaded connection with the valve-seat section and adapted to be moved with relation to the valve-seat, a tapered valve carried by and movable with and independently of said valve-seat section, and a spring connecting the stem of said valve with the nipple whereby a movement of the nipple will cause the seating and unseating of the valve and an independent movement of said valve will also be allowed.

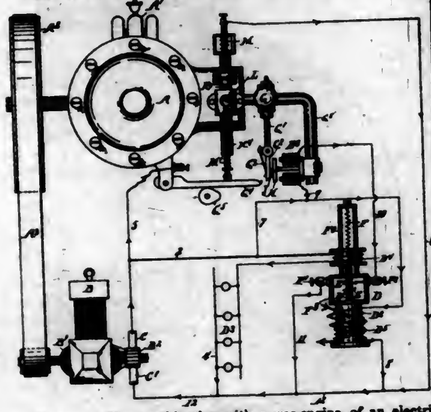
606,884. ATTACHMENT FOR STEAM-BOILERS. AUGUST GRIMM, Hamburg, Germany. Filed Jan. 19, 1898. Serial No. 667,158. (No model.)

Claim.—1. The combination, with a Cornish or other flue-boiler, of a spindle supported in suitable bearings in said boiler, a steam-outlet pipe, said spindle passing through the end of the steam-outlet pipe adjacent to the boiler, a propelling device on said spindle in said steam-outlet pipe, and an agitating device on said spindle operated by the propelling device, substantially as set forth.



2. The combination, with a Cornish or other flue-boiler, of a spindle supported in suitable bearings in said boiler, a steam-outlet pipe, said spindle passing through the end of the steam-outlet pipe adjacent to the boiler, a helical screw on said spindle located in the steam-outlet pipe, and a screw-propeller on said spindle operated by the motion imparted to the helical screw by the outgoing steam, substantially as set forth.

606,885. ACETYLENE-GAS LAMP. GUSTAF R. HESS, Brooklyn, N. Y., assignor of two-thirds to George H. Robinson, New York, N. Y. Filed Nov. 2, 1897. Serial No. 657,144. (No model.)



Claim.—1. The combination with the carbid-receptacle and the water-reservoir above it, of a wick-tube having a plurality of branches between said receptacle and reservoir and a cock in said wick-tube for controlling all its branches, substantially as herein described.

2. In an acetylene-lamp, the combination of a carbid-receptacle constituting a generator, a water-reservoir, a water-cock between said reservoir and said generator, a main burner and a supplementary burner supplied from said generator, a gas-cock common to both of said burners for opening either when the other is closed, and a connection between the said cocks for opening and closing the water-cock and the main burner simultaneously and for closing or opening the supplementary burner while the main burner and the water-cock are respectively open or closed, substantially as herein described.

606,885.

606,886. GAS-ENGINE. THOMAS H. HICKS, Fort Wayne, Ind. Filed Nov. 29, 1895. Serial No. 570,421. (No model.)

Claim.—1. The combination with a gas-engine, of an electric ignition device, provided with two movable conducting-plungers M, M', a transparent disk L for bringing the ends of said plungers to view while the engine is running, so that the igniting-spark may be seen for adjustment, a source of electricity, mechanical means for operating said ignition device, mechanism operated by said engine to cause one of said plungers to lift the other plunger, and means for automatically pulling one of said plungers away from the other, substantially as described.

2. The combination with a gas-engine provided with a gas-valve G, through which said engine is supplied with gas, of a valve-stem G', a hinged finger G^3 attached to said valve-stem, a cam-arm G^4 for opening the gas-valve G, through the finger G^3, an electromechanical device for connecting said finger with said cam-arm for operating said gas-valve, electric means for operating said electromechanical device, and means for cutting an electric current off from supplying said electromechanical device for the purpose of throwing said gas-valve entirely out of action in checking the speed of said engine, substantially as described.

3. The combination with a gas-engine provided with a gas-controlling valve G, of mechanical and electrical means to operate said valve in supplying gas to said engine, a governing-magnet D to assist in operating said valve, a compounding-coil D^4 arranged in combination with said governing magnet, and an electric work-circuit D^3, said work-circuit and said coil D^4 being arranged in linear series with each other, the current flowing through said coil D^4 acting in combination with said governing-magnet in controlling the speed of said engine, substantially as described.

4. The combination with a power-producing engine, of two sets of electromagnetic devices E^3 and D for controlling the speed of said engine, an electrical work-circuit D^3, and a supplemental series coil arranged in linear series with said work-circuit, said series coil acting in combination with said electromagnetic devices E^3 and D in controlling the speed of said engine, substantially as set forth.

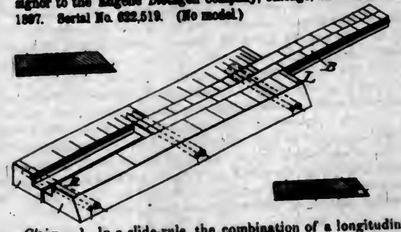
5. The combination with a power-producing engine, of a solenoid-magnet D, an electrical work-circuit, a source of electricity, and a supplemental coil arranged in linear series with said work-circuit, said coil being arranged in combination with said magnet D to assist in controlling the speed of said engine, substantially as described.

6. The combination with a gas-engine, provided with a gas-valve, arranged to be normally out of action, and with suitable mechanical means operated by said engine for operating said valve, of electrical means for throwing said valve into action through said mechanical means operated by said engine, substantially as described.

7. The combination with a gas-engine, provided with a gas-valve, of two independent sets of mechanical attachments G^3, G^4 and G^6, G^7 operated by said engine for operating said valve, said valve being arranged to be normally out of action, and two sets of magnets for throwing said valve into action to supply gas for said engine, substantially as described.

8. The combination with a gas-engine, provided with a gas-valve, and suitable mechanical means operated by said engine for operating said valve, said valve being arranged to be normally out of action, of an electromagnet provided with suitable attachments for throwing said valve into action, a second electromagnet provided with suitable attachments for controlling the first-named magnet, and an electric generator for supplying said electromagnets with current, substantially as described.

9. The combination with a gas-engine, provided with a gas-valve G, of cam-arms G^4, G^7, fingers G^3, G^6, lever-arms H H', and electromagnets E^2, E^4, said gas-valve being arranged to be normally out of action, said magnets and levers being arranged to throw said valve into action through said cam-arms and fingers, in supplying said engine with gas, substantially as described.

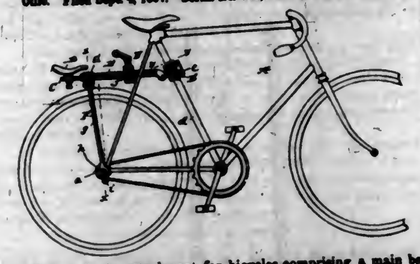


606,887. FIREPROOF PLASTERING-SUPPORT. ALBIN KÜHN, Heidelberg, Germany. Filed Jan. 6, 1897. Serial No. 618,173. (No model.)

Claim.—1. In combination, with the slats, the foundation K of reeds, rushes or the like, the wire-web applied over the foundation, the stiffening-wires passing through the wire-web and the nails or staples engaging the stiffening-wires and passing through the foundation into the lathe.

2. In combination, the foundation, the slats, the wire-webbing applied over the foundation and the stiffening-wires running through the web, substantially as described.

606,888. SLIDE-RULE. JOHN G. D. MACK, Madison, Wis., assignor to the Eugene Dietzgen Company, Chicago, Ill. Filed Feb. 8, 1897. Serial No. 622,519. (No model.)

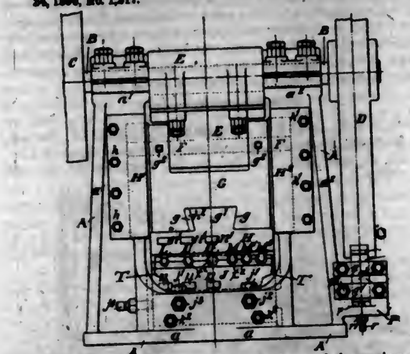


Claim.—1. In a slide-rule, the combination of a longitudinally-divided rule or slide, with a series of springs maintaining the abutting scales in contact, and a series of guides for the registering of the scales of the divided portion.

2. In a slide-rule, the combination of a longitudinally-divided rule or slide, with a series of pressure-springs, a series of guide-pins and a series of adjustable limiting-stops, substantially as described and for the purposes set forth.

3. In a compensating slide-rule, the combination of a longitudinally-divided rule or slide with transverse guide-pieces connecting the sections of the divided portion, and a series of springs, the latter being arranged so as to cause the longitudinal sliding surfaces to move under spring-pressure, for the purposes set forth in this specification.

606,889. BICYCLE ATTACHMENT. CLIFTON S. MOORE, Newark, Ohio. Filed Sept. 4, 1897. Serial No. 650,644. (No model.)



Claim.—1. An attachment for bicycles comprising a main bar terminating at its forward end in a flattened portion, a hinge-clamp adapted to be fixed on the king-post of a bicycle-frame and having a wing pivotally connected to the flat portion of the bar, a clip arranged on said bar and having apertured lugs, and a support adapted to bear on the rear axle of a bicycle; the said support having a leg provided with an eye at its upper end, and a second leg provided with a lateral threaded branch extending through the apertures of the clip and said eye, and a nut on said branch, substantially as specified.

2. The combination of a bar, a handle-bar, a hinge-clip arranged on the first-named bar and comprising one member having a socket with apertures *t*, *t'*, and a second member having an apertare, a screw extending through said aperture and the apertures *t*, *t'*, of the socket, and a stem connected to the handle-bar and arranged in the socket of the clip member, and having diametrically opposite apertures for receiving the screw, substantially as specified.

3. A foldable attachment for bicycles comprising a main bar, a clamp pivotally connected with the forward end of said bar and having two members connected in a hinged manner and one or more screws for binding said members against the king-post of a bicycle-frame, and a support comprising legs adapted to straddle the rear wheel of a bicycle and bear on the extensions of the rear axle thereof; the said support being formed of spring metal and pivotally connected with the main bar, whereby, when it is not in use, its free end may be placed and secured in the clamp on the main bar by the screw or screws of said clamp, substantially as specified.

606,890. MACHINE FOR SHAPING OR FORGING AND SHARPENING ROCK-DRILLS, &c. STEPHEN P. GNIOK, Johannesburg, South African Republic. Filed Aug. 19, 1897. Serial No. 648,900. (No model.) Patented in South African Republic Dec. 13, 1895, No. 1,037, and Sept. 24, 1896, No. 1,317.

Claim.—1. A die for shaping or forging and sharpening rock-drills and similarly-shaped edged tools fitted with an inclined cutter so disposed or arranged as to constitute that portion of the die which effects the formation of the extreme cutting edge on the drill simultaneously with the formation of the tapering or angular faces, said cutter being set at such an inclination as to form the desired bevel at the cutting-point of the drill in addition to the cutting edge substantially as described.

2. A die for shaping or forging and sharpening rock-drills and the like in which is arranged an adjustable inclined cutter for imparting the desired bevel to the drill at the cutting-point and also to form the extreme cutting edge thereon simultaneously with the formation of the tapering or angular faces substantially as described.

3. In combination, the die for forging or shaping and sharpening rock-drills and like tools, the adjustable inclined cutter, constituting a portion of the die, slightly rounded and beveled to form the slightly rounded and beveled cutting edge on the drill simultaneously with the formation of the tapering or angular faces thereon substantially as described.

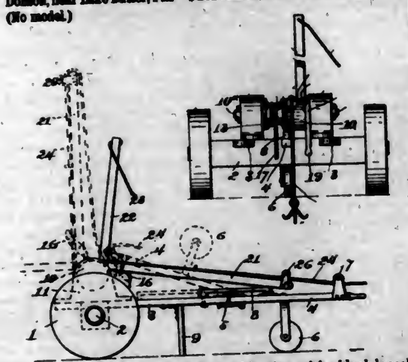
4. A die-block in which is sunk or fitted a die for shaping or forging and sharpening rock-drills and the like provided with an inclined slot projecting into or terminating at one end of the die in which is fitted a removable cutter constituting that portion of the die which effects the sharpening or formation of the extreme cutting edge on the drill substantially as described.

5. In combination, a die-block, a die sunk or fitted therein for shaping or forging the tapering or angular faces on rock-drills and like tools, an inclined slot formed in the die-block projecting into said die, a cutter arranged therein and forming that portion of the die which effects the sharpening or formation of the extreme cutting edge on the drill, a further slot formed in the die-block, intersecting the inclined slot in which the cutter is arranged and an adjusting-wedge or tapered bolt fitted within this further slot and bearing against the end of the cutter for effecting any required adjustment thereof substantially as described and shown.

6. In machines or apparatus for shaping or forging and sharpening rock-drills and the like the combination of upper and lower die-blocks to the upper one of which a vertical reciprocating or up-and-down motion is imparted in any suitable manner, the die-blocks being sunk or fitted with one or more dies for effecting the shaping and sharpening of drills or tools on their tapering or angular faces, said die or dies being fitted or provided with an adjustable cutter or cutters for forming the extreme cutting edge on the drill simultaneously with the formation of the angular faces and with one or more dies for forming the drill on its slightly-spreading sides or edges and finishing same to gage substantially as described and shown.

7. In machines or apparatus for shaping or forging and sharpening rock-drills and the like the combination of upper and lower die-blocks to the upper one of which a vertical reciprocating or up-and-down motion is imparted in any suitable manner, the die-blocks being sunk or fitted with one or more dies having tapering and angular faces for effecting the shaping and sharpening of drills or tools on their tapering or angular faces, said die or dies being fitted or provided with an adjustable cutter or cutters slightly rounded and beveled and set at such an inclination in the blocks as to form the desired bevel at the cutting-point and the slightly rounded and beveled cutting edge of the drill simultaneously with the formation of the tapering and angular faces thereof substantially as described.

8. In machines or apparatus for shaping or forging and sharpening rock-drills and like tools, the combination of the upper and lower die-blocks H J, in which are sunk or fitted the set or series of dies L L' L^3 for forming the tapering or angular faces of the drill, the inclined slots or holes *l l'* formed in the die blocks and terminating at the inner ends of the dies, the cutters *m m'* fitted within the slots *l l'* and constituting the innermost portion of the dies, the slots or holes *o o'* formed in the die-blocks and intersecting the slots *l l'*, the wedges or tapered bolts *n n'* fitted in slots *o o'* and bearing upon the extremities of the cutters *m m'* for adjusting same as may be desired and a rest or stop O substantially as described and shown.



9. In machines or apparatus for shaping or forging and sharpening rock-drills and the like the combination of the bracket or extension P of the frame, the slot *p* formed therein, the slightly rounded and beveled cutter Q fitted within slot *p*, the straps or bars *q q'* affixed to the bracket P and securing cutter Q in position in the slot *p*, the adjusting-screw *r* for the cutter Q, the fly-wheel D, the slot *d* formed in the rim or periphery thereof, the slightly rounded and beveled cutter R fitted within the slot *d*, the retaining-stud r^3 and adjusting-screw r^2 for the cutter R for shearing off the bur or fine edge or strip of metal left on the cutting edge of the drill or tool after it has been passed through the dies substantially as described and shown.

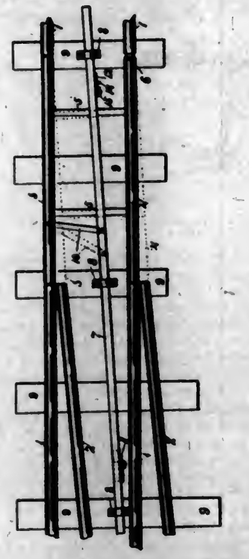
10. In machines or apparatus for shaping or forging and sharpening rock-drills and the like the combination of the frame A of the machine, comprising the base *a* and the standards or pedestals $a' a^2$, the shaft B journaled therein, the driving-pulley C, the fly-wheel D, the cross-head G working in guides or recesses formed on the inside of the pedestals $a' a^2$ and coupled up with the driving-shaft B by means of an eccentric, crank or other suitable device to impart a vertical reciprocating or up-and-down motion thereto on the rotation of the shaft, the recess *g* formed in the cross-head G on the under side, the upper die-block H, the projection *g'* fitting and secured within the recess *g*, the dies L L' L^3 sunk or fitted within the die-block H, the inclined cutters *m m'* the adjusting-wedges or tapered bolts *n n'*, the stops or rests O, the dies M M' M^3 sunk or fitted within die-block H, the lower die-block J, the dies L L' L^3 sunk or fitted therein, the inclined cutters *m m'*, the adjusting-wedges or tapered bolts *n n'*, the dies M M' M^3 sunk or fitted within die-block J, the tapered or inclined under surface *j* of the die-block J the adjusting-wedge K fitted within

the base *a* upon which block J rests, the holding and adjusting screws or studs j^3 j^3 j^4 l' l^3 for the wedge K and the holding-down bolts j' for the lower die-block J substantially as described and shown.

11. In machines or apparatus for shaping or forging and sharpening rock-drills and the like, the combination of the frame A, comprising the base *a* and the standards or pedestals a' a^2, the eccentric-shaft B journaled therein, the driving-pulley C, the connecting-rod E, the cross-head G, the pin F, the screws or studs g^2, the retaining-plates H' H^2 affixed to the pedestals a' a^2, the recess *g* formed in the cross-head G on the under side, the upper die-block H, the corresponding projection g' formed thereon and fitting within the recess *g*, the wedge or tapered key k^2, the dies L L' L^2 sunk or fitted within the die-block H, the inclined cutters *m* *m'* the adjusting-wedges or tapered bolts *n* *n'*, the stops or rests O, the dies M M' M^2 sunk or fitted within die-block H, the lower die-block J, the dies L L' L^2 sunk or fitted therein, the inclined cutters *m* *m'*, the adjusting-wedges or tapered bolts *n* *n'*, the dies M M' M^2 sunk or fitted within die-block J, the tapered or inclined under surface *j* of the die-block J the adjusting-wedge K fitted within the base *a* upon which block J rests, the holding and adjusting screws or studs j^3 j^3 j^4 l' l^3 for the wedge K and the holding-down bolts j' for the lower die-block J, the bracket or extension P of the frame A, the slot *p* formed therein, the cutter Q fitted within slot *p*, the straps or bars *q* q' affixed to the bracket P and securing cutter Q in position in the slot *p*, the adjusting-screw *r* for the cutter Q, the fly-wheel D, the slot *d* formed in the rim or periphery thereof, the cutter R fitted within the slot *d*, the retaining-stud r^2 and adjusting-screw r^3 for the cutter R substantially as described and shown.

606,891. STUMP-PULLER. BERRYAN C. RIDDOX and SHADRUS DUNSON, near Lake Butler, Fla. Filed Jan. 14, 1898. Serial No. 666,846. (No model.)

Claim.—1. In a stump-puller the combination, with a block loosely mounted to turn, the levers secured to the block, and a draft-cable carried by one of said levers, of a drum having ratchet-teeth and loosely mounted on the end of the said block, and a draft-cable secured to the drum, substantially as set forth.



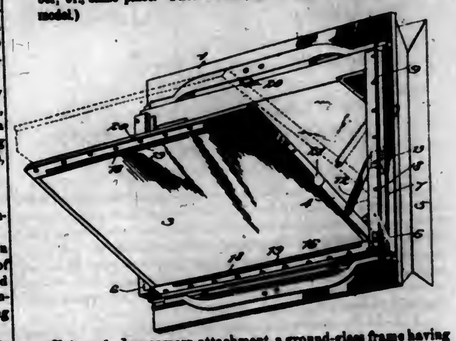
2. In a stump-puller the combination, with the block loosely mounted to turn and provided with ratchet-teeth, levers secured to the block, a draft-cable carried by one of said levers, and pawls to control the movement of said block, of a drum having ratchet-teeth upon each end and loosely mounted on the end of the block opposite the said block-teeth, a draft-cable secured to the drum, and the drum-pawls, substantially as set forth.

3. The combination, in a stump-pulling machine, of a block loosely mounted in the machine and having a toothed end and a conical end, levers secured to the block at right angles, a toothed drum having a recess to fit the conical end of said block, and the pawls for turning the drum and block together or independently by moving said levers, as set forth.

606,892. AUTOMATIC SWITCH. FINLAY W. ROSS, Birtle, Canada. Filed July 31, 1897. Serial No. 646,669. (No model.)

Claim.—1. In a tramway-switch, the combination with the main and side track rails, of a movable section of track, the two rails of which are rigidly connected to move on a single pivot, an interposed longitudinally-sliding rod connected to said section, and levers connected to said rod to be acted upon by the moving car for operating it and said pivoted section, substantially as described.

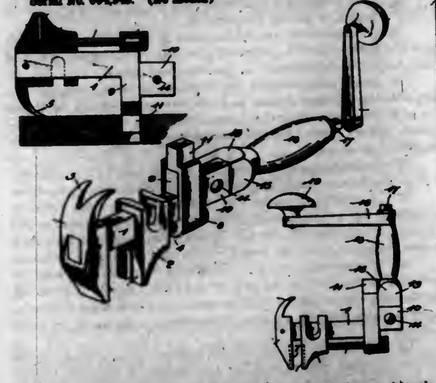
2. In a tramway-switch, the track-rails thereof having a movable section in which the two rails are rigidly connected to move on a pivot at one end of one rail of said section, in combination with a sliding rod intermediate the rails of said section and linked thereto, and upright levers adapted to be operated by the passing car for opening and closing the switch, substantially as described.



606,893. BICYCLE-SADDLE. BENJAMIN S. SEAMAN, Canton, Ohio. Filed Mar. 26, 1897. Serial No. 629,234. (No model.)

Claim.—A support for a bicycle-seat consisting of a single piece of wood so shaped as to form a cap in the center thereof, the ends thereof being bent around and forward, forming a pommel, and held in engagement by the downwardly-curved prongs of a T-headed bolt passing therethrough, and adapted to engage the spring-support, substantially as described for the purpose set forth.

606,894. FOCUSING ATTACHMENT FOR CAMERAS. DAVID R. SHARPTS, Washington, D. C., assignor of one-half to Charles R. Kleeber, Jr., same place. Filed Oct. 28, 1897. Serial No. 656,602. (No model.)



Claim.—1. In a camera attachment, a ground-glass frame having an oblong reflector provided with pivots disposed at right angles to each other, whereby either vertical or horizontal pictures may be erected, substantially as described.

2. In a camera attachment, a ground-glass frame provided with a compound reflector-frame having pivots disposed at right angles to each other whereby the reflector is capable of tilting horizontally or vertically, substantially as described.

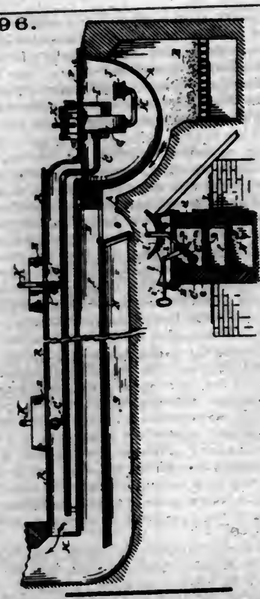
2. In a camera attachment, the combination with a ground-glass frame, of an oblong reflector pivoted in an inner frame, said reflector having its pivots operating in an outer frame and said outer frame having pivots disposed at right angles to those of the inner frame and confined in sliding bearings on the ground-glass frame, substantially as described.

4. In a camera attachment, the combination with the ground glass, of a reflector provided with movable pivots, whereby the reflector can be moved up and down before the face of the ground glass, and its free end moved toward and away from the latter, substantially as described.

606,895. COMBINATION-TOOL. ELVIN H. SHAW, Sedalia, Mo., assignor of one-half to W. A. Fraser, same place. Filed Dec. 31, 1897. Serial No. 664,949. (No model.)

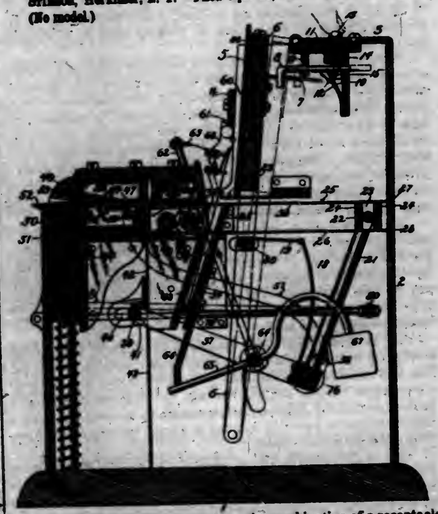
Claim.—1. In a device of the class described, the combination of a shank provided with a shoulder or stop, a stationary jaw, a movable jaw, a collar or loop arranged on the shank and abutting against the shoulder or stop, said collar or loop being provided with a lug adapted to fit in an opening or socket of a bench, and means for adjusting the movable jaw, substantially as described.

2. In a device of the class described, the combination of a shank provided at its inner end with an enlarged portion and having a perforated ear 10 laterally offset to form a shoulder 12, a stationary jaw detachably secured to the outer end of the shank, an adjustable jaw, means for operating the latter, a crank-handle provided at its inner arm with a perforation, said inner arm being adapted to be arranged longitudinally of the shank and at right angles to the same and to fit against the said shoulder 12 in both positions, and a fastening device passing through the perforations and detachably securing the crank-handle to the shank, substantially as described.



3. In a device of the class described, the combination of a shank having one end enlarged and provided beyond the enlarged portion with a laterally-offset ear forming a shoulder, a movable jaw, a detachable stationary jaw, a collar or loop arranged on the enlarged portion of the shank and provided with a lug adapted to fit in an opening or socket of a bench, and means for adjusting the movable jaw, substantially as described.

4. In a device of the class described, the combination of a shank enlarged at one end and provided with a laterally-offset ear forming a straight inner shoulder, a loop arranged on the enlarged portion of the shank, fitting against the said shoulder and provided with a lug, a sliding jaw, a stationary jaw, and a crank-handle detachably and adjustably connected to the ear of the shank and fitting against the outer edge of the said enlargement, substantially as described.



606,896. CASK-PITCHING APPARATUS. PHILIP SHERIDAN, Cleveland, Ohio. Filed Aug. 20, 1897. Serial No. 648,908. (No model.)

Claim.—In a cask-pitching apparatus the combination with the kettle and a fireplace therefor, of a pipe leading from a pump within said kettle, said pipe being provided with a series of spray-nozzles, keg-supports arranged with regard to said spray-nozzles, a drip pan under said pitch-conveying pipe and a divided controllable flue for heating said pan and leading the smoke from said fireplace all constructed and arranged substantially as and for the purpose set forth.

606,896.

606,897. PRINTING AND FOLDING MACHINE. NATHANIEL A. STILSON, Herkimer, N. Y. Filed Apr. 10, 1897. Serial No. 631,522. (No model.)

Claim.—1. In a folding-machine, the combination of a receptacle to contain successively the sheets or blanks to be folded; a slide movable across said receptacle; a second slide movable in a plane intersecting that of the first-mentioned slide; blocks or bodies on opposite sides of the slides; a rock-shaft; arms extending from the rock-shaft to the respective slides; and a lever for rocking said shaft; whereby the slides are caused to act successively upon the sheet and to fold and refold the same.

2. In a folding-machine, the combination of two slides movable in parallel planes; a third slide movable in a plane intersecting those of the other two slides; blocks or bodies on opposite sides of each slide; and means for simultaneously advancing the parallel slides and receding the intersecting slide, and for receding the parallel slides and advancing the intersecting slide; whereby one of the parallel slides is caused to act upon a sheet or slip, to produce an initial fold therein, and to deliver it across the path of the intersecting slide;

the intersecting slide is caused to produce a second fold and to deliver the folded sheet across the path of the second of the parallel slides; and said second parallel slide is caused to form a third fold in the sheet, substantially as set forth.

3. In combination with suitable guiding or confining blocks or bodies, slides 25, 26 and 42 movable between said blocks; rock-shaft 16; connecting-arms 21, 37 and 38; and a lever for rocking the shaft 16.

4. A feeding mechanism, comprising the following elements in combination: a plate or platform upon which the lower ends of sheets or slips may rest; a front bar or plate to retain said slips; a follower movable toward and from said front bar; a rock-shaft; an elastic or yielding connection between said rock-shaft and follower; arms carried by the rock-shaft; a second rock-shaft pivoted in said arms; a rod or bail carried by said second rock-shaft and provided with a feeding strip or edge; a counterbalance tending to move the rod or bail toward the follower; means for throwing the rod or bail from said follower; and a lever for rocking the main rock-shaft.

5. In combination with horizontal support 29 having an upturned edge or lip, a fixed retaining-bar 4; a follower 5; a feeding-strip 63; and means for moving the feeding-strip toward the follower, lifting it, and then moving it away from the follower, substantially as set forth; whereby the free lower end of a sheet held between the retaining-bar and follower is lifted up from behind the upturned edge or lip of support 29 and permitted to descend in front thereof.

6. The combination substantially as set forth, of a supporting-plate 29; a retaining-bar 4; a follower 5; a rock-shaft 16; an elastic or yielding connection between the rock-shaft and the follower; a feeding plate or strip 63; a connection between the rock-shaft 16 and the feeding-strip; a latch or guide 68 to hold the feeding-strip away from the follower during a portion of its movement; and means for rocking shaft 16.

7. In combination with supporting-plate 29; retaining-bar 4 provided with flexible strip 61; follower 5; rock-shaft 16; spring 18; link 19 connecting the follower and spring 18; arms 37 and 38 carried by rock-shaft 16; rock-shaft 64 pivotally supported in said arms; rod or bail 65 carried by rock-shaft 64 and provided with counterbalance 67; stop 66 located in the path of rod or bail 65; bail or rod 62 carried by rock-shaft 64 and provided with a feeding edge or lip; gravitating guide 68; and means for rocking shaft 16, all substantially as described.

8. In combination with a holder or receptacle adapted to contain sheets or slips in an upright position, a bottom support having an upturned lip or edge; a follower adapted to clamp the sheets and to release them, alternately; a feeding-strip adapted to engage or adhere to the surface of a sheet or slip; and means for carrying the feeding-strip into contact with the sheet, moving it in plane therewith, and then withdrawing it from the sheet, whereby the sheet is bowed or buckled while clamped, is lifted above the lip or edge of the bottom support, and is allowed to straighten out and thus to spring from the holder when released, substantially as set forth.

9. In combination with a sheet holder or receptacle having a retaining-bar at one side; a follower at the opposite side; a forwardly-movable stop in rear of the follower; a detent to prevent the backward movement of said stop; and a connection between the follower and the stop, permitting a limited play of the follower independently of the stop; whereby the range of movement of the follower is maintained constantly the same.

10. In combination with a receptacle for sheets or slips, having a retaining bar or plate at the front; a follower movable toward and from said retaining-bar; a slidable stop-rod 8 in rear of said follower; a connection between the follower and the stop-rod permitting a limited play of the follower independently of the stop-rod; and a locking spring or detent 12 adapted to engage the stop-rod and prevent its backward movement.

11. In combination with a follower; a stop-rod, free to move forward with the follower; a loose connection between the follower and the stop; a locking device to prevent the backward movement of the stop-rod; and means substantially as shown for throwing the locking device out of engagement with the stop-rod.

12. In combination with follower 5 provided with slotted plate 7; stop-rod 8; spring-detent 12 adapted to engage said rod; block 15 arranged to act upon and to disengage the detent; and a push-button for actuating said block.

13. In a folding-machine, the combination of the following elements: a casing or framework containing a space or receptacle for sheets to be folded; a slide 26 movable in a plane intersecting said receptacle; a slide 42, movable across the path of slide 26; a slide 25 movable across the path of slide 42; a rock-shaft 16 provided with a lever for rocking it; and connections between said rock-shaft and slides substantially such as shown and described; whereby the several slides are caused to act upon the sheet in proper sequence.

14. In combination with a casing provided with a chamber or holder to receive folded slips, and with a follower in said chamber arranged to press constantly against the folded slips therein; a folding-slide adapted to fold a sheet or slip and deliver it to the chamber; an interposed bridge-plate adapted to move forward over the follower or over the folded sheets thereon to prevent interference with an incoming slip; and means for advancing and receding the bridge-plate.

15. In a folding-machine, the combination of a casing provided with a receiving-chamber for the folded sheets; a follower contained within said chamber; overhanging fingers against which the folded sheets are pressed by the follower; a slide adapted to carry a folded slip or sheet to the receiving-chamber; a bridging-plate adapted to move forward in advance of the slide and to bear upon the follower or the uppermost folded sheet; a rock-shaft; and intermediate connections between the rock-shaft and the slide and bridge-plate, whereby said parts are advanced and receded in proper sequence.

16. In combination with casing 2 provided with fingers 49; follower 50; slide 25; plate 54 interposed between the slide and the follower; rock-shaft 16; arm 21 connecting slide 25 with said rock-shaft; and links or bars 57 connecting the plate-support and arms on the rock-shaft; substantially as described and shown.

17. In combination with folding-slide 25, and blocks or bodies 45 and 47; fingers 49 having shoulders 53.

18. In combination with folding-slide 25, and blocks or bodies 45 and 47; bridge-plate 54; fingers 49 provided with shoulders 53; and follower 50, all substantially as described and shown.

19. In a folding-machine, the combination of two parallel folding-slides in different planes; and a holder or receptacle for sheets to be folded, intersecting the planes of the slides, one slide being provided with an opening for the passage through it of the sheets, substantially as shown.

20. In combination with slide 25 having opening 30; slide 26; receptacle or sheet-holder 32; and means for reciprocating the slides.

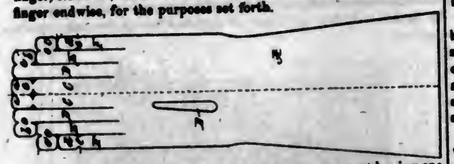
21. In a folding-machine, the combination of a sheet holder or receptacle 32; a folding-blade 26 movable in a plane intersecting said holder; a rock-shaft 80; an arm 79 extending from said rock-shaft across the lower part of the holder; and a lever for rocking said shaft.

22. In combination with a folding-slide 26, printing-cylinder 70, provided with pin 76, in the path of said slide, adapted to be struck by the slide and to put the cylinder positively into motion, and thereafter to leave the cylinder free of the slide except as to frictional contact.

23. In combination with slide 26, printing-cylinder 70 having pin 76 and flattened bearing-face 77; and spring 78, arranged to bear normally upon said flattened face and thus to hold pin 76 in the path of the slide 26.

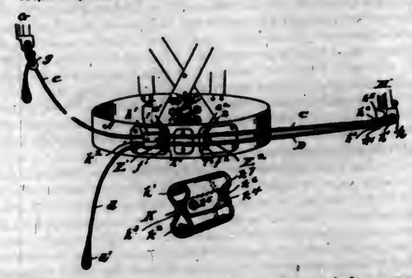
24. In combination with a slide 26; printing-cylinder 70, having disks or collars 74 provided with flattened faces 75, and having also pin 76 and flattened face 77; and a spring 78 arranged to bear normally upon the flattened face 77, to hold the pin 76 normally in the path of the slide 26 and to complete the rotation of said cylinder.

25. The herein-described printing mechanism, consisting of cylinder 70 provided with collars 74 having flattened faces 75, pin 76 and flattened face 77; spring 78; inking-cylinder 69; and slide 26 adapted to carry the sheet or slip to be printed and to rotate the printing-cylinder, substantially as set forth.



606,898. UMBRELLA-HOLDER. HARRIET T. STOCKEY, Manassville, S. C. Filed June 18, 1898. Serial No. 683,996. (No model.)

Claim.—An umbrella-holder, consisting of a plate of rigid material which is adapted to bear against the back of the operator and forms a broad bearing-surface extending from a point adjacent to the neck down to a point adjacent to the waist, and is provided with inwardly-extending loops through which the back-band of the suspenders which support the trousers of the operator are adapted to pass, and a tube or cylindrical portion secured to the rear of said plate, into which an umbrella is adapted to fit, as and for the purpose set forth.



606,899. GLOVE. LEONIDAS A. VAN PRAAG, New York, N. Y. Filed Nov. 21, 1896. Renewed Dec. 4, 1897. Serial No. 660,800. (No model.)

Claim.—1. A finger-tipped glove, the finger portions whereof have integral tip-reinforcements attached to them, and projecting therefrom as follows: from the index-finger endwise; from the second finger, sidewise; from the third finger sidewise, and from the little finger endwise, for the purposes set forth.

2. A finger-tipped glove made in two parts, each part having one half of each finger, and each half of each finger having an integral tip-reinforcement attached to it, and projecting therefrom, as follows: from the index-finger endwise; from the second finger sidewise; from the third finger sidewise, and from the little finger endwise, for the purposes set forth.

606,400. SAFETY-SUPPORT FOR WINDOW-CLEANERS. HIRAM K. WHITNER, Chicago, Ill. Filed Feb. 2, 1898. Serial No. 668,815. (No model.)

Claim.—1. In a safety apparatus adapted to encircle a person, the combination with a stay and its terminals, of a guard fixed to one of said terminals and means whereby said guard is held in relative position with said stay, substantially as and for the purpose set forth.

2. In a safety apparatus adapted to encircle a person, the combination with a stay and its terminals, of a guard fixed to one of said terminals, a combination-eye fixed in said safety apparatus and means whereby said guard is held in relative position with said stay, substantially as and for the purpose set forth.

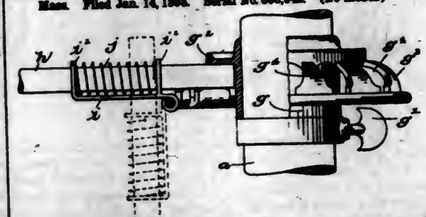
3. In a safety apparatus adapted to encircle a person, the combination with a stay and its terminals, of a guard fixed to one of said terminals, a carrier movably attached to said stay whereby said guard is held taut, and means whereby said guard is held in relative position to said stay in said safety apparatus, substantially as and for the purpose set forth.

4. In a safety apparatus adapted to encircle a person, the combination with a stay and its terminals, of a guard fixed to one of said terminals, a combination-eye fixed in said safety apparatus, and a carrier movably attached to said stay and said guard whereby said guard is held adjustable in relative position to said stay in said safety apparatus, substantially as and for the purpose set forth.

5. In a safety apparatus adapted to encircle a person, the combination with a stay and its terminals G and H, of a guard D fixed to terminal H and means whereby guard D is held in relative position to stay C, substantially as and for the purpose set forth.

6. In a safety apparatus adapted to encircle a person, the combination with stay C and its terminals, of a guard D fixed to one of said terminals, a combination-eye fixed in position E', F' and in position E^2, F^2 in said safety apparatus and means whereby guard D is held in relative position to stay C, substantially as and for the purpose set forth.

7. In a safety apparatus adapted to encircle a person, the combination with stay C and its terminals, of a guard D fixed to one of said terminals, a carrier K movably attached to stay C and guard D and means whereby guard D is held in relative position with stay C in said safety apparatus, substantially as and for the purpose set forth.



8. In a safety apparatus for window-cleaners, the combination with stay C and its terminals G and H, of a guard D fixed to terminal H, combination-eyes fixed in positions E', F' and E^2, F^2 in safety-jacket A, carrier K movably attached to stay C and guard D, substantially as and for the purpose set forth.

9. In a safety apparatus adapted to encircle a person, the combination with stay C and its terminals, of a guard D fixed to one of said terminals, a carrier K having a guardway k^2 and a stayway k' provided with a serrated tongue k^3 and means whereby said guard D is held in relative position with stay C in said safety apparatus, substantially as and for the purpose set forth.

10. In a safety apparatus adapted to encircle a person, the combination with stay C and its terminals, of a guard D fixed to one of said terminals, a combination-eye having a stay-eye E and a guard-eye F provided with antifriction-surfaces M and N and rivet-holes e and f as a means whereby said guard is held in relative position with stay C in said safety apparatus, substantially as and for the purpose set forth.

11. In a safety apparatus for window-cleaners, the combination with stay C and its terminals G and H, of a guard D fixed to terminal H, a combination-eye fixed in positions X, Y and Z in belt B, carrier K movably attached to stay C and guard D, substantially as and for the purpose set forth.

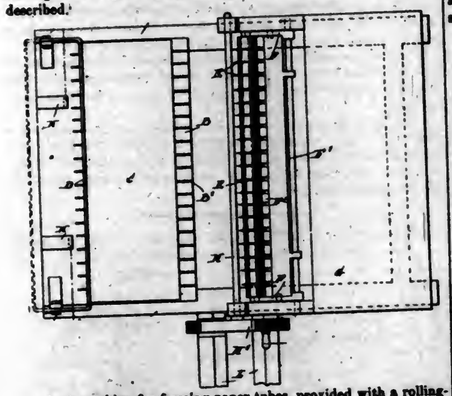
606,401. CLOTHES-DRIER. EDWARD A. WILLISTON, Boston, Mass. Filed Jan. 14, 1898. Serial No. 666,642. (No model.)

Claim.—1. A clothes-drier comprising a central column, a collar mounted to slide thereon, legs pivoted to said collar and forming a base, braces pivoted intermediate of their ends to the legs and at their lower ends to the lower end of the column, a cord connecting the upper ends of the braces, a hub mounted to slide on the column and provided with means for securing it at different heights, a flange formed on said hub, a series of brackets pivoted to the hub, a series of clothes-arms slidingly mounted in said brackets, the said arms being adapted to fold alongside of the central column or to engage the flange on the hub so as to project radially from said hub, and a spring connection between each arm and its bracket, acting to hold said arm in engagement with the flange.

2. A clothes-drier comprising a central column provided with a folding base, a hub mounted on the column, a flange formed on said hub and extending outwardly and downwardly to form a hood, substantially as set forth, apertures formed in said hood, brackets pivoted to the lower edge of said hood below each of the apertures, and arms slidingly mounted in said brackets and adapted to fold alongside of the central column, or to extend through the apertures in the hood and engage the flange on the hub, so as to project radially from said hub.

3. A clothes-drier comprising a central column provided with a folding base, a hub mounted on said column, a flange formed on said hub, brackets i i pivoted to the hub and adapted to swing in vertical planes, the said brackets being formed with flanges i' i' apertures to form a socket, clothes-arms mounted to slide in the sockets thus formed, and adapted to fold alongside of the central column or to engage the flange on the hub, so as to project radially from said hub, and springs surrounding the arms and occupying the space between the flanges of the brackets, the said springs acting to hold the arms in engagement with the flange of the hub.

606,402. MACHINE FOR FORMING PAPER TUBES. FREDERICK S. RABE, Jersey City, N. J. Filed Sept. 13, 1897. Serial No. 651,518. (No model.)

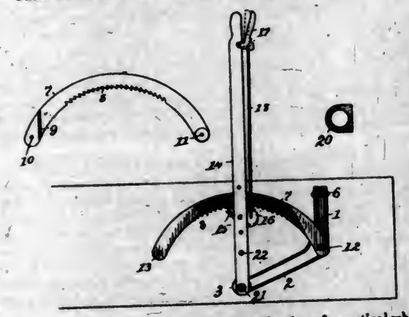


Claim.—1. A machine for forming paper tubes, comprising a rolling-table, a recessed head on the said table, and a slidable mandrel-frame carrying a revolvable mandrel adapted to engage the paper on the said recessed head, substantially as shown and described.

2. A machine for forming paper tubes, provided with a rolling and cutting table, a slidable mandrel-frame, a knife-frame pivoted in the said mandrel-frame and carrying knives for cutting a sheet of paper into strips, and a revolvable mandrel in the said frame, for winding the strips into tubes, substantially as shown and described.

3. A machine for forming paper tubes, provided with a rolling-table adapted to support strips of paper, a bar for raising the forward ends of the said strips of paper, and a head having a recess, and removably held on the said table, the said head passing under the raised ends of the said strips of paper, substantially as shown and described.

4. A machine for forming paper tubes, provided with a slidable frame carrying a revolvable mandrel, a knife-frame pivoted in the said slidable frame and spaced cutting disks or knives carried by the said

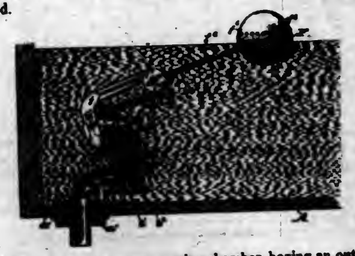


knife-frame, for cutting the sheet of paper into strips, the mandrel serving for rolling the strips into tubes, substantially as shown and described.

5. A machine for forming paper tubes, provided with a rolling-table, a gage adapted to be swung upon the said table for placing the sheet of paper in proper position on the table, a recessed head removably held on the said table, and adapted to engage the strips of paper to be rolled into tubes, and a slidable mandrel-frame carrying a revoluble mandrel, for engaging the paper in the said recessed head and for winding the paper into tubes, substantially as shown and described.

6. A machine for forming paper tubes provided with a device for lifting one end of the paper, a recessed head adapted to pass under the uplifted end of the paper, and a mandrel for engaging the uplifted end of the paper to press it into the recessed head, substantially as shown and described.

606,403. WAGON-BRAKE. WALTER L. BOARDMAN, Decatur, Ill. Filed Jan. 17, 1898. Serial No. 666,918. (No model.)



Claim.—1. In a wagon-brake, the combination of a vertical whip-socket open from end to end and having an integral pivot-arm extending downward and backward, a ratchet-rack fastened at one end to the whip-socket by a bolt which extends through the socket and forms a support for the whip, such rack being extended in an arc concentric with the end of the pivot-arm and a brake-lever pivoted on the end of the arm, substantially as set forth.

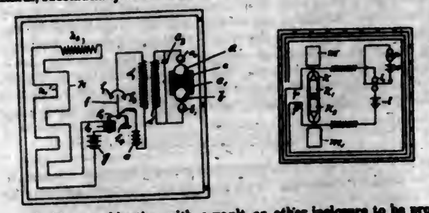
2. In a wagon-brake, the combination of the rack having teeth in its under surface, the brake-lever pivoted concentric with the rack, the pawl on the lever having the engaging end 15 and the rounded counterbalancing end 16 adapted to bear frictionally against the teeth, substantially as set forth.

606,404. VALVE. WESLEY BURNETT, Cambridge, Mass., assignor of one-half to Thomas R. Morford, same place. Filed Sept. 4, 1897. Serial No. 650,575. (No model.)

Claim.—1. In a valve apparatus, a valve-chamber provided with inlet and discharge ports at its lower end, an imperforate piston-valve movable in said chamber by fluid-pressure, to open and close the inlet, a connected main valve for the discharge-port, the chamber having an outlet above the piston-valve, a controlling-valve for said outlet located outside of the chamber, and a positive connection between the controlling and piston valves and passing through said outlet to effect positive initial movement of the piston-valve while permitting a limited relative movement of said valves, substantially as described.

2. In a valve apparatus, a valve-chamber having an outlet and provided with inlet and discharge ports, means actuated by fluid-pressure to govern the passage of a fluid from the inlet into the chamber and out by the discharge-port, and a controlling-valve for the outlet of said chamber, connected with and to impart a positive initial movement to said means, and having a limited movement independent of said means, combined with a pivoted actuating-lever for said controlling-valve having an attached float at its outer end, a rocker-arm pivotally connected with the controlling-valve, and a spring connection between said lever and rocker-arm, to impart sudden throw to said rocker-arm and thereby effect quick movement of the valve when the actuating-lever is moved beyond a certain point, substantially as described.

3. In a valve apparatus, a valve chamber provided with inlet and discharge ports, an imperforate piston-valve fitting the valve chamber closely and adapted to open and close the inlet-port, a main valve carried by said piston-valve to open and close the discharge-port, an outlet leading from the valve-chamber above the piston-valve, a controlling-valve therefor located outside of the said chamber, connections between said valves and passing through the outlet to permit a limited movement of one relatively to the other, and a spring-operated actuator to effect rapid initial movement of the controlling-valve and start the piston-valve, substantially as described.



4. In a valve apparatus, the combination with a valve-chamber provided with a discharge-port, a superimposed valve-seat, an inlet-pipe entering said chamber above the discharge-port, an imperforate piston-valve fitting the valve-chamber closely and having an attached main valve to coöperate with the seat above the discharge port, and an outlet leading from the valve-chamber above the piston, of an auxiliary controlling-valve for said outlet in axial alinement with the piston-valve, means to positively actuate it, and a positive connection between said controlling and piston valves, to effect positive initial movement of the latter through movement of the controlling-valve, the piston and main valves being so arranged that as the latter moves to its seat the former gradually closes the inlet-pipe, substantially as described.

5. In a valve apparatus, a valve-chamber having an outlet and provided with inlet and discharge ports, means actuated by fluid-pressure to govern the passage of a fluid from the inlet into the chamber and out by the discharge-port, and a controlling-valve for the outlet of said chamber, connected with and to impart a positive initial movement to said means, an actuating-lever for the controlling-valve, having a perforated float attached to its outer end, spring connections between said lever and valve, and an auxiliary connection adapted to be positively engaged by the lever when depressed by fluid entering the float, to thereby close the valve, substantially as described.

6. In a valve apparatus, a valve-chamber having an outlet and provided with inlet and discharge ports, means actuated by fluid-pressure to govern the passage of a fluid from the inlet into the chamber and out by the discharge-port, and a controlling-valve for the outlet of said chamber, connected with and to impart a positive initial movement to said means, combined with a spring-operated actuator for the controlling-valve, to effect sudden and rapid movement thereof, and a controlling-float connected with said actuator and operative independent of the fluid-pressure in the valve, to move said actuator into operative position, substantially as described.

606,405. ALARM SYSTEM. CLYDE COLEMAN, Chicago, Ill., assignor, by mesne assignments, of two-thirds to George P. Jones, same place. Filed Sept. 3, 1897. Serial No. 650,475. (No model.)

Claim.—1. The combination with a vault or other inclosure to be protected, of a wave-transmitter thereat capable of transmitting vibrations to a distance through the intervening media, an alarm system for throwing said transmitter into action by an attempt to enter the vault, and a receiver at the alarm-station responsive to the waves produced by the transmitter for actuating a signal device to give an alarm, substantially as described.

2. The combination with a vault or other inclosure to be protected, of a Hertzian-wave transmitter thereat, an alarm system for actuating said transmitter by an attempt to enter the vault, a Hertzian-wave receiver at the alarm-station and a signal device actuated by said receiver, substantially as described.

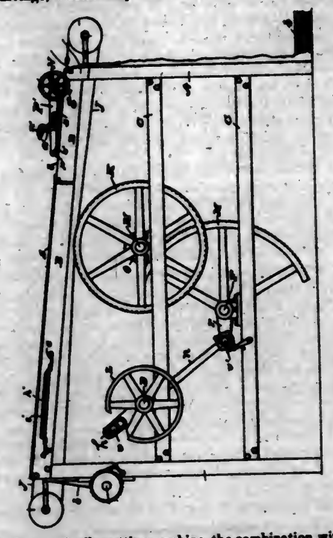
3. The combination with a vault or other inclosure to be protected, of a Hertzian-wave transmitter thereat, an electrical barrier protecting said vault against entrance and arranged to actuate said transmitter when disturbed, a Hertzian-wave receiver at the alarm-station, and a signal device adapted to be actuated by said receiver, substantially as described.

4. The combination with a vault or other inclosure to be protected, of a Hertzian-wave transmitter thereat, an alarm system for throwing said transmitter into action by an attempt to enter the vault, a receiver at the alarm-station comprising a mass of particles adapted to be cohered by the Hertzian waves, and a signal device arranged to be thrown into operation by said receiver, substantially as described.

5. The combination with a vault or other inclosure to be protected, of a Hertzian-wave transmitter thereat, an alarm system for throwing said transmitter into action by an attempt to enter the vault, a receiver at the alarm-station comprising a mass of particles adapted to be cohered by the Hertzian waves, and a signal device arranged to be operated continuously by said receiver until the cohering particles have been decohered, substantially as described.

6. The combination with a vault or other inclosure to be protected, of a Hertzian-wave transmitter thereat, an alarm system for throwing said transmitter into action by an attempt to enter the vault, a receiver at the alarm-station, a signal device actuated thereby and an alarm system protecting the alarm device against access and arranged to actuate a signal device when interfered with, substantially as described.

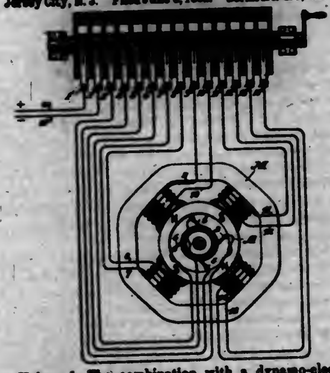
7. The combination with a vault or other inclosure to be protected, of a Hertzian-wave transmitter thereat, an alarm system for throwing said transmitter into action by an attempt to enter the vault, a receiver at the alarm-station comprising a mass of particles adapted to be cohered by the Hertzian waves, a signal device arranged to be operated by said receiver and a normally open protective circuit guarding the alarm device against access thereto and arranged in multiple with said coherer, substantially as described.



606,406. WEFT-PILE-CUTTING MACHINE. JOHN B. DAVISON, Crompton, R. I., assignor to the Crompton Company, same place. Filed Apr. 20, 1897. Serial No. 634,373. (No model.)

Claim.—1. In a weft-pile-cutting machine, the combination of a frame to hold the cloth, a knife-carriage, ways for the carriage, a screw extending crosswise of the cloth and mounted in bearings on said carriage, devices acting automatically at the close of a stroke of the carriage to rotate said screw intermittingly, a nut fitted to the screw-threaded portion of said screw, a knife, and a knife-carrying arm gravitating toward the cloth to press the knife against the latter and connected to move in unison with said nut crosswise of the cloth, with means to reciprocate said knife-carriage lengthwise of the machine, substantially as described.

2. In a machine of the class described, the combination of a frame to hold the cloth, with a knife-carriage, a knife, a knife-holder, a screw operating to feed the knife-holder and knife across the carriage, a wheel connected with said screw, a bar or rack, springs supporting said bar or rack, a cam-bar pivoted to said carriage and operating to depress said bar or rack clear of the wheel when the carriage is moving in one direction and to leave said rack up in position to engage and turn the wheel when the carriage is moving in the other direction, substantially as described.



3. The combination with a frame to hold the cloth, of a knife, a knife-carriage, means to reciprocate the said knife-carriage, and devices whereby automatically to vary the position of the limits of the strokes of the knife, to break the regularity of the cuts and thereby guard against injury to the appearance of the cloth, substantially as described.

4. In a weft-pile-cutting machine, the combination with a frame to hold the cloth, of a knife-carriage, a knife mounted on said knife-carriage, a driving-shaft, and operating devices intermediate said shaft and said carriage whereby to communicate a reciprocatory movement to said carriage, the said devices embracing as a portion thereof an eccentric connection and means to effect rotary adjustment thereof, substantially as set forth, whereby to vary the strokes of the carriage, substantially as described.

5. In a weft-pile-cutting machine, the combination with a frame to hold the cloth, of a knife-carriage, a knife, a pulley, a rope attached to said carriage and pulley, a gear connected with said pulley, a segment-gear engaging said gear, and having an eccentric mounted on an arm thereof, a ratchet-wheel connected with said eccentric, a pawl to engage said ratchet-wheel when the arm moves in one direction, and actuating devices engaging with said eccentric to operate the segment-gear, substantially as described.

606,407. DYNAMO-ELECTRIC MACHINE. ROBERT S. DOBBIE, Jersey City, N. J. Filed June 6, 1898. Serial No. 683,715. (No model.)

Claim.—1. The combination with a dynamo-electric machine having two or more pairs of pole-pieces, of a switch for rendering said machine bipolar or multipolar at will.

2. The combination with a multipolar dynamo-electric machine having pairs of pole-pieces of opposite polarity, of a series of contact-points to which the terminals of the field-magnet coils and commutator-brushes are connected, and means for varying the connections between said contact-points whereby said machine is rendered bipolar or multipolar at will.

3. A dynamo electric machine or electric motor having two or more pairs of field-magnet coils and an armature provided with two

or more pairs of commutator-brushes, in combination with circuit connections for changing the relative polarities of the field-magnet poles, substantially as described.

4. A multipolar dynamo-electric machine or electric motor provided with means for causing it to produce a bipolar or multipolar effect in accordance with the work it is called upon to perform.

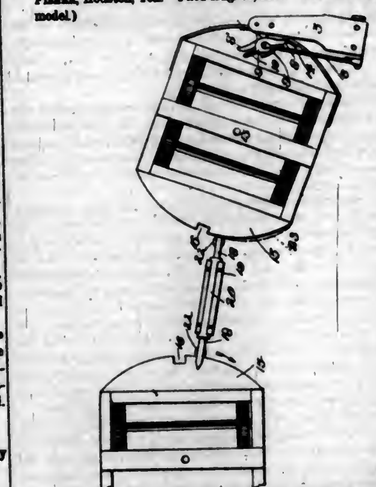
5. A dynamo-electric machine or electric motor having two or more pairs of field-magnet coils and a single rotary part or armature provided with two or more pairs of commutator-brushes, in combination with an operating-switch carrying circuit connections for connecting the machine or motor to a pair of current-mains, and additional circuit connections for varying the circuit relations between the field-magnet coils and the commutator-brushes in accordance with the work which the machine is called upon to perform, the field-coils and outer ends of the commutator-brushes having circuit connection with each other only through the several movable circuit connections carried by the operating-switch, whereby said machine is rendered bipolar or multipolar at will.

6. A dynamo-electric machine or electric motor having two or more pairs of field-magnet coils, both ends of which coils are connected to stationary switching-contacts, two or more armature-circuits both ends of which armature-circuits are also connected to similar stationary switching-contacts, in combination with one or more series of movable switching-contacts provided with circuit connections for varying the circuit relations through the field-magnet and armature-circuits in accordance with the work which the machine is called upon to perform, and additional circuit connections connecting said movable switching-contacts with a current feeder or main, the field-magnet coils and armature-circuits having connection with each other only through the movable switching-contacts, whereby said machine is rendered bipolar or multipolar at will.

7. The combination with a multipolar dynamo-electric machine of a switch for varying the number of effective magnetic poles at will to vary the speed or voltage of the machine.

8. The combination with a multipolar dynamo-electric machine of the direct-current type, of a series of contact-points, to which the terminals of the field-magnet coils and commutator-brushes are connected, and means for varying the connections between said contact-points, whereby the number of poles of the machine is varied at will.

606,408. SEAL-LOCK. JOHN DOWLING, Altoona, Pa. Filed May 5, 1897. Serial No. 635,235. (No model.)



Claim.—1. In a lock, the combination of a staple or keeper adapted to be engaged by a hasp and constructed to form an elongated pin-seat of uniform cross-sectional area, a pin fitted snugly in said seat and having a seal-slot, a seal, to engage said slot, having a pin-engaging notch, and a pivotless pawl loosely mounted in a recess or cavity in the rear wall of the pin-seat to engage a notch in the pin, said recess, at its point of communication with the seat, being of smaller dimensions than the pawl, to prevent the forward displacement of the latter, and rearward displacement of the pawl being prevented by an actuating spring closing the rear side of the recess and bearing against the pawl to hold it yieldingly in its operative position, substantially as specified.

2. In a lock, the combination of a staple or keeper of rectangular exterior contour adapted to be received and entirely encircled by the opening of a hasp, and having a vertical open-ended pin-seat provided in its front wall with a longitudinal slot, a non-rotatable pin fitted to slide in the pin-seat and adapted to secure the hasp in engagement with the staple or keeper, a pawl arranged within the staple or keeper to engage a notch in the pin, a flexible connection, as a chain, attached to the pin and having an elongated link adapted to pass through said slot in the front wall of the pin-seat, and a seal fitted in a transverse opening in the pin and having a pin-engaging notch, substantially as specified.

3. In a lock, the combination of a staple or keeper provided with a base-plate for attachment to a supporting-surface, said staple projecting perpendicularly from the plane of the base-plate, and having an open-ended pin-seat of uniform cross-sectional area, extending continuously therethrough parallel with the base-plate, and also having in one side a continuous longitudinal slot communicating with the pin-seat and open at both extremities of the staple, a hasp adapted at its free end to occupy a position parallel and in contact with the base-plate, and having an opening to receive and wholly encircle the staple in rear of the pin-seat therein, or between the pin-seat and the base-plate, a pin slidably fitted in the pin-seat, and having an attached safety-chain adapted to pass through said slot in the side of the staple when the pin is removed from the pin-seat, a concealed locking device within the staple for engaging the pin and preventing movement thereof in one direction, and a seal fitted in a seat in the pin and extending laterally beyond the same, to engage the contiguous end of the staple and prevent movement of the pin in the opposite direction, substantially as specified.

606,409. STEERING DEVICE FOR VEHICLES. CHARLES H. FISHER, Houston, Tex. Filed Aug. 17, 1897. Serial No. 648,599. (No model.)

Claim.—1. In a vehicle steering device, the combination with a truck having a shouldered curved extension thereon, of a vertically-pivoted arm adapted to swing from side to side, and to engage the said extension to swing the truck, and means for swinging the arm, the arm being so positioned as to be disengaged from the shouldered extension when in its normal position, substantially as described.

2. In a vehicle steering device, the combination with a vertically-pivoted arm, having a nose on each side thereof, of means for swinging the arm from side to side, and a truck provided with a curved extension having shoulders for engagement with a nose upon the arm when the latter is swung to one side, but capable of movement with the truck without engaging the nose when the arm is in its normal position, substantially as described.

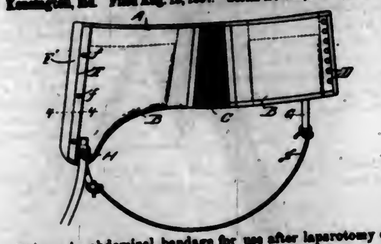
3. In a vehicle steering device, the combination with a truck having a shouldered curved extension thereon, of an arm vertically pivoted in front of the extension, and extending to within the circle described thereby, projections upon the sides of the arm adapted to engage the shoulders upon the extension to swing the truck, and means for swinging the arm, substantially as described.

4. In a vehicle steering device, the combination with a truck having a shouldered extension thereon, of a vertically-pivoted arm having spring-pressed dogs thereon adapted to engage the shoulders upon the extension, and means for swinging the arm, substantially as described.

5. In a vehicle steering device, the combination with a truck having a shouldered curved extension thereon, of an arm vertically pivoted in front of the extension and extending to within the circle described thereby, spring-pressed dogs upon the arm, adapted when the arm is swung to engage the shoulders upon the extension, and means for moving the arm, the arm being so positioned that the dogs thereon are disengaged from the shouldered extension when the arm is in its normal position.

6. In a vehicle steering device, the combination with a truck having a shouldered extension thereon, of a vertically-pivoted arm, having a pair of dogs pivoted thereon, each dog having a nose projecting to one side of the arm, and a shoulder upon the other side of the arm, springs holding the shoulders of the dogs against the arm, and means for swinging the arm, substantially as described.

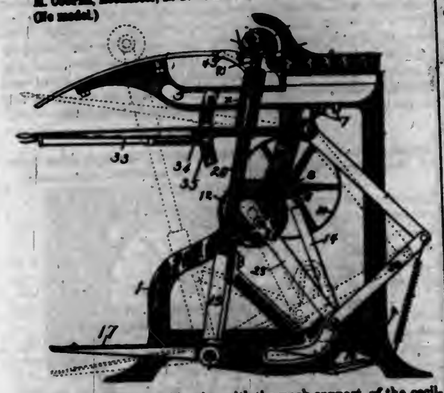
7. The combination with a vehicle-body and a pivoted truck, having a curved bearing-face thereon, of a friction member carried by the vehicle-body and adapted by friction upon the curved bearing-face on the truck to swing the latter when the vehicle-body is turned thereon, substantially as described.



8. The combination with a vehicle-body and two pivoted trucks, each having an extension provided with a bearing-surface on each side of its center, of a lever horizontally pivoted to the vehicle and provided with rollers upon its ends, and means for tilting the said lever upon the swinging of one of the trucks, whereby one of the rollers upon the lever will be placed in position to bear upon the extension of the other truck upon the turning of the car-body thereon, substantially as described.

9. The combination with a vehicle-body and two pivoted trucks, each having an extension provided with a cam-track on its lower face, and a curved bearing-surface, and a central notch, of a lever horizontally pivoted to the vehicle body, and provided with rollers upon the lower surface of its ends, the ends of the levers being normally below the notches in the said extensions, substantially as described.

10. The combination with a vehicle-body and two pivoted trucks, each having an extension provided with a cam-track on its lower face and a curved bearing-surface flattened at its center and a central notch, of a guide-bracket secured to the body of the vehicle, a lever vertically pivoted in the said bracket and having beveled ends normally located below the notches in the said extensions, and rollers upon the lower surface of the ends of the said levers, substantially as described



---

606,410. ABDOMINAL SUPPORTER. GRAHAM L. FOWLER, Lexington, Md. Filed Aug. 13, 1897. Serial No. 648,103. (No model.)

Claim.—An abdominal bandage for use after laparotomy comprising two flexible sections A each having a substantially horizontal upper edge and curved lower edge, an elastic web C intermediate the front and rear, steels E provided with fastening devices to unite the fronts, a flap located on one section underlying the steels, textile pads B placed parallel to the front steels, a lacing device for the back of the bandage, and perineal straps G, g.

606,411. STARCHING-MACHINE. ARTHUR T. HAGEN and DANIEL M. OSBURN, Rochester, N. Y. Filed June 21, 1897. Serial No. 641,612. (No model.)

Claim.—1. The combination with the work-support, of the oscillatory frame, the roller on the frame moving over the support and cooperating therewith, a rotary shaft having a crank of determinate throw, and adjustable connections under the control of the operator arranged between said crank and the frame for varying the extent of movement of the roller over the support, substantially as described.

2. The combination with the work-support and the starch-receptacle at the end thereof, of the starch-roller movable over the support and arranged to cooperate with the starch-receptacle, power devices for actuating the roller back and forth over the support and into and out of cooperative relation with the receptacle, and means controlled by the operator for varying the extent of movement of the roller over the support while being operated upon by the power devices.

3. The combination with the work-support, the starch-receptacle at the end thereof, the roller movable over the support and cooperating with the receptacle, and the oscillating frame on which the roller is mounted, of an arm on the frame, a rotary crank-shaft, a pitman connected thereto, and means controlled by the operator for varying the connection between the pitman and arm to vary the movement of the roller over the support.

4. The combination with the work-support, a starch-receptacle at one end thereof, an oscillating frame, and a starch-carrying device thereon movable over the support, of a rotary crank-shaft, an arm on the oscillating frame, and adjustable connections between said arm and crank-shaft for varying the extent of oscillation of the frame, substantially as described.

5. The combination with the work-support, the oscillating frame, and the roller mounted thereon, of the slotted arm on the frame, the rotary crank-shaft, the pitman having the pin operating in the slot in the arm, and means for adjusting said pin in the slot, substantially as described.

6. The combination with the work-support, the pivoted oscillating frame having the actuating-arm, the spring-mounted roller on the frame, of the rotary shaft having the crank, and adjustable connections between said crank and the arm on the frame for varying the extent of the oscillations of the latter, substantially as described.

7. The combination with the work-support, the oscillating frame having the actuating-arm, and the roller on the frame, of the rotary shaft, the crank thereon, a pitman connected to the crank and operating on the actuating-arm, and the controlling-lever connected to the pitman and controlling the connection between the latter and the arm, substantially as described.

8. The combination with the work-support, the oscillating frame, and the operating device on the latter movable over the support, of a rotary shaft, adjustable connections between said shaft and the oscillating frame, whereby the extent of movement of the frame may be controlled, a starting and stopping device for the shaft, such as a clutch, connections between said starting and stopping device and the frame whereby the latter may operate the former to arrest the machine, and a starting-arm controlling the movement of the frame relatively to said device, and cooperating with the starting mechanism to start the machine when moved in one direction, substantially as described.

9. The combination with the work-support, the oscillating frame, and the operating device on the latter movable over the support, of a rotary shaft, connections between said shaft and the oscillating frame, a clutch device for controlling said shaft actuated in a direction by the frame to arrest the shaft, a starting-arm cooperating with the clutch device to start the machine and preventing the frame from actuating the clutch device when moved in one direction and permitting the frame to release the clutch when operated in the opposite direction, substantially as described.

10. The combination with the work-support, the oscillating frame, and the operating device on the latter movable over the support, and the arm on the frame having the curved slot, of the rotary shaft, the pitman having the pin operating in the slot of the arm, the lever and link controlling the pin, a clutch device for controlling the shaft, the treadle operating the frame, and connections between the treadle, arm and clutch device for starting the machine by the movement of the treadle in one direction and permitting its arrest when the treadle is released, substantially as described.

11. The combination with the work-support, the oscillatory frame, and the operating device on the latter movable over the support, of a rotary shaft, connections between the latter and the oscillating frame, a clutch for controlling the rotation of the shaft, connections between it and the frame for disengaging the clutch by the movement of the latter, a starting-arm cooperating with the clutch to engage it, and also cooperating with and limiting the movement of the frame, thereby preventing the disengagement of the clutch, substantially as described.

12. The combination with the work-support, the oscillating frame, and the operating device on the latter movable over the support, of a driving-shaft, and connections between it and the oscillating frame for actuating the latter, a starting and stopping mechanism, such as a clutch, arranged between the driving-shaft and the oscillating frame, a lever for operating said starting and stopping device engaged by the oscillating frame, and a treadle for holding the frame out of contact with the lever and also operating said lever in one direction, substantially as described.

13. In a starching-machine, the combination with the smooth work-support upon which the articles may be adjusted, and a starch-

receptacle at one end thereof, the surface of said support being accessible to the operator during the operation so that the article may be readily adjusted thereon, of a horizontally-movable frame, a starch-carrying roller mounted thereon movable over the support and adapted to enter the starch-receptacle at one extreme of its movement substantially as described.

14. In a starching-machine, the combination with the work-support, the surface of which is readily accessible and a starch-receptacle at one end thereof, of a movable frame, a starch-carrying roller mounted thereon and adapted to travel over the support and enter the receptacle, power devices for oscillating the frame, and controlling devices for varying the extent of movement of the frame while oscillating, substantially as described.

15. In a starching-machine, the combination with the work-support, and a starch-receptacle at one end thereof, of a movable frame, a starch-carrying roller mounted thereon and adapted to travel over the support and enter the receptacle, and means for rotating the roller independently of its movement over the support and while within the receptacle, substantially as described.

16. In a starching-machine, the combination with the work-support, and a starch-receptacle at one end thereof, of a movable frame, a starch-carrying roller mounted thereon and adapted to travel over the support and enter the receptacle, a pulley on the roller, and a friction driving device arranged in proximity to the receptacle for engaging the roller when the latter is in the receptacle, substantially as described.

17. In a starching-machine, the combination with the work-support, and the starch-receptacle at one end thereof, of the movable frame, the roller carried thereby movable over the support and adapted to enter the starch-receptacle, and the pivoted flap on the receptacle with which the roller cooperates, substantially as described.

18. In a starching-machine, the combination with the work-support and the starch-receptacle at one end thereof, of the movable frame, the roller carried thereby movable over the support and adapted to enter the starch-receptacle, the pivoted flap at the end of the receptacle having the rock-arms at the ends, substantially as described.

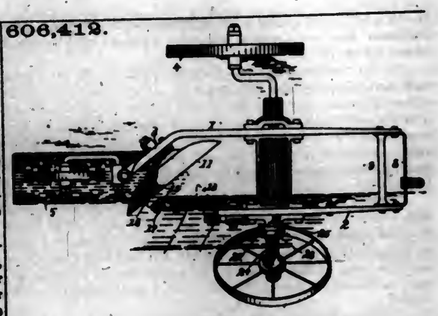
19. In a starching-machine, the combination with the work-support and the starch receptacle at the end thereof, of the movable frame, the roller carried thereby movable over the support and adapted to enter the receptacle, the pulley on the roller, the traveling belt and the belt-tightener, substantially as described.

20. The combination with the work-support, the surface of which is readily accessible and the starch-receptacle at the end thereof, of the movable frame, the roller mounted on the frame having the elastic cellular surface, devices under the control of the operator for actuating the roller over the surface of the support or into cooperative relation with the receptacle.

21. The combination with the curved work-support, the surface of which is readily accessible to the operator, of the pivoted swinging frame, the roller mounted on the frame and having the elastic cellular surface, a starch-receptacle at the end of the work-support, devices under the control of the operator for operating the roller over the support or into cooperative relation with the receptacle.

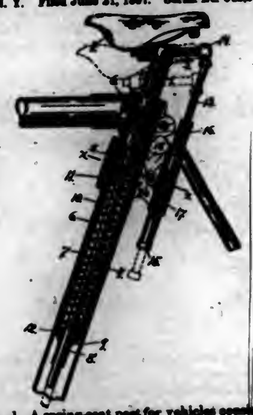
22. The combination with the hollow frame having the hollow arm, the work-support on the arm, and the starch-receptacle on the frame at the end of the work-support, of the movable frame and the starch-roller carried thereby and movable over the work-support and into and out of the receptacle, substantially as described.

23. The combination with the curved work-support, and the receptacle at the end thereof, of the rocking frame having the spring-operated telescoping arms, the roller mounted on said frame, and means for operating said roller back and forth over the support and into and out of the receptacle, substantially as described.



24. The combination with the work support and the starch-carrying roller, one of which is movable, and the starch-receptacle with which the roller cooperates, of power devices for operating the movable part and causing the cooperation of the roller and receptacle and means controlled by the operator for varying the extent of movement of the movable part while the power devices are in operation.

606,412. DISK PLOW. EDWARD M. HEYLMAN, Canton, Ill., assignor to the Parlin & Orendorff Company, same place. Filed Aug. 27, 1897. Serial No. 649,760. (No model.)



Claim.—1. In a plow the combination of a furrow-forming disk, an oblique standard having its upper end in advance of its lower end, and a horizontal blade on the lower end of the standard adapted to cut away the ridges between furrows, substantially as described.

2. In a disk plow, the combination of a disk, a beam in front of the disk, a sleeve secured to the beam and extended obliquely toward the face of the disk, a shank journaled loosely in the sleeve and a scraper on the shank presented to the disk, substantially as described.

606,413.

606,413. SPRING-SEAT FOR VEHICLES. ALBERT H. HOLLAND, Buffalo, N. Y. Filed June 21, 1897. Serial No. 641,588. (No model.)

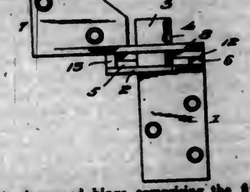
Claim.—1. A spring-seat post for vehicles consisting of a tubular casing removably secured within the frame-tubing of a bicycle, a seat-bar within the casing, and a spiral spring between the bar and casing; a clip removably secured to the frame-tubing of the bicycle and provided with a socket in its rear end, and a keeper secured to the rear end of the seat-bar and passing through the socket, substantially as described.

2. A spring-seat post for vehicles consisting of a tubular casing removably secured within the frame-tubing of a bicycle, a seat-bar within the casing, and a spring between the bar and casing; a removable clip adjustably secured to the frame-tubing and having an upright opening near its rear end, a tubular socket held within the opening, a keeper removably secured to rear end of the seat-bar and passing through the tubular socket, and a flange near the lower end of the keeper, substantially as and for the purpose set forth.

606,414. VEHICLE RUNNING-GEAR. ALBERT A. HALE, Fitchburg, Mass. Filed June 7, 1897. Serial No. 639,647. (No model.)

Claim.—1. In a vehicle running-gear, the combination with a forked reach having its separated rear ends pivotally connected to the body of the vehicle, of a short link connecting the front end of said reach with the front running-gear, said short link being vertically pivoted at its ends, substantially as described.

2. In a vehicle running-gear, the combination with a forked reach having its separated rear ends pivotally connected to the body of the vehicle, of a short link connecting the front end of said reach with the front running-gear, said short link having a vertical pivot connection at its rear end to the reach and a compound vertical and horizontal connection at its front end to the said front running-gear, substantially as described.



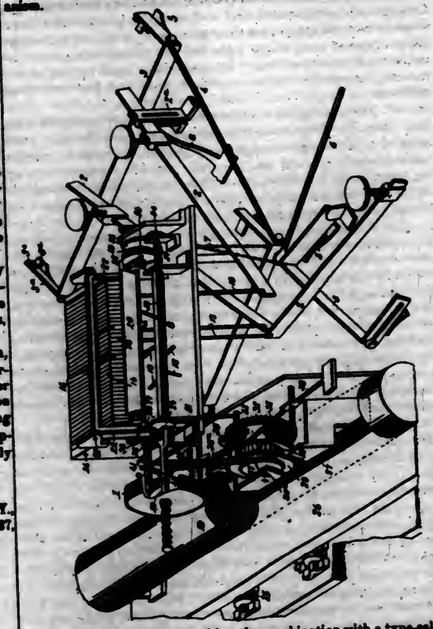
3. The combination with a forked reach, pivotally connected to a vehicle-body at its separated rear ends, and extending at its forward end close to the front axle of the vehicle, of a short casting or bracket mounted on the front running-gear, and a short link connecting said reach to said casting or bracket, said short link having a vertical pivot connection at one end and a compound vertical and horizontal connection at its other end, substantially as described.

4. In a vehicle running-gear, a link or hanger connecting the body with the front running-gear, said link having a vertical pivot at each end thereof, and being formed in two parts oppositely disposed, one above the portion to which it is secured and one below the same, said link having recesses at its respective ends concentric with its pivots to receive correspondingly-formed projections on the inclosed portions, substantially as described.

5. The combination with a reach pivotally connected to the body of the vehicle for vertical movement and rigid against lateral movement, of a short link connecting the front end of said reach with the front running-gear, said short link being vertically pivoted at its ends, substantially as described.

6. A bracket adapted to retain the shouldered ends of the reach, said bracket being formed in two plate-like parts, adapted to be overlapped on each other, and having registering bolt-holes, the inner edge of one of said overlapping parts having an interlocking portion A³ in the form of a rotatrant angle cooperating with an interlocking ridge and projection on the other part, and said parts having cup-shaped lugs extending outwardly and facing each other, substantially as described.

606,415. LOCK-HINGE. WILLIAM M. HOVALDEN, Port Byron, N. Y., assignor of one-half to Josiah Hasbrouck, same place. Filed Jan. 27, 1898. Serial No. 668,102. (No model.)



Claim.—An improved hinge comprising the fixed bracket 1 formed with the horizontal plate 2 provided with the radial recess 6, the transverse shoulder 5, the vertical tubular post 3 and the radial pin 4, in combination with the movable bracket 7 formed with the horizontal plate 8 provided with the axial orifice 9 and radial communicating recess 10, the transverse shoulder 12 and the depending lug 13, substantially as shown and described.

606,416. TYPE-WRITING MACHINE. EDUARD VON ESMARCH, Charlottenburg, Germany. Filed May 12, 1896. Serial No. 591,303. (No model.)

Claim.—1. In a type-writing machine, a type-selecting mechanism comprising key-operated means impelled through a cycle of movement embracing all the type by manipulation of any key or a number of keys simultaneously, and devices controlled by simultaneous manipulation of the keys for successive cooperation with said key-operated means in a cycle of movement thereof to select for printing the types corresponding to the keys simultaneously manipulated.

2. In a type-writing machine, a type-selecting mechanism comprising key-operated means impelled through a cycle of movement embracing all the type by manipulation of any key or a number of keys simultaneously, and devices controlled by simultaneous manipulation of the keys for successive cooperation with said key-operated means in a cycle of movement thereof to select for printing the types corresponding to the single keys simultaneously manipulated, said key-controlled devices including a stop to temporarily check the key-operated means.

3. In a type-writing machine, the combination with a type-selecting mechanism comprising key-operated means impelled through a cycle of movement embracing all the type by manipulation of a key or a number of keys simultaneously, and devices controlled by simultaneous manipulation of the keys for successive cooperation with said key-operated means in a cycle of movement thereof to select for printing the types corresponding to the single keys simultaneously manipulated, of a normally-inactive printing mechanism, and connections between the same and the type-selecting mechanism for rendering said printing mechanism active by the cooperation of the key-operated means and the key-controlled devices of said selecting mechanism.

4. In a type-writing machine, the combination with a type-selecting mechanism comprising key-operated means impelled through a cycle of movement embracing all the type by manipulation of a key or a number of keys simultaneously, and devices controlled by simultaneous manipulation of the keys for successive cooperation with said key-operated means in a cycle of movement thereof to select for printing the types corresponding to the single keys simultaneously manipulated, said key-controlled devices including a stop to temporarily check the key-operated means, of a normally-inactive printing mechanism, and connections between the same and the type-selecting mechanism for rendering said printing mechanism active by the cooperation of the key-operated means and the key-controlled devices of said selecting mechanism.

5. In a type-writing machine, the combination with a type-selecting mechanism comprising key-operated means impelled through a cycle of movement embracing all the type by manipulation of a key or a number of keys simultaneously, and devices controlled by simultaneous manipulation of keys for successive cooperation with said key-operated means in a cycle of movement thereof to select for printing the types corresponding to the single keys simultaneously manipulated, said key-controlled devices including a stop to temporarily check the key-operated means, of a normally-inactive printing mechanism, and connections between the same and the type-selecting mechanism for rendering said printing mechanism active by the cooperation of the key-operated means and the key-controlled devices of said selecting mechanism, and connections between the printing mechanism and the stop of the selecting mechanism for retracting said stop.

6. The combination of a type-carrier, means for moving the same, keys operatively connected with said means to put the same under stress to effect a cycle of movement of the type-carrier by manipulation of a key or keys, and key-controlled means for bringing together the printing-couple at different predetermined positions of the type-carrier in its cycle of movement, operation of said means being brought about by the movement of the type-carrier.

7. The combination of a type-wheel, means for rotating the same, keys operatively connected with said means to put the same under stress to turn the type-wheel through a single revolution by manipu-

lation of one or more of said keys, and key-controlled means for establishing different positions of the type-wheel in such revolution.

8. The combination of a type-wheel, means for rotating the same, keys operatively connected with said means to put the same under stress to turn the type-wheel through a single revolution by manipulation of one or more of said keys, and key-controlled means for bringing together the printing-couple at different predetermined positions of the type-wheel in such revolution.

9. The combination of a type-wheel, means for rotating the same, keys operatively connected with said means to put the same under stress to turn the type-wheel through a single revolution by manipulation of one or more of said keys, and key-controlled means for establishing different positions of the type-wheel in such revolution, and for bringing together the printing-couple when such positions are established.

10. The combination of a type-wheel, means for rotating the same, keys operatively connected with said means to put the same under stress to turn the type-wheel through a single revolution by manipulation of one or more of said keys, key-controlled means for bringing together the printing-couple at different predetermined positions of the type-wheel in such revolution, operation of such means being brought about by movement of the type-wheel.

11. The combination of a type-carrier, means for moving the same, keys operatively connected with said means to put the same under stress to effect a cycle of movement embracing all the type of the type-carrier by manipulation of a key or keys, a series of projections relatively arranged to correspond with the relative location of the type on the type-carrier, and a series of abutments to coact successively with said series of projections under movement of the type-carrier by the keys, and coaction of said projections and abutments determining several printing positions of the type-carrier during one cycle of movement and bringing together the printing-couple when such positions have been established, and key-operated means controlling operative coaction of the projections and abutments.

12. The combination of a type-carrier, means for moving the same, keys operatively connected with said means to put the same under stress to effect a cycle of movement of the type-carrier embracing all the type by manipulation of a key or keys, a series of projections relatively arranged to correspond with the relative location of the type on the type-carrier, and a series of abutments to coact successively with said series of projections under movement of the type-carrier by the keys, means controlled by coaction of said projections and abutments to determine several printing positions of the type-carrier during one cycle of movement, and to bring together the printing-couple when such positions have been established, and key-operated means controlling operative coaction of the projections and abutments.

13. The combination of a type-carrier, means for moving the same, keys operatively connected with said means to put the same under stress to effect a cycle of movement of the type-carrier embracing all the type by manipulation of a key or keys, a normally-inactive motor operatively connected to effect coaction of the printing-couple, and key-controlled means for establishing several different positions of the type-carrier during one cycle of movement and for rendering said motor active for the purpose described.

14. The combination of a type-carrier, means for moving the same, keys operatively connected with said means to put the same under stress to effect a cycle of movement of the type-carrier embracing all the type by manipulation of a key or keys, a normally-inactive motor operatively connected to effect coaction of the printing-couple, a series of abutments relatively arranged to correspond with the relative location of the type-carrier, one or more projections to coact successively with said series under movement of the type-carrier by the keys, coaction of said projections and abutments determining several printing positions of the type-carrier during one cycle of movement and rendering the said motor active, and key-operated means controlling operative coaction of the projections and abutments.

15. The combination of a type-carrier, means for moving the same, keys operatively connected with said means to put the same under stress to effect a cycle of movement of the type-carrier embracing all the type by manipulation of a key or keys, a normally-restrained motor operatively connected to effect coaction of the printing-couple, and key-controlled means for establishing several different positions of the type-carrier, during one cycle of movement and for momentarily releasing the motor.

16. The combination of a type-carrier, means for moving the same, keys operatively connected with said means to put the same under stress to effect a cycle of movement of the type-carrier embracing all the type by manipulation of a key or keys, a normally-restrained motor operatively connected to effect coaction of the printing-couple, a series of abutments relatively arranged to correspond with the relative location of the type on the type-carrier, one or more projections to coact successively with said series under movement of the type-carrier by the keys, coaction of said projections and abutments determining several printing positions of the type-carrier during one cycle of movement and releasing the motor, and key-operated means controlling operative coaction of said projections and abutments.

17. The combination of a type-wheel, means for rotating the same, keys operatively connected with said means to put the same under stress to turn the type-wheel through a single revolution by manipulation of one or more of said keys, a normally-inactive motor operatively connected to effect coaction of the printing-couple, and key-controlled means for establishing several different positions of the type-wheel in its one revolution and for simultaneously rendering said motor active.

18. The combination of a type-wheel, means for rotating the same, keys operatively connected with said means to put the same under stress to turn the type-wheel through a single revolution by manipulation of one or more of said keys, a normally-inactive motor operatively connected to effect coaction of the printing-couple, a series of projections associated with the type-wheel and corresponding in relative location with the type, a series of key-controlled abutments to cooperate successively with said type-wheel series, and means operated by coaction of said projections and abutments to establish several predetermined positions of the type-wheel during the one revolution and render the motor active.

19. The combination of a type-wheel, means for rotating the same keys operatively connected with said means to put the same under stress to turn the type-wheel through a single revolution by manipulation of one or more of said keys, a normally-restrained motor operatively connected to effect cooperation of the printing-couple, and key-controlled means for establishing several different positions of the type-wheel in its one revolution, and for releasing the motor.

20. The combination of a type-wheel, means for rotating the same, keys operatively connected with said means to put the same under stress to turn the type-wheel through a single revolution by manipulation of one or more of said keys, a normally-restrained motor operatively connected to effect cooperation of the printing-couple, a series of projections associated with the type-wheel and corresponding in relative location with the type, a series of key-controlled abutments to cooperate successively with said type-wheel series, and means operated by coaction of said projections and abutments to establish predetermined positions of the type-wheel and release the motor.

21. The combination of a type-wheel, means for rotating the same, keys operatively connected with said means to put the same under stress to turn the type-wheel through a single revolution by manipulation of one or more of said keys, a series of projections associated with the type-wheel and relatively located to correspond with the type, a corresponding series of key-supported abutments normally out of the path of rotation of the type-wheel projections but arranged to move into their paths when the keys are manipulated and to coact successively with them, a normally-restrained motor to effect coaction of the printing-couple, and an escapement therefor controlled by coaction of the projections and abutments.

22. The combination of a type-wheel, means for rotating the same, keys operatively connected with said means to put the same under stress to turn the type-wheel through a single revolution by manipulation of one or more of said keys, a series of projections associated with the type-wheel and relatively located to correspond with the type, a corresponding series of key-supported abutments normally out of the path of rotation of the type-wheel projections, but arranged to move into their paths when the keys are manipulated and to coact successively with them, a normally-restrained motor to effect coaction of the printing-couple, an escapement therefor, and a detent engaging the escapement and arranged to be displaced by the coaction of the projections and abutments.

23. The combination of a type-wheel, means for rotating the same, keys operatively connected with said means to put the same under stress to turn the type-wheel through a single revolution by manipulation of one or more of said keys, a series of projections associated with the type-wheel and relatively located to correspond with the type, a corresponding series of key-supported abutments normally out of the path of rotation of the type-wheel projections but arranged to move into their paths when the keys are manipulated and to coact successively with them, a normally-restrained motor to effect coaction of the printing-couple, an escapement therefor, a detent engaging the escapement, type-wheel-locking means, and a member actuated by displacement of the key-supported abutments by the type-wheel projections to operate the type-wheel-locking means, and to displace the escapement-restraining detent.

24. In a type-writing machine, the combination with a supporting-bed for the paper; a type-wheel movable toward and from said bed; and a normally-restrained motor operatively connected with said type-wheel to move the same toward the bed: of a shaft operatively connected with the type-wheel to rotate the same, and having one or more projections; one or more movable frames associated with the keys so as to be actuated by any of them; connections between the said frames and the type-wheel shaft for turning the latter; and key-controlled means cooperating with the shaft projections to establish predetermined positions of the type-wheel and to release the motor.

25. In a type-writing machine, the combination with a supporting-bed for the paper; a type-wheel movable toward and from said bed; and a normally-restrained motor operatively connected with said type-wheel to move the same toward the bed: of a shaft operatively connected with the type-wheel to rotate the same, and having one or more projections; one or more movable frames associated with the keys so as to be actuated by any of them: gearing associated with said shaft; a drum and-chain connection between said gearing and the movable frames; and key-controlled means cooperating with the shaft projections to establish predetermined positions of the type-wheel and to release the motor.

26. In a type-writing machine, the combination with a supporting-bed for the paper; a type-wheel movable toward and from said bed; and a normally-restrained motor operatively connected with said type-wheel to move the same toward the bed: of a shaft operatively connected with the type-wheel to rotate the same, and having one or more projections; one or more movable frames associated with the keys so as to be actuated by any of them; gearing engaged with said shaft through a flexible connection; means of connection between the movable frames and said gearing for turning the shaft by movement of the frames; stop mechanism for positively limiting movement of the shaft to a single revolution; and key-controlled means cooperating with the shaft projections to establish predetermined positions of the type-wheel and to release the motor.

27. In a type-writing machine, the combination with a supporting-bed for the paper; a type-wheel movable toward and from said bed; and a normally-restrained motor operatively connected with said type-wheel to move the same toward the bed: of a shaft operatively connected with the type-wheel to rotate the same, and having one or more projections; one or more movable frames associated with the keys so as to be actuated by any of them; a drum carrying a pawl; a flexible connection between the said drum and the movable frames; a ratchet-wheel engaged with said pawl; gearing associated with said ratchet-wheel; flexible connections between said gearing and the type-wheel shaft; and key-controlled means cooperating with the shaft projections to establish predetermined positions of the type-wheel and to release the motor.

28. In a type-writing machine, the combination with a supporting-bed for the paper; a type-wheel movable toward and from said bed; and a normally-restrained motor operatively connected with said type-wheel to move the same toward the bed: of a shaft operatively connected with the type-wheel to rotate the same, and having one or more projections; one or more movable frames associated with the keys so as to be actuated by any of them; a drum carrying a pawl; a flexible connection between the said drum and the movable frames; a ratchet-wheel engaged with said pawl; gearing associated with said ratchet-wheel; flexible connections between said gearing and the type-wheel shaft; a latch engaged with said shaft to lock the same and having a part in the path of an abutment carried by the drum; and key-controlled means cooperating with the shaft projections to establish predetermined positions of the type-wheel to release the motor.

29. In a type-writing machine, the combination with a supporting-bed for the paper; a type-wheel movable toward and from said bed; and a normally-restrained motor operatively connected with said type-wheel to move the same toward the bed: of a shaft operatively connected with the type-wheel to rotate the same, and having a plurality of projections; key-operated means for rotating said shaft; a series of key-supported movable abutments corresponding with the projections on the shaft and normally out of the paths of movement of the same, said abutments arranged to drop into the paths of movement of said projections when the keys are manipulated and to be displaced from such paths of movement by the action of the projections against them; and mechanism associated with said abutments and operating to lock the type-wheel in predetermined positions and to release the motor.

30. In a type-writing machine, the combination with a supporting-bed for the paper; a type-wheel movable toward and from said bed; and a normally-restrained motor operatively connected with said type-wheel to move the same toward the bed: of a shaft operatively connected with the type-wheel to rotate the same, and having a plurality of projections; key-operated means for rotating said shaft; a series of key-supported arms pivoted to a fixed support having abutment-pieces corresponding with the shaft projections, but normally out of position for engagement therewith; a movable frame common to all said abutment-pieces and adapted to be displaced thereby; and detent mechanisms associated with said movable frame and adapted to lock the type-wheel in predetermined positions and to release the motor.

31. In a type-writing machine, the combination with a supporting-bed for the paper; a type-wheel movable toward and from said bed; and a normally-restrained motor operatively connected with said type-wheel to move the same toward the bed: of a shaft operatively connected with the type-wheel to rotate the same, and having a plurality of projections; key-operated means for rotating said shaft; a series of key-supported pivotal arms having pendent springs with beveled blocks for coaction with the shaft projections but normally out of position for engagement therewith; a hinged frame common to said blocks and designed to be displaced thereby; and detent mechanisms associated with said movable frame and adapted to lock the type-wheel in predetermined positions and to release the motor.

32. In a type-writing machine, the combination with a supporting-bed for the paper; a type-wheel movable to ward and from said bed; and a normally-restrained motor operatively connected with said type-wheel to move the same toward the bed: of a shaft operatively connected with the type-wheel to rotate the same, and having a plurality of projections; depressible key-bars; connections between the same and the shaft, whereby to rotate the latter; a series of arms pivoted to a fixed support corresponding with the shaft projections and having abutments for engagement therewith; rods rising from the key-bars and supporting the said pivotal arms with their abutments clear of the shaft projections; and detent mechanisms associated with said movable frame and adapted to lock the type wheel in predetermined positions and to release the motor.

33. In a type-writing machine, the combination with a supporting-bed for the paper; a type-wheel movable toward and from said bed; and a normally-restrained motor operatively connected with said type-wheel to move the same toward the bed: of a shaft operatively connected with the type-wheel to rotate the same, and having one or more projections; key-operated means for rotating said shaft; a toothed wheel affixed on said shaft; a locking dog or pawl to engage said wheel but normally removed therefrom; key-controlled mechanism associated with said shaft projections and with the said locking-dog, to move the latter into engagement with the toothed wheel; and key-controlled detent mechanism for releasing the motor.

34. In a type-writing mechanism, the combination with a supporting-bed for the paper; a type-wheel movable toward and from said bed; and a normally-restrained motor operatively connected with said type-wheel to move the same toward the bed: of a shaft operatively connected with the type-wheel to rotate the same, and having a plurality of projections; key-operated means for rotating said shaft; a series of key-controlled abutments corresponding with the projections on the shaft, but normally out of the paths of movement of the same; a toothed wheel affixed to the shaft; a movable locking-dog normally out of engagement with said wheel; connections between the series of abutments and the said dog, to move the same into engagement with the toothed wheel; and detent mechanism associated with the abutments and adapted to release the motor.

35. In a type-writing machine, the combination with a supporting-bed for the paper; a type-wheel movable toward and from said bed; and a normally-restrained motor operatively connected with said type-wheel to move the same toward the bed: of a shaft operatively connected with the type-wheel to rotate the same, and having a plurality of projections; key-operated means for rotating said shaft; a series of key-supported pivotal arms having abutment-pieces corresponding with the shaft projections, but normally out of position for engagement therewith; a movable frame common to all said abutment-pieces and adapted to be displaced thereby; a toothed wheel on the type-wheel shaft; a movable locking-dog normally disengaged from said wheel; an arm connecting said dog with the movable frame; and detent mechanism actuated by the latter to release the motor.

36. In a type-writing machine, the combination with a supporting-bed for the paper; a type-wheel movable toward and from said bed; and a normally-restrained motor operatively connected with said type-wheel to move the same toward the bed: of a shaft operatively connected with the type-wheel to rotate the same, and having a plurality of projections; key-operated means for rotating said shaft; a series of key-controlled abutments corresponding with the projections on the shaft, but normally out of the paths of movement of the same; a toothed wheel affixed to the shaft; a movable locking-dog normally out of engagement with said wheel; connections between the series of abutments and the said dog to move the same into engagement with the toothed wheel; detent mechanism associated with the abutments and adapted to release the motor; and means associated with said motor and operating to disengage the dog from the toothed wheel.

37. In a type-writing machine, the combination with a supporting-bed for the paper; a type-wheel movable toward and from said bed; and a normally-restrained motor operatively connected with said type-wheel to move the same toward the bed: of a shaft operatively connected with the type-wheel to rotate the same, and having a plurality of projections; key-operated means for rotating said shaft; a series of key-supported arms pivoted to a fixed support having abutment-pieces corresponding with the shaft projections, but normally out of position for engagement therewith; a movable frame common to all said abutment-pieces and adapted to be displaced thereby; and detent mechanisms associated with said movable frame and adapted to lock the type-wheel in predetermined positions and to release the motor.

38. In a type-writing machine, the combination with a supporting-bed for the paper; a type-wheel movable toward and from said bed; and a normally-restrained motor operatively connected with said type-wheel to move the same toward the bed: of a shaft operatively connected with the type-wheel to rotate the same, and having a plurality of projections; key-operated means for rotating said shaft; a series of key-controlled abutments corresponding with the shaft projections, but normally out of the paths of movement of the same; a toothed wheel affixed to the shaft; a movable locking-dog normally out of engagement with said wheel; connections between the series of abutments and the said dog to move the same into engagement with the toothed wheel; detent mechanism associated with the abutments and adapted to release the motor; and means associated with said motor and operating to disengage the dog from the toothed wheel; and a spring-actuated escapement-wheel and escapement controlling the movement of the shaft.

39. In a type-writing machine, the combination with a supporting-bed for the paper; a type-wheel movable toward and from said bed; and a normally-restrained motor operatively connected with said type-wheel to move the same toward the bed: of a shaft operatively connected with the type-wheel to rotate the same, and having a plurality of projections; key-operated means for rotating said shaft; a series of key-supported arms pivoted to a fixed support having abutment-pieces corresponding with the shaft projections, but normally out of position for engagement therewith; a movable frame common to all said abutment-pieces and adapted to be displaced thereby; and detent mechanisms associated with said movable frame and adapted to lock the type-wheel in predetermined positions and to release the motor; and a spring-actuated escapement-wheel and escapement controlling the movement of the shaft.

40. In a type-writing machine, the combination with a supporting-bed for the paper; a type-wheel movable toward and from said bed; and a normally-restrained motor operatively connected with said type-wheel to move the same toward the bed: of a shaft operatively connected with the type-wheel to rotate the same, and having a plurality of projections; key-operated means for rotating said shaft; a series of key-controlled abutments corresponding with the shaft projections, but normally out of the paths of movement of the same; a toothed wheel affixed to the shaft; a movable locking-dog normally out of engagement with said wheel; connections between the series of abutments and the said dog to move the same into engagement with the toothed wheel; detent mechanism associated with the abutments and adapted to release the motor; and means associated with said motor and operating to disengage the dog from the toothed wheel; and a spring-actuated escapement-wheel and escapement controlling the movement of the shaft; and a detent controlling the escapement-wheel and arranged to be displaced by the coaction of the projections and abutments.

41. In a type-writing machine, the combination with a supporting-bed for the paper; a type-wheel movable toward and from said bed; and a normally-restrained motor operatively connected with said type-wheel to move the same toward the bed: of a shaft operatively connected with the type-wheel to rotate the same, and having a plurality of projections; key-operated means for rotating said shaft; a series of key-supported arms pivoted to a fixed support having abutment-pieces corresponding with the shaft projections, but normally out of position for engagement therewith; a movable frame common to all said abutment-pieces and adapted to be displaced thereby; and detent mechanisms associated with said movable frame and adapted to lock the type-wheel in predetermined positions and to release the motor; and a spring-actuated escapement-wheel and escapement controlling the movement of the shaft; and a detent controlling the escapement-wheel and arranged to be displaced by the coaction of the projections and abutments.

42. In a type-writing machine, the combination with a supporting-bed for the paper; a type-wheel movable toward and from said bed; and a normally-restrained motor operatively connected with said type-wheel to move the same toward the bed: of a shaft operatively connected with the type-wheel to rotate the same, and having a plurality of projections; key-operated means for rotating said shaft; a series of key-controlled abutments corresponding with the shaft projections, but normally out of the paths of movement of the same; a toothed wheel affixed to the shaft; a movable locking-dog normally out of engagement with said wheel; connections between the series of abutments and the said dog to move the same into engagement with the toothed wheel; detent mechanism associated with the abutments and adapted to release the motor; and means associated with said motor and operating to disengage the dog from the toothed wheel; and a spring-actuated escapement-wheel and escapement controlling the movement of the shaft; and a detent controlling the escapement-wheel and arranged to be displaced by the coaction of the projections and abutments; and a spring-actuated escapement-wheel and escapement controlling the movement of the shaft.

43. In a type-writing machine, the combination with a supporting-bed for the paper; a type-wheel movable toward and from said bed; and a normally-restrained motor operatively connected with said type-wheel to move the same toward the bed: of a shaft operatively connected with the type-wheel to rotate the same, and having a plurality of projections; key-operated means for rotating said shaft; a series of key-supported arms pivoted to a fixed support having abutment-pieces corresponding with the shaft projections, but normally out of position for engagement therewith; a movable frame common to all said abutment-pieces and adapted to be displaced thereby; and detent mechanisms associated with said movable frame and adapted to lock the type-wheel in predetermined positions and to release the motor; and a spring-actuated escapement-wheel and escapement controlling the movement of the shaft; and a detent controlling the escapement-wheel and arranged to be displaced by the coaction of the projections and abutments; and a spring-actuated escapement-wheel and escapement controlling the movement of the shaft; and a detent controlling the escapement-wheel and arranged to be displaced by the coaction of the projections and abutments.

44. In a type-writing machine, the combination with a supporting-bed for the paper; a type-wheel movable toward and from said bed; and a normally-restrained motor operatively connected with said type-wheel to move the same toward the bed: of a shaft operatively connected with the type-wheel to rotate the same, and having a plurality of projections; key-operated means for rotating said shaft; a series of key-controlled abutments corresponding with the shaft projections, but normally out of the paths of movement of the same; a toothed wheel affixed to the shaft; a movable locking-dog normally out of engagement with said wheel; connections between the series of abutments and the said dog to move the same into engagement with the toothed wheel; detent mechanism associated with the abutments and adapted to release the motor; and means associated with said motor and operating to disengage the dog from the toothed wheel; and a spring-actuated escapement-wheel and escapement controlling the movement of the shaft; and a detent controlling the escapement-wheel and arranged to be displaced by the coaction of the projections and abutments; and a spring-actuated escapement-wheel and escapement controlling the movement of the shaft; and a detent controlling the escapement-wheel and arranged to be displaced by the coaction of the projections and abutments.

45. In a type-writing machine, the combination with a supporting-bed for the paper; a type-wheel movable toward and from said bed; and a normally-restrained motor operatively connected with said type-wheel to move the same toward the bed: of a shaft operatively connected with the type-wheel to rotate the same, and having a plurality of projections; key-operated means for rotating said shaft; a series of key-supported arms pivoted to a fixed support having abutment-pieces corresponding with the shaft projections, but normally out of position for engagement therewith; a movable frame common to all said abutment-pieces and adapted to be displaced thereby; and detent mechanisms associated with said movable frame and adapted to lock the type-wheel in predetermined positions and to release the motor; and a spring-actuated escapement-wheel and escapement controlling the movement of the shaft; and a detent controlling the escapement-wheel and arranged to be displaced by the coaction of the projections and abutments; and a spring-actuated escapement-wheel and escapement controlling the movement of the shaft; and a detent controlling the escapement-wheel and arranged to be displaced by the coaction of the projections and abutments.

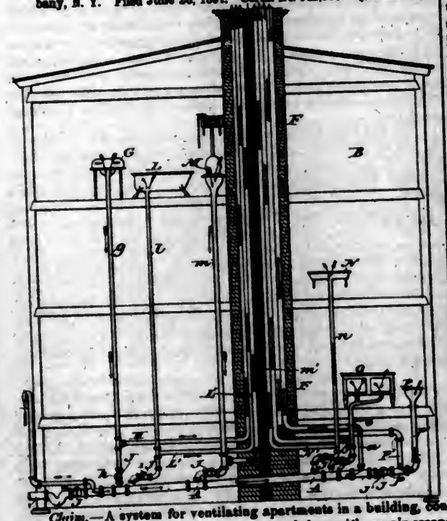
46. In a type-writing machine, the combination with a supporting-bed for the paper; a type-wheel movable toward and from said bed; and a normally-restrained motor operatively connected with said type-wheel to move the same toward the bed: of a shaft operatively connected with the type-wheel to rotate the same, and having a plurality of projections; key-operated means for rotating said shaft; a series of key-controlled abutments corresponding with the shaft projections, but normally out of the paths of movement of the same; a toothed wheel affixed to the shaft; a movable locking-dog normally out of engagement with said wheel; connections between the series of abutments and the said dog to move the same into engagement with the toothed wheel; detent mechanism associated with the abutments and adapted to release the motor; and means associated with said motor and operating to disengage the dog from the toothed wheel; and a spring-actuated escapement-wheel and escapement controlling the movement of the shaft; and a detent controlling the escapement-wheel and arranged to be displaced by the coaction of the projections and abutments; and a spring-actuated escapement-wheel and escapement controlling the movement of the shaft; and a detent controlling the escapement-wheel and arranged to be displaced by the coaction of the projections and abutments.

47. In a type-writing machine, the combination with a supporting-bed for the paper; a type-wheel movable toward and from said bed; and a normally-restrained motor operatively connected with said type-wheel to move the same toward the bed: of a shaft operatively connected with the type-wheel to rotate the same, and having a plurality of projections; key-operated means for rotating said shaft; a series of key-supported arms pivoted to a fixed support having abutment-pieces corresponding with the shaft projections, but normally out of position for engagement therewith; a movable frame common to all said abutment-pieces and adapted to be displaced thereby; and detent mechanisms associated with said movable frame and adapted to lock the type-wheel in predetermined positions and to release the motor; and a spring-actuated escapement-wheel and escapement controlling the movement of the shaft; and a detent controlling the escapement-wheel and arranged to be displaced by the coaction of the projections and abutments; and a spring-actuated escapement-wheel and escapement controlling the movement of the shaft; and a detent controlling the escapement-wheel and arranged to be displaced by the coaction of the projections and abutments.

48. In a type-writing machine, the combination with a supporting-bed for the paper; a type-wheel movable toward and from said bed; and a normally-restrained motor operatively connected with said type-wheel to move the same toward the bed: of a shaft operatively connected with the type-wheel to rotate the same, and having a plurality of projections; key-operated means for rotating said shaft; a series of key-controlled abutments corresponding with the shaft projections, but normally out of the paths of movement of the same; a toothed wheel affixed to the shaft; a movable locking-dog normally out of engagement with said wheel; connections between the series of abutments and the said dog to move the same into engagement with the toothed wheel; detent mechanism associated with the abutments and adapted to release the motor; and means associated with said motor and operating to disengage the dog from the toothed wheel; and a spring-actuated escapement-wheel and escapement controlling the movement of the shaft; and a detent controlling the escapement-wheel and arranged to be displaced by the coaction of the projections and abutments; and a spring-actuated escapement-wheel and escapement controlling the movement of the shaft; and a detent controlling the escapement-wheel and arranged to be displaced by the coaction of the projections and abutments.

wheel; connections between the series of abutments and said angular lever for moving the dog into engagement with the toothed wheel; detent mechanism associated with the abutments and operating to release the motor; and a wheel associated with the latter and having inclines to act on an arm of the angular lever and disengage the dog from the toothed wheel.

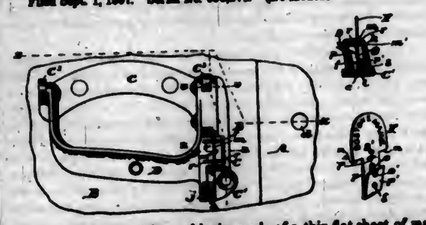
38. In a type-writing machine, the combination of a bed for the paper; a type-wheel movable toward and from said bed; key-operated means for impelling said type-wheel through a complete revolution; key-controlled mechanism for establishing predetermined positions of said wheel in the course of each revolution; a spring-motor operatively connected with the movable supports of said wheel; and a key-controlled escapement for said motor.



39. In a type-writing machine, the combination of a bed for the paper; a type-wheel movable toward and from said bed; key-operated means for rotating said type-wheel through a complete revolution; key-controlled mechanism for establishing predetermined positions of said wheel in the course of such revolution; a lever engaged with the movable supports of the type-wheel; a spring-motor having a cam-wheel to actuate said lever; and a key-controlled escapement for said motor.

40. In a type-writing machine, the combination of a bed for the paper; a type-wheel movable toward and from said bed; key-operated means for rotating said type-wheel through a complete revolution; key-controlled mechanism for establishing predetermined positions of said wheel in the course of such revolution; said mechanism including a movable frame; a detent-lever engaged with said frame; an escapement-lever restrained by said detent-lever; and a spring-motor operatively connected with the movable supports of the type-wheel and normally restrained by said escapement-lever.

41. In a type-writing machine, the combination of a carriage having a bed for the paper, and a rack; a toothed wheel engaging said rack; a pawl for engaging said wheel, but normally removed therefrom; a normally-restrained spring-motor; connections between the same and said toothed wheel to wind its spring by reverse movement of the paper-carriage; a type-wheel in supports movable toward and from the paper-bed; suitable connections between said motor and the type-wheel supports, and between the motor and the said pawl; means for engaging the latter with the toothed wheel upon operation of the motor; key-actuated means for rotating the type-wheel; and key-controlled means for establishing predetermined positions of said type-wheel; and for releasing the motor.



42. In a type-writing machine, the combination of a suitable bed for the paper; a type-wheel on a journal movable toward and from the said bed; a normally-restrained motor operatively connected with said type-wheel journal; a shaft in fixed bearings and connected with the latter by a universal joint; key-actuated means for rotating said shaft; and key-controlled detent mechanism for establishing predetermined positions of the type-wheel and for releasing the motor.

606,417. HOUSE-VENTILATING SYSTEM. THOMAS HYDE, Albany, N. Y. Filed June 26, 1897. Serial No. 642,266. (No model.)

Claim.—A system for ventilating apartments in a building, consisting of a drain, a fresh-air inlet connected therewith, an air-escape pipe connected with said drain, a chimney through which said air-escape pipe extends, the discharge-pipes from the plumbing-fixtures in said building connected with said drain, pipes located in said chimney connecting respectively with said discharge-pipes, in each of said discharge-pipes, between the drain and the pipes connected with said discharge-pipes extending into said flue, a means for preventing passage of air or gas from the drain through the discharge-pipes, substantially as described.

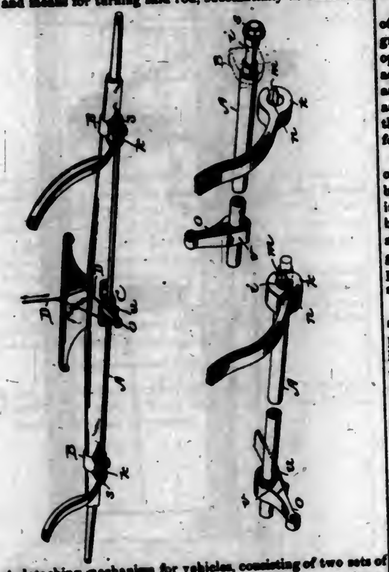
606,418. SEAL-LOCK. MORRIS H. KAHALY, Somerville, Mass. Filed Sept. 1, 1897. Serial No. 650,271. (No model.)

Claim.—1. A seal for seal-locks made of a thin flat sheet of material comprising a shank-section, the end portion of which is folded upon its main body into a position slightly diverging therefrom and having a notch or open slot formed in the end of said folded-over portion, and a slot cut through the main body of said shank with its lower end coinciding with the lower end of the notch in the folded-over portion; a head-section having shoulders to limit the inward movement of said seal; and a portion of said shank near the level of said shoulders partially severed from the main body of said shank and bent outward into an inclined position upon the side of said shank opposite to the folded-over section at its lower end.

2. A seal for seal-locks comprising a shank-section the end portion of which is folded upon the main body but slightly diverging therefrom, and having a notch or open slot formed in the upper end of said folded-over portion, and a slot cut through the main body of said shank with its lower end coinciding with the lower end of the notch in said folded-over portion; a head-section having shoulders to limit the depth to which said seal may be inserted into the chambered handle; an outwardly-projecting boss or lug on the folded-over portion of the shank; and a corresponding boss upon the head-section just above the level of its shoulders, as and for the purposes described.

3. In a seal-lock the combination of the plate C C′ provided with the tubular hub C² having the shoulder *b* in the outer end of its bore; the handle D pivoted to said plate; and the bolt E provided with the shoulder *c* to engage the shoulder *b* and pivoted to said handle by a pin fixed in said handle.

4. In a seal-lock the combination of the plate C C′ provided with the rectangular opening *e* and having the single ear *f* at one side of said opening; the tooth *g* projecting from said ear over said opening; the handle D provided on its inner face with the chamber *k*, the slot *m*, and the inclined surfaces *l*, *l*, within said chamber; and a seal having a head portion provided with the shoulders *n*, *n*, the shank portions *p*, and *p′* the latter folded upon the former and provided with the notch *o′* and the former provided with slot *o*, all constructed arranged and operating substantially as described.

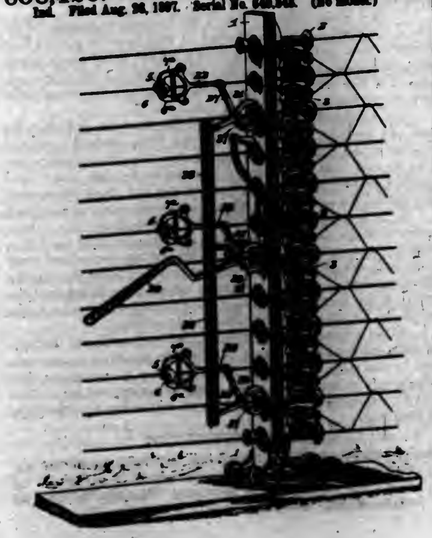


5. In a seal-lock the combination of the plate C C′ provided with the ear *f* having the tooth *g* projecting laterally therefrom; the handle D provided with the chamber *k* having the curved surfaces *l l* therein, and with the slot *m* having the enlargement *m′* on one side thereof; and a seal having a head-section provided with the shoulders *n*, *n*; and a shank composed of the parts *p* and *p′* provided respectively with the slot *o* and notch *o′*; and the hemispherical bosses *o* and *d* projecting from the shank portion *p′* and the head of the seal respectively.

6. In a seal-lock the combination of the plate C C′ provided with the perforated hub C³; the bolt E; the handle D pivoted to said plate and bolt by pins set in fixed positions in holes in said handle that extend only part way through said handle in such a manner that said pins cannot be driven out of, or withdrawn from, said handle.

7. In a seal-lock the combination of the plate C C′ having the outwardly-projecting ear *f* and the tooth *g*; the handle D provided with the chamber *k*, the inclined surfaces *l*, *l*, within said chamber and the seal-receiving slot *m*; and the ribs *r*, *r*, projecting outward from the outer face of said handle on opposite sides of said slot *m* and having their contiguous ends beveled as shown.

606,419. HORSE-DETACHER. CHARLES F. KIMBALL, Washington, D. C. Filed Jan. 13, 1896. Serial No. 575,577. (No model.)



Claim.—1. A detaching mechanism for vehicles, consisting of coupling parts, one on the front axle and one on the shaft or tongue—one part being slotted, combined with a release-rod having a thin part, or section, fitted to the slot, said rod being located in the unslotted part and adapted to receive and, when turned, hold the slotted part; and means for turning said rod, substantially as described.

2. A detaching mechanism for vehicles, consisting of two sets of coupling parts, one set on the front axle and one on the shafts or tongue—one of which sets is slotted, combined with a rod the ends of which are supported in the unslotted set of coupling parts, and which rod has thin parts, or sections, adapted to enter the said slots and, when turned, to hold the slotted parts, substantially as described.

3. In combination with the front axle of a vehicle, a rod supported in brackets on said axle and having thin parts, or sections; coupling parts, as *b*, on the tongue or shafts slotted to pass over said thin parts, or sections, and to be held by said sections when turned, substantially as described.

606,420. FENCE-MACHINE. ALVA L. KIMMELMAN, Ridgeville, Ind. Filed Aug. 26, 1897. Serial No. 649,843. (No model.)

Claim.—1. The combination with supporting-brackets, of a propelling-lever fulcrumed on one of the brackets, grippers arranged to engage with line-wires of a fence, and intermediate connections between said grippers and the lever arranged to open, advance, and close the grippers, for the purposes described substantially as set forth.

2. The combination with a single controlling or propelling lever, of a series of grippers each having movable members arranged to grip a line-wire, a series of devices connected with said grippers to open and close the same, and operating connections between said actuator devices arranged to impel the said actuating devices to open and advance the grippers when the lever is moved in one direction and to close the grippers upon line-wires when the lever is moved in the other direction, for the purposes described, substantially as set forth.

3. The combination with a single controlling or propelling lever, of a series of sectional grippers each constructed to open and close by a cam movement, a series of slidable actuator devices each having a cam connection with said grippers to open or close the members of the gripper, and intermediate connections between the slidable actuator devices and the lever to advance the latter and the grippers and cause said actuator devices to open and close the grippers automatically as the lever is moved, as and for the purposes described.

4. The combination with a single controlling-lever, of a series of sectional grippers, slidable actuator devices connected with said grippers to open and close the same, operative connections between the lever and said slidable devices, and means for varying the stroke of the lever and for regulating the advancement of the actuator devices and the grippers, as and for the purposes described.

5. The combination of a series of sectional grippers each having its members provided with oppositely-inclined slots, a series of actuator devices connected with the slotted ends of the sectional grippers, a lever, and intermediate connections between the actuator devices and the lever, as and for the purposes described.

6. The combination with a series of grippers, of slidable actuator-links connected thereto, bell-cranks attached to said actuator-links, a lever, and a rod connected with the lever and with the bell-cranks, for the purposes described, substantially as set forth.

7. The combination with a series of fixed brackets, one of which carries an adjustable stop-bolt, a lever fulcrumed to said bracket with the stop-bolt, a series of grippers, slidable actuator links attached to the grippers, bell-cranks attached to the actuator-links, and a rod or bar pivoted to the lever and the bell cranks, as and for the purposes described.

8. A gripper for wire-fence machines comprising two members constructed for the passage of a fence-wire and pivoted together at a point intermediate of the length thereof, each gripper member provided, on opposite sides of the pivotal connection, with a pair of gripping-faces arranged to coact with similarly-disposed gripping-faces on the other member and a spring operatively connected with said members to normally draw the coacting gripper-faces thereof toward each other, whereby the members may be closed upon a wire to firmly grip the latter at points in opposite sides of the pivotal movement of said members, substantially as described.

9. A gripper for a wire-fence machine constructed in laterally-separable sections for the passage of a fence-wire and pivotally connected together at a point intermediate of their length, each gripper member provided with a pair of gripper-surfaces disposed on opposite sides of the gripper-pivot and coacting with similar faces on the other member, substantially as described.

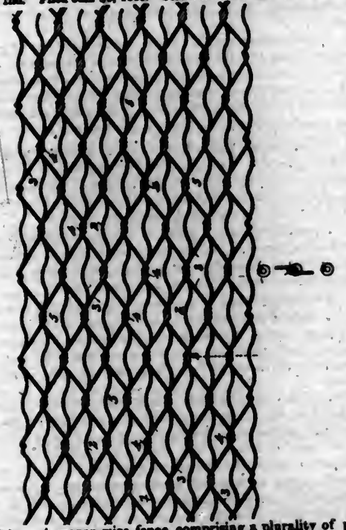
10. A gripper for a wire-fence machine comprising a member having a pair of gripper-faces and a pintle slotted for the passage of a fence-wire, and another member mounted on said pintle and having gripper-faces that coact with the corresponding faces of the first-named member, substantially as described.

11. A gripper for a wire-fence machine comprising a member having a transversely-slotted pintle and the gripping-faces disposed on opposite sides of lines drawn longitudinally and transversely through the pintle, and another member loosely fitted to said pintle and having gripper-faces arranged to coact with the similar faces of the first-named member, substantially as described.

12. A gripper for a wire-fence machine, comprising a member 6 flanged to provide the gripper-faces 12 and 13 and having a slotted pintle, another gripper member perforated to fit loosely on the pintle and having the gripper-faces 17ª and 18, to coact with the faces of the first-named member, and means for confining the gripper members against lateral displacement, substantially as described.

13. A gripper for wire-fence machines comprising laterally-separable members having their coacting gripper-faces arranged for the passage of a fence-wire and united pivotally together by a transversely-slotted pintle, and the extended arms carried by the gripper members, for the purposes described, substantially as set forth.

14. In a wire-fence machine, the combination with a twister-car-



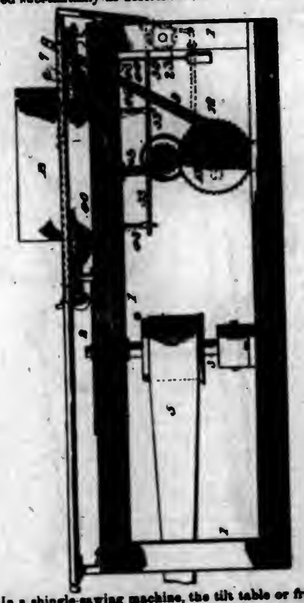
rying frame, of a series of grippers, an operating-lever fulcrumed on the frame, and links connected with the frame, the grippers and the lever for forming a positive connection from the grippers to the frame and lever; said links and lever serving to open and advance the grippers, positively close the same upon the wires, and advance or feed the machine, substantially as described.

15. In a wire-fence machine, a two-part gripper having its members pivoted together, and an operating-link having a cam-slotted connection with both gripper members, substantially as described.

16. In a wire-fence machine, a two-part gripper having its pivoted members provided with inclined slotted arms, a link slidably fitted to said slotted gripper-arms, and a spring which normally closes the gripper members, substantially as described.

17. In a wire-fence machine, the combination with a frame carrying wire-twisters, of a lever, a series of grippers, and devices connecting said lever and grippers with said frame, whereby the lever closes the grippers upon the fence-wires and feeds or moves the twister-carrying frame along the fence-wires, substantially as set forth.

606,421. WOVEN-WIRE FENCING. ALVA L. KITSELMAN, Ridgeville, Ind. Filed Jan. 26, 1898. Serial No. 668,045. (No model.)



Claim.—A woven-wire fence comprising a plurality of parallel warp-wires extending longitudinally of the fence and regularly coiled throughout their entire length, and weft-wires twisted together at their points of intersection to produce diamond-shaped meshes having their greatest width disposed lengthwise of the fence, the twisted portions of the intersecting weft-wires being closely wrapped about a coil of said warp-wires, which latter bisect the diamond-shaped meshes and contract and expand therewith without becoming loose at their points of connection with the weft-wires, substantially as set forth.

606,422. SHINGLE-SAWING MACHINE. EDWARD H. KRUGER, Elizabeth City, N. C. Filed Dec. 27, 1897. Serial No. 663,618. (No model.)

Claim.—1. In a shingle-sawing machine, a horizontal saw, a traveling carriage moving in horizontal ways toward and from the saw, means for grasping a block in said carriage at the ends and in the line of movement of the carriage toward and away from said saw, and a tilt-table having a block-supporting surface constructed to yield independently of the tilting movement, all combined substantially as described.

2. In a shingle-sawing machine, a horizontal saw, a reciprocating block-carriage having holding-dogs at the end of the carriage toward the center of the saw and at the opposite end thereof, and a tilting table under such carriage, having a block-support pivoted thereto, and in position to swing toward the saw to permit the passage of a shingle projecting below the normal plane of the block-support, all combined substantially as described.

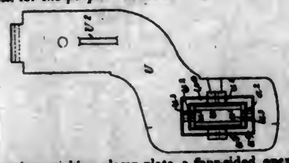
3. In a shingle-sawing machine, a horizontal saw, a horizontally-reciprocating block-carriage and means for holding the shingle bolt or block therein, a tilt-table under the retracted position of said carriage, and a block-support carried by links pivotally connected to the tilt-table, and movable out of perpendicular position, to permit a depression of the block-support independently of the tilting movement, all combined substantially as described.

4. In a shingle-sawing machine, the tilt table or frame, a block-support connected to said table by pivoted links which may swing under the forward movement of the block to depress such support, and means for restoring the block-support to normal position, all combined.

5. In a shingle-sawing machine, the tilt frame or table, the block-supports connected to said frame so as to swing toward the saw independently of the tilting movement of the frame, and a weight and connections acting to restore said block-supports to normal position, all combined substantially as described.

6. In a shingle-sawing machine, the pivoted tilt-frame, the links pivotally connected thereto in position to swing out of the perpendicular, toward the saw, to depress the block-supports carried by said links, and a stop serving to limit the swing of the links, all combined substantially as described.

7. In a shingle-sawing machine, the tilt-frame and means for tilting it, the block-supports connected to said frame by pivoted links constructed to yield by swinging toward the saw to depress the block-supports independently of the tilting movement, a draw-weight connected to said links, and an adjustable stop to limit the movement of the draw-weight, all combined.

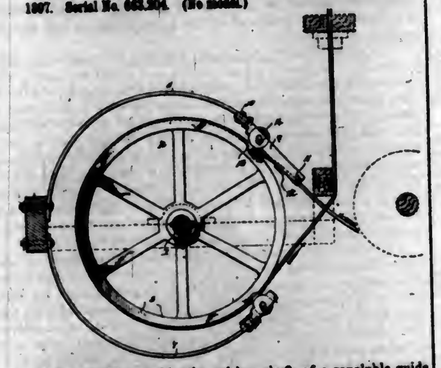


8. In a shingle-sawing machine of the character described, the saw and carriage, the tilt frame having links pivotally connected thereto in position to swing toward the saw, the block-supports carried by said links and depressed by swinging the links to a normal position slightly inclined away from the saw, and means for supporting the links in such position, all combined substantially as described.

9. In a shingle-sawing machine, the horizontal saw, the reciprocating carriage, the tilt-table having its vertically rising and falling ends in the direction of movement of the carriage toward and away from said saw, swinging links connected to said table, (bearing the block-supports) in position to yield by swinging the direction of the travel of the carriage, and means for adjusting the block-supports vertically, all combined substantially as described.

10. In a shingle-sawing machine, the horizontal saw, the horizontally reciprocating carriage, the tilt table, the block-support carried by said table and yielding under the forward movement of a shingle-butt independently of the tilting movement, and an antifriction device carried by said block-support, all combined substantially as described.

606,423. PRESSER-CLAMP FOR BUTTONHOLE-SEWING MACHINES. JOHN LAIRD, Belfast, Ireland, assignor of two-thirds to the Hope Street Factory, Limited, same place. Filed Sept. 20, 1897. Serial No. 607,234. (No model.)



Claim.—1. A sewing-machine clamp-plate, a frame journaled in an opening thereof and having a limited movement on its journals, and a clamping-foot journaled in said frame and having its journals in the same horizontal plane but at right angles to the frame-journals, said clamping-foot having likewise a limited movement on its said journals, for the purpose set forth.

2. A sewing-machine clamp-plate, a four-sided open frame pivoted at opposite ends in an opening thereof and a four-sided clamping frame or foot pivoted at two opposite sides in the opening of the first-mentioned frame at right angles to its pivots, all the pivot-centers being in the same horizontal plane and both frames having limited movement, for the purpose set forth.

3. A sewing-machine clamp-plate, a frame pivoted in an opening thereof and projecting slightly below said plate and a clamping-frame pivoted at right angles to, and within the first-mentioned frame and projecting slightly below said frame, all the pivots being in the same plane and the frames having limited motion.

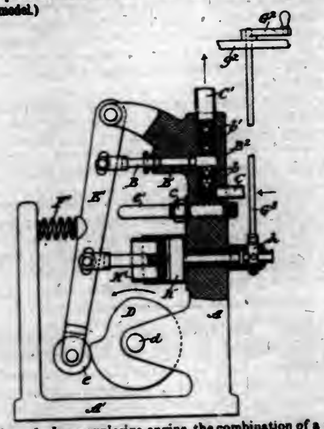
606,424. TENSION AND FEED MECHANISM FOR WIRE-FABRIC MACHINES. GEORGE R. LANE, Hudson, Mich. Filed Dec. 22, 1897. Serial No. 663,204. (No model.)

Claim.—1. The combination with a shaft, of a revoluble guide having a series of ways or channels for the direction of wires or strands, and tension devices adjacent to said ways or channels and on opposite sides of the line of feed of said wires or strands to said revoluble guide, whereby the tension devices engage the ingoing and outgoing lengths of the strands and maintain the same in intimate contact with the revoluble guide, as set forth.

2. The combination of a revoluble guide having a plurality of grooves or channels, and tension devices arranged to direct the wires or strands into intimate engagement with the grooved or channeled surfaces of the revoluble guide, substantially as described.

3. The combination of a revoluble guide having its working surface provided with a plurality of spaced circumferential grooves or channels, and two series of cushioned guide-rollers situated in close relation to the grooved or channeled face of said revoluble guide, substantially as and for the purposes described.

4. A tension and feed mechanism for fabric-forming machines, consisting of a revoluble guide having its working surface provided with a plurality of channels or grooves, an upper spring-hanger adjacent to each groove or channel in said guide, a lower spring-hanger also adjacent to each groove or channel in the guide, and independent rollers carried by said upper and lower hangers and sustained thereby in close relation to each channel or groove in the revoluble guide, substantially as and for the purposes described.



5. The combination of a revoluble guide having a grooved or channeled working face, curved spring-hangers arranged above and below the revoluble guide and having their free ends terminating adjacent to the revoluble guide at one side of the vertical axis thereof, and guide devices carried by said spring-hangers in close relation to the working face of the revoluble guide, substantially as and for the purposes described.

6. The combination of a revoluble guide having a channeled or grooved working face, an upper hanger adjacent to each channel or groove in said revoluble guide, a guide-block attached to the free end of each upper hanger and provided with a stud and bar arranged in different horizontal and vertical planes, a roller journaled in the guide-block adjacent to the groove or channel in the revoluble guide, a lower series of spring-hangers provided at their free ends with blocks or carriers, and rollers journaled in said blocks or carriers of the lower hangers, substantially as and for the purposes described.

7. A tension and feed device for fabric-making machines consisting of a shaft, a series of grooved disks or pulleys clamped to the shaft at proper intervals from each other, a series of upper spring-hangers arranged over the series of disks or pulleys and carrying rollers in close relation to the peripheral faces of said disks or pulleys, and a lower series of spring-hangers also provided with rollers adjacent to the grooved faces of said disks or pulleys, substantially as and for the purposes described.

8. A tension and feed mechanism for wire-fabric machines, comprising a shaft, a revoluble guide carried by said shaft and adapted to receive a series of strands or wires, and two sets of tension devices situated in different horizontal planes, on one side of the vertical axis of said revoluble guide, and adjacent to the working surface thereof, for the purpose described, substantially as set forth.

606,425. GOVERNOR FOR EXPLOSIVE-ENGINES. HIRAM P. MAXIM, Hartford, Conn., assignor to the Pope Manufacturing Company, same place and Portland, Me. Filed Feb. 27, 1897. Serial No. 626,315. (No model.)

Claim.—1. In an explosive-engine, the combination of a working cylinder, piston and moving parts operated thereby, a pump to deliver fluid to said cylinder, an actuator operated with the engine with a definite stroke and moving the plunger of the pump in one direction, independent means to return the plunger of the pump in the opposite direction and other devices to retard the return movement of the plunger, whereby the extent of return of the plunger is automatically varied.

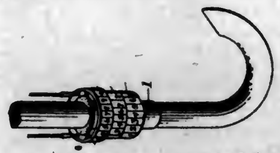
2. In an explosive-engine, the combination of a working cylinder, a piston and moving parts operated thereby, a pump to deliver fluid to said cylinder, an actuator operated with the engine with a definite stroke and moving the plunger of the pump in one direction, a spring to return the plunger of the pump in the opposite direction and other devices to retard the return movement of the latter as the speed of the actuator is accelerated it runs ahead of the plunger and checks the return movement of the latter.

3. In an explosive-engine, the combination of a working cylinder, a piston and moving parts operated thereby, a pump to deliver fluid to said cylinder, a cam having a relatively quick drop, operated with the engine with a definite stroke and moving the plunger of the pump in one direction means to return the plunger of the pump in the opposite direction, and other devices to retard the return movement, whereby as the speed of the cam is accelerated, it runs ahead of the plunger and checks the return movement of the latter.

4. In an explosive-engine, the combination of a working cylinder, a piston and moving parts operated thereby, a pump to deliver fluid to said cylinder, a cam having a relatively quick drop rotated with the engine and moving the plunger of the pump in the opposite direction, a spring to return the plunger of the pump in the opposite direction, and other devices to retard the return movement, whereby as the speed of the cam is accelerated, it runs ahead of the plunger and checks the return movement of the latter.

5. A feeding and governing mechanism for explosive-engines, &c., comprising a pump, an actuator operated with the engine with a definite stroke and moving the plunger of the pump in one direction, independent means to return the plunger of the pump in the opposite direction, and a dash-pot in operative relation with said plunger to retard its return movement whereby as the speed of the actuator is accelerated, it runs ahead of the plunger and checks the return movement of the latter.

6. In an explosive-engine, the combination of a working cylinder, piston and moving parts operated thereby, a pump to deliver fluid to said cylinder, an actuator operated with the engine with a definite stroke, a lever connected to the plunger of the pump and operated by said actuator in one direction, and other devices to retard the return movement of the lever and the plunger, whereby as the speed of the actuator is accelerated, it runs ahead of the plunger and checks the return movement of the latter.



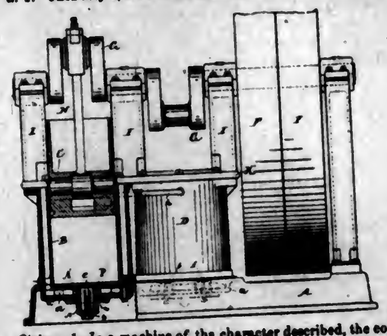
7. In an explosive-engine, the combination of a working cylinder, a piston and moving parts operated thereby, a pump to deliver fluid to said cylinder, an actuator operated with the engine with a definite stroke, a lever connected to the plunger of the pump and operated by said actuator in one direction, and a dash-pot to retard the return movement of the lever and the plunger, whereby as the speed of the actuator is accelerated, it runs ahead of the plunger and checks the return movement of the latter.

8. In an explosive-engine, the combination of a working cylinder, piston and moving parts operated thereby, a pump to deliver fluid to said cylinder, a cam having a relatively quick drop operated with the engine with a definite stroke, a lever connected to the plunger of the pump and normally bearing against said cam to be actuated thereby in one direction, and other means to retard the return movement of the lever and the plunger, whereby as the speed of the cam is accelerated, it runs ahead of the plunger and checks the return movement of the latter.

9. A feeding and governing mechanism for explosive-engines, &c., comprising a pump, a cam actuated with the engine with a definite stroke, a lever connected to the plunger of the pump and normally bearing against said cam to be actuated thereby in one direction, and a dash-pot to retard the return movement of the lever and the plunger.

10. A feeding and governing mechanism for explosive-engines, &c., comprising a pump, an actuator operated with the engine with a definite stroke and moving the plunger of the pump in one direction, independent means to return the plunger of the pump in the opposite direction, a dash-pot in operative relation with said plunger, and means to vary the action of the dash-pot.

606,426. COMBINATION-LOCK FOR UMBRELLA-TIPS. CHAS. MCCURDY, Richmond, Va. Filed June 8, 1897. Serial No. 639,896. (No model.)



Claim.—An umbrella-lock comprising a fixed sleeve provided with an annular groove, in combination with an encompassing sleeve formed with a corresponding groove and having a longitudinal movement thereon, one or more rings rotatably mounted on said encompassing sleeve, and means substantially as described for locking or releasing said encompassing sleeve on the fixed sleeve, substantially as shown and described.

606,427. SAFETY-PIN. MINNIE REISS, Philadelphia, Pa. Filed Oct. 8, 1897. Serial No. 654,534. (No model.)

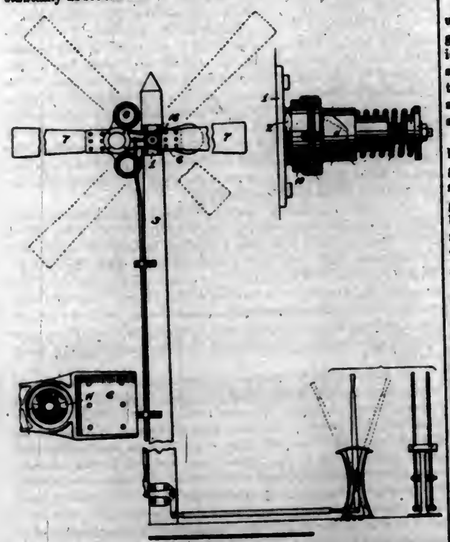
Claim.—A safety-pin consisting of a single piece of wire doubled on itself and then bent to produce a T-shaped figure having the shanks B and hooked arms A, A, the ends C, C, of the wire being bent parallel with the shanks to engage the hooks, said shanks being bent down just before their junction with the arms A, A, and the ends C, C, whereby said ends are in a plane below that of the shanks, and in combination a T-shaped plate having the arms A', A', and the shank E, said arms being bent around the arms A, A, and the shank E around the shanks B, substantially as shown and described.

606,428. AIR-COMPRESSOR. FRANK RICHARDS, New York, N. Y. Filed July 3, 1896. Serial No. 597,995. (No model.)

Claim.—1. In a machine of the character described, the combination with a plurality of upright cylinders, surrounding water-jackets, pistons in the cylinders, and means for moving them; of a base having an open bottom and comprising a flat top plate and a second plate below the top plate so as to leave water-chambers between the plates, connections between the chambers and jackets for the purpose set forth, upright tubes each integral with the plates and communicating with the bottom of the base and the interior of a cylinder, a valve-casing and air-valve removably inserted in each tube from below, connections between the casings of all the inlet-valves, and connections between the casings of all the outlet-valves, as and for the purpose set forth.

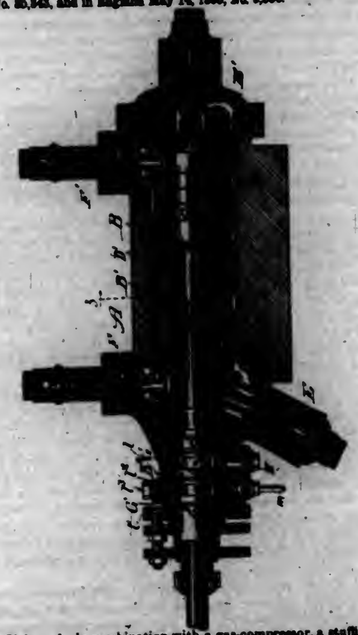
2. In a machine of the character described, the combination with a plurality of cylinders, pistons therein, and means for driving the latter; of a base having an open bottom and comprising a flat top plate and a second plate spaced below the top plate so as to leave a chamber between the plates, two sets of upright tubes for each cylinder integral with both plates and opening through them, a valve-casing consisting of a short pipe fitting each tube and having lateral ears between its ends bolted to the bottom plate, the upper end of this pipe having a valve-seat while the other end is threaded, a valve therein, a guide for the valve-stem having a head engaging said threads, and a pipe connecting the casings of the outlet-valves at points below their ears, as and for the purpose set forth.

3. In an air-compressor, the combination with a plurality of upright cylinders having surrounding water-jackets open at their lower ends, pistons in the cylinders, means for moving them, and a top plate closing the upper ends of the jackets; of a base comprising a flat top plate having ports communicating with said jackets and a bottom plate spaced therefrom so as to leave a water-chamber below each cylinder, communications between these chambers, upright tubes integral with both plates and opening through them from within the cylinders to the space beneath the bottom plate, air-outlet-valve casings consisting of short pipes removably inserted for part of their length in said tubes, a valve-seat and valve in each casing, and a pipe connecting the protruding portions of the casing-pipes and leading to a suitable air-receiver, as and for the purpose set forth.



606,429. SIGNAL. JESS G. SCHRUDER, Edgewood Park, Pa., assignor to the Union Switch and Signal Company, Swissvale, Pa. Filed Feb. 21, 1898. Serial No. 671,105. (No model.)

Claim.—1. The combination of a semaphore-signal, mechanism for shifting the signal to clear and caution positions and a mechanism operative on the signal at one side of its pivotal support for automatically shifting the signal from both clear and caution positions to normal position, substantially as set forth.



2. The combination of a semaphore-signal, mechanism for shifting the signal to clear and caution positions and a mechanism connected to the signal on one side of its pivotal support and rendered operative by the shifting of the signal for automatically returning the signal from both clear and caution positions to normal position, substantially as set forth.

3. The combination of a semaphore-signal, mechanism for shifting the signal to clear and caution positions and a spring connected to the signal at one side of its pivotal support and adapted to be placed under tension by the movement of the signal to clear and caution positions, whereby it is rendered operative to return the signal, when free to move to normal position, substantially as set forth.

4. The combination of a semaphore-signal provided with an inclined bearing-surface at one side of its pivotal support, a non-rotatable block provided with a correspondingly-inclined bearing-surface, a spring for yieldingly holding the inclined surfaces against each other and means for shifting the signal to clear and caution positions, substantially as set forth.

606,480. GAS-COMPRESSOR. JULIUS SEBLANEK, Nuremberg, Germany. Filed Aug. 30, 1897. Serial No. 649,922. (No model.) Patented in France Dec. 21, 1896, No. 264,564; in Germany Jan. 18, 1896, No. 77,119; in Austria-Hungary Mar. 18, 1898, No. 56,187 and No. 56,911, May 4, 1898, No. 1,660 and No. 5,657, and Aug. 30, 1898, No. 10,220 and No. 13,909; in Italy Mar. 26, 1898, No. 1,194; in Switzerland July 24, 1893, No. 7,343, and June 25, 1894, No. 8,796; in Belgium Aug. 26, 1894, No. 95,943, and in England May 14, 1896, No. 9,690.

Claim.—1. In combination with a gas-compressor, a stuffing-box chamber upon the piston-rod for receiving leakage-gas from the compressor, and a regulating-valve controlling the outlet from said chamber and presenting thereto one face having a surface area smaller than that on its opposite face, substantially as and for the purpose set forth.

2. In combination with a gas-compressor, a stuffing-box chamber upon the piston-rod for receiving leakage-gas from the compressor, a gas-chamber communicating with said stuffing-box chamber and having its gas contents at a lower pressure than the pressure in said stuffing-box chamber, and a regulating-valve interposed between the two said chambers and presenting a smaller surface area to the stuffing-box chamber and a larger surface area to said gas-chamber, substantially as and for the purpose set forth.

3. In combination with a gas-compressor, a plurality of stuffing-box chambers upon the piston-rod for receiving in succession leakage-gas from the compressor, a gas-chamber communicating with the stuffing-box chamber next adjacent to the compressor and having its gas contents at a lower pressure than the pressure in said stuffing-box chamber, and a regulating-valve interposed between the last-named stuffing-box chamber and said gas-chamber and presenting to the former a smaller surface area and to the latter a larger surface area, substantially as and for the purpose set forth.

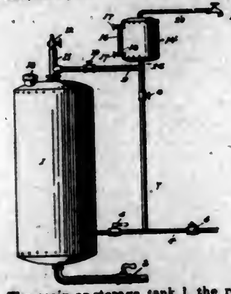
4. In combination with a gas-compressor, a plurality of stuffing-box chambers upon the piston-rod for receiving in succession leakage-gas from the compressor, a gas-chamber communicating with the first stuffing-box chamber, or that next adjacent to the compressor, and having its gas contents at a lower pressure than the pressure in said stuffing-box chamber, a regulating-valve interposed between the last-named stuffing-box chamber and said gas-chamber and presenting to the former a smaller surface area and to the latter a larger surface area, and a lubricant-supply pipe leading into the second stuffing-box chamber, substantially as and for the purpose set forth.

5. In combination with the compressor and suction-chamber of an ice or refrigerating machine, a stuffing-box chamber on the piston-rod for receiving leakage gas from the compressor and communicating with said suction-chamber and a regulating-valve interposed in the communication between said stuffing-box chamber and said suction-chamber and presenting a lesser surface area to the former and a greater surface area to the latter, substantially as and for the purpose set forth.

6. In an ice or refrigerating machine, the combination with the compressor of a suction-chamber D part way surrounding the compressor-chamber B', valves E, E' and F, F', a stuffing-box chamber G on the piston rod, a passage *n* between said chamber G and the chamber of the valve E, and a valve H interposed in said passage and presenting a smaller surface area to the stuffing-box chamber and a larger surface area to the pressure from said suction-chamber, substantially as and for the purpose set forth.

7. In an ice or refrigerating machine, the combination with the compressor of a suction-chamber D part way surrounding the compressor-chamber B', valves E, E' and F, F', stuffing-box chambers G and G' on the piston-rod, a passage *n* between said chamber G and the chamber of the valve E, a valve H interposed in said passage and presenting a smaller surface area to said stuffing-box chamber and a larger surface area to the pressure from said suction-chamber, and a lubricant-supply pipe leading into said chamber G', substantially as and for the purpose set forth.

606,481. TRUNK. PAUL H. SMITH, Columbus, Ohio. Filed Feb. 10, 1898. Serial No. 669,737. (No model.)



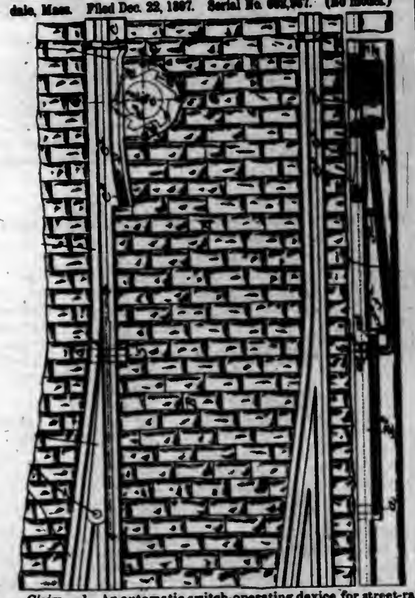
Claim.—1. A bracket-supporting tube having at its lower end a slot at one side and at the opposite side having a T-slit, the parts being bent out to form tongues or guides to prevent rotation, and just above said tongues or guides on the inside of said tube a cylindrical block with a hole through its center held in position by means of pins, substantially as described.

2. A removable tray-supporting bracket having a horizontal bar,

this bar having at one end two upright arms, at its other a depressed portion which provides a rest for a cross-arm and having on its under side a web or a strip and a socket flared at its lower end, substantially as described.

606,482. MEANS FOR RAISING OIL BY WATER-PRESSURE.

ELISHA STRETCH, East Orange, N. J., assignor of one-half to Margaret Elizabeth Stretch, same place. Filed Sept. 9, 1897. Serial No. 651,133. (No model.)



Claim.—1. The main or storage tank 1, the refuse-pipe 2, and valve 3, the water-inlet pipe 4, the valves 5 and 6, the branch pipe 7, and its valve 8 in combination with the gage-tank 14, the pipes 9 and 15 connecting both tanks and the valved pipe 7, the visual gage connected to the tank 14, and means for discharging the contents of said latter tank, as and for the purpose set forth.

2. The main or storage tank 1, the refuse-pipe 2, and valve 3, the vented oil-discharge pipe 11, in combination with the gage-tank 14, the visual gage 16 connected to said tank, and the float-ball 18 mounted in said gage, the water-supply pipe 4 connected to the main tank, and the branch pipes 7 9 and 15 connecting said supply-pipe 4 and tanks 1 and 14, and means for controlling the discharge from the tank 14, substantially as shown and described.

606,488. SWITCH-OPERATING MECHANISM FOR STREET-RAILWAYS.

FRANCIS M TYLER and WILLIAM W. TYLER, Auburndale, Mass. Filed Dec. 22, 1897. Serial No. 663,967. (No model.)

Claim.—1. An automatic switch-operating device for street-railways, comprising a channel-block next to a rail of the track, an arm projecting horizontally across said channel-block, an inclined cam connected to and operated by said arm, a switch-point, a rock-shaft extending between and journaled adjacent said switch-point and said cam and having at its ends lateral arms, one in engagement with said cam and the other connected to said switch-point, whereby movement of said horizontal arm, and thereby of said cam, serves to rock said shaft axially and shift said switch, substantially as described.

2. An automatic switch-operating device for street-railways, comprising a channel-block adjacent a rail of the track, an arm projecting across said channel-block, an inclined cam connected to and operated by said arm, a switch-point, a rock-shaft extending from said switch-point to said cam and having lateral arms, one in engagement with said cam and the other connected to said switch-point, whereby movement of said arm, and thereby of said cam, serves to rock said shaft and shift said switch, said cam having a dwell at the opposite ends of its incline, said dwell cooperating with the adjacent arm of the rock-shaft, to hold the same rigid and thereby lock the switch-point, substantially as described.

3. An automatic switch-operating device for street-railways, comprising a channel-block adjacent a track-rail, a vertical drum carrying a wheel provided with arms extending horizontally across said channel-block, said arms having their forward sides sloping rearwardly relatively to the length of the channel in all positions of the arms therein, whereby upon forward rotation of said wheel said rearwardly-sloping sides automatically remove foreign matter, a switch-point, and connections between said drum and said switch-point for operating the latter by movement of the former, substantially as described.

4. An automatic switch-operating device for street-railways, comprising a channel-block adjacent a track-rail, a vertical drum having a cam-groove carrying a horizontal wheel provided with lateral arms extending horizontally across said channel-block, said arms having their forward sides beveled at an angle to slope rearwardly relatively to the length of the channel in all positions therein, whereby upon forward rotation of said wheel said beveled sides automatically push foreign matter ahead along the channel, a switch-point, a rock-shaft extending between said drum and said switch-point, said rock-shaft having an arm at one end in engagement with and actuated by said cam-groove, and an arm at its other end in connection with and to actuate said switch-point, substantially as described.

5. In a device of the class described, a rock-shaft, means to rock the same by the passage of a car, a switch-point, a slide connected to said rock-shaft and connected to said switch-point, and means for instantly connecting or disconnecting said slide from said switch-point, substantially as described.

6. In a device of the class described, a drum, operating means therefor, a switch-point, connections between said drum and switch-point for operating the latter from the former, and a housing for said drum, said drum having an outwardly projecting and depending flange, and said housing having an upwardly-projecting flange beneath and overhung by said drum-flange, for affording the latter free movement clear of all foreign matter, substantially as described.

7. In a device of the class described, a drum, operating means therefor, a switch-point, connections between said drum and switch-point for operating the latter from the former, and a housing for said drum, said housing having at its upper end an annular flange adjacent said drum, said flange being provided with a rib, and said drum having an overhanging wheel provided with a recess to interlock with said rib, substantially as described.

8. In a device of the class described, a drum, operating means therefor, a switch-point, connections between said drum and switch-point for operating the latter from the former, and a housing for said drum, said housing having at its upper end an annular flange adjacent said drum, said flange being provided with a rib, and said drum having an overhanging wheel provided with a recess to interlock with said rib, brackets beneath said annular flange, and an electric heater held in said bracket adjacent the wall of said housing, to maintain the latter and adjacent parts normally heated, as and for the purpose set forth.

9. In a device of the class described, a drum, operating means therefor, a switch-point, connections between said drum and switch-point for operating the latter from the former, and a housing for said drum, said housing having at its upper end an annular flange adjacent said drum, said flange being provided with a rib, and said drum having an overhanging wheel provided with a recess to interlock with said rib, brackets beneath said annular flange, and an electric heater held in said bracket adjacent the wall of said housing, to maintain the latter and adjacent parts normally heated, recesses adjacent the switch-point, and an electric heater in said recess to maintain the parts adjacent the moving switch-point in heated connection, as and for the purpose set forth.

10. In a device of the class described, a switch-point, a rock-shaft to operate the same, means to actuate said rock-shaft, and a tube inclosing said rock-shaft, said tube being secured adjacent the web of a track-rail, between and within the outer edges of the base and head of the rail, said tube having at its end adjacent the switch a laterally-flared funnel-shaped portion, substantially as described.

11. A switch-point, an actuating-cam therefor, connections between said cam and said switch-point, an arm carried by said cam, a channel-block adjacent a track-rail, said arm projecting across said channel-block, the channel of the latter extending parallel to the rail for the main part of its length, and having at its forward end a lateral bend away from the rail, combined with a car device comprising a depending arm, and means to raise and lower said arm, the latter when in its lowered position being adapted to travel in said channel and thereby actuate the arm carried by said cam, said car device being provided with a spring normally tending to raise said arm, and a detent arranged to engage and hold said arm depressed, said bent-away part of said channel disengaging said arm from said detent and permitting the spring to restore the arm to its raised position, substantially as described.

12. The herein-described car device, comprising a rock-shaft, arms extending therefrom at its opposite ends, a plunger engaging one of said arms and adapted to be depressed by the foot, a depending arm connected to the free end of the second arm of said rock-shaft, a spring normally holding said depending arm in raised position, and a detent adapted to engage and hold said depending arm in depressed position, substantially as described.

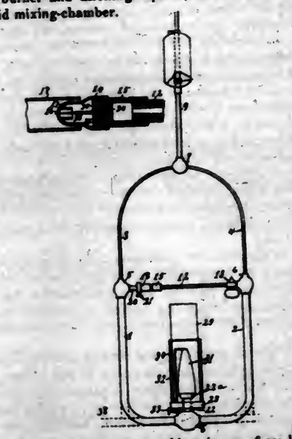
606,484. BINDER FOR SHEET-MUSIC, &c.

HENRY R. VEIT, Chicago, Ill. Filed Oct. 29, 1897. Serial No. 656,759. (No model.)

Claim.—1. In a binder for sheet-music, or the like, the combination of two separable cover-sections B and C, said section B comprising an inner sheet of cardboard *l* and an outer sheet of cardboard *n*, the sheet *l* being provided with a securing-strip D having the attaching-strips *r'* of linen pasted upon the inner and outer surfaces of the rear edge of the cardboard, and the sheet *n* being provided with sheets of flexible material *s'* and *m* on the outer and inner surfaces respectively, both prolonged to produce the flexible back E, and said section C being provided similarly with inner and outer sheets of cardboard separated at the rear edges to afford a pocket *k*, said inner sheet of the section C being further provided with a securing-strip D to coact with the like strip on the section B, substantially as and for the purpose set forth.

2. In a binder for sheet-music, or the like, the combination with two separable cover-sections, of securing-strips D, each comprising narrow parallel strips of cardboard *s* pasted close together upon a wider strip of linen *r* said strip of linen being folded to bring said strips of cardboard to a superimposed position and one of the strips D being provided with binding-posts *q*, each strip of linen being of sufficient width to afford, after folding, strips *r'* between which is pasted a sheet of the cover-section, substantially as described

3. A binding-strip comprising a plurality of strips of paper, each provided with a gummed surface, said strips having their gummed surfaces turned toward each other, all being folded longitudinally, and a flexible securing-strip folded longitudinally and sewed on its line of folding to said strips of paper at their line of folding, substantially as described.



4. A binding-strip comprising a plurality of strips of paper, each provided with a gummed surface, said strips having their gummed surfaces turned toward each other, all being folded longitudinally, a strip of thick paper *h'* covered with linen h^3, a strip of cardboard h^2 connected to one edge of the strip *h'*, linen stitches or the like securing the gummed strips of paper to the combined strip *h'*, h^2 at the longitudinal center line, said strip being folded back at the line of sewing and cemented to the exposed surface of the cardboard strip h^2 and said composite securing-strip being supplied with perforations as shown, substantially as and for the purpose set forth.

606,485. GAS-GENERATING GAS-FIXTURE.

JOHN F. WILLIAMS, Kansas City, Kans., assignor to Robert M. Snyder, Kansas City, Mo. Filed June 8, 1897. Serial No. 639,912. (No model.)

Claim.—1. In a device for generating and burning gas from liquid hydrocarbons, the combination of a suitable supply-pipe; a gas-generating pipe connected thereto and provided with a gradually-decreasing internal bore toward its discharge end; a discharge-outlet for said generating-pipe; a burner; a mixing-chamber intermediate said burner and outlet; and means for admitting air into said mixing-chamber.

2. In a device for generating and burning gas from liquid hydrocarbons; the combination of a suitable supply-pipe; a gas-generating pipe connected thereto and provided with gradually-decreasing internal bore toward its discharge end; a restricted discharge-opening for said generating-pipe; a burner; a mixing-chamber intermediate said burner and discharge-opening: and means for admitting air into said mixing-chamber.

3. In a device for generating and burning gas from liquid hydrocarbons, the combination of a suitable supply-pipe, a gas-generating pipe connected thereto and provided with a gradually-decreasing internal bore toward its discharge end; a restricted outlet for said pipe; a burner located in proximity to said pipe; a mixing-chamber intermediate said burner and the generating-pipe; an air-inlet into said mixing-chamber; and means for controlling the admission of air.

4. In combination with an elevated reservoir; a discharge-pipe leading therefrom; a gas-generating chamber connected to said pipe and provided with a gradually-narrowing passage toward its discharge end; a restricted discharge-opening for said chamber; a burner located in proximity to said generating-chamber; a mixing-chamber intermediate said burner and the discharge-opening of the gas-generating chamber; and means for controlling the admission of air to said mixing-chamber.

5. The combination with a gas-fixture for generating and burning gas from liquid hydrocarbons, having a supply-pipe and mixing-pipe forming part of the fixture, a suitable burner connected with the mixing-pipe, a chimney-holder mounted below said burner, and a chimney supported thereon, of a vaporizing-tube having a gradually-decreasing bore toward its discharge end and connected with the supply-pipe arranged over said chimney, a tip mounted upon the discharge end of the tube and having a minute opening therein, and an air-supply regulator surrounding said tip connected with said mixing-pipe, substantially as set forth.

6. In a gas-fixture for generating and burning liquid hydrocarbons, the combination with a supply-pipe and a mixing-pipe forming part of the fixture, and a burner connected with the mixing-pipe and provided with a suitable chimney, of a vaporizing-tube provided with a shut-off cock connected with the supply-pipe arranged to be heated from the burner, a tip having a minute opening therein, and a coupling connecting said tip with said vaporizing-tube, arranged to form an expansion-chamber between said tip and said tube and a sleeve surrounding said tip provided with openings in the sides thereof, adjustably connected with said mixing-pipe, and arranged to regulate the air-supply, substantially as set forth.

7. In a gas-fixture for generating and burning liquid hydrocarbons, the combination with a supply-pipe and a mixing-pipe forming part of the fixture, of a vaporizing-tube connected with the supply-pipe, a tip having a minute opening and provided with an internal collar surrounding said opening, a coupling connecting said tip with said tube arranged to form an expansion-chamber between said tip and tube, and a sleeve surrounding said tip provided with openings in the sides thereof, adjustably connected with said mixing-pipe, and arranged to regulate the air-supply, substantially as set forth.

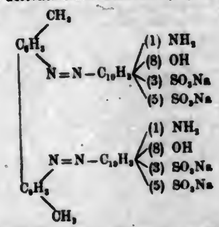
8. In a gas-fixture for generating and burning liquid hydrocarbons, a vaporizing-tube, a tip having a minute opening and provided with an internal collar surrounding said opening and a coupling connecting said tip to said tube and arranged to form an expansion-chamber between said tip and tube, substantially as set forth.

9. In a gas-fixture for generating and burning liquid hydrocarbons, a vaporizing-tube, a tip having a suitable opening and provided

with an internal collar surrounding said opening, a coupling connecting said tip with said tube, and a needle-point connected with said coupling arranged to pass through said opening in said tip to control the flow of vapor therethrough, substantially as set forth.

10. In an apparatus for generating and burning gas from liquid hydrocarbons, the combination with a suitable burner and a supply-pipe leading to a source of supply, of a vaporizing-tube having a tapering longitudinal opening arranged between said supply-pipe and the burner, said opening diminishing toward the discharge end of the tube, substantially as and for the purposes set forth.

11. In an apparatus for generating and burning gas from liquid hydrocarbons, the combination of a generator provided with a gradually-diminishing area toward its discharge end; a minute discharge-opening; a burner; a mixing-chamber intermediate the burner and said discharge-opening, said chamber being of a relatively large area; and an air-inlet for said chamber.



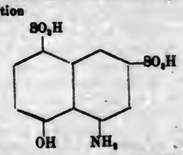
12. In an apparatus for generating and burning gas from liquid hydrocarbons, a gas-generating chamber comprising a tube of gradually-diminishing area toward its discharge end; a minute discharge-opening; and an enlarged chamber intermediate the opening and the end of the tube.

13. In an apparatus for generating and burning gas from liquid hydrocarbons, a gas-generating tube having a bar or rod mounted therein, said rod being provided with an inclined flat face upon one side and so arranged within the tube as to gradually diminish the area thereof toward the discharge end; and a discharge-tip mounted on the tube.

14. A fixture for generating and burning gas from liquid hydrocarbons, comprising in combination a tube or pipe 9 having a reservoir connected thereto; supply-pipe 4; a gas-generator 12 connected to pipe 4, and provided with a suitable valve; a mixing and conducting pipe 1 into which the gas is discharged; an air-inlet for said mixing-pipe and means for controlling it; a pipe 3 connecting pipe 9 and pipe 1; a pipe 22 communicating with the mixing-pipe; a chimney mounted on said pipe 22 below the generator 12; and a mantle of incandescing material mounted in said chimney.

606,436. BLUE DYE. FRITZ BENDER, Mühlheim, Germany, assignor to Farbwerk Mühlheim, vormals A. Leonhardt & Co., same place. Filed Dec. 22, 1897. Serial No. 663,042. (Specimens.) Patented in England Oct. 14, 1896, No. 19,263, and in France July 21, 1896, No. 258,853.

Claim.—As a new article of manufacture the dyestuff having in case the tetrazo derivative of tolidin is employed, the formula

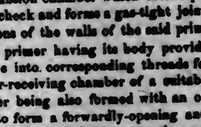


having the form of a dark powder with metallic luster, soluble in water giving a pure-blue solution, insoluble in spirit, soluble in concentrated sulfuric acid with a pure-blue color, and dyeing unmordanted cotton a pure-blue shade.

606,437. AMIDONAPHTHOLDISULFO-ACID AND PROCESS OF MAKING SAME. FRITZ BENDER, Mühlheim, Germany, assignor to Farbwerk Mühlheim, vormals A. Leonhardt & Co., same place. Filed Dec. 22, 1897. Serial No. 663,041. (Specimens.) Patented in England Oct. 14, 1896, No. 19,263, and in France July 21, 1896, No. 258,853.

Claim.—1. The process of producing 1.8 amidonaphthol 3.5 disulfo-acid, which process consists in sulfonating 1.8 amidonaphthol 3 monosulfo-acid, substantially as described.

2. As a new product the new 1.8 amidonaphthol 3.5 disulfo-acid having the composition



being easily soluble in hot water, but with difficulty soluble in cold water, the alkaline solution showing an intensely-violet fluorescence, the diazo compound being soluble in water with an intensely-yellow color which by carbonate of soda turns to violet; the said acid when boiled with dilute sulfuric acid at 140° centigrade yielding 1.8 amidonaphthol 3 sulfo-acid and when heated with dilute caustic-soda lye up to 230° centigrade yielding 1.8 dioxynaphthalene 3.5 (4.6) disulfo-acid, and being adapted to form an acid sodium salt.

606,438. BLUE-BLACK DYE. FRITZ BENDER, Mühlheim, Germany, assignor to Farbwerk Mühlheim, vormals A. Leonhardt & Co., same place. Filed Dec. 22, 1897. Serial No. 663,292. (Specimens.) Patented in England Oct. 14, 1896, No. 19,263, and in France July 21, 1896, No. 258,853.

Claim.—1. The diazo dyes derived from one molecular proportion of the herein-described "acid B" and two molecular proportions of a diazo compound such as diazo-benzene hereinabove mentioned, dissolving in water with a greenish to reddish blue color being insoluble or nearly so in spirit and dyeing wool in an acid-bath in greenish to bluish black shades.

2. The new dyestuff herein described and deriving from one molecular proportion of the "acid B" one molecular proportion of diazo-benzene and one molecular proportion of paranitrodiazo-benzene, having the formula

and which is soluble in water with a blue color but scarcely soluble in spirit, and the solution of which in concentrated sulfuric acid has a bluish-green tint and when diluted with water yields a blue precipitate; the said dyestuff dyeing wool in bluish-black shades.

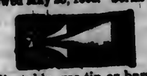
606,439. GREEN DISAZO DYE. FRITZ BENDER, Mühlheim, Germany, assignor to Farbwerk Mühlheim, vormals A. Leonhardt & Co., same place. Filed Dec. 22, 1897. Serial No. 663,290. (Specimens.) Patented in England Oct. 14, 1896, No. 19,263, and in France July 21, 1896, No. 258,853.

Claim.—The new coloring-matter derived from 1.8 amidonaphthol 3.5 disulfo-acid, forming when dried a dark powder, dissolving in water with a green color, being scarcely soluble in spirit, giving with concentrated sulfuric acid a violet solution, which when diluted with water yields a violet precipitate; said coloring-matter dyeing unmordanted cotton in green shades.

606,440. PRIMER FOR ORDNANCE. THOMAS G. BENNETT, New Haven, Conn., assignor to the Winchester Repeating Arms Company, same place. Filed Nov. 26, 1897. Serial No. 660,734. (No model.)

Claim.—1. A primer having its body provided with external threads which take into corresponding threads formed in the side walls of the primer-receiving chamber of a suitable cartridge-case, and the said primer being also provided with a laterally-expansible, annular gas-check inclosing a forwardly-opening, annular, gas receiving or expansion chamber which intercepts the gas which then expands the check and forms a gas-tight joint between it and the adjacent portions of the walls of the said primer-receiving chamber.

2. A primer having its body provided with external threads which take into corresponding threads formed in the side walls of the primer-receiving chamber of a suitable cartridge-case, and the said primer being also formed with an overhanging head which is grooved to form a forwardly-opening annular gas receiving or expansion chamber which intercepts the gas which then expands the check and forms a gas-tight joint between it and the adjacent portions of the walls of the said primer-receiving chamber.



3. A primer having an overhanging head which is grooved to form a forwardly-opening annular gas-receiving chamber, inclosed by a laterally-expansible, integral, annular gas-check.

4. A primer provided with an independently-formed powder-cup fitted snugly into it, and projecting forward beyond its forward end.

5. A primer having an externally-threaded body, and provided with an independently-formed cylindrical powder-cup fitted snugly into it, and projecting forward beyond its forward end, and surrounded by a forwardly-opening annular gas-receiving chamber located at the forward end of the primer-body and inclosed by a laterally-expansible annular gas-check.

6. The combination with a cartridge-case having a threaded primer-opening, of a primer externally threaded for engagement therewith, and a laterally-expansible annular gas-check between said case and primer, substantially as described.

606,441. ACETYLENE-GAS TIP. LUDWIG K. BÖHM, New York, N. Y., assignor to the Electro Gas Company, of West Virginia. Filed May 3, 1893. Renewed May 25, 1898. Serial No. 681,754. (No model.)

Claim.—1. An adjustable gas tip or burner for mixing gas and air and consisting of an imperforate lower part having a nozzle extending therefrom which forms the outlet for the gas, an adjustable tip proper threaded at its lower outside portion and forming the outlet for the mixture and a wire-gauze mantle connecting the same, substantially as described.

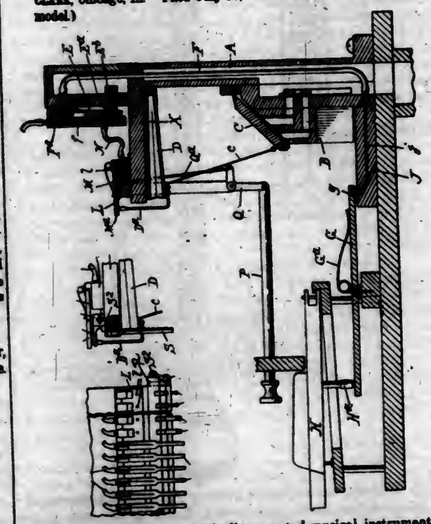
2. In an adjustable gas tip or burner for mixing gas and air in various proportions and consisting of an imperforate lower part having a nozzle extending therefrom which forms the outlet for the gas, an adjustable tip proper threaded at its lower outside portion and forming the outlet for the mixture in combination with a wire-gauze mantle between the two and connecting the same, substantially as described.

606,442. CURTAIN-FIXTURE. JUDITH R. BULLIS, Ann Arbor, Mich., assignor to the Ann Arbor Manufacturing Company, same place. Filed Nov. 22, 1897. Serial No. 659,497. (No model.)

Claim.—1. The combination with a curtain-pole having inwardly-extending supporting-arms at the ends forming continuations of the pole over which the rings are adapted to be moved, of false end pieces supported free from the pole and in the line of the pole proper, substantially as described.

2. The combination with a curtain-pole having inwardly-extending supporting-arms at the ends forming continuations of the pole over which the rings are adapted to be moved, and a securing-plate at the end of these arms, of false end pieces in line with the pole proper, but separated therefrom to allow of the passage of the rings between, and arms projecting from the securing-plate supporting said false end pieces.

3. In a curtain fixture, the combination with the curtain-pole having the curved ends for the purpose described, of the arms G extending out beside the curved arms of the pole and the false end pieces C forming apparent end extensions of the pole, projecting on both sides of the arms G, for the purpose described.



606,443. SEWING-MACHINE SHUTTLE. MARY F. BURROUGHS, Marshall, Mo. Filed May 11, 1897. Serial No. 636,093. (No model.)

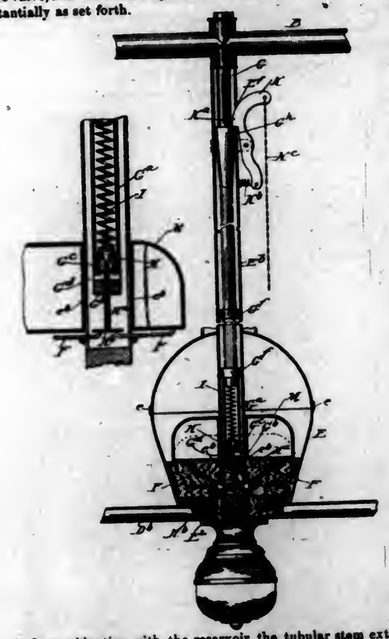
Claim.—1. A shuttle, comprising a casing rounded to conform to the contour of the spool of thread, one of the end walls of the casing being hinged thereto, the opposite end being pointed, a door hinged to the casing by means of which access may be obtained to the interior of the casing for inserting the spool of thread therein, means for securing the said door in a closed position, said door being provided with a slot through which the thread is adapted to be passed, a guide upon the exterior of the door for holding and guiding the thread, and a screw adapted to be passed through the casing and bear at its end upon the spool to regulate its rotation, substantially as set forth.

2. The combination of a shuttle-carrier provided with a guiding side wall and an end wall, a shuttle comprising a casing having its end wall hinged thereto and its opposite end pointed and adapted to be positioned within the said shuttle-carrier, a door for the shuttle by means of which access is obtained to the interior thereof, a latch whereby said door is secured in closed position, a spring-guide upon the door for directing the thread from the said shuttle, and a tension device by means of which the rotation of the spool of thread is regulated, substantially as described.

606,444. COUPLER FOR PNEUMATIC-ORGANS. MELVILLE CLARK, Chicago, Ill. Filed July 30, 1897. Serial No. 646,475. (No model.)

Claim.—1. In a pneumatically-operated musical instrument, in combination with the motor-pneumatics and the primary pneumatics which operate them, vent-valves for the primary pneumatics respectively, and mechanical connections by which the motor-pneumatics may actuate the vent-valves of the octave distant primary pneumatics respectively.

2. In a pneumatically-operated musical instrument, in combination with the motor-pneumatics and primary pneumatics which operate them; vent-valves for the primary pneumatics respectively; movable mechanical connections by which the motor-pneumatics may actuate the vent-valves of the octave distant primary pneumatics, and means for moving the same into and out of movement-communicating position.



3. In a pneumatically-operated musical instrument, in combination with the motor-pneumatics and the primary pneumatics which operate them respectively; ducts leading from the primary pneumatics and valves which control such ducts located proximate to the octave distant motor-pneumatics respectively; and mechanical connections by which the motor-pneumatics act upon such proximate primary pneumatic valves to cause their respective sound-producing devices to speak.

4. In a pneumatically-operated musical instrument, in combination with the motor-pneumatics and the primary pneumatics which operate them; a coupler-board and ducts leading from the primary pneumatics respectively to such board; valves on the board which control the ducts respectively located proximate to the motor-pneumatics which are an octave distant from the primary pneumatics from which the ducts respectively lead; abutments extending from the motor-pneumatics and adapted to encounter their proximate valves respectively, the board being movable to carry such valves into and out of the range of the motor-pneumatic abutments respectively.

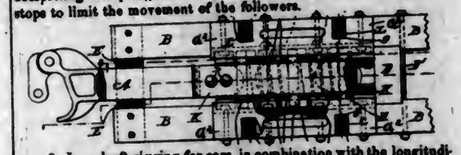
606,445. LAMP. ROBERT D. CODY, Chicago, Ill. Filed June 14, 1897. Serial No. 640,682. (No model.)

Claim.—1. In combination with the burner, an oil-reservoir fixed with respect thereto having an upwardly-extending tubular stem affording access into the reservoir; a fixed oil-supply pipe terminating downwardly and provided with a valve at its lower end, and adapted to be inserted with its valve through said tubular stem of the reservoir into the latter, and an annular float within the reservoir, through whose central opening the downwardly-terminating valved supply-

pipe protrudes; a plurality of levers fulcrumed within the reservoir below the float adapted to act upon the downwardly-protruding stem of the valve, and to be acted upon at their opposite ends by the float; substantially as set forth.

2. In combination with the reservoir, the tubular stem extending thereinto from the top and secured thereto at the bottom, the oil-supply pipe extending downwardly through the tubular stem, and a valve at the lower end of the pipe supported thereby and adapted to seat downwardly; the annular float without the encompassing tubular stem, and a plurality of levers fulcrumed within the reservoir underneath the float disposed radially with respect to the stem, and adapted at their inner ends to be encountered by the lower end of the valve-stem, and at their outer ends to be encountered by the float; and suitable disengageable means for securing the tubular stem to the depending supply-pipe.

606,446. FUMIGATOR. JOSEPH T. COMMONS, New York, N. Y. Filed Feb. 28, 1898. Serial No. 671,945. (No model.)



Claim.—A fumigator for toilet rooms and other similar places, composed of the strand-supporting card, with an eyelet-hole at one end for its suspension from a nail or the like, and a notched button at the other end thereof, forming a strand-holder and extinguisher, and of a strand of combustible material which is wound on the card between its ends and adapted to engage and interlock with the notched button, substantially as herein described

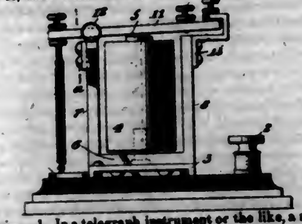
606,447. DRAFT-RIGGING FOR RAILWAY-CARS. JOHN CONRATH, Chicago, Ill. Filed Mar. 28, 1898. Serial No. 675,354. (No model.)

Claim.—1. In a draft-rigging for cars, in combination with the draft-timbers, a plurality of groups of springs arranged tandem between the draft-timbers; followers between consecutive groups and beyond the extreme groups in both directions; the draw-bar adapted to abut against the nearest follower; a draft connection therefrom extending beyond the most remote follower, and stops rigid with the draft-timbers to limit the inward movement of the extreme followers, each intermediate follower having a range of movement in both directions from the position at which it is held by the springs when free from any action of the draw-bar, a distance equal to the compression for which the springs are calculated.

2. In a draft-rigging for cars, in combination with the draft-timbers, face-plates G let into the proximate faces of the timbers respectively and having horizontal flanges at top and bottom which are also let into the upper and lower sides of the timbers respectively; the draw-bar and draft connections therefrom between the face-plates comprising the springs and followers; the face-plates having rigid stops to limit the movement of the followers.

3. In a draft-rigging for cars, in combination with the longitudinal sills; the draft-timbers and face-plates provided for the same having flanges extending over the upper surface of the draft-timbers, such flanges being let into said timbers, the flanges having notches; keys let into the lower side of the sills and upper side of the draft-timbers and extending through the notches in the flanges; and bolts which bind the draft-timbers up against the under side of the sills.

4. In a draft-rigging for cars, in combination with draft-timbers, the face-plates made rigid therewith; the draw-bar and draft connection therefrom, and the springs and followers associated therewith between the face-plates; the ends of the followers extending laterally beyond the springs and stops and upper guides for said ends on the face-plates, said face-plates having at their lower edges inwardly-projecting flanges cut away below the path of the followers respectively and provided with longitudinal inwardly-facing grooves between said cut-away portions; and a slide adapted to be inserted in such grooves underneath the followers and springs, and to afford lower support and guidance for the followers, and suitable key to retain such slide against longitudinal displacement.

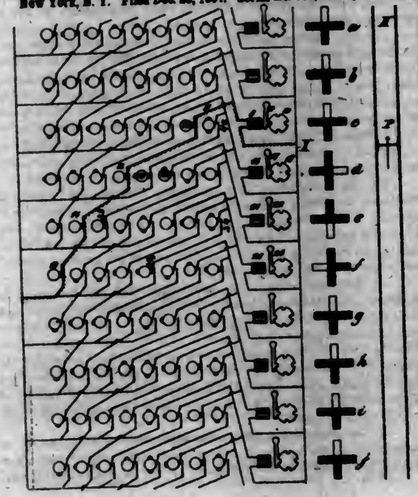


5. In a draft-rigging for cars, in combination with draft-timbers, the face-plates made rigid therewith; the draw-bar and draft connections therefrom, and the springs and followers associated therewith between the face-plates; the ends of the followers extending laterally beyond the springs and stops and upper guides for said ends on the face-plates; said face-plates having at their lower edges flanges cut away below the path of the followers respectively and provided with longitudinal inwardly-facing grooves between said cut-away portions; and a slide adapted to be inserted in such grooves underneath the followers and springs, and to afford lower support and guidance for the followers, said face-plates having each an apertured lug G^3, and the slide having a correspondingly-situated apertured lug whose apertures are adapted to register with the apertures of the lugs of the face-plates when the slide is in operative position, and a suitable removable key inserted through said apertures.

606,448. SASH-FASTENER. ORRY L. CORBIN, Columbus, Ohio. Filed Nov. 10, 1896. Serial No. 611,664. (No model.)

Claim.—A window-sash fastener consisting of an anchor-plate let into the window-frame and having a struck-up notched longitudinal rib corresponding to and forming a continuation of the parting-bead; an angle-plate let into the adjacent corner of the upper-sash stile and having corresponding notches; and a spring-seated sliding bolt on the top of the meeting-rail of the lower sash, mounted obliquely thereof, so as to be adapted to enter a notch of the anchor-plate and one of the angle-plate at the same time.

606,449. TELEGRAPH INSTRUMENT. JAMES I. OUTLER, Cincinnati, Ohio, assignor of one-half to Edwin Goodes, same place. Filed Oct. 18, 1897. Serial No. 655,532. (No model.)



Claim.—1. In a telegraph instrument or the like, a magnet comprising a core, a coil wound thereon and a soft-iron bar connected at its central part to one end of the core and having its ends bent to form arms extending along opposite sides of the coil with their extremities adjacent to the free end of the core, in combination with an armature-lever located in the field of the magnet pivoted on one of the arms and extending in line with the free ends of the arms and core, substantially as set forth.

2. In a telegraph instrument or the like, the combination of a core, a coil wound thereon and a soft-iron bar connected at its central part to one end of the core and having its ends bent to form arms extending along opposite sides of the coil and having their extremities adjacent to the free end of the core, in combination with an armature-lever located in the field of the magnet and pivotally connected with one of said arms in position to move in line with the other arm and the core, and stops on the last-mentioned arm to limit the movement of the armature-lever substantially as set forth.

3. In a telegraph instrument or the like, the combination of a magnet comprising a core, a coil thereon and a bar connected at its central part to one end of the core and having its ends bent to form arms extending along opposite sides of the coil with their extremities adjacent to the free end of the core, a plate carried by one arm, an armature-lever pivotally connected to said plate, a plate carried by the other arm and forming a stop to limit the movement of the armature-lever, and a spring to hold said lever in its normal position, substantially as set forth.

4. In a telegraph-sounder, the combination of a magnet comprising a core, a coil wound thereon and a soft-iron bar connected at its central part to one end of the core and having its ends bent to form arms extending along opposite sides of the coil with their extremities adjacent to the free end of the core, a plate secured to one side of one arm and having upwardly-projecting side portions, an armature-lever pivoted between said side portions and arranged to move in line with the upper ends of the arms and core, stops carried by the other arm to limit the movement of the armature-lever, and a retracting-spring for the armature-lever, substantially as set forth.

606,450. RAILWAY SIGNALING SYSTEM. CHARLES H. DAVIS, New York, N. Y. Filed Dec. 30, 1897. Serial No. 664,195. (No model.)

Claim.—1. In a railroad signal system, a railway-line, a single series of signaling devices in proximity thereto, each device being constructed to exhibit a danger-signal and a safety-signal, and interlocking mechanism connecting each device with two or more immediately-succeeding signaling devices; the said devices being constructed and arranged so that a given device cannot be set to exhibit a safety-signal ahead of a train until it shall have exhibited a danger-signal as many times as there are succeeding devices interlocked with it in rear of said train, and unless said succeeding devices shall previously have been set to exhibit "danger," substantially as described.

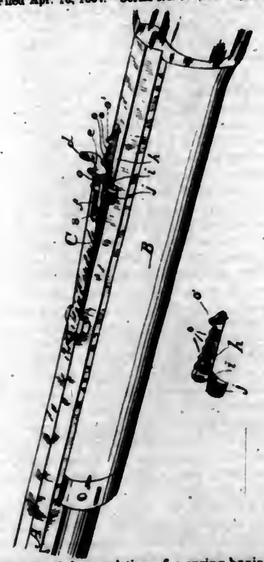
2. In a railroad signal system, a railway-line, a single series of signaling devices in proximity thereto, each device being constructed to exhibit a danger-signal and a safety-signal and interlocking mechanism connecting said devices; the said devices and interlocking mechanism being constructed and arranged so that each device successively from one end of the line to the other may be set to exhibit a safety-signal ahead of a train provided the two or more immediately-succeeding devices in rear of said train are previously set to exhibit "danger," substantially as described.

3. In a railroad signal system, a railway-line, a single series of signaling devices in proximity thereto, each device being constructed to exhibit a danger-signal and a safety-signal and interlocking mechanism connecting said devices; the said devices and interlocking mechanism being constructed and arranged to exhibit a danger-signal everywhere when the line is unoccupied, and so that each device having once been set to "safety" cannot again be so set until it shall have exhibited a danger-signal as many times as there are succeeding devices interlocked with it, substantially as described.

4. In a railroad signal system, a single series of signal devices each having a safety-signal and a danger-signal, means for actuating said signals to cause them to be displayed, a locking device engaging with said means, circuit-closing devices controlled by said means, an electromagnet controlling said locking device and circuit connections substantially as set forth; whereby the said signaling devices are interlocked so that the safety-signal of one device cannot be exhibited ahead of a train unless the danger-signals of two or more succeeding signaling devices in rear of said train are also exhibited, substantially as described.

5. In a railroad signal system, a single series of signal devices each having a signal-arm indicating "safety" and a signal-arm indicating "danger," a rotary shaft actuated coincidently with said arms, a locking device engaging with said shaft, an electromagnet controlling said locking device, circuit-closing devices controlled by said shaft and circuit connections substantially as set forth; whereby the said signaling devices are interlocked so that the safety-signal of one device cannot be exhibited ahead of a train unless the danger-signals of two or more succeeding signaling devices are also exhibited in rear of said train, substantially as described.

606,451. PERAMBULATOR. WILLIAM H. ENGLISH, Detroit, Mich. Filed Feb. 14, 1898. Serial No. 670,201. (No model.)



Claim.—1. In a perambulator, the combination of the frame A having wheels at the lower end, of a hinged seat, a rearwardly-extending hinged wheeled arm, a folding link connecting the arm to the stationary part of the frame and a connection from the folding link to the seat whereby the folding of both the seat and the arm is effected by moving one.

2. In a perambulator the combination of the frame A having a wheeled axle at the lower end, of a rearwardly-inclined arm I pivoted to the frame and having a wheel or wheels at the lower end, a folding link having a rule-joint connecting the axle of the frame with the arm and the link connecting the folding link with the seat, whereby the drawing up of the seat will positively fold in the arm I, substantially as described.

3. In a perambulator, the combination of the frame A, the arm I pivoted thereto and extending rearwardly and downwardly therefrom having a wheel or wheels at its lower end, the folding link L

connecting the arm with the axle K, the link having a slot connection with the arm I, the link M connecting the folding link with the seat and a bail or bar O on the seat with which the upper end of the link M has a sliding engagement, the parts arranged as and for the purpose described.

606,452. SIGHT FOR FIREARMS. SOPHIAN H. FISCHER, Hayward, Cal. Filed Apr. 16, 1897. Serial No. 632,475. (No model.)

Claim.—1. A gun-sight consisting of a spring having a sight at one end while its opposite end is secured to the barrel of the gun; a longitudinal slot formed in said spring; a hump or bend in the spring on one side of the slot; an inclined slide or elevator having its upper inclined edge provided with notches or stops adapted to move in the slot; a lug or knob at the lower end of the incline; a shank adapted to pass under the spring on one side of the slot, and a thumb-piece at the outer end of the shank, substantially as described.

2. A gun-sight comprising a spring having a sight at its rear end, while its front end is fastened to the barrel of the gun, said spring having a longitudinal slot adapted to receive a sliding elevator, and a sliding inclined block or elevator guided in said slot, said block or elevator having its upper inclined edge formed into notches to provide graduated steps for the sight-piece, said elevator having a shank extending laterally therefrom, said shank carrying a vertically-disposed shoulder opposing the outer side of the spring to prevent lateral motion of the elevator, substantially as described.

606,453. FILTERING APPARATUS. GEORGE G. FRYER, Syracuse, N. Y., assignor to The Solvay Process Company, same place. Filed Mar. 2, 1897. Serial No. 626,736. (No model.)

Claim.—1. The combination of a cylindrical filtering-body having a perforated peripheral filtering-surface, a facing consisting of an endless band encircling the filtering-surface and having its side portions extended beyond the side edges of said surface, said facing being formed with perforations of less size than the perforations of the filtering-surface, and a retaining-band wound spirally around the facing and engaged with the side portions of the facing at opposite sides of the filtering-surface for securing the facing in position, substantially as and for the purpose described.

2. The combination of a cylindrical filtering-body having a perforated peripheral filtering-surface, a facing consisting of a perforated band encircling the peripheral surface, and a retaining-band for holding the facing in position, said retaining-band being embedded into the facing and having its outer face substantially coincident with the outer face of the facing, substantially as and for the purpose specified.

3. The combination of a cylindrical filtering-body having its periphery perforated, a perforated facing encircling said periphery, and a retaining-band wound spirally around the facing and having its convolutions surrounding the intermediate or substantially central portion of the facing separated a greater distance than its convolutions surrounding the side portions of said facing, said band being embedded in the facing, substantially as and for the purpose described.

4. The combination of a cylindrical filtering-body having a filtering-surface and flanges projecting from the filtering-body at opposite sides of said surface, the adjacent faces of the flanges being provided with annular grooves formed of greater diameter than the filtering-surface, a perforated facing encircling the filtering-surface and having its side portions extended beyond said filtering-surface and inserted into the annular grooves, and a retaining-band engaged with the portion of the facing interposed between said flanges, substantially as and for the purpose specified.

5. The combination of a cylindrical filtering-body having a filtering-surface and flanges projecting from the filtering-body at opposite sides of said surface and formed with annular grooves in their adjacent faces, a facing consisting of a perforated band encircling the filtering-surface and having its side portions inserted into the annular grooves, and a retaining-band wound spirally around the portion of the facing interposed between the flanges, said retaining-band being embedded into the facing, substantially as and for the purpose set forth.

6. The combination of a cylindrical filtering-body consisting of a tubular wall and opposite end walls detachably secured to the extremities of the tubular wall, a facing consisting of a perforated band encircling the tubular wall, and a retaining-band wound spirally around the facing and having its opposite ends secured to said end walls, substantially as and for the purpose described.

7. The combination of a revoluble filtering-body consisting of a tubular wall and opposite end walls secured to the extremities of the tubular wall and having their adjacent faces formed with annular grooves, a perforated facing encircling the tubular wall and having its side edges inserted into the annular grooves, and a retaining-band wound spirally around the facing and having its ends secured to said end walls, substantially as and for the purpose specified.

8. The combination of a movable filtering-body consisting of a perforated tubular wall, and opposite end walls, one of which end walls is formed with a perforation extending therethrough, a perforated facing encircling the tubular wall, and a retaining-band wound spirally around the facing and having one of its ends passed through the perforation in said one of the end walls, substantially as and for the purpose specified.

9. The combination of a movable filtering-body consisting of a perforated tubular wall, and opposite end walls having their adjacent faces formed with annular grooves, said end walls being also formed with perforations extending therethrough from the annular grooves, a perforated facing encircling the tubular wall and having its side portions inserted into the annular grooves, and a retaining-band wound spirally around the facing and having its opposite ends passed through the perforations in the end walls, substantially as and for the purpose set forth.

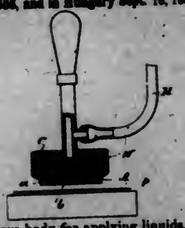
10. The combination of a revoluble filtering-body consisting of a perforated tubular wall, opposite end walls having their adjacent faces formed with annular shoulders engaged with the inner faces of the opposite extremities of the tubular wall, gaskets or packing-rings interposed between the end faces of the tubular wall and the adjacent faces of the end walls, clamping means for securing together said tubular and end walls, a perforated facing surrounding the tubular wall, and a retaining-band wound around the facing and secured to the end walls, substantially as and for the purpose specified.

11. The combination of a cylindrical filtering-body having its periphery provided with grooves extending substantially parallel with the axis of the body, a facing consisting of a perforated band encircling said periphery, and a retaining-band wound spirally around the facing and extending substantially crosswise of the grooves, substantially as and for the purpose described.

12. The combination of a cylindrical filtering-body having its periphery provided with grooves arranged substantially parallel with the axis of said body and extending inwardly from said periphery and each communicating at intervals with the inner chamber of the filtering-body, a facing consisting of a perforated band encircling the periphery of the filtering-body and extending beyond the ends of the grooves, and a retaining-band extending substantially crosswise of the grooves for securing the facing in position, substantially as and for the purpose specified.

13. The combination of a cylindrical filtering-body having its periphery provided with annular grooves, a facing consisting of a perforated band encircling the periphery of the filtering-body for covering the annular grooves, and a retaining-band for securing the facing in position, said retaining-band being supported by portions of the periphery of the filtering-body arranged between the annular grooves, substantially as and for the purpose set forth.

14. The combination of a cylindrical body having the inner face of its peripheral wall provided with grooves and the periphery of said wall formed with grooves extending substantially crosswise of the first grooves and communicating at intervals with the first grooves, a facing consisting of a perforated band encircling the periphery of the filtering-wall for covering the grooves in said periphery, and a retaining-band for securing the facing in position, said retaining-band being embedded in the facing, substantially as and for the purpose described.

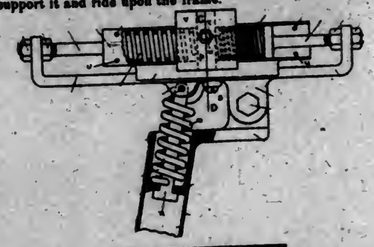


15. The combination of a cylindrical filtering-body having its peripheral wall provided with grooves arranged substantially parallel with the axis of the filtering-body and extending inwardly from said periphery and each communicating at intervals with the inner chamber of the filtering-body, said periphery being also provided with annular grooves intersecting the first grooves and formed of less depth than the first grooves, and a facing consisting of a perforated band encircling the periphery of said peripheral wall for covering said grooves and having its side portions extended beyond the ends of the first grooves and the outermost annular grooves, substantially as and for the purpose specified.

16. The combination of a cylindrical body having the inner face of its peripheral wall provided with grooves and the periphery of said wall formed with grooves extending substantially crosswise of the first grooves and communicating at intervals with said first grooves, a facing consisting of a perforated band encircling the periphery of the peripheral wall for covering the second grooves, and a retaining-band extending substantially crosswise of the second grooves for securing the facing in position, substantially as and for the purpose set forth.

17. The combination of a filtering-body formed with a tubular wall having its inner face provided with annular grooves and its periphery formed with lengthwise grooves communicating at intervals with the annular grooves, a facing consisting of a perforated band encircling the periphery of the tubular wall for covering the grooves in said periphery, and a retaining-band wound spirally around the facing and extending substantially crosswise of the second grooves for securing the facing in position, substantially as and for the purpose described.

18. The combination of a filtering-body formed with a tubular wall having its inner face provided with annular grooves communicating with the inner chamber of the filtering-body and its periphery formed with lengthwise grooves communicating at intervals with the annular grooves, said periphery being provided with annular grooves intersecting the lengthwise grooves and formed of less depth than said lengthwise grooves, a facing consisting of a perforated band encircling the periphery of the tubular wall for covering the grooves in said periphery, and a retaining-band extending substantially crosswise of the lengthwise grooves for securing the facing in position, said retaining-band being embedded in the facing, substantially as and for the purpose specified.

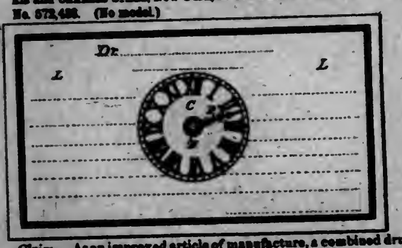


606,454. APPARATUS FOR APPLYING LIQUIDS TO TEXTILE FABRICS. FERDINAND GERARD, Paris, France. Filed Mar. 14, 1895. Serial No. 541,602. (No model.) Patented in France May 15, 1894, No. 236,545; in Spain Jan. 19, 1895, No. 16,049; in Belgium Jan. 22, 1895, No. 112,734; in England Jan. 22, 1895, No. 1,518; in Germany Jan. 26, 1895, No. 84,451; in Switzerland Jan. 26, 1895, No. 9,941; in Italy Jan. 31, 1895, XXIX, 38,153, and LXXV, 19; in Austria July 15, 1895, No. 45/2,566, and in Hungary Sept. 16, 1895, No. 4,473.

Claim.—A porous body for applying liquids, built up of sections of non-absorbent material alternating with sections of a bibulous or absorbent nature, and a porous layer or pad in contact with the inner faces of said sections, substantially as described.

606,455. BICYCLE-SEAT SUPPORT. JOSEPH M. GLENNON, Chicago, Ill. Filed Sept. 13, 1895. Serial No. 562,575. (No model.)

Claim.—In a seat-support for a bicycle or other saddle a frame; the rods provided with plungers or pistons secured thereto; a seat connection provided with tubes for said plungers and a central partition; springs placed between said partition and said plungers within said tubes, and a rider-plate attached to the seat connection adapted to support it and ride upon the frame.

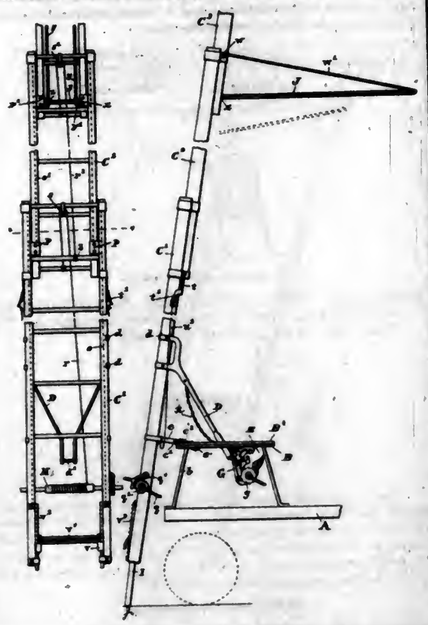


606,456. DENTAL MOUTH-MIRROR. CHARLES HARRISON, Bowmanville, Canada, assignor to James W. Ivory, Philadelphia, Pa. Filed June 1, 1896. Serial No. 593,393. (No model.)

Claim.—A dental mouth-mirror consisting of the reflector A, the angular bracket B, having said reflector A secured to one of its limbs, the sleeve D in which the horizontal limb of said bracket is adjusted, and which is provided at one end with the ball E, the spring-clamp G adapted to be secured to a tooth, and having a bent upper end and a spring-socket, the latter inclosing the ball E.

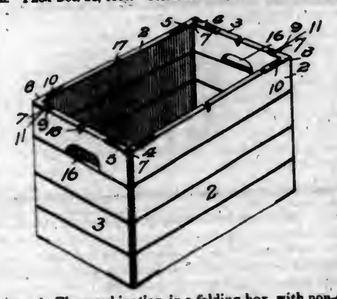
606,457. DRUGGIST'S AND MEDICINE LABEL. AARON HARRIS and CHARLES STAHL, New York, N. Y. Filed Dec. 17, 1895. Serial No. 572,488. (No model.)

Claim.—As an improved article of manufacture, a combined druggist's time-indicating and direction label, comprising a flexible card, a clock-dial imprinted thereon, a rotary indicating-hand therefor; the remaining portion of said card being appropriately lettered and ruled for said direction, substantially as described.



606,458. EXTENSION-LADDER. FREDERICK HEISE, Baltimore, Md. Filed Mar. 31, 1898. Serial No. 675,851. (No model.)

Claim.—1. The combination of a truck-frame; a ring turn-table elevated on standards above the truck-frame; a ladder pivoted to the movable ring of said elevated turn-table; two lifting-arms, D, each having an end attached to a different one of the side bars of the pivoted ladder and said arms inclining downward through the ring turn-table and also toward each other and their lower unattached ends joined; a winding-drum carried by the elevated movable ring; and a chain attached to the joined ends of said lifting-arms and connected with the winding-drum, as shown and described.



2. An extensible ladder having in combination three slidable sections; two horizontal guide-rods on the third section; a bracket having one end pivoted and also slidable on the said rods; link-rods having one end pivoted to the upper end of the second section and their other ends jointed to said bracket; and means to extend the three sections whereby when fully extended the bracket will automatically project in an inclined or horizontal position.

3. The combination of a truck; a turn-table mounted on the truck; a ladder pivoted to the movable member of the turn-table;

mechanism to raise and lower the ladder; a ratchet-bar, v^3, attached to the lower end of each side bar of the ladder; a slidable extension-bar, I, adjoining each ratchet-bar; and a dog or pawl, v, carried with each extension-bar to engage the said ratchet-bar, as set forth.

606,459. FOLDING BOX. ARTHUR O. HUBBARD, Minneapolis, Minn. Filed Dec. 21, 1897. Serial No. 662,787. (No model.)

Claim.—1. The combination, in a folding box, with non-overlapping side and end walls, of hinge-plates secured to the upper and lower edges of said walls and overlapping the same, and pivot pins or rods passing through said plates and vertically through said walls, substantially as described.

2. The combination, in a box, with the sides and ends, each composed of a series of strips or slats placed one above the other, of plates arranged between said strips and upon the upper edges of the top strips and the lower edges of the bottom strips and overlapping said sides and ends, and lacing-wires passing vertically through said plates and through said strips or slats, substantially as described.

3. The combination, in a folding box, with the sides and ends, each composed of a series of strips or slats placed one above the other, of plates arranged between said strips and upoo the upper edges of the top strips and the lower edges of the bottom strips, and overlapping said sides and ends, lacing-wires passing vertically through said plates and through said strips or slats, and pivot pins or rods also passing through said plates and said strips, substantially as described.

4. The combination, in a folding box, with the sides and end walls, of hinges secured to the upper and lower edges of one of said abutting walls at each corner of the box, said hinges composed of horizontal plates overlapping the abutting walls, and pivot pins or rods passing through the free ends of said plates, and vertically through the walls, for the purpose set forth.

5. The combination, in a folding box, with the sides and ends, of plates or straps arranged at intervals in the sides and ends at the corners of said box, and at the top and bottom thereof, means for securing said plates in the corners of the box, said plates overlapping the abutting sides and ends, and pivot-pins passing through said plates and vertically through the walls at the corners of the box, substantially as described.

6. In a folding box, the combination, with the sides and ends, of plates 4, 4, and 5, 5, arranged at two diagonal corners of the box, said plates having overlapping ends, and lacing-wires passing through said plates and vertically through said sides or ends, and pivot pins or rods passing through the overlapping ends of said plates, and vertically through the walls at the corners of the box, and angle irons or plates pivotally arranged at the other diagonal corners, substantially as described.

7. In a folding box, the combination, with the sides and ends, of plates 8, 8, having lateral extensions 9, 9, arranged at two diagonal corners of the box, lacing-wires whereby said plates are secured to the sides of the box, pivot pins or rods passing through said extensions 9, 9, and through the ends of the box and whereon the sides and ends are swung when the box is folded or unfolded, substantially as described.

8. The combination, in a folding box, with the sides and ends, of plates or straps secured to said sides and ends at the corners of the box, pins or rods passing through said plates and vertically through said sides and ends and forming pivots whereon the same are swung when the box is folded or unfolded, slots provided in the upper edges of said sides and ends, and dowel-pins in the lower edges of the same, for the purpose set forth.

9. In a folding box, the combination, with the sides and ends, of the angle irons or plates secured at two diagonal corners of the box, said irons comprising plates 8, 8, having the lateral extensions 9, 9, pivot-pins passing through said extensions and vertically through the ends of the box, a swinging bottom, the distance between said pivot-pins and the sides of the box corresponding substantially to the thickness of said bottom, for the purpose set forth.

10. The combination, in a folding box, with the sides and ends, composed of a series of strips or slats placed one above the other, of plates arranged between said strips and upon the upper edges of the top strips and the lower edges of the bottom strips and overlapping said sides and ends, lacing-wires passing vertically through said plates and through said strips or slats, and the lips or flanges provided upon the edges of said plates, for the purpose set forth.

11. The combination, in a box, of a series of slats or narrow boards making up each side and end thereof, hinge-plates overlapping the abutting side and end walls, and metallic fastenings included by the thickness of said slats or boards and passing through the same and said plates to secure them together, substantially as described.

12. The combination, in a box, of a series of slats or narrow boards making up each side and end thereof, and metallic fastenings included by the thickness of said slats or boards and between the same for securing them together, and means having fastenings within the body of the slats or boards and pivoting the sides and ends, substantially as described.

13. The combination, in a box, with non-overlapping side and end walls, of hinge-plates arranged at the corners of the box and included in the thickness of said walls and overlapping their abutting ends, and metallic fastenings passing through said plates and vertically through said walls, substantially as described.

14. In a folding box, the combination, with side and end walls and a swinging bottom, of plates included between the inner and outer surfaces of said walls and overlapping their abutting ends, pivot-pins passing through said plates and vertically through said walls at or near the apexes of two diagonal corners and in the remaining diagonal corners at a distance from their apexes corresponding substantially to the thickness of said bottom.

606,460. DENTAL MATRIX-RETAINER. JAMES W. IVORY, Philadelphia, Pa. Filed Nov. 20, 1897. Serial No. 659,286. (No model.)

Claim.—1. A matrix consisting of a band having a loop at one end and the other end passing through said loop, a barrel having a longitudinal slot therein, a follower mounted in said barrel and adapted to be connected with the free end of said band, a lip on said follower adapted to register with said slot, and a nut engaging with said follower and bearing on said barrel.

2. The combination with a matrix consisting of a band having a loop at one end and the other end passing through said loop, of a barrel having a serrated bearing end, a follower mounted in said barrel and engaging with the free end of said band, and means for moving said follower in said barrel.

3. A follower provided with a lip and means for connection with a matrix, a barrel which is adapted to receive said follower, and having a slot in which said lip is adapted to have longitudinal play, and means for operating said follower, said barrel having a recess in its side, the same being adapted to have the end of the matrix-band seated therein.

4. In a dental matrix-retainer, a barrel containing a follower which may be connected with and control a matrix, and serrations on the end of said barrel for engagement with a tooth.

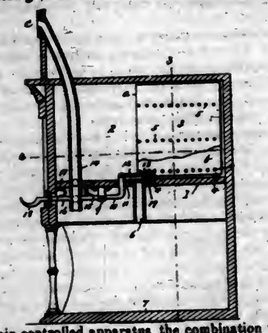
606,461. WIRE-FENCE CLAMP. FERDINAND JOHNSON, New London, Pa. Filed Mar. 29, 1898. Serial No. 675,576. (No model.)

Claim.—1. A wire-fence clamp consisting of a body portion formed with parallel arms, webs projecting therefrom at angles thereto, and the integral fingers extending inwardly and approximately parallel with said arms, substantially as described.

2. The improved sheet-metal wire-fence clamp, formed with the integral alined arms 7, 7 connected at their outer ends with the integral right-angular webs 8, 8 which terminate in the alined integral fingers 9, 9, substantially as shown and described.

606,462. CASTER. JOHN A. KNIERIEM-MCGREGOR, Chicago, Ill. Filed Apr. 4, 1896. Serial No. 586,155. (No model.)

Claim.—1. A socket for a pin-caster, as herein shown and described, consisting of two parts, each having a semitubular portion, an external flange on either side, and a triangular-shaped prolongation, the two parts being riveted or otherwise secured together at the end, the mouth of the tubular portion being secured by an overhanging flanged annular plate, with which the tubular portion is caused to interlock, as shown and described.



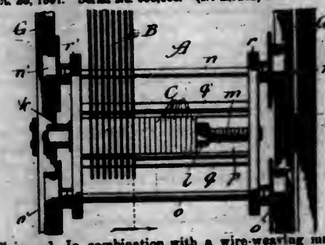
2. A wheel for casters consisting of a flat disk, two saucer-shaped spacing-disks placed on opposite sides of the flat disk with their edges leward, two shaped disks having equidistant lugs or arms turned up at right angles to the disk portions and which are placed outside the other disks and are so arranged that the arms of one shaped disk will interlock with the arms of the other shaped disk, the arms of each disk extending beyond the other disk so that by pressure in a die the extending portions may be caused to curl round and grip onto the outside of the opposite disk portion, facing pieces or disks placed outside the lining formed as above, and a length of tube, the ends of which by pressure in a die are caused to curl round inward to press the facing pieces against the lining and secure all the parts firmly, as set forth.

3. A wheel for casters consisting of spacing-pieces, two shaped disks formed with equidistant lugs or arms, the arms of one disk adapted to interlock with the arms of the other disk and to overlap, the overlapping portions being curled round by pressure in a die to grip onto the outer face of the opposite disk, as set forth.

606,468. COIN-OPERATED MECHANISM. JOHN D. KNEBLER, Sioux City, Iowa, assignor of one-half to James Henry Ball, Oakland, Nebr. Filed Mar. 29, 1897. Serial No. 629,703. (No model.)

Claim.—1. In a coin-controlled apparatus, the combination with a cabinet having a floor with a transverse opening therein, a carriage movable over said transverse opening and provided with a series of vertical spaces or compartments, together with levers operating the carriage through the intervention of a coin, one of the levers being spring-actuated and having a pawl to engage a series of projections on the carriage corresponding in number with the spaces or compartments therein, substantially as shown and set forth.

2. In a coin-controlled apparatus, the combination with a cabinet having a floor with a transverse opening 6, of a carriage movable upon the floor over said transverse opening and provided with a series of vertical spaces or compartments, lugs or projections extending from said carriage, and levers adapted to operate or move the carriage when a coin is interposed between the adjoining ends of the same, one of the levers having a pawl which engages the projections of said carriage, substantially as shown and for the purpose set forth.



3. In a coin-controlled apparatus, the combination with a cabinet having a floor with a transverse opening, of a carriage or case movable on said floor over the transverse opening and provided with projections, a lever pivoted within the cabinet and provided with a pawl in engagement with said projections, a second lever having its inner end adjoining the end of the aforesaid lever, and a tube or coin-chute leading to the space between the adjoining ends of the levers, substantially as shown and for the purpose set forth.

4. In a coin-controlled apparatus, the combination with the floor having a transverse opening therein, of a carriage movable upon the floor over said transverse opening and provided with a series of vertical spaces or compartments, projections on said carriage corresponding in number with the vertical spaces or compartments, a lever centrally fulcrumed and provided at its rear end with a pawl in engagement with said projections and at its other end with a curved depending portion, a second lever pivoted in the cabinet and having its inner end curved downward and located adjoining the corresponding end of the other lever, and a coin-chute leading to the space between said levers, substantially as shown and for the purpose set forth.

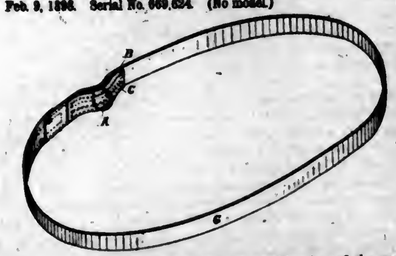
5. In a coin-controlled apparatus, the combination with the cabinet having a floor with a transverse opening therein, of a carriage located upon the floor and having a series of vertical spaces or compartments and projections corresponding in number therewith, a lever 10 centrally fulcrumed and provided with a pawl, spring-actuated to engage the projections on the carriage, a spring for lifting the forward end of said lever, a second lever pivoted in the cabinet and having a spring for depressing the inner end thereof, the adjoining ends of the said levers being curved as shown, and a coin chute or tube leading to the space between the adjoining ends of the levers, substantially as shown and for the purpose set forth.

606,464. WARP-FEED EQUALIZER FOR WIRE-WEAVING MACHINES. CHARLES M. LAMB and JOHN W. PAGE, Adrian, Mich., assignors to the Page Woven-Wire Fence Company, same place. Filed Oct. 20, 1897. Serial No. 656,209. (No model.)

Claim.—1. In combination with a wire-weaving machine and the supply of warp-wires therefor, a warp-wire feeding and equalizing carriage provided with clamps for holding the equalized warp-wires upon it, and supported between said supply and machine to travel toward and feed the warp-wires from the supply to the machine by its operation, substantially as described.

2. In combination with a wire-weaving machine, an overhead track between said machine and the warp-wire supply thereto, and a clamping-carriage movable on said track and operating to hold

the equalized warp-wires while being fed to said machine, substantially as and for the purpose set forth.

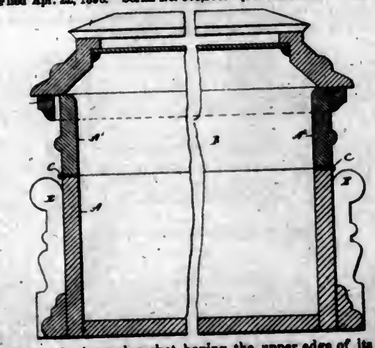


3. A clamping-carriage for holding the equalized warp-wires while being fed to a wire-weaving machine, comprising a frame, a rod supported on the frame to extend across it, clamps supported on the rod and adjustable lengthwise thereof to clamp the warp-wires between them, and means for tightening the clamps, substantially as described.

4. A clamping-carriage for holding the equalized warp-wires while being fed to a wire-weaving machine, comprising a frame, a clamp-support on said frame, clamps on said support, means for tightening said clamps against the warp-wires interposed between them, and a channeled bar below the clamps for confining them at their lower ends, substantially as described.

5. A clamping-carriage for holding the equalized warp-wires while being fed to a wire-weaving machine, comprising a frame, a threaded rod *m* supported in said frame and carrying nuts *l* and *k*, clamps C suspended on said rod and having sockets *i* for the warp-wires and sockets *i'* for spacers *h*, substantially as described.

6. A clamping-carriage for holding the equalized warp-wires while being fed to a wire-weaving machine, comprising a frame adapted to ride on a track and formed with side bars *r* and *r'*, bars *q* and *q'*, and a channeled bar *p*, a threaded rod *m* supported in said side bars and carrying nuts *l* and *k*, and clamps C suspended on said rod and having sockets *i* for the warp-wires and sockets *i'* for spacers *h*, substantially as described.



606,465. TRUSS. WILLIAM P. LE SEUR, New York, N. Y. Filed Feb. 9, 1898. Serial No. 669,634. (No model.)

Claim.—1. In a truss for hernia, the combination of the upper and lower leaf-springs B, C, inwardly curved in a horizontal plane, flexible connections D', D² of leather, pad A secured independently of the springs B, C, a webbing or belt G, and suitable securing means for the latter, as herein specified.

2. In a truss for hernia, the combination of the inwardly-curved springs B, C, having their ends secured as shown, with the double pocket D', D², and fastening provision I between them engaging the pad A and washer H, the flexible webbing or belt G, two straps J', J², of differing lengths, two buckles K', K², out of coincidence with two straps M', M², all arranged to serve substantially as herein specified.

606,466. CASKET. THOMAS H. LINAHAN, New Haven, Conn. Filed Apr. 22, 1898. Serial No. 678,536. (No model.)

Claim.—1. A couch-casket having the upper edge of its body provided with front and back and end leaves arranged to swing outward, and provided with a cover which is rigidly secured to the back leaf and which is adapted to shut over the upper edges of the front and end leaves for holding them in their closed or upright positions.

2. A couch-casket having its body provided upon its upper edge with outwardly-swinging front and back and end leaves, and provided with a cover rigidly secured to its back leaf and adapted to shut over the upper edges of the front and end leaves for securing them in their closed positions, and the said body of the casket being provided with pilasters or ornaments arranged to support the leaves in their open positions, in which the casket is converted into a couch.

606,467. FARM-GATE. THEODORE C. LEFFITT, Shenandoah, Iowa. Filed Oct. 13, 1897. Serial No. 655,071. (No model.)

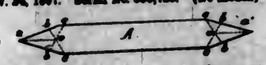
Claim.—1. In a farm-gate, a series of bars and uprights pivotally connected for parallel movement in their structural plane, a pair of hinges secured to one of the end uprights, a brace rigidly connected with each hinge and the two braces joined together at a distance from the hinges forming a triangle with the hinged upright; a notched rack secured to an upright of the gate near the juncture of the said two braces and a latch secured to one of the braces adapted to engage the rack-notches, substantially as described.

2. In a farm-gate, a series of parallel bars and uprights pivotally joined, a pair of hinges secured to one of the end uprights, a notched plate secured to a midway upright to project beyond one edge thereof, braces extending from each hinge and joined near said midway upright, one of the said braces having a return or hook-shaped bend at its end to engage the projecting edge of the notched plate, and a latch to engage the notches, substantially as described.

606,468. CURTAIN-FIXTURE. ABRAHAM S. LOEB, Lynn, Mass., assignor of one-half to George H. Field, same place. Filed Dec. 29, 1896. Serial No. 617,360. (No model.)

Claim.—1. The combination in a curtain-fixture, of a pair of curtain-rolls lying in parallel and adjacent position with respect to each other, a pair of double-bearing brackets having sockets opening toward each other and having laterally-extending ears or projections adapted to engage supporting devices attached to the window frame or casing, a spacing-rod joining said sockets, and operating-cords for said rolls, as described.

2. The combination in a curtain-fixture, of a pair of curtain-rolls in close and parallel relation, a set of double-bearing brackets therefor having each a right-angle extension, supporting devices adapted to be permanently attached to the window frame or casing, a spacing-rod joining said brackets in line with said curtain-rolls, and operating-cords for said rolls; said extensions adapted to detachably engage said supporting devices and permit said rolls and brackets to be removed from or replaced in position in their normal engaged relation, as set forth.



3. The herein-described improved curtain-fixture, comprising a pair of curtains, independent rolls therefor, a pair of brackets each having bearings for the spindles of said rolls, respectively, a spacing and supporting rod joining said brackets, supports for said brackets, and devices upon said brackets for detachably engaging with said supports and permitting said brackets and curtains to be detached in their engaged relation, substantially as set forth.

4. The combination in a curtain-fixture, of the rolls H H', the brackets F F' therefor each having the double bearings G G' therein, a spacing-rod R joining said brackets, and suitable supporting devices S S'; said brackets being provided the one with a horizontal slot or recess U' and the other with a vertical slot or recess U, for the purpose mentioned.

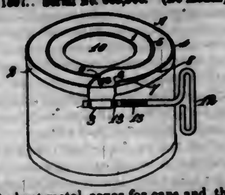
5. In a curtain fixture the combination of a pair of curtain-rolls lying parallel and adjacent, a pair of double-bearing brackets for said rolls having laterally-projecting extensions or ears, a spacing-rod joining said brackets, and supporting devices on the window frame or casing adapted for locking engagement with said extensions or ears.

6. In a curtain-fixture, a pair of curtain-rolls in parallel and adjacent relation, a pair of double-bearing brackets therefor having extensions or ears, a spacing bar or rod joining said brackets, in combination with devices upon the window-casing adapted for locking engagement with said extensions or ears.

606,469. PAIL-HOOK. CHARLES W. MITCHELL, Brooklyn, N. Y., assignor to the Twisted Wire Box Strap Company, New York, N. Y. Filed Nov. 24, 1897. Serial No. 659,723. (No model.)

Claim.—1. A pail-hook consisting of a sheet-metal strip having pointed ends bent up and folded to form points of double thickness, substantially as set forth.

2. A pail-hook consisting of a sheet-metal strip, with pointed ends bent up and folded flat together to form points of double thickness, substantially as set forth.



3. A pail-hook consisting of a sheet-metal strip with pointed ends bent up and folded together from each side, and with the parts of the strip at the base of the points folded down against the strip, so as to form a double thickness at the point and the part of the strip immediately supporting the same, while leaving the intermediate portion of the strip of single thickness and therefore comparatively flexible.

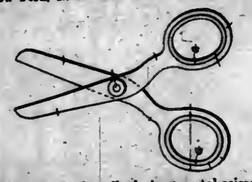
606,470. PROCESS OF MAKING CHLORIN DERIVATIVES OF TOLUENE. PIERRE P. MONNET, Lyons, France, assignor to La Société Chimique des Usines du Rhône, successor, Gillard P. Monnet et Cartier, same place. Filed Nov. 22, 1897. Serial No. 659,514. (No specimens.) Patented in England Dec. 24, 1896, No. 28,717.

Claim.—1. The method or process of preparing chlorin derivatives of toluene from the ortho or para toluene sulfo chlorid which consists in treating ortho or para toluene sulfo chlorid when heated with a current of dry chlorin gas, substantially as described.

2. The method or process of manufacturing chlorin derivatives of toluene from the ortho or para toluene sulfo chlorid, which consists in passing into the said sulfo chlorid heated to 150° centigrade a stream of dry chlorin gas, and maintaining the reaction at 150° to 200° centigrade until the required quantity of chlorin has been absorbed, and purifying the resultant product, substantially as described.

606,471. KEY-OPENING CAN-HEAD. BENJAMIN W. MONROE, Chicago, Ill., assignor of one-half to Hugo Engdahl, Mount Vernon, N. Y. Filed Dec. 27, 1897. Serial No. 663,869. (No model.)

Claim.—1. A sheet-metal cover for cans and the like provided with weakening-lines forming a detachable strip, a portion of which follows the contour of the cover and is located near the edge, the remaining portion being deflected inwardly and then outwardly across said edge and terminating in a projecting tongue, whereby said tongue is disposed approximately at right angles to said edge, and the strain on the weakening-lines is equalized in the ripping operation, substantially as described.



2. A flanged sheet-metal cover for cans and the like provided with weakening-lines forming a detachable strip, a portion of which follows the contour of the cover and is located near the flange, the remaining portion being deflected inwardly and then outwardly across said flange at a point adjacent to the commencement of the strip and terminating in an approximately radially-projecting tongue, substantially as described.

3. A sheet-metal cover for cans and the like having weakening-lines providing a detachable strip, said lines conforming for the major portion of their length to the contour of the cover edge, the remaining portion being deflected inwardly from the edge and thence outwardly across the latter, and an extension of the strip projecting approximately radially from said edge to provide a tongue, substantially as described.

4. A flanged sheet-metal cover for cans and the like having weakening-lines providing a detachable strip, said lines conforming for the major portion of their length to the contour of the cover edge, the remaining portion being deflected inwardly from the edge in the arc of a circle, thence outwardly in the arc of a circle across the edge and finally downwardly in vertical direction across the flange, and a right-angled extension of the flange between the said lines providing a tongue, substantially as described.

5. A flanged sheet-metal cover for cans and the like provided with weakening-lines forming a detachable strip the middle portion of which follows the contour of the cover and is located near the flange, the end portions being deflected inwardly and then outwardly across the flange approximately to each other and terminating in radially-projecting tongues, substantially as described.

606,472. SHEET-METAL SCISSORS OR SHEARS. MORTIMER C. OSBUN, New York, N. Y. Filed Dec. 6, 1897. Serial No. 660,947. (No model.)

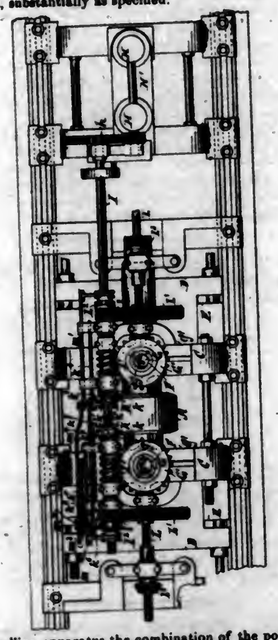
Claim.—1. The herein-described sheet-metal scissors or shears, having bushings located within the loops and overlapping the inner edges thereof, substantially as described.

2. The herein-described sheet-metal scissors or shears, having flanged bushings inserted through the loops so as to rest upon one side thereof, and upset upon the opposite side, whereby the bushings are interlocked in the loops, substantially as described.

606,473. TOBACCO-PIPE. GEORGE G. PALMER, New York, N. Y. Filed June 18, 1897. Serial No. 641,344. (No model.)

Claim.—1. A tobacco-pipe comprising a bowl having a draft-opening, a stem, a tube located within said stem and communicating with the draft-opening, and through a similar opening with the interior of the stem, and a valve for controlling the opening in said tube.

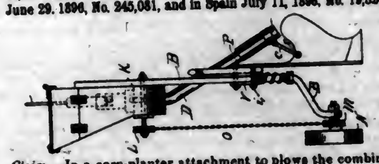
2. A tobacco pipe comprising a bowl having a draft-opening, a stem for the bowl having an opening adjoining the bowl communicating with the outside, means for closing the opening in said stem, a tube located within said stem communicating with the draft-opening, closed at its outer end, and provided with an opening in its upper side, and a valve for the opening in said tube.



3. A tobacco-pipe comprising a bowl having a draft-opening therethrough, a curved stem secured to said bowl provided with an opening adjoining the bowl and communicating with the outside, a cap for closing said opening, a tube located within said stem communicating with the draft-opening, closed at its outer end, and having an opening in its upper side, and a gravity-valve for closing the opening in said tube, as and for the purpose set forth.

4. A tobacco-pipe comprising a bowl having a draft-opening therein, a stem for the bowl, said stem being curved, and a mouth-piece connected to the stem, the latter having an opening at or adjoining the bowl which is closed by a removable cap; together with a tube located within the stem and communicating with the draft-opening of the bowl, said tube being closed at its outer end and provided with an opening in its upper side, and a valve or flap closing the opening in the draft-tube, the parts being constructed and arranged substantially as shown and described.

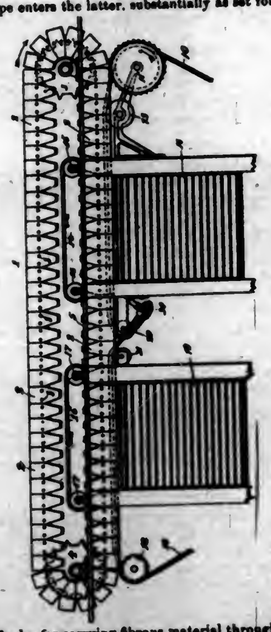
606,474. ROLLING APPARATUS. DE WITT C. PRESCOTT, Duluth, Minn., assignor to the York Structural Steel Company, New York, N. Y. Filed Mar. 22, 1895. Serial No. 542,757. (No model.)



Claim.—1. In a rolling apparatus, the combination with top and bottom rolls and side rolls, of a single power-shaft, worms and worm-wheels with which said worms engage to secure the adjustment of the top and bottom rolls, clutches for operatively connecting with and disconnecting said worms from said shaft, pinions driven by said power-shaft, and driving mechanism for securing the adjustment of

the side rolls, clutches for operatively connecting said pinions with said shaft and disconnecting them therefrom, and means for operating the clutches, substantially as specified.

2. In a rolling apparatus the combination of the power-shaft I, the shafts G, G, driving the screws F, F, the worm-wheels G' G' splined to the shafts G, G, the worms I', I' driven from the shaft I and engaging with the worm-wheels G', G', the clutches K, K the pinions *l l* driving the shafts L, L, and the clutches L^2 L^2 for operatively connecting the pinions *l*, *l*, with the shaft I and disconnecting them therefrom, substantially as specified.



606,475. SEEDING-MACHINE. KARL PÖSKÁS, Kisujszallas, Austria-Hungary. Filed Feb. 10, 1897. Serial No. 622,883. (No model.) Patented in Hungary June 6, 1896, No. 4,599; in Belgium June 12, 1896, No. 93,878; in England June 12, 1896, No. 13,009; in Italy June 22, 1896, No. 13,618; in Austria June 25, 1896, No. 46/2,806; in France June 29, 1896, No. 245,081, and in Spain July 11, 1896, No. 19,324.

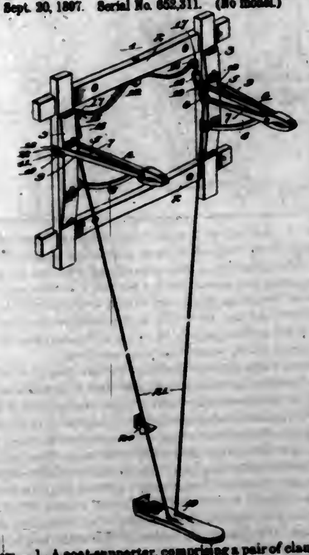
Claim.—In a corn-planter attachment to plows the combination of a seedbox on an upright supported by a wheel running with the plow and attached thereto, divided into three chambers by movable sliding partitions, and containing a feeding-wheel conveying the corn from the second to the third chamber from which the corn is discharged through a rotary pipe and delivery-tube into the furrow, motion being obtained by means of a chain-gearing engaging with the supporting-wheel as and for the purpose above specified.

606,476. FEEDER FOR SCUTCHING-MACHINES. ELIS G. A. SCHENSON, Arbra, Sweden, assignor to the Patentaktiebolaget Svea, Stockholm, Sweden. Filed Dec. 23, 1896. Serial No. 616,718. (No model.)

Claim.—1. A feeder for carrying fibrous material through a scutching or hackling machine, comprising an endless series of clips 2, arranged in a vertical plane over the said machine with its lower side adjacent thereto, the wheels on which said endless series of clips is mounted, means for moving said series of clips, an endless rope arranged in a vertical plane and its upper side engaging the jaws of the clips at the lower side of said endless series, whereby the latter carry the rope in their travel, guides on which said rope is supported, means for supplying the fiber laterally and in a regulated manner into the bite of the rope and series of clips at the point where the rope enters the latter, substantially as set forth.

2. A feeder for carrying fibrous material through a scutching or hackling machine, comprising an endless series of clips 2, arranged in a vertical plane over the said machine with its lower side adjacent thereto, the wheels on which said endless series of clips is mounted, means for moving said series of clips, an endless rope arranged in a vertical plane and its upper side engaging the jaws of the clips at the lower side of said endless series, whereby the latter carry the rope in their travel, guides on which said rope is supported, means for supplying the fiber to the feeder in a regulated manner, and means substantially as described for spreading the upper ends of the jaws of the clips 2, above the scutching-machine, substantially as set forth.

3. A feeder for carrying fibrous material through a scutching or hackling machine, comprising an endless series of clips 2, arranged in a vertical plane over the said machine with its lower side adjacent thereto, the wheels on which said endless series of clips is mounted, means for moving said series of clips, an endless rope arranged in a vertical plane and its upper side engaging the jaws of the clips at the lower side of said endless series, whereby the latter carry the rope in their travel, guides on which said rope is supported, means for supplying fiber in regulated quantity to the feeder, and means for causing the jaws of the clips 2 to clamp firmly on the fiber, said means comprising an endless belt 14 and carrying-pulleys therefor, the said belt being arranged in a vertical plane with its lower side occupying a position between the upper ends of the jaws of the clips, substantially as set forth.



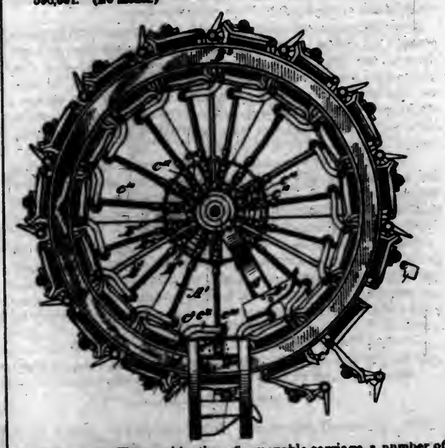
4. In a fiber feeding and carrying machine, the combination with the endless chain of clips, means for moving said clips and the endless rope 10, having its upper side embraced by the jaws of said clips, of means for turning the fiber end for end, comprising a sheave 29, which guides the rope from the clips, a toothed sheave 30, situated below and forward of the sheave 29, the rope 10 passing over both of said sheaves, the sheave 31, which guides the rope back into the clips, and the smooth bars, 32, arranged at the sides of that part of the rope 10 between the sheaves 30 and 31, substantially as set forth.

5. The combination with the endless chain of clips, means for moving said clips and the endless rope having its upper side embraced by the jaws of the clips at the lower side of the chain, of the sheave 12 which guides the rope out of the clips at the delivery end of the feeder, the triangular table 33, situated at the delivery end of the chain, and the moving endless ropes arranged at the respective sides of the table, for receiving and straightening out the fiber, substantially as set forth.

6. In a feeder for the purpose set forth, the combination with the endless rope 10, of a chain of clips 2, each composed of two jaws 6, hinged together and adapted to be clamped on the said rope, and means for spreading the other ends of the jaws to cause them to clamp on the rope, substantially as set forth.

7. The combination with the endless chain or clips, means for moving said clips and the endless rope 10, embraced and carried thereby, of means for supplying the fiber to the chain, comprising the toothed wheels 24, the rocking table 22, means for pressing the table up to the said toothed wheels, and the fixed plates 25, over the said wheels, substantially as set forth.

606,477. COAT-SUPPORT. JOHN T. STEVENS, Manning, Wis. Filed Sept. 20, 1897. Serial No. 652,311. (No model.)



Claim.—1. A coat-supporter, comprising a pair of clamps adapted to be folded inwardly out of the way, a spring connected to the movable jaws of said clamps for holding them normally in closed position, and foot-operated mechanism for opening said clamps.

2. In a coat-supporter, the combination with a frame adapted to be secured to the wall, of a pair of clamps hinged to the upright bars of said frame and adapted to fold inwardly, means for holding said clamps in their outward operative position, a spring secured to one of the longitudinal bars of said frame, connections between said spring and the movable jaws of said clamps for holding the latter normally in closed position, and foot-operated mechanism for opening said clamps, substantially as and for the purpose described.

3. In a coat-supporter, the combination with a frame adapted to be secured to the wall, of a pair of clamps pivoted to the upright bars of said frame and adapted to fold inwardly, each of said clamps comprising a stationary jaw, a bracing-bar, a spring attached to the stationary jaw at a point adjacent to its outer end and having an opening in its rear end to receive a pin on the outer surface of said upright bar, and a movable jaw pivoted to said stationary jaw, a retractile spring secured at a point intermediate of its ends to the upper horizontal bar of said frame, connections between the outer ends of said retractile spring and the rear end of said movable jaw, and means for operating said movable jaw for opening the clamps, substantially as and for the purpose described.

4. In a coat-supporter, the combination with a frame adapted to be secured to the wall, of a pair of clamps pivoted to the upright bars of said frame and adapted to fold inwardly, each of said clamps comprising a stationary jaw, a bracing-bar connected to said stationary jaw, a spring attached to said stationary jaw extending rearwardly therefrom, having an opening in it adapted to receive a pin on the side of the upright bar of said frame, fitting within a recess in said bar and provided with a loop on its free end constituting a handle, and a movable jaw pivoted to said stationary jaw and formed with an eye at its rear end, a retractile spring secured at a point intermediate of its ends to the upper horizontal bar of said frame and formed with loops or eyes at its ends, swivels having hooks upon their ends fitting respectively in the eyes on said retractile spring and on said movable jaw, a foot-lever, and cords connecting said foot-lever with the rear end of said movable jaw, as and for the purpose described.

606,478. PRESSING-MACHINE. EDWARD S. TRENAMAN, Brooklyn, and PIERRE LORILLARD, Jr., Tuxedo, N. Y., assignors to the P. Lorillard Company, Jersey City, N. J. Filed May 8, 1896. Serial No. 590,661. (No model.)

Claim.—1. The combination of a movable carriage, a number of presses each comprising a hydraulic ram supported by said carriage, inlet and outlet valves for each ram, and stationary means in the path of the movable carriage for automatically opening and closing the valves of such rams at predetermined points as the presses are moved along, substantially as specified.

2. The combination of a movable carriage, comprising superposed rings B', B^2 and a central hub, a number of presses intermediate said rings and comprising hydraulic rams, a number of radial pipes extending from said hub to the rams, valves controlling said radial pipes, and stationary means for automatically operating said valves, substantially as specified.

3. The combination of a movable carriage, a number of presses supported by said carriage, and each comprising stationary sides, and doors or movable sides, and means carried by the presses for locking said doors or movable sides in closed position, substantially as specified.

4. The combination of a movable carriage, a number of presses supported by said carriage, and each comprising a platen, stationary sides thereon, and doors or movable sides, and means carried by the presses and brought into operation by the movement of the carriage for locking said doors or movable sides in closed position, substantially as specified.

5. The combination of a movable carriage, a number of presses supported by said carriage, and each comprising a platen, stationary sides thereon, and doors or movable sides hinged to the stationary sides, and means on the doors for locking them together, and stationary devices in position to successively secure and release said locking means as the presses are moved along, substantially as specified.

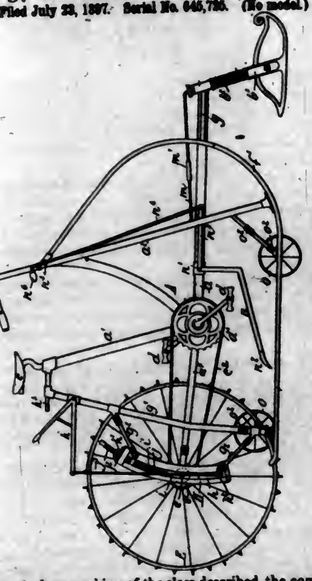
6. The combination of a movable carriage, a number of presses supported thereby and each comprising a plunger and platen, two stationary sides at right angles to each other on the platen, a movable side and door hinged respectively to said stationary sides, means for locking said movable side and door together, and stationary devices in position to successively secure and release said locking means as the presses are moved along, substantially as specified.

7. The combination of a movable carriage, a number of presses supported by said carriage, doors or movable sides for said presses, means comprising locking-cams, an oscillating rod, fingers extending from said rod, and stationary cams for locking and unlocking said doors or movable sides, substantially as specified.

8. The combination of a movable carriage, a number of presses supported thereby and each having a swinging front or door and locking means therefor, a frame adjacent to the carriage, cams on said frame arranged to successively close and lock said doors as the presses are moved along, substantially as specified.

9. The combination of a movable carriage, a number of presses supported thereby and each having a horizontally-swinging front or door, and locking means therefor, an upright frame adjacent to the carriage, cams on said frame in line to close and lock said doors, and a cam for releasing the doors as the presses are moved along, substantially as specified.

10. The combination of a movable carriage comprising superposed rings, and a central hub, a series of presses located interme-



diate of said rings and each having a swinging door and locking means therefor, an upright frame pivoted at its lower end and engaging the upper ring at its opposite end, and cams on said frame in line to successively close and lock said doors as the presses are moved along, substantially as specified.

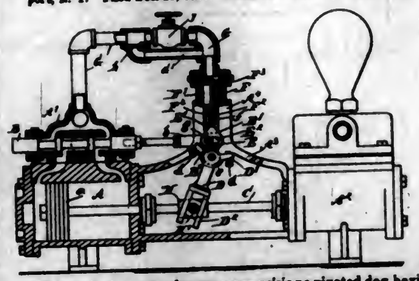
11. The combination of a movable carriage comprising superposed rings and a central hub, a series of presses located intermediate of said rings and each having a horizontally-swinging door and locking means therefor, an upright frame pivoted at its lower end and having an adjustable bearing at its opposite end engaging the upper ring of the carriage, and cams on said frame arranged to close and lock said doors as the presses are moved along, substantially as specified.

12. The combination with a carriage having superposed rings and a central hub, of a series of presses supported on the lower ring and each comprising a hydraulic ram, and suitable inlet and outlet pipes and valves therefor, and stationary stop for the presses carried by the upper ring, substantially as specified.

13. The combination with a rotating carriage, of a series of presses thereon, each comprising a hydraulic ram, and suitable inlet and outlet pipes therefor, valves in said pipes having elongated stems, and stationary cams in line to be engaged by said stems for automatically operating said valves as the carriage rotates, substantially as specified.

606,479. ICE-VELOCIPEDE. WILLIAM L. WILLIAMS, Winona, Minn. Filed July 23, 1897. Serial No. 645,735. (No model.)

Claim.—1. In a machine of the class described, the combination with a frame carrying runners, of a driving-wheel, sprocket wheel and chain mechanism for operating said driving-wheel, brackets adjustably connected with the frame, blocks movable in said brackets and affording bearings for the driving-wheel axle, springs for controlling said blocks, and means for adjusting the tension of the springs, substantially as set forth.



2. In a machine of the class described; the combination with a frame carrying runners, of a driving-wheel journaled in spring-controlled movable bearings, means adjustably connecting the bearings with the frame, and means for elevating said wheel above the runners, consisting of a hand-operated lever having rod connection with said bearings, and a lock for said means, substantially as described.

3. In a machine of the class described the combination with a frame carrying runners, of a driving-wheel provided on its periphery with removable and interchangeable blades and spikes, sprocket wheel and chain mechanism for operating said driving-wheel, curved brackets carrying spring-controlled movable bearings for the axle of the driving-wheel, arms adjustably connecting the brackets with the frame, and means for elevating said wheel above the runners consisting of a hand-operated lever having rod connection with the bearings, and a lock for said means, substantially as described.

4. In a machine of the class described, the combination with the frame and driving-wheel, of brackets in which the said wheel is journaled, and arms secured to the frame and having adjustable connection with said brackets, substantially as described.

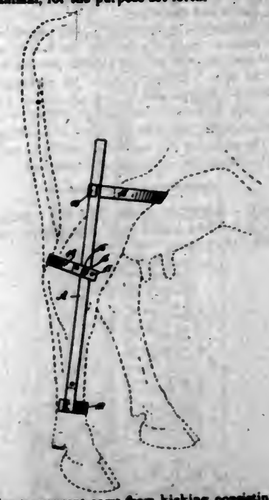
5. In a machine of the class described the combination with a frame carrying runners, of wheels mounted on arms slidably connected with the frame and adapted to be moved to a position below the runners, substantially as and for the purpose set forth.

606,480. VALVE-GEAR FOR PUMPS. JOHN DOHERTY, Lockport, N. Y. Filed Dec. 29, 1897. Serial No. 664,378. (No model.)

Claim.—1. A pump valve-gear, comprising a pivoted dog having its outer edge faces inclined toward each other and forming cam-surfaces, a roller mounted to slide toward and from the pivot of said dog and engaging said cam-surfaces, a pivoted lever having vibratory connections to the pump-piston and having arms adapted to engage opposite sides of the dog, to vibrate it, but being wider than the dog so as to have lost motion between the two, and connections from said dog to the steam-valve, substantially as described.

2. A pump valve-gear, comprising a pivoted dog or lever having its outer end pointed or diamond-shaped, and a laterally-extending slot therein, a valve-operating rod having a pin extending into said slot, a roller mounted to slide toward and from the pivot of said dog and bearing upon its inclined edges, a pivoted lever having vibrating connection with the pump piston-rod, and arms upon said lever adapted to embrace the dog, to vibrate it, substantially as described.

3. A pump valve-gear, comprising a pivoted dog or lever having its outer end pointed or diamond-shaped and a laterally-extending slot therein, a valve-operating rod having a pin extending into said slot, a cylinder and plunger mounted in line with the pivot of the dog, connections from the cylinder to the steam-supply for the pump, a plunger having a roller engaging the inclined surfaces of the dog, a pivoted lever having vibrating connection with the pump piston-rod, and arms upon said lever adapted to embrace the dog, to vibrate it, substantially as described.



4. A pump valve-gear, comprising a pivoted dog or lever having its outer end pointed or diamond-shaped and forming inclined cam-surfaces and also having a laterally-extending slot therein, a valve-operating rod having a pin extending into said slot, a cylinder or plunger mounted in line with the pivot of the dog, connections from said cylinder to the steam-supply for the pump, a throttling-valve in said steam connection, a by-pass having a check-valve opening toward the steam-supply, a roller mounted upon the plunger and engaging the cam-surfaces of the dog, and a pivoted lever having vibrating connection with the pump piston-rod and arms adapted to embrace the dog, to vibrate it, substantially as described.

5. A pump valve-gear, comprising a pivoted dog or lever having its outer end pointed or diamond-shaped and forming inclined cam-surfaces, connections therefrom to the steam-valve, a yielding plunger having a roller bearing upon the cam-surfaces of the dog and toward its pivot, a pivoted lever having vibratory connection with the pump-rod and having arms embracing the dog, and set-screws extending through said arms whereby the slack or lost motion between the arms and the dog may be regulated, substantially as described.

6. A pump valve-gear, comprising a pivoted dog or lever having its outer end pointed or diamond-shaped and forming inclined cam-surfaces, said dog having a lateral slot, adjustable plates by which the extent of said slot may be regulated, a valve-stem connection to said slot comprising a pin entering said slot, a yielding plunger having a roller bearing upon the cam-surfaces of the dog and toward its pivot, a pivoted lever having vibratory connection with the pump-rod and having arms embracing the dog, and set-screws extending through said arms, whereby the slack or lost motion between the arms and the dog may be regulated, substantially as described.

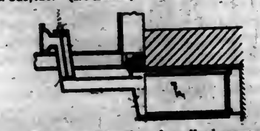
606,481. DEVICE FOR PREVENTING COWS FROM KICKING. CHRISTOPHER A. RISBOSO, Pleasant, S. D. Filed Mar. 7, 1898. Serial No. 673,008. (No model.)

Claim.—1. A device to prevent cows from kicking, consisting of two main pivotally-connected members, oppositely-disposed clamps on said members, adapted to embrace the leg of the animal and prevent flexure thereof, and means for locking the device in place on the leg of the animal, for the purpose set forth.

2. A device to prevent cows from kicking, consisting of a body constructed of two pivotally-connected members, one member being provided with a lower and with an intermediate open clamping-band, which bands face in opposite directions, the other member being provided with an upper open clamping-band facing in the same direction as the lower clamping-band, and a locking connection between the two members of the body, for the purpose set forth.

3. In a device to prevent cows from kicking, a body comprising an outer bar, and an inner bar of less length than the outer bar and pivoted thereto, an open clamping-band secured to the lower end of the longer body-bar and facing rearward, an adjustable open binding-band pivoted on the said longer body-bar intermediate of its ends, a locking device for the intermediate band, a larger open clamping-band secured to the upper end of the shorter body-bar and facing in the same direction as the lower open band, and means for locking the two body-bars together, for the purpose specified.

4. In a device to prevent cows from kicking, the combination, with a body comprising an inner and an outer bar pivotally connected, the outer bar being the longer one and the inner bar being pivotally attached to the outer bar at a point near the lower end of the latter, of an open binding-clamp secured to the lower end of the longer body-bar and facing to the rear, a second open clamping-band pivoted upon the longer body-bar and facing to the front, a locking device for the said intermediate band, a larger open clamping-band secured to the upper end of the shorter body-bar and facing rearward, and an open loop located upon the outer face of the shorter body-bar and facing forwardly, said loop being adapted to receive within it the longer body-bar, as and for the purpose specified.



606,482. CLOTHES-LINE BRUSH. DARIUS F. GALLAGHER, New York, N. Y. Filed Feb. 12, 1898. Serial No. 670,169. (No model.)

Claim.—1. A clothes-line brush having a spirally-bent back, and bristles extending from the inside of said back to engage the exterior surface of the clothes-line, and clean the same upon pulling the line through the brush in an axial direction thereto, substantially as shown and described.

2. A clothes-line brush having a spirally-bent back, and bristles extending from the inside of said back to engage the exterior surface of the clothes-line, and clean the same upon pulling the line through the brush in an axial direction thereto, said back being provided at one end with means for loosely suspending it from a fixed support adjacent to the clothes-line, substantially as shown and described.

606,488. APPARATUS FOR DISPOSING OF GARBAGE FROM BUILDINGS. IRA C. GOODRIDGE, Rochester, N. Y. Filed July 16, 1896. Serial No. 600,720. (No model.)

Claim.—1. A device of the class described, comprising a receiver within a room of the building, a casing below the floor of the said room, a pipe leading from the receiver to the casing, and a plunger in said pipe, substantially as described.

2. A device of the class described comprising a receiver within a room of the building and provided with a lid, a casing outside of the building and below the floor of the room in which the receiver is located, said casing being provided with a door, a pipe leading from the receiver out through the wall of the building and then down into the casing, and a plunger in the portion of the pipe leading through the side of the building, substantially as described.

606,484. SASH-FASTENER. JOHN GREIFF, Dayton, Ky. Filed Oct. 1, 1897. Serial No. 653,769. (No model.)

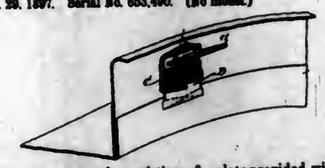
Claim.—1. In a sash-lock, the combination with an eccentric block pivoted to lock the lower sash, of a pivotally-supported bell-crank lever, a pusher-bar loosely held on and projecting from the bell-crank lever, a presser-block on the pusher-bar, and a connecting-rod loosely engaged at its ends with the eccentric block and bell-crank lever, substantially as described.

2. In a sash-lock, the combination with a rockable friction-block adapted to lock the lower sash, of a pivoted bell-crank lever above said rockable friction-block, another friction-block on a pusher-bar which is rockable on a hub of the bell-crank and thus adapted for projection toward the upper sash to lock it, means to connect the bell-crank and lower friction-block for their simultaneous rocking movement, and a projection on the bell-crank for support of the upper friction-block when it is rocked away from the upper window-sash, substantially as described.

3. In a sash-lock, the combination with an eccentric block having a finger-piece, and a gum facing held to project from the periphery of the eccentric block, said block being eccentrically pivoted upon a bead-strip of the window-casement adjacent to the lower sash of the window, of a bell-crank lever pivoted, between two opposite limbs, on the bead-strip above the eccentric block, a connecting-rod loosely engaging its ends with the bell-crank lever and eccentric block at the same side of the pivots of said parts, a pusher-bar pivoted on the bell-crank lever so as to project therefrom toward the upper sash, an adjustable presser-block on the projected end of the

pusher-bar, and a gum facing on the presser-block adapted to contact with the upper sash, substantially as described.

606,485. ANTIFRICTION-BEARING. JAMES H. LAWRENCE, Farnham, Canada. Filed Oct. 15, 1897. Serial No. 655,298. (No model.)



Claim.—1. An antifriction-bearing, comprising a shaft, an annulus surrounding a portion of said shaft but not engaging therewith, a series of rolling antifriction devices supported on the annulus, a series of outer rolling antifriction devices engaging the first-named antifriction devices, and a casing, bearing on the last-named antifriction devices, substantially as specified.

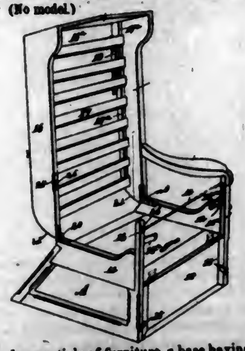
2. An antifriction-bearing, comprising a shaft, an annulus surrounding a portion of said shaft but not engaging therewith, balls engaging on said annulus, an outer series of balls bearing on the inner balls, a ring surrounding the shaft and having a bearing for the outer balls, and a cap connected to said ring and also having a bearing for the outer series of balls, substantially as specified.

3. An antifriction-bearing, comprising a shaft, an outwardly-extending flange on said shaft having a bearing-surface for balls, a disk supported on the shaft and having a bearing for said balls, an annulus surrounding the shaft between the flange and disk, balls supported on said annulus, outer balls engaging with the first-named balls and with the bearings of the flange and disk and a casing engaging with said outer balls, substantially as specified.

4. An antifriction-bearing, comprising a shaft or axle, an outwardly-extended flange on said shaft or axle, a disk on a portion of the shaft or axle, there being a space between the flange and disk, a grooved annulus in said space but free from the shaft or axle, balls engaging in the groove of the annulus, the said balls being within the space mentioned, an outer series of balls engaging with the first-named series and also with the peripheries of the flange and disk, a ring surrounding the shaft or axle, but free therefrom, the said ring having a raceway or bearing-surface for the outer balls, and a cap adjustable relatively to the ring, said cap also having a raceway or bearing for the outer balls, substantially as specified.

606,486. HAT-GUARD. WILLIAM LORD, New York, N. Y. Filed Sept. 29, 1897. Serial No. 653,490. (No model.)

Claim.—A hat-guard, consisting of a plate provided with means for securing one end only to the sweat-band of a hat so that the main portion of the plate will be free to permit a cord being wrapped around it, the plate being provided at its other end with a transversely-extending socket, a cord secured to the end of the plate opposite that having the socket, and a bar on the free end of the cord, whereby when not in use, the cord may be wrapped around the plate and one end of the bar inserted in the socket, as set forth.



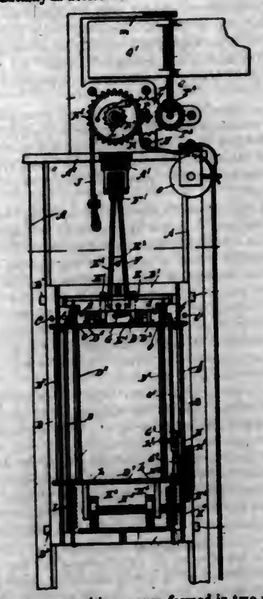
606,487. BICYCLE-SUPPORT. WILLIAM MEHRATH, Highland Park, N. J. Filed June 2, 1896. Serial No. 593,960. (No model.)

Claim.—1. In bicycle-supports, the combination, with the shouldered clip for a frame-bar B, of the pivoted head D, having the transverse open slot in its outer and free end, and a pin E^3, fixed transversely in the central upper portion of the slot, the two similar rods pivoted side by side at opposite points within said slot, their heads or upper portions being extended into the latter beyond the pivots and beveled and notched on their inner sides as specified, whereby they are adapted to fit together and engage the stop-pin E^3; when extended, as shown and described.

2. A bicycle-support, comprising a clip, adapted to be secured to the lower brace or reach of a bicycle, and having an open lengthwise slot, and rear shoulder A'; the head D, pivoted in said slot, and having itself an open transverse slot; a pin crossing the latter slot centrally; the two legs pivoted at opposite points below and equidistant from such cross-pin, and having notches in their extended upper ends for engaging the same; a spring and locking-pin arranged as specified, the aforesaid clip and head having coincident holes for receiving said locking-pin, as shown and described.

606,488. COMBINED CHAIR AND BED. BERNARD MURTAGH, Hewlett's, N. Y. Filed May 13, 1896. Renewed Dec. 22, 1897. Serial No. 663,098. (No model.)

Claim.—1. In an article of furniture, a base having front uprights and a back having a hinged connection with the base, in combination with detachable arms having rearwardly-extending tongues for entering openings in the uprights, and a slot-and-key connection between the rear ends of the arms and the back, as and for the purpose specified.



2. An article of manufacture, comprising a base having an interior chamber, side boards, and uprights at the front portion of the side boards, and a back section the side boards of which extend beyond the back board, the said back section being provided with an end board at its outer extremity and folding legs at its rear portion, the lower or inner end of the back section having a hinged connection with the side boards of the base, keepers attached to the side boards of the back section, and arms having projections at their rear ends to enter the said keepers, their forward ends being provided with tongues arranged to enter openings in the uprights, as and for the purpose specified.

3. In an article of furniture, the combination, with a chambered base, a board having a hinged connection with the front portion of the base and arranged to fold upwardly therefrom, side boards attached to the base, and uprights located at the forward ends of the side boards, of a back section comprising a back board, an upper end board and side boards, the latter having a hinged connection with the side boards of the base, folding legs attached to the back section, keepers secured to the forward edges of the back section, and arms having projections at their rear ends, removably entering the keepers of the back section, the said arms being also provided with tongues at their forward ends, arranged to enter openings in the uprights, as and for the purpose specified.

4. An article of furniture, comprising a base having uprights rising therefrom, a hinged back, removable arms terminating in downward extensions at the front ends overlapping the front of the uprights, means for engaging the rear sides of said extensions with the front faces of the uprights and means for engaging the rear ends of the arms with the hinged back, substantially as described.

606,489. SAFETY DEVICE FOR ELEVATORS. RAFFAELE FARINELLI, Jersey City, N. J. Filed Mar. 19, 1896. Serial No. 674,481. (No model.)

Claim.—1. An elevator, comprising a cage formed in two parts adapted to have relative vertical movement, a locking device adapted to normally restrain the movement of said parts in one direction, a guide-clutching mechanism actuated by the relative movements of the parts of the cage, a suspension device for the cage, having a limited yielding action, and a trip for the locking device, actuated by the recoil of the suspension device when the strain on the latter is relieved, substantially as described.

2. An elevator, comprising a cage formed in two parts adapted to have relative vertical movement, springs supporting one of said parts from the other, a locking device adapted to normally restrain the action of the springs, a guide-clutching mechanism actuated by the relative movement of the parts of the cage, a spring-influenced suspension device for the cage, having a limited yielding action, and a trip for the locking device, actuated by the recoil of the suspension device when the strain on the latter is relieved, substantially as described.

3. An elevator, comprising a cage formed in two parts adapted to have relative vertical movement, a locking device adapted to normally restrain the movement of said parts in one direction, clutch-dogs connected to the parts of the cage and actuated to engage the elevator-guides by the relative movements of the parts of the cage, a suspension device for the cage, having a limited yielding action, and a trip for the locking device actuated by the recoil of the suspension device when the strain on the latter is relieved, substantially as described.

4. An elevator, comprising a cage formed in two parts adapted to have relative vertical movement, a locking device adapted to normally restrain the movement of said parts in one direction, eccentrics pivoted upon one part of the cage and having arms connected to the other part, whereby the eccentrics are forced into engagement with the elevator-guides by the relative vertical movement of the parts of the cage, a suspension device for the cage, having a limited yielding action, and a trip for the locking device, actuated by the recoil of the suspension device when the strain on the latter is relieved, substantially as described.

5. An elevator, comprising a cage formed in two parts adapted to have relative vertical movement, springs supporting one of said parts from the other, a locking device adapted to normally restrain the action of the springs, eccentrics pivoted upon one part of the cage and having arms connected to the other part, whereby the eccentrics are forced into engagement with the elevator-guides by the relative movement of the parts of the cage, a spring-influenced suspension device for the cage, having a limited yielding action, and a trip for the locking device actuated by the recoil of the suspension device when the strain on the latter is relieved, substantially as described.

6. An elevator, comprising a cage formed in two parts, a main cage and an auxiliary frame adapted to have relative vertical movement, a suspension connection between the main cage and the auxiliary frame, eccentric clutch-dogs pivoted upon the auxiliary frame and adapted to engage the elevator-guides, said dogs having operative connection with the main cage, a lock adapted to restrain the movement of the parts of the cage, and a trip for the lock held out of action by the strain upon the suspension connection, substantially as described.

7. An elevator, comprising a cage formed in two parts, a main cage and an auxiliary frame adapted to have relative vertical movement, a suspension connection between the main cage and the auxiliary frame, eccentric clutch-dogs pivoted upon the auxiliary frame and adapted to engage the elevator-guides, said dogs having operative connection with the main cage, an eccentric pivoted upon one part of the cage and engaging the other, to hold the two separated and the clutch-dogs in inoperative position, a lock normally holding the parts in said position, springs connecting the two parts of the cage and acting in opposition to the eccentrics to throw the dogs into action, and a trip for the lock, held out of action by the strain upon the suspension connection, substantially as described.

8. An elevator, comprising a cage formed in two parts, a main cage and an auxiliary frame adapted to have relative vertical movement, a suspension connection between the main cage and the auxiliary frame, eccentric clutch-dogs pivoted upon the auxiliary frame and adapted to engage the elevator-guides, said dogs having operative connection with the main cage, an eccentric pivoted upon one part of the cage and engaging the other part to hold the two separated and the clutch-dogs in inoperative position, a crank within the cage having a rotative connection with said eccentric, a lock for said crank, springs connecting the two parts of the cage and acting in opposition to the eccentric to throw the dogs into action, and a trip for the lock, held out of action by the strain upon the suspension connection, substantially as described.

9. A lowering device for elevators, comprising a governor fixed at the top of the elevator-well and having a wheel adapted to receive a flexible connector, a flexible connector passing over said wheel and adapted to be connected with the cage to support it, means for freeing the elevator-cage and for locking it in the well, at will, and positive means by which the belt is prevented from slipping on the wheel, substantially as described.

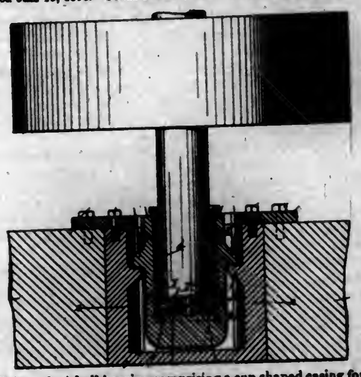
10. A lowering device for elevators, comprising a governor fixed at the top of the elevator-well and having a wheel adapted to receive a flexible connector, a flexible connector passing over said wheel and adapted to be connected with the cage to support it, means for freeing the elevator-cage and for locking it in the well, at will, and a friction device acting upon the belt before it reaches the wheel, substantially as described.

11. In a lowering device for elevators, a governor fixed at the top of the well and having a wheel adapted to receive a flexible connector, a ratchet connection between said wheel and the governor mechanism permitting said wheel to run free in one direction, a flexible connector passing over said wheel, and adapted to be connected with the cage to support it, and means for freeing the elevator-cage and for locking it in the well, at will, substantially as described.

12. In a lowering device for elevators, a governor fixed at the top of the elevator-well and comprising a revolving vane, a wheel and multiple gearing between the vane and wheel, said wheel being adapted to receive a flexible connector, a flexible connector passing over said wheel and adapted to be connected with the cage to support it, and means for freeing the elevator-cage and for locking it in the well, at will, substantially as described.

13. In a lowering device for elevators, a governor fixed at the top of the elevator-well and comprising a revolving vane, a wheel, and multiple gearing between them, said wheel being adapted to receive a flexible connector, a flexible connector passing over said wheel and adapted to be connected with the cage to support it, means for freeing the elevator-cage and for locking it in the well, at will, and a friction device acting on the belt before it reaches the wheel, substantially as described.

606,490. PLOW. JESSE W. ROSS, New Orleans, La. Filed Oct. 20, 1897. Serial No. 655,786. (No model.)



Claim.—1. The combination of two beams joined to each other at their front ends and diverging as they extend rearwardly, a plow joined to the rear end of each beam, a bracket attached to the moldboard of each plow, a handle attached to each bracket, a brace attached to each handle, the braces extending forwardly and being respectively attached to the rear portions of the beams, an arm attached to the rear portion of each beam and a roller mounted between the rear ends of the arms, the arms extending rearwardly from the plow.

2. The combination of two beams joined to each other at their front ends, the beams being separated at their rear ends, adjustably-

connected bars extending between and bracing the beams, a plow removably attached to the rear end of each beam, a handle attached to the moldboard of each plow, adjustably-connected bars extending between the handles and serving to hold them rigid with each other, and braces respectively attached to the handles and run forwardly and attached to the respective beams at the rear portions thereof.

3. The combination of two plow-beams joined to each other, a plow removably attached to the rear end of each beam, a bracket attached to the moldboard of each plow, an arm attached to the shank of each plow, two handles capable respectively of being removably connected with either the arms or the brackets, and means for bracing the handles.

606,491. BALL-BEARING. JOHN R. SAUCIER, New Iberia, La. Filed Jan. 19, 1898. Serial No. 667,148. (No model.)

Claim.—1. A ball-bearing comprising a cup-shaped casing formed at its inside with a support, an oil-box hung on the said support within the casing, a button set in the bottom of the box, and formed on its top with a circular groove, a second button above the first-named button, and on which rests the lower end of a shaft, the second button being provided in its under side with a circular groove registering with the groove in the other button, and balls filling the said grooves, to hold the buttons separated, substantially as shown and described.

2. A ball-bearing comprising a cup-shaped casing formed at its inside with a support, an oil-box hung on the said support within the casing, a lining for the box and for receiving a shaft, the lining and box being formed with apertures for admitting oil from the casing to the inner surface of the lining and the parts contained therein, a button set in the bottom of the box, and formed on its top with a circular groove, a second button above the first-named button, and on which rests the lower end of the shaft, the second button being provided in its under side with a circular groove registering with the groove in the other button, and balls filling the said grooves for holding the buttons separated, substantially as shown and described.

3. The combination of a casing, an oil-box mounted in the casing and communicating with the interior of the casing, a button seated in the oil-box and a second button revolubly seated on the first button and forming a step whereon may be mounted a revoluble shaft.

606,492. DRESS-GUARD ATTACHMENT. WILLIAM SHIRLEY, Coventry, England. Filed Sept. 15, 1897. Serial No. 651,769. (No model.) Patented in England Sept. 17, 1896, No. 20,597; in France Nov. 10, 1896, No. 261,146, and in Germany Nov. 10, 1896, No. 92,855.

Claim.—1. An attaching device for bicycle dress-guards, consisting of a keeper, and a latch adapted for locking engagement with the keeper and having casings formed upon its body the said latch being provided with spring-controlled members having movement in the said casings and arranged for attachment to the dress-guard, for the purpose set forth.

2. In a bicycle dress-guard, a latch adapted for attachment to a bicycle-frame and comprising a segmental body-plate having casings formed at its upper edge, and a spring-pressed rod arranged in each casing and extending out through the upper end thereof, the said rods being arranged for attachment to a dress-guard substantially as set forth.

3. In an attaching device for bicycle dress-guards, a latch arranged for attachment to a bicycle-frame, a cylindrical casing carried by the latch-body, and a spring-controlled rod having guided movement in the casing and terminating at its upper end in an eye, the said rod being arranged for attachment to a dress-guard, for the purpose specified.

4. In a dress-guard for bicycles, an attaching device for the said guard, consisting of a keeper adapted to be attached to the bicycle-frame, a latch arranged for locking engagement with the keeper, and spring-controlled pistons arranged for engagement with the lower portion of the dress-guard, for the purpose set forth.
